Tablets not licensed for use in children under 3 months. EC capsules not licensed for use in children under 6 years.

**CAUTIONS**

History of pancreatitis (preferably avoid, otherwise extreme caution) - hyperuricaemia - peripheral neuropathy

**INTERACTIONS** → Appendix 1 (didanosine). Antacids in tablet formulation might affect absorption of other drugs—give at least 2 hours apart.

**SIDE-EFFECTS**

Acute renal failure - alopecia - anaphylactic reactions - diabetes mellitus - dry eyes - dry mouth - hyperuricaemia (suspend if raised significantly) - hypoglycaemia - liver failure - non-cirrhotic portal hypertension - optic nerve changes - pancreatitis (less common in children) - parotid gland enlargement - peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) - retinal changes - rhabdomyolysis - saliadenitis

**SIDE-EFFECTS, FURTHER INFORMATION**

Pancreatitis: Suspend treatment if serum lipase raised (even if asymptomatic) or if symptoms of pancreatitis develop; discontinue if pancreatitis confirmed. Whenever possible avoid concomitant treatment with other drugs known to cause pancreatic toxicity (e.g. intravenous pentamidine isetionate); monitor closely if concomitant therapy unavoidable. Since significant elevations of triglycerides cause pancreatitis monitor closely if elevated.

**PREGNANCY**

Manufacturer advises use only if potential benefit outweighs risk.

**HEPATIC IMPAIRMENT**

In hepatic impairment, monitor for toxicity.

**RENAL IMPAIRMENT**

Reduce dose if estimated glomerular filtration rate less than 60 mL/minute/1.73 m²; consult product literature.

**MONITORING REQUIREMENTS**

Ophthalmological examination (including visual acuity, colour vision, and dilated fundus examination) recommended annually or if visual changes occur.

**DIRECTIONS FOR ADMINISTRATION**

Capsules should be swallowed whole and taken at least 2 hours before or 2 hours after food.

With chewable tablets, to ensure sufficient antacid, each dose to be taken as at least 2 tablets (child under 1 year 1 tablet) chewed thoroughly, crushed or dispersed in water; clear apple juice may be added for flavouring; tablets to be taken 2 hours after lopinavir with ritonavir capsules and oral solution or atazanavir with ritonavir.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer didanosine capsules and chewable tablets.
Lamivudine (3TC)

**INDICATIONS AND DOSE**

**EPIVIR® ORAL SOLUTION**

**HIV infection in combination with other antiretroviral drugs**

- **BY MOUTH**
  - Child 1-2 months: 4 mg/kg twice daily
  - Child 3 months-11 years (body-weight up to 14 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg)
  - Child 3 months-11 years (body-weight 14-20 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg twice daily, alternatively 150 mg once daily
  - Child 3 months-11 years (body-weight 21-29 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg once daily, dose to be taken in the morning and 150 mg daily, dose to be taken in the evening; alternatively 225 mg once daily
  - Child 3 months-11 years (body-weight 30 kg and above): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 150 mg twice daily, alternatively 300 mg once daily
  - Child 12-17 years: 150 mg twice daily, alternatively 300 mg once daily

**EPIVIR® TABLETS**

**HIV infection in combination with other antiretroviral drugs**

- **BY MOUTH**
  - Child 1-2 months: 4 mg/kg twice daily
  - Child 3 months-11 years (body-weight up to 14 kg): 4 mg/kg twice daily, alternatively 8 mg/kg once daily
  - Child 3 months-11 years (body-weight 14-20 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg twice daily, alternatively 150 mg once daily
  - Child 3 months-11 years (body-weight 21-29 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg once daily, dose to be taken in the morning and 150 mg daily, dose to be taken in the evening; alternatively 225 mg once daily
  - Child 3 months-11 years (body-weight 30 kg and above): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 150 mg twice daily, alternatively 300 mg once daily
  - Child 12-17 years: 150 mg twice daily, alternatively 300 mg once daily

**ZEFFIX®**

**Chronic hepatitis B infection either with compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis) when first-line treatments cannot be used, or (in combination with another antiviral drug without cross-resistance to lamivudine) with decompensated liver disease**

- **BY MOUTH**
  - Child 2-11 years: 3 mg/kg once daily (max. per dose 100 mg), children receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

**UNLICENSED USE**

**EPIVIR® ORAL SOLUTION** Not licensed for use in children under 3 months.

**ZEFFIX®** Not licensed for use in children.

**EPIVIR® TABLETS** Not licensed for use in children under 3 months.

**CAUTIONS** Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine

**INTERACTIONS** → Appendix 1 (lamivudine).

**SIDE-EFFECTS** Alopecia, muscle disorders, nasal symptoms, peripheral neuropathy, rhabdomyolysis

**BREAST FEEDING** Can be used with caution in women infected with chronic hepatitis B alone, providing that adequate measures are taken to prevent hepatitis B infection in infants.

**RENA L IMPAIRMENT** Reduce dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²; consult product literature.

**MONITORING REQUIREMENTS** When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral markers of hepatitis B every 3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana and strawberry.

**M EDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Epivir (ViiV Healthcare UK Ltd)
  - Lamivudine 150 mg Epivir 150mg tablets | 60 tablet £121.82
  - Lamivudine 300 mg Epivir 300mg tablets | 30 tablet £133.89
- Zeffix (GliaxoSmithKline UK Ltd)
  - Lamivudine 100 mg Zeffix 100mg tablets | 28 tablet £78.09
  - Lamivudine 150 mg per 1 ml Epivir 50mg/5ml oral solution | 240 ml £31.16

**Stavudine (d4T)**

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs when no suitable alternative available and when prescribed for shortest period possible**

- **BY MOUTH**
  - Child (body-weight up to 30 kg): 1 mg/kg twice daily, to be taken preferably at least 1 hour before food
  - Child (body-weight 30–59 kg): 30 mg twice daily, to be taken preferably at least 1 hour before food
  - Child (body-weight 60 kg and above): 40 mg twice daily, to be taken preferably at least 1 hour before food

**UNLICENSED USE** Capsules not licensed for use in children under 3 months.

**CAUTIONS** Excessive alcohol intake - higher risk of lactic acidosis than other nucleoside reverse transcriptase inhibitors (especially when used in combination with...
didanosine)—use only if alternative regimens are not suitable - history of pancreatitis - history of peripheral neuropathy

**INTERACTIONS** → Appendix 1 ( stavudine).
Caution with concomitant use of isolated—risk of peripheral neuropathy.
Caution with concomitant use with other drugs associated with pancreatitis.

**SIDE-EFFECTS**
- Common or very common Abnormal dreams - cognitive dysfunction - depression - drowsiness - peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) - pruritus
- Uncommon Anxiety - gynaecomastia
- PREGNANCY  Manufacturer advises use only if potential benefit outweighs risk.
- RENAL IMPAIRMENT Reduce dose to 50% if estimated glomerular filtration rate 25–50 mL/minute/1.73 m²; reduce dose to 25% if estimated glomerular filtration rate less than 25 mL/minute/1.73 m². Risk of peripheral neuropathy.
- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include cherry.
- Risk of lipodystrophy and should be used only if alternative regimens are not suitable; it is considered to be less suitable for prescribing.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - Zerit (Bristol-Myers Squibb Pharmaceuticals Ltd)  
  - Stavudine 20 mg  
  - Zerit 20 mg capsules | 56 capsule (Hospital only)
  - Stavudine 30 mg  
  - Zerit 30 mg capsules | 56 capsule (Hospital only)
  - Stavudine 40 mg  
  - Zerit 40 mg capsules | 56 capsule (Hospital only)
- **Oral solution**
  - Zerit (Bristol-Myers Squibb Pharmaceuticals Ltd)  
  - Stavudine 1 mg per 1 mL  
  - Zerit 1 mg/ml oral solution | 200 ml (BNFC) £22.94 (Hospital only)

**DOSE EQUIVALENT AND CONVERSION**
7.5 scoops of granules contains approx. 245 mg tenofovir disoproxil (as fumarate).

**INTERACTIONS** → Appendix 1 (tenofovir).
Use with caution if concomitant or recent use of nephrotoxic drugs.

**SIDE-EFFECTS**
- Rare Nephrogenic diabetes insipidus - proximal renal tubulopathy - renal failure
- Frequency not known Hypophosphataemia - reduced bone density

**RENAI IMPAIRMENT**  Manufacturer advises avoid—no information available.

**MONITORING REQUIREMENTS**
- Test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases.
- When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

**DIRECTIONS FOR ADMINISTRATION**
Granules: mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do not mix granules with liquids.

**PATIENT AND CARER ADVICE**
Patients or carers should be given advice on how to administer tenofovir granules.

Missed doses
If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21
- Viread (Gilead Sciences International Ltd)  
  - Tenofovir disoproxil (as Tenofovir disoproxil fumarate)  
  - 123 mg Viread 123 mg tablets | 30 tablet (BNFC) £102.60
  - Tenofovir disoproxil (as Tenofovir disoproxil fumarate)  
  - 163 mg Viread 163 mg tablets | 30 tablet (BNFC) £135.98
  - Tenofovir disoproxil (as Tenofovir disoproxil fumarate)  
  - 245 mg Viread 245 mg tablets | 30 tablet (BNFC) £204.39

Granules

CAUTIONARY AND ADVISORY LABELS 21
- Viread (Gilead Sciences International Ltd)  
  - Tenofovir disoproxil (as Tenofovir disoproxil fumarate)  
  - 33 mg per 1 gram Viread 33 mg/g granules | 60 gram (BNFC) £54.50

**Zidovudine**
(Azidothymidine; AZT)

**INDICATIONS AND DOSE**
HIV infection in combination with other antiretroviral drugs

- **BY MOUTH**
  - Child: 180 mg/m² twice daily (max. per dose 300 mg)
  - Child (body-weight 6-13 kg): 100 mg twice daily
  - Child (body-weight 14-20 kg): 100 mg, to be taken in the morning and 200 mg, to be taken in the evening
  - Child (body-weight 21-27 kg): 200 mg twice daily
  - Child (body-weight 28-29 kg): 200–250 mg twice daily
HIV infection 395

Zidovudine with lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, zidovudine p. 394, lamivudine p. 393.

- **INDICATIONS AND DOSE**
  - HIV infection in combination with other antiretroviral drugs
    - **BY MOUTH**
      - Child (body-weight 14–20 kg): 0.5 tablet twice daily
      - Child (body-weight 21–29 kg): 0.5 tablet daily, to be given in the morning and 1 tablet daily, to be given in the evening
      - Child (body-weight 30 kg and above): 1 tablet twice daily
  - **DIRECTIONS FOR ADMINISTRATION**
    - **COMBIVIR® TABLETS** Tablets may be crushed and mixed with semi-solid food or liquid just before administration.
  - **RENAI IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Tablet**
      - Zidovudine with lamivudine (Non-proprietary) Lamivudine 150 mg, Zidovudine 300 mg Zidovudine 300mg / Lamivudine 150mg tablets | 60 tablet £70.61–£285.11
      - **Combivir** (ViiV Healthcare UK Ltd) Lamivudine 150 mg, Zidovudine 300 mg Combivir 150mg/300mg tablets | 60 tablet £255.10

### ANTIVIRALS > PROTEASE INHIBITORS, HIV

**Protease inhibitors**

- **CONTRA-INDICATIONS** Acute porphyrias p. 562
- **CAUTIONS** Diabetes - haemophilia (increased risk of bleeding)
- **RENAI IMPAIRMENT**
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Capsule**
    - Zidovudine (Non-proprietary) Zidovudine 100 mg Zidovudine 100mg capsules | 60 capsule £40.41
  - Zidovudine 250 mg Zidovudine 250mg capsules | 60 capsule £96.36
  - **Retrovir** (ViiV Healthcare UK Ltd) Zidovudine 100 mg Retrovir 100mg capsules | 100 capsule £88.86
  - Zidovudine 250 mg Retrovir 250mg capsules | 40 capsule £88.86
  - **Oral solution**
    - Retrovir (ViiV Healthcare UK Ltd) Zidovudine 10 mg per 1 ml Retrovir 50mg/5ml oral solution sugar-free | 200 ml £117.78
  - **Solution for infusion**
    - Retrovir (ViiV Healthcare UK Ltd) Zidovudine 10 mg per 1 ml Retrovir IV 200mg/20ml concentrate for solution for infusion vials | 5 vial £44.61

### HIV infection

**BY MOUTH, OR BY INTRAVENOUS INFUSION**

- **CONTRA-INDICATIONS** Abnormally low haemoglobin concentration (consult product literature) - abnormally low neutrophil counts (consult product literature) - Acute porphyrias p. 562 - neonates with hyperbilirubinaemia requiring treatment other than phototherapy, or with raised transaminase (consult product literature)
- **CAUTIONS** Risk of haematological toxicity particularly with high dose and advanced disease - vitamin B₁₂ deficiency (increased risk of neutropenia)
- **INTERACTIONS** → Appendix 1 (zidovudine).
- **SIDE-EFFECTS** Anaemia (may require transfusion) - anxiety - chest pain - convulsions - depression - dizziness - drowsiness - gynaecomastia - influenza-like symptoms - loss of mental acuity - myopathy - neuropathy - paraesthesia - pigmentation of nails - pigmentation of oral mucosa - pigmentation of skin - pruritus - sweating - taste disturbance - urinary frequency
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Anaemia and myelosuppression If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment
  - Lipatrophy Zidovudine is associated with a higher risk of lipatrophy than other antiretrovirals and should be used only if alternative regimens are not suitable.
- **HEPATIC IMPAIRMENT** Accumulation may occur.
- **RENAI IMPAIRMENT** Reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²—consult product literature.
- **MONITORING REQUIREMENTS** Monitor full blood count after 4 weeks of treatment and every 3 months.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For intermittent intravenous infusion, dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give over 1 hour.
- **PRESCRIBING AND DISPENSING INFORMATION** The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Capsule**
    - Zidovudine (Non-proprietary) Zidovudine 100 mg Zidovudine 100mg capsules | 60 capsule £40.41
  - **Retrovir** (ViiV Healthcare UK Ltd) Zidovudine 100 mg Retrovir 100mg capsules | 100 capsule £88.86
  - Zidovudine 250 mg Retrovir 250mg capsules | 40 capsule £88.86
  - **Oral solution**
    - Retrovir (ViiV Healthcare UK Ltd) Zidovudine 10 mg per 1 ml Retrovir 50mg/5ml oral solution sugar-free | 200 ml £117.78
  - **Solution for infusion**
    - Retrovir (ViiV Healthcare UK Ltd) Zidovudine 10 mg per 1 ml Retrovir IV 200mg/20ml concentrate for solution for infusion vials | 5 vial £44.61
**Atazanavir**

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir

- **BY MOUTH**
  - Child 6-17 years (body-weight 15-19 kg): 150 mg once daily
  - Child 6-17 years (body-weight 20-39 kg): 200 mg once daily
  - Child 6-17 years (body-weight 40 kg and above): 300 mg once daily

**INTERACTIONS** → Appendix 1 (atazanavir).

Caution if concomitant use with drugs that prolong QT interval.

**SIDE-EFFECTS**

- Common or very common AV block
- Uncommon Abnormal dreams, alopecia, amnesia, anxiety, arthralgia, chest pain, cholelithiasis, depression, disorientation, dry mouth, dyspnoea, gynaecomastia, haematuria, hypertension, increased appetite, mouth ulcers, nephrolithiasis, peripheral neuropathy, proteinuria, syncope, tropical de pointes, urinary frequency, weight changes
- Rare Abnormal gait, cholecystitis, hepatosplenomegaly, oedema, palpitiation

**SIDE-EFFECTS, FURTHER INFORMATION**

- Rash Mild to moderate rash occurs commonly, usually within the first 3 weeks of therapy. Severe rash occurs less frequently and may be accompanied by systemic symptoms. Discontinue if severe rash develops.
- PREGNANCY Theoretical risk of hyperbilirubinaemia in neonate if used at term.
  In pregnancy, monitor viral load and plasma-atazanavir concentration during third trimester.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Capsule

**CAUTIONARY AND ADVISORY LABELS** 5, 21

- Reyataz (Bristol-Myers Squibb Pharmaceuticals Ltd)
- Atazanavir (as Atazanavir sulfate) 150 mg Reyataz 150 mg capsules | 60 capsule (£43.75) (Hospital only)
- Atazanavir (as Atazanavir sulfate) 200 mg Reyataz 200 mg capsules | 60 capsule (£43.75) (Hospital only)
- Atazanavir (as Atazanavir sulfate) 300 mg Reyataz 300 mg capsules | 30 capsule (£43.75) (Hospital only)

**Darunavir**

**INDICATIONS AND DOSE**

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—with low-dose ritonavir

- **BY MOUTH**
  - Child 12-17 years (body-weight 40 kg and above): 800 mg once daily

**INTERACTIONS** → Appendix 1 (darunavir).

**SIDE-EFFECTS**

- Common or very common Peripheral neuropathy, rash
- Uncommon Abnormal dreams, acne, alopecia, anxiety, arthralgia, chest pain, conjunctival hyperaemia, cough, depression, dry eyes, dry mouth, dyspnoea, dysuria, eczema, erectile dysfunction, flushing, gynaecomastia, hypertension, hypothyroidism, increased appetite, increased sweating, memory impairment, myocardial infarction, nail discoloration, nephrolithiasis, osteoporosis, peripheral oedema, polyuria, pyrexia, QT interval prolongation, reduced libido, renal failure, severe skin rash, Stevens-Johnson syndrome, stomatitis, tachycardia, throat irritation, toxic epidermal necrolysis, weight changes
- Rare Bradycardia, confusion, convulsions, haematemesis, palpitation, rhinorrhea, seborrhoeic dermatitis, syncope, visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

- Rash Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if severe rash develops.
- ALLERGY AND CROSS-SENSITIVITY Use with caution in patients with sulfonamide sensitivity.
- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen.
- HEPATIC IMPAIRMENT Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment—no information available.
- MONITORING REQUIREMENTS Monitor liver function before and during treatment.
- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include strawberry.
- PATIENT AND CARER ADVICE

**Missed doses**

If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

**CAUTIONARY AND ADVISORY LABELS** 21

- Prezista (Janssen-Cilag Ltd)
  - Darunavir (as Darunavir ethanolate) 75 mg Prezista 75 mg tablets | 480 tablet (£44.70)
  - Darunavir (as Darunavir ethanolate) 150 mg Prezista 150 mg tablets | 240 tablet (£44.70)
  - Darunavir (as Darunavir ethanolate) 400 mg Prezista 400 mg tablets | 60 tablet (£43.75) £297.80
  - Darunavir (as Darunavir ethanolate) 600 mg Prezista 600 mg tablets | 60 tablet (£43.75) £446.70
**Fosamprenavir**

- **DRUG ACTION** Fosamprenavir is a pro-drug of amprenavir.

- **INDICATIONS AND DOSE**
  - **HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir**
    - **BY MOUTH**
      - Child 6-17 years (body-weight 25-39 kg): 18 mg/kg twice daily (max. per dose 700 mg)
      - Child 6-17 years (body-weight 40 kg and above): 700 mg twice daily

- **DOSE EQUIVALENCE AND CONVERSION**
  - 700 mg fosamprenavir is equivalent to approximately 600 mg amprenavir.

- **INTERACTIONS** → Appendix 1 (fosamprenavir).

- **SIDE-EFFECTS**
  - Rare Stevens-Johnson syndrome
  - Frequency not known Rash

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Rash Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—usually resolves within 2 weeks and may respond to antihistamines.

- **PREGNANCY** Toxicity in animal studies; manufacturer advises use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Reduce dose in moderate to severe impairment. Manufacturer advises caution in mild impairment.

- **DIRECTIONS FOR ADMINISTRATION** In children, oral suspension should be taken with food.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include grape, bubblegum, or peppermint.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer fosamprenavir oral suspension.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

### Tablet
- **Telzir** (ViiV Healthcare UK Ltd)
  - Fosamprenavir (as Fosamprenavir calcium) 700 mg Telzir 700mg tablets | 60 tablet £220.13

### Oral suspension
- **EXCIPIENTS:** May contain Propylene glycol
- **Telzir** (ViiV Healthcare UK Ltd)
  - Fosamprenavir (asт Fosamprenavir calcium) 50 mg per 1 ml Telzir 50mg/ml oral suspension | 225 ml £58.70

---

**Lopinavir with ritonavir**

- **INDICATIONS AND DOSE**
  - **HIV infection in combination with other antiretroviral drugs**
    - **BY MOUTH**
      - Child 2-17 years (body-weight up to 40 kg and body surface area 0.5-0.7 m²): 200/50 mg twice daily

---

**Ritonavir**

- **INDICATIONS AND DOSE**
  - **HIV infection in combination with other antiretroviral drugs (high-dose ritonavir)**
    - **BY MOUTH**
      - Child 2-17 years: Initially 250 mg/m² twice daily, increased in steps of 50 mg/m² every 2-3 days; increased to 350 mg/m² twice daily (max. per dose 600 mg twice daily), tolerability of this regimen is poor continued →
Tipranavir

**INDICATIONS AND DOSE**

HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals–with low-dose ritonavir

- **BY MOUTH USING CAPSULES**
  - Child 12-17 years: 500 mg twice daily
- **BY MOUTH USING ORAL SOLUTION**
  - Child 2-11 years: 375 mg/m² twice daily (max. per dose 500 mg)

**DOSE EQUIVALENCE AND CONVERSION**

The bioavailability of tipranavir oral solution is higher than that of the capsules; the oral solution is not interchangeable with the capsules on a milligram-for-milligram basis.

**CAUTIONS**

- Patients at risk of increased bleeding from trauma, surgery or other pathological conditions
- **INTERACTIONS** → Appendix 1 (tipranavir). Caution with concomitant use of drugs that increase risk of bleeding.

**SIDE-EFFECTS**

- Rare Dehydration
- **Frequency not known** Anorexia, dyspnoea, influenza-like symptoms, peripheral neuropathy, photosensitivity, renal impairment

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hepatotoxicity Potentially life-threatening hepatotoxicity reported. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature).
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate or severe impairment—no information available.

**MONITORING REQUIREMENTS** Monitor liver function before treatment then every 2 weeks for 1 month, then every 3 months.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include toffee and mint.

**PATIENT AND CARER ADVICE**

- Patients or carers should be told to observe the oral solution for crystallisation; the bottle should be replaced if more than a thin layer of crystals form (doses should continue to be taken at the normal time until the bottle is replaced).

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.
  - **Capsule**
    - CAUTIONARY AND ADVISORY LABELS 5, 21
    - EXCIPIENTS: May contain Ethanol
  - **Aptivus** (Boehringer Ingelheim Ltd)
    - Tipranavir 250 mg Aptivus 250mg capsules | 120 capsule £441.00
  - **Oral solution**
    - CAUTIONARY AND ADVISORY LABELS 5, 21
    - EXCIPIENTS: May contain Vitamin e
  - **Aptivus** (Boehringer Ingelheim Ltd)
    - Tipranavir 100 mg per 1 ml Aptivus 100mg/ml oral solution sugar-free | 55 ml £129.65

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

BNFC 2016-2017
**ANTIVIRALS**  >  **OTHER**

**Maraviroc**

- **DRUG ACTION** Maraviroc is an antagonist of the CCR5 chemokine receptor.

- **INDICATIONS AND DOSE**

  **CCR5-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals**
  - **BY MOUTH**
  - **Child:** (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

- **CAUTIONS** Cardiac disease

- **INTERACTIONS** → Appendix 1 (maraviroc).

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain - anaemia - anorexia - depression - diarrhoea - flatulence - headache - insomnia - malaise - nausea - rash
  - **Uncommon** Myositis - proteinuria - renal failure - seizures
  - **Rare** Angina - granulocytopenia - hepatitis - pancytopenia - Stevens–Johnson syndrome - toxic epidermal necrolysis
  - **Frequency not known** Eosinophilia - fever - hepatic reactions - hypersensitivity reactions - osteonecrosis - rash

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Osteonecrosis** For further information see HIV infection p. 385.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in hepatic impairment, including patients with chronic hepatitis B or C.

- **RENAL IMPAIRMENT** If estimated glomerular filtration rate less than 80 mL/minute/1.73 m², consult product literature.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - **Celsentri** (ViiV Healthcare UK Ltd)
    - **Maraviroc 150 mg** Celsentri 150mg tablets | 60 tablet [PAM] £441.27
    - **Maraviroc 300 mg** Celsentri 300mg tablets | 60 tablet [PAM] £441.27

---

### 6.5 Influenza

**Influenza**

**Management**

Oseltamivir below and zanamivir p. 401 are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; oseltamivir is licensed for use within 36 hours of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days.

Oseltamivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza. However, in children with severe influenza or in those who are immunocompromised, antivirals may still be effective after this time if viral shedding continues [unlicensed use]. Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

There is evidence that some strains of influenza A virus have reduced susceptibility to oseltamivir, but may retain susceptibility to zanamivir. Resistance to oseltamivir may be greater in severely immunocompromised children.

Zanamivir should be reserved for patients who are severely immunocompromised, or when oseltamivir cannot be used, or when resistance to oseltamivir is suspected. For those unable to use the dry powder for inhalation, zanamivir is available as a solution that can be administered by nebuliser or intravenously [unlicensed].

Information on pandemic influenza, avian influenza, and swine influenza may be found at [www.gov.uk/phe](http://www.gov.uk/phe). Immunisation against influenza is recommended for persons at high risk, and to reduce transmission of infection.

**Oseltamivir in children under 1 year of age**

Data on the use of oseltamivir in children under 1 year of age is limited. Furthermore, oseltamivir may be ineffective in neonates because they may not be able to metabolise oseltamivir to its active form. However, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age.

The Department of Health has advised (May 2009) that during a pandemic, treatment with oseltamivir can be overseen by healthcare professionals experienced in assessing children.

Amanpridine hydrochloride is licensed for prophylaxis and treatment of influenza A in children over 10 years of age, but it is no longer recommended.

**ANTIVIRALS**  >  **NEURAMINIDASE INHIBITORS**

**Oseltamivir**

- **DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

- **INDICATIONS AND DOSE**

  **Prevention of influenza**
  - **BY MOUTH**
    - **Neonate:** 3 mg/kg once daily for 10 days for post-exposure prophylaxis.
    - **Child 1–11 months:** 3 mg/kg once daily for 10 days for post-exposure prophylaxis
    - **Child 1–12 years (body-weight 10–15 kg):** 30 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
    - **Child 1–12 years (body-weight 15–23 kg):** 45 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
    - **Child 1–12 years (body-weight 23–40 kg):** 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
    - **Child 1–12 years (body-weight 40 kg and above):** 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
    - **Child 13–17 years:** 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

  **Treatment of influenza**
  - **BY MOUTH**
    - **Neonate:** 3 mg/kg twice daily for 5 days.
    - **Child 1–11 months:** 3 mg/kg twice daily for 5 days
    - **Child 1–12 years (body-weight 10–15 kg):** 30 mg twice daily for 5 days
    - **Child 1–12 years (body-weight 15–23 kg):** 45 mg twice daily for 5 days
    - **Child 1–12 years (body-weight 23–40 kg):** 60 mg twice daily for 5 days

---
400 Viral infection

- Child 1-12 years (body-weight 40 kg and above): 75 mg twice daily for 5 days
- Child 13-17 years: 75 mg twice daily for 5 days

- **UNLICENSED USE** Not licensed for use in premature infants.
- **SIDE-EFFECTS**
  - Common or very common Abdominal pain - dyspepsia - headache - nausea - vomiting
  - Uncommon Altered consciousness - arrhythmias - convulsions - eczema - rash
  - Rare Gastro-intestinal bleeding - hepatitis - neuropsychiatric disorders - Stevens-Johnson syndrome - thrombocytopenia - toxic epidermal necrolysis - visual disturbances
- **PREGNANCY** Although safety data are limited, oseltamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).
- **BREAST FEEDING** Although safety data are limited, oseltamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding. Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).
- **RENAL IMPAIRMENT** For treatment, use 40% of normal dose twice daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose once daily if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²). For prevention, use 40% of normal dose twice daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose every 48 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²). Avoid for treatment and prevention if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION** If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.
- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Oseltamivir for influenza (flu) [www.medicinesforchildren.org.uk/oseltamivir-for-influenza](http://www.medicinesforchildren.org.uk/oseltamivir-for-influenza)
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - NICE technology appraisals (TAs)
    - Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158
    - Oseltamivir is not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
    - Oseltamivir is not recommended for seasonal prophylaxis against influenza.
    - When influenza is circulating in the community, oseltamivir is a treatment option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)
    - During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes. At risk patients are those who have one or more of the following conditions:
      - chronic respiratory disease (including asthma);
      - chronic heart disease;
      - chronic renal disease;
      - chronic liver disease;
      - chronic neurological disease;
      - immunosuppression;
      - diabetes mellitus.
  - The Department of Health in England has advised (November 2010 and April 2011) that ‘at risk patients’ also includes children who are at risk of developing medical complications from influenza (treatment only) or females who are pregnant.
  - This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.
  - www.nice.org.uk/TA158
    - Oseltamivir, zanamivir, and amantadine for treatment of influenza (February 2009) NICE TA168
      - Oseltamivir is not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
      - When influenza is circulating in the community, oseltamivir is an option recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 48 hours of the onset of symptoms. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)
      - During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for treatment in at-risk patients living in long-term residential or nursing homes. At risk patients are those who have one or more of the following conditions:
        - chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
        - chronic heart disease;
        - chronic renal disease;
        - chronic liver disease;
        - chronic neurological disease;
        - immunosuppression;
        - diabetes mellitus.
  - The Department of Health in England has advised (November 2010 and April 2011) that ‘at risk patients’ also includes children who are at risk of developing medical complications from influenza (treatment only) or females who are pregnant.
  - This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.
  - www.nice.org.uk/TA168
- NHS restrictions Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription ‘SL’S’.

  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
- **Capsule**
  - **CAUTIONARY AND ADVISORY LABELS**
  - Oseltamivir (as Oseltamivir phosphate) 30 mg Tamiflu 30mg capsules | 10 capsule | [£7.71](http://www.nice.org.uk/TA168) Roche Products Ltd
Zanamivir

**DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

**INDICATIONS AND DOSE**

**Post-exposure prophylaxis of influenza**
- By inhalation of powder
  - Child 5–17 years: 10 mg once daily for 10 days

**Prevention of influenza during an epidemic**
- By inhalation of powder
  - Child 5–17 years: 10 mg once daily for up to 28 days

**Treatment of influenza**
- By inhalation of powder
  - Child 5–17 years: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)

**UNLICENSED USE** Use of zanamivir for up to 10 days if resistance to oseltamivir suspected is an unlicensed duration.

**CAUTIONS** Asthma - chronic pulmonary disease - uncontrolled chronic illness

CAUTIONS, FURTHER INFORMATION
- Asthma and chronic pulmonary disease Risk of bronchospasm—short-acting bronchodilator should be available.
  - Avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm.

**SIDE-EFFECTS**
- Common or very common Rash
- Uncommon Angioedema - bronchospasm - dyspnoea - urticaria
- Rare Neuropsychiatric disorders - Stevens-Johnson syndrome - toxic epidermal necrolysis

**PREGNANCY** Although safety data are limited, zanamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).

**BREAST FEEDING** Although safety data are limited, zanamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

**DIRECTIONS FOR ADMINISTRATION** Other inhaled drugs should be administered before zanamivir.

**PRESCRIBING AND DISPENSING INFORMATION** Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription 'SLS'.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)
- Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158

Zanamivir is not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
- Zanamivir is not recommended for seasonal prophylaxis against influenza.
- When influenza is circulating in the community, zanamivir is an option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Zanamivir should be given within 36 hours of exposure to influenza. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, zanamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At risk patients are those who have one or more of the following conditions:
- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes children who are at risk of developing medical complications from influenza (treatment only) or females who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

6.6 Respiratory syncytial virus

Respiratory syncytial virus

Management
Ribavirin p. 378 inhibits a wide range of DNA and RNA viruses. It is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV bronchiolitis. Ribavirin is given by mouth with peginterferon alfa p. 379 or interferon alfa p. 517 for the treatment of chronic hepatitis C infection. Ribavirin is also effective in Lassa fever and has also been used parenterally in the treatment of life-threatening RSV, parainfluenza virus, and adenovirus infections in immunocompromised children [unlicensed indications].

Palivizumab below is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation. Palivizumab is recommended for:

- children under 9 months of age with chronic lung disease (defined as requiring oxygen for at least 28 days from birth) and who were born preterm;
- children under 6 months of age with haemodynamically significant, acyanotic congenital heart disease who were born preterm.

Palivizumab should be considered for:

- children under 2 years of age with severe combined immunodeficiency syndrome;
- children under 1 year of age who require long-term ventilation;
- children 1–2 years of age who require long-term ventilation and have an additional co-morbidity (including cardiac disease or pulmonary hypertension).

For details of the preterm age groups included in the recommendations, see Immunisation against Infectious Disease (2006), available at www.gov.uk/dh.

DRUGS FOR RESPIRATORY DISEASES

MONOCLONAL ANTIBODIES

Palivizumab

- INDICATIONS AND DOSE
  Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease (under expert supervision)
  - BY INTRAMUSCULAR INJECTION
    - Neonate: 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk.
    - Child 1–23 months: 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites
  Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease and undergoing cardiac bypass surgery (under expert supervision)
  - BY INTRAMUSCULAR INJECTION
    - Child 1–23 months: Initially 15 mg/kg, to be administered as soon as stable after surgery, preferably in the anterolateral thigh, then 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites

- UNLICENSED USE
  Licensed for the prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus (RSV) in children under 6 months of age (at the start of the RSV season) and born at less than 35 weeks corrected gestational age, or in children under 2 years of age who have received treatment for bronchopulmonary dysplasia in the last 6 months, or in children under 2 years of age with haemodynamically significant congenital heart disease.

- CAUTIONS
  Moderate to severe acute infection · moderate to severe febrile illness · serum-palivizumab concentration may be reduced after cardiac surgery · thrombocytopenia

- SIDE-EFFECTS
  - Common or very common
    Fever · injection-site reactions · nervousness
  - Uncommon
    Asthenia · constipation · cough · diarrhoea · drowsiness · haemorrhage · hyperkinesia · leucopenia · pain · rash · rhinitis · vomiting · wheeze
  - Frequency not known
    Anaphylaxis · apnoea · convulsions · hypersensitivity reactions · thrombocytopenia

- ALLERGY AND CROSS-SENSITIVITY
  Hypersensitivity to humanised monoclonal antibodies.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Synagis (AbbVie Ltd)

Chapter 6
Endocrine system

1 Antidiuretic hormone disorders

Diabetes insipidus

Diabetes insipidus is caused by either a deficiency of antidiuretic hormone (ADH, vasopressin) or by failure of the renal tubules to react to secreted antidiuretic hormone (nephrogenic diabetes insipidus).

Vasopressin (antidiuretic hormone, ADH) is used in the treatment of pituitary diabetes insipidus. Dosage is tailored to produce a regular diuresis every 24 hours to avoid water intoxication.

Treatment may be required permanently or for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin, it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients.

Desmopressin is also used in the differential diagnosis of diabetes insipidus; following an intramuscular or intranasal dose, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of pituitary diabetes insipidus. Failure to respond suggests nephrogenic diabetes insipidus. Fluid input must be managed carefully to avoid hyponatraemia; this test is not usually recommended in young children.

In nephrogenic and partial pituitary diabetes insipidus, benefit may be gained from the paradoxical antidiuretic effect of thiazides.

Other uses

Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand’s disease; it is also used to test fibrinolytic response. Desmopressin also has a role in nocturnal enuresis.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, before introducing more definitive treatment. Terlipressin acetate, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, and octreotide are used similarly but experience in children is limited.

1.1 Diabetes insipidus

Drugs used for Diabetes insipidus not listed below
Chlorothiazide, p. 103

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES ➔ VASOPRESSIN AND ANALOGUES

Desmopressin

- **Drug Action**: Desmopressin is an analogue of vasopressin.

- **Indications and Dose**
  - **Diabetes insipidus, treatment**
    - **By mouth**
      - Neonate: Initially 1–4 micrograms 2–3 times a day, adjusted according to response.
      - Child 1–2 years: Initially 10 micrograms 2–3 times a day, adjusted according to response; usual dose 30–150 micrograms daily
      - Child 2–11 years: Initially 50 micrograms 2–3 times a day, adjusted according to response; usual dose 100–800 micrograms daily
      - Child 12–17 years: Initially 100 micrograms 2–3 times a day, adjusted according to response; usual dose 0.2–1.2 mg daily
Antidiuretic hormone disorders

BNFC 2016–2017

ENDOCRINE SYSTEM

Child 2–17 years: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day

BY INTRanasal ADMINISTRATION

Neonate: Initially 100–500 nanograms, adjusted according to response; usual dose 1.25–10 micrograms daily 1–2 divided doses.

Child 1–23 months: Initially 2.5–5 micrograms 1–2 times a day, adjusted according to response.

Child 2–11 years: Initially 5–20 micrograms 1–2 times a day, adjusted according to response.

Child 12–17 years: Initially 10–20 micrograms 1–2 times a day, adjusted according to response.

BY INTRAMUSCULAR INJECTION

Neonate: Initially 100 nanograms once daily, adjusted according to response.

Primary nocturnal enuresis

BY MOUTH

Child 5–17 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration.

BY SUBLINGUAL ADMINISTRATION

Child 5–17 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week.

Diabetes insipidus, diagnosis (water deprivation test)

BY INTRanasal ADMINISTRATION

Neonate: Not recommended, use trial of treatment.

Child 1–23 months: 5–10 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia, not usually recommended.

Child 2–11 years: 10–20 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia.

Child 12–17 years: 20 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia.

BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION

Neonate: Not recommended, use trial of treatment.

Child 1–23 months: 400 nanograms for 1 dose, manage fluid input carefully to avoid hyponatraemia, not usually recommended.

Child 2–11 years: 0.5–1 microgram for 1 dose, manage fluid input carefully to avoid hyponatraemia.

Child 12–17 years: 1–2 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia.

Renal function testing

BY INTRanasal ADMINISTRATION

Child 1–11 months: 10 micrograms, empty bladder at time of administration and restrict fluid intake to 50% at next 2 feeds to avoid fluid overload.

Child 1–14 years: 20 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload.

Child 15–17 years: 40 micrograms, empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload.

BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

Child 1–11 months: 400 nanograms, empty bladder at time of administration and restrict fluid intake to 50% at next 2 feeds to avoid fluid overload.

Child 1–17 years: 2 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload.

Mild to moderate haemophilia and von Willebrand’s disease

BY INTRanasal ADMINISTRATION

Child 1–17 years: 4 micrograms/kg for 1 dose, for pre-operative use give 2 hours before procedure.

BY INTRavenous INFUSION, OR BY INTRamuscular INJECTION

Child: 300 nanograms/kg for 1 dose, to be administered immediately before surgery or after trauma; may be repeated at intervals of 12 hours if no tachycardia.

Fibrinolytic response testing

BY SUBCUTANEOUS INJECTION, OR BY INTRavenous INJECTION

Child 2–17 years: 300 nanograms/kg for 1 dose, blood to be sampled after 20 minutes for fibrinolytic activity.

Assessment of antidiuretic hormone secretion (congenital deficiency suspected) (specialist use only)

BY INTRanasal ADMINISTRATION

Child 1–23 months: Initially 100–500 nanograms for 1 dose.

Assessment of antidiuretic hormone secretion (congenital deficiency not suspected) (specialist use only)

BY INTRanasal ADMINISTRATION

Child 1–23 months: 1–5 micrograms for 1 dose

UNLICENSED USE

Consult product literature for individual preparations. Not licensed for assessment of antidiuretic hormone secretion. Oral use of DDAVP intravenous injection is not licensed.

CONTRA-INDICATIONS

Cardiac insufficiency - conditions treated with diuretics - polydipsia in alcohol dependence - psychogenic polydipsia.

CAUTIONS

GENERAL CAUTIONS

Asthma - avoid fluid overload - cardiovascular disease (not indicated for nocturnal enuresis or nocturia) - conditions which might be aggravated by water retention - cystic fibrosis - epilepsy - heart failure - hypertension (not indicated for nocturnal enuresis or nocturia) - migraine - nocturia—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards - nocturnal enuresis—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards.

SPECIFIC CAUTIONS

With intranasal use Should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects.

INTERACTIONS ➔ Appendix 1 (desmopressin).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Allergic reactions - emotional disturbance in children - epistaxis - fluid retention - headache - hyponatraemia (in more serious cases with convulsions) on administration without restricting fluid intake - nasal congestion - nausea - stomach pain - vomiting.

SPECIFIC SIDE-EFFECTS

With intranasal use Rhinitis.
Corticosteroid responsive conditions

Corticosteroids, general use

Overview
Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

2 Corticosteroid responsive conditions
When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin. Corticosteroids should be avoided or used only under specialist supervision in psoriasis.

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn’s disease.

Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 411 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, low-dose hydrocortisone p. 411 can be used in septic shock that is resistant to volume expansion and catecholamines, and is accompanied by suspected or proven adrenal insufficiency.

The suppressive action of glucocorticoids on the hypothalamic–pituitary–adrenal axis is greatest and most prolonged when they are given at night. In most adults a single dose of dexamethasone at night is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the ‘overnight dexamethasone suppression test’ for diagnosing Cushing’s syndrome.

Betamethasone p. 409 and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see Prescribing in palliative care p. 18); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should not be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions, such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline/epinephrine p. 128. In such cases hydrocortisone (as sodium succinate) by intravenous injection may be required.

In the management of asthma, corticosteroids are preferably used by inhalation but systemic therapy along with bronchodilators is required for the emergency treatment of severe acute asthma.

Betamethasone is used in women at risk of preterm delivery to reduce the incidence of neonatal respiratory distress syndrome [unlicensed use].

Dexamethasone should not be used routinely for the prophylaxis and treatment of chronic lung disease in neonates because of an association with adverse neurological effects.

Corticosteroids may be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis, and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia and thrombocytopenic purpura.

High doses of a corticosteroid (usually prednisolone p. 413) are used in the treatment of glomerular kidney disease, including nephrotic syndrome. The condition frequently recurs; a corticosteroid given in high doses and for prolonged periods may delay relapse but the higher incidence of adverse effects limits the overall benefit. Those who suffer frequent relapses may be treated with prednisolone given in a low dose (daily or on alternate days) for 3–6 months; the dose should be adjusted to minimise effects on growth and development. Other drugs used in the treatment of glomerular kidney disease include indomethasone p. 361, cyclophosphamide p. 498, chlorambucil p. 496, and ciclosporin p. 486. Congenital nephrotic syndrome may be resistant to corticosteroids and immunosuppressants; indomethacin p. 611 and an ACE inhibitor such as captopril p. 103 have been used.

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see: Prescribing in Palliative Care, immunosuppression, rheumatic diseases, eye, otitis externa, allergic rhinitis, and aphthous ulcers.

**Side-effects**

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

**Mineralocorticoid side-effects**

- hypertension
- sodium retention
- water retention
- potassium loss
- calcium loss

Mineralocorticoid side effects are most marked with fludrocortisone acetate, but are significant with hydrocortisone, corticotropin, and tetracosactide p. 441. Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone p. 412, prednisolone, and triamcinolone.

**Glucocorticoid side-effects**

- diabetes
- osteoporosis
- in addition, high doses are associated with avascular necrosis of the femoral head.
- Muscle wasting (proximal myopathy) can also occur.
- Corticosteroid therapy is also weakly linked with peptic ulceration and perforation.
- Psychiatric reactions may also occur.

**Managing side-effects**

Side-effects can be minimised by using lowest effective dose for minimum period possible. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma. Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug.

Whenever possible local treatment with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to systemic treatment.

Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids, but adverse effects including adrenal suppression have been reported. Use of other corticosteroid therapy (including topical) or concurrent use of drugs which inhibit corticosteroid metabolism should be taken into account when assessing systemic risk. In children, growth restriction associated with systemic corticosteroid therapy does not seem to occur with recommended doses of inhaled therapy; although initial growth velocity may be reduced, there appears to be no effect on achieving normal adult height. Large-volume spacer devices should be used for administering inhaled
Corticosteroids, replacement therapy

Overview

The adrenal cortex normally secretes hydrocortisone (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of hydrocortisone and the mineralocorticoid fludrocortisone acetate. Hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In Addison’s disease or following adrenalectomy, hydrocortisone by mouth is usually required. This is given in divided doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone acetate.

In acute adrenocortical insufficiency, hydrocortisone is given intravenously (preferably as sodium succinate) every 6 to 8 hours in sodium chloride intravenous infusion 0.9%.

In hypopituitarism, glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required.

Additional replacement therapy with levothyroxine sodium p. 454 and sex hormones should be given as indicated by the pattern of hormone deficiency.

In congenital adrenal hyperplasia, the pituitary gland increases production of corticotropin to compensate for reduced formation of cortisol; this results in excessive adrenal androgen production. Treatment is aimed at suppressing corticotropin using hydrocortisone. Careful and continual dose titration is required to avoid growth retardation and toxicity; for this reason potent, synthetic glucocorticoids such as dexamethasone are usually reserved for use in adolescents. The dose is adjusted according to clinical response and measurement of adrenal androgens and 17-hydroxyprogesterone. Salt-losing forms of congenital adrenal hyperplasia (where there is a lack of aldosterone production) also require mineralocorticoid replacement and salt supplementation (particularly in early life). The dose of mineralocorticoid is adjusted according to electrolyte concentration and plasma-renin activity.

Glucocorticoid therapy

Glucocorticoid and mineralocorticoid activity

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids). The mineralocorticoid activity of fludrocortisone acetate p. 411 is so high that its anti-inflammatory activity is of no clinical relevance.

The relatively high mineralocorticoid activity of hydrocortisone p. 411, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked.

Prednisolone p. 413 has predominantly glucocorticoid activity and is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone p. 409 and dexamethasone p. 410 have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion.

Some esters of betamethasone and of beclometasone dipropionate (beclomethasone) p. 652 exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort p. 409 has a high glucocorticoid activity; it is derived from prednisolone.

Corticosteroids (systemic)

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates (in neonates) - avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished) - systemic infection (unless specific therapy given)

- **CONTRA-INDICATIONS, FURTHER INFORMATION** With intra-articular use or intradermal use or intralesional use For further information on contra-indications associated with intra-articular, intradermal and intralesional preparations, consult product literature.

- **CAUTIONS** Congestive heart failure - diabetes mellitus (including a family history of) - diverticulitis - epilepsy - glaucoma (including a family history of or susceptibility to) - history of steroid myopathy - history of tuberculosis or X-ray changes (frequent monitoring required) - hypertension - hypothyroidism - infection (particularly untreated) - myasthenia gravis - ocular herpes simplex (risk of corneal perforation) - osteoporosis - peptic ulcer - psychiatric reactions - recent intestinal anastomoses - recent myocardial infarction (rupture reported) - severe affective disorders (particularly if history of
steroid-induced psychosis) should not be used long-term.
- thromboembolic disorders - ulcerative colitis

**SIDE-EFFECTS, FURTHER INFORMATION**

- With intra-articular use or intradermal use or intraleisonal use. For further information on cautions associated with intra-articular, intradermal and intralesional preparations, consult product literature.
- **INTERACTIONS**

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

**SPECIFIC SIDE-EFFECTS**

- With intra-articular use - Flushing - may affect the hyaline cartilage

**SIDE-EFFECTS, FURTHER INFORMATION**

Side effects can be managed by choice of route and duration of course. For further detail see Corticosteroids, general use p. 405

- **Adrenal suppression During prolonged therapy with corticosteroids, particularly with systemic use, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension, or death.**

  To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment. To avoid a precipitous fall in blood pressure during anaesthesia or in the immediate postoperative period, anaesthetists must know whether a patient is taking or has been taking a corticosteroid. A suitable regimen for corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of surgery, is:

  - **Minor surgery under general anaesthesia**—usual oral corticosteroid dose on the morning of surgery or hydrocortisone (usually thornum succinate) intravenously at induction; the usual oral corticosteroid dose is recommenced after surgery.

  - **Moderate or major surgery**—usual oral corticosteroid dose on the morning of surgery and hydrocortisone intravenously at induction, followed by hydrocortisone 3 times a day by intravenous injection for 24 hours after moderate surgery or for 48–72 hours after major surgery; the usual pre-operative oral corticosteroid dose is recommenced on stopping hydrocortisone injections.

Patients on long-term corticosteroid treatment should carry a steroid treatment card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

- **Infections**

  Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. septicaemia and tuberculosis may reach an advanced stage before being recognised, and amoebiasis or strongyloidiasis may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral ocular infections may also be exacerbated.

- **Chickenpox**

  Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being at risk of severe chickenpox (see Steroid Treatment Card). Manifestations of fulminating illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature.

  Passive immunisation with varicella-zoster immunoglobulin is needed for exposed non-immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months.

  Confirmed chickenpox warrants specialist care and urgent treatment. Corticosteroids should not be stopped and dosage may need to be increased.

  Topical, inhaled or rectal corticosteroids are less likely to be associated with an increased risk of severe chickenpox.

- **Measles**

  Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs.

  Prophylaxis with intramuscular normal immunoglobulin may be needed.

- **Psychiatric reactions**

  Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, nightmares, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. A serious paranoid state or depression with risk of suicide can be induced, particularly in patients with a history of mental disorder. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment.

  Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

- **PREGNANCY**

  The benefit of treatment with corticosteroids during pregnancy outweighs the risk. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) concluded that corticosteroids vary in their ability to cross the placenta but there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip. When administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome). Any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important.
Betamethasone

**INDICATIONS AND DOSE**

**Suppression of inflammatory and allergic disorders**

- **Congenital adrenal hyperplasia**
  - By slow intravenous injection, or by intravenous infusion
    - Child 1-11 months: Initially 1 mg, repeated up to 4 times in 24 hours according to response
    - Child 1-5 years: Initially 2 mg, repeated up to 4 times in 24 hours according to response
    - Child 6-11 years: Initially 4 mg, repeated up to 4 times in 24 hours according to response
    - Child 12-17 years: 4–20 mg, repeated up to 4 times in 24 hours according to response

**PREGNANCY**

Readily crosses the placenta. Transient effect on fetal movements and heart rate.

**DIRECTIONS FOR ADMINISTRATION**

For intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

CAUTIONARY AND ADVISORY LABELS

- **Betamethasone** (Non-proprietary)
  - Betamethasone (as Betamethasone sodium phosphate) 4 mg per 1 ml
    - Betamethasone 4mg/1ml solution for injection ampoules | 5 ampoule | £13.06

Deflazacort

**INDICATIONS AND DOSE**

**Inflammatory and allergic disorders**

- By mouth
  - Child 1 month–11 years: 0.25–1.5 mg/kg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations
  - Child 12–17 years: 3–18 mg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 5, 10**  
Dexamethasone 6 mg Calcort 6mg tablets | 60 tablet [POTS] £15.82

---

**DIRECTIONS FOR ADMINISTRATION**

- **BY SLOW INTRAVENOUS INJECTION**
  - Child: 10–100 micrograms/kg daily in 1–2 divided doses, adjusted according to response; up to 300 micrograms/kg daily may be required in emergency situations
- **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Child 1 month–11 years: 83–333 micrograms/kg daily in 1–2 divided doses; maximum 20 mg per day
  - Child 12–17 years: Initially 0.4–20 mg daily

**Corticosteroid responsive conditions**

- **Severe croup**
  - **BY MOUTH**  
    - Child: 35 kg and above: Initially 0.3 mg/kg daily for 4 days
    - Child 3 months–17 years: 150 micrograms/kg every 6 hours (max. per dose 10 mg) for 4 days

**Life-threatening cerebral oedema**

- **BY INTRAVENOUS INJECTION**
  - Child (body-weight up to 35 kg): Initially 16.7 mg, then 3.3 mg every 3 hours for 3 days, then 3.3 mg every 6 hours for 1 day, then 1.7 mg every 6 hours for 4 days, then reduced in steps of 0.8 mg daily
  - Child (body-weight 35 kg and above): Initially 20.8 mg, then 3.3 mg every 2 hours for 3 days, then 3.3 mg every 4 hours for 1 day, then 3.3 mg every 6 hours for 4 days, then reduced in steps of 1.7 mg daily

**UNLICENSED USE**

- With intravenous use Consult product literature; not licensed for use in bacterial meningitis.
- **SIDE-EFFECTS**
  - With intravenous use Perineal irritation may follow intravenous administration of the phosphate ester

- **PREGNANCY** Dexamethasone readily crosses the placenta.
- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use For administration by mouth tablets may be dispersed in water or injection solution given by mouth.
  - With intravenous use For intravenous infusion dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–20 minutes.

**PRESCRIBING AND DISPENSING INFORMATION**

Dexamethasone 3.8 mg/mL Injection has replaced Dexamethasone 4 mg/mL Injection. All dosage recommendations for intravenous, intramuscular, intrathecal use or local infiltration; are given in units of dexamethasone base.

- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Dexamethasone for cough [www.medicinesforchildren.org.uk/dexamethasone-croup-0](http://www.medicinesforchildren.org.uk/dexamethasone-croup-0)
  - With systemic use Patient counselling is advised for dexamethasone tablet, oral solution and injection (steroid card).

  - **Tablet** CAUTIONARY AND ADVISORY LABELS
    - Fludrocortisone acetate (Non-proprietary) Fludrocortisone acetate 100 microgram

  - **Hydrocortisone**

- **INDICATIONS AND DOSE**
  - Acute adrenocortical insufficiency (Addisonian crisis)
    - **BY SLOW INTRAVENOUS INJECTION**
      - Neonate: Initially 10 mg, then (by continuous intravenous infusion) 100 mg/m² daily, alternatively (by intravenous infusion) 100 mg/m² daily in divided doses, to be given every 6–8 hours; adjusted according to response, when stable reduce over 4–5 days to oral maintenance dose.
      - Child 1 month–11 years: Initially 2–4 mg/kg, then 2–4 mg/kg every 6 hours, adjusted according to response, when stable reduce over 4–5 days to oral maintenance dose.
      - Child 12–17 years: 100 mg every 6–8 hours

  - **CONGENITAL ADRENAL HYPERPLASIA**
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Neonate: 9–15 mg/m² in 3 divided doses, adjusted according to response.
      - Child: 9–15 mg/m² in 3 divided doses, adjusted according to response

- **ADRENAL HYPOPLASIA | ADDISON’S DISEASE, CHRONIC MAINTENANCE OR REPLACEMENT THERAPY**
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
    - Neonate: 8–10 mg/m² daily in 3 divided doses, the larger dose to be given in the morning and the smaller in the evening, higher doses may be needed.

- **SIDE-EFFECTS**
  - Unlicensed Use of injection by mouth is unlicensed.
  - **CONTRA-INDICATIONS**
    - When used by ear: Avoid alone in the presence of untreated infection (combine with suitable anti-infective).
    - With rectal use Bowel perforation - extensive fistulas - intestinal obstruction - recent intestinal anastomoses
  - **CAUTIONS**
    - With rectal use Systemic absorption may occur
  - **UNLICENSED USE** Use of injection by mouth is unlicensed.
  - **CONTRA-INDICATIONS**
    - When used by ear: Avoid alone in the presence of untreated infection (combine with suitable anti-infective).
    - With rectal use Bowel perforation - extensive fistulas - intestinal obstruction - recent intestinal anastomoses
  - **CAUTIONS**
    - With rectal use Systemic absorption may occur
  - **SIDE-EFFECTS**
    - With intravenous use Phosphate ester associated with pain and paraesthesia (particularly in the perineal region)
    - With rectal use Local irritation

- **Corticosteroid responsive conditions**

- **INFLAMMATORY BOWEL DISEASE—INDUCTION OF REMISSION**
  - **BY INTRAVENOUS INJECTION**
  - Child 2–17 years: 2.5 mg/kg every 6 hours (max. per dose 100 mg)
  - **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Child 2–17 years: 10 mg/kg daily; maximum 400 mg per day

- **UCERATIVE COLITIS | PROCTITIS | PROCTOSIGMOIDITIS**
  - **BY RECTUM USING RECTAL FOAM**
  - Child 2–17 years: Initially 1 metered application 1–2 times a day for 2–3 weeks, then reduced to 1 metered application once daily on alternate days, to be inserted into the rectum

- **ACUTE HYPERSENSITIVITY REACTIONS | ANGIOEDEMA**
  - **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
  - Child 1–5 months: Initially 2.5 mg/kg every 6 hours (max. per dose 100 mg)
  - Child 6 months–5 years: Initially 50 micrograms once daily, adjusted according to response
  - Child 6–11 years: Initially 100 mg/kg every 3 days, adjusted according to response
  - Child 12–17 years: Initially 200 mg/kg every 3 days, adjusted according to response

- **HYPOTENSION RESISTANT TO INOTROPIC TREATMENT AND VOLUME REPLACEMENT (LIMITED EVIDENCE)**
  - **BY INTRAVENOUS INJECTION**
  - Neonate: Initially 2.5 mg/kg, then 2.5 mg/kg after 4 hours if required, followed by 2.5 mg/kg every 6 hours for 48 hours or until blood pressure recovers, dose to then be reduced gradually over at least 48 hours.
  - Child: 1 mg/kg every 6 hours (max. per dose 100 mg)

- **SEVERE ACUTE ASTHMA | LIFE-THREATENING ACUTE ASTHMA**
  - **BY INTRAVENOUS INJECTION**
  - Child 1 month–1 year: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 25 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
  - Child 2–4 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 50 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
  - Child 5–11 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
  - Child 12–17 years: 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
**412 Corticosteroid responsive conditions**

**DIRECTIONS FOR ADMINISTRATION**
- **With intravenous use** For *intravenous administration*, dilute with Glucose 5% or Sodium Chloride 0.9%. For *intermittent infusion* give over 20–30 minutes.
- **With oral use** For administration *by mouth*, injection solution may be swallowed [unlicensed use] but consider phosphate content.

**PATIENT AND CARER ADVICE**
- With systemic use Patient counselling is advised for hydrocortisone tablets and injections (steroid card).
- **LESS SUITABLE FOR PRESCRIBING**
  - With intravenous use Hydrocortisone as the sodium phosphate is less suitable for prescribing as paraesthesia and pain (particularly in the perineal region) may follow intravenous injection.

**EXCEPTIONS TO LEGAL CATEGORY**
- With intramuscular use or intravenous use Prescription only restriction does not apply where administration is for saving life in emergency.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, tablet, injection vials, inhaled powder.

### Tablet
**CAUTIONARY AND ADVISORY LABELS 10, 21**
- Hydrocortisone (Non-proprietary)
  - Hydrocortisone 10 mg
    - Hydrocortisone 10mg tablets | 30 tablet [P] \(£13.00\) DT price = \(£76.07\)
  - Hydrocortisone 20 mg
    - Hydrocortisone 20mg tablets | 30 tablet [P] \(£100.86\) DT price = \(£101.40\)

**Solution for injection**
**CAUTIONARY AND ADVISORY LABELS 10**
- Hydrocortisone (as Hydrocortisone sodium phosphate) 100 mg
  - Hydrocortisone sodium phosphate 100mg/1ml solution for injection ampoules | 5 ampoule [P] \(£8.33\)
  - Hydrocortisone sodium phosphate 500mg/5ml solution for injection ampoules | 5 ampoule [P] \(£36.45\)

### Powder for solution for injection
- **Solu-Cortef** (Pfizer Ltd)
  - Hydrocortisone (as Hydrocortisone sodium succinate) 100 mg
    - Hydrocortisone sodium succinate 100mg powder for solution for injection vials | 10 vial [P] \(£9.17\)

### Powder and solvent for solution for injection
**CAUTIONARY AND ADVISORY LABELS 10**
- **Solu-Cortef** (Pfizer Ltd)
  - Hydrocortisone (as Hydrocortisone sodium succinate) 100 mg
    - Hydrocortisone sodium succinate 100mg powder and solvent for solution for injection vials | 1 vial [P] \(£11.16\) DT price = \(£11.16\)

### Foam
**EXCipients:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), propylene glycol
- **Coliflom** (Meda Pharmaceuticals Ltd)
  - Hydrocortisone acetate 100 mg per 1 gram 
    - Coliflom 10% aerosol | 14 dose [P] \(£3.33\) DT price = \(£3.33\)

**Severe erythema multiforme | Lupus nephritis | Systemic onset juvenile idiopathic arthritis**
- **BY INTRAVENOUS INJECTION**
  - Child: 10–30 mg/kg once daily or on alternate days (max. per dose 1 g) for up to 3 doses

**DEPO-MEDrone**

**Suppression of inflammatory and allergic disorders**
- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child: Seek specialist advice, to be injected into the gluteal muscle

**CAUTIONS**
- With intravenous use Rapid intravenous administration of large doses associated with cardiovascular collapse

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use Intravenous injection given over 30 minutes. For intravenous infusion, may be diluted with sodium chloride intravenous infusion 0.9% or 0.45%, or glucose intravenous infusion 5% or 10%.

**PATIENT AND CARER ADVICE**
- Patient counselling is advised for methylprednisolone tablets and injections (steroid card).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, tablet, injection vials, inhaled powder.

### Tablet
**CAUTIONARY AND ADVISORY LABELS 10, 21**
- **Medrone** (Pfizer Ltd)
  - Methylprednisolone 2 mg
    - Methylprednisolone 2 mg tablets | 30 tablet [P] \(£3.68\)
  - Methylprednisolone 4 mg
    - Methylprednisolone 4 mg tablets | 30 tablet [P] \(£6.19\)
  - Methylprednisolone 16 mg
    - Methylprednisolone 16 mg tablets | 30 tablet [P] \(£17.17\)
  - **Methylprednisolone 100 mg**
    - Methylprednisolone 100 mg tablets | 20 tablet [P] \(£48.32\)

### Powder and solvent for solution for injection
**CAUTIONARY AND ADVISORY LABELS 10**
- **Methylprednisolone (Non-proprietary)**
  - Methylprednisolone (as Methylprednisolone sodium succinate) 500 mg
    - Methylprednisolone sodium succinate 500mg powder and solvent for solution for injection vials | 1 vial [P] \(£9.60\)
  - Methylprednisolone (as Methylprednisolone sodium succinate) 1 gram
    - Methylprednisolone sodium succinate 1g powder and solvent for solution for injection vials | 1 vial [P] \(£17.30\)
  - **Methylprednisolone (as Methylprednisolone sodium succinate)**
    - Methylprednisolone (as Methylprednisolone sodium succinate) 40 mg
      - Methylprednisolone sodium succinate 40mg powder and solvent for solution for injection vials | 1 vial [P] \(£1.58\)
    - Methylprednisolone (as Methylprednisolone sodium succinate) 125 mg
      - Methylprednisolone sodium succinate 125mg powder and solvent for solution for injection vials | 1 vial [P] \(£4.75\)
    - Methylprednisolone (as Methylprednisolone sodium succinate) 500 mg
      - Methylprednisolone sodium succinate 500mg powder and solvent for solution for injection vials | 1 vial [P] \(£32.86\)

**Suspension for injection**
**CAUTIONARY AND ADVISORY LABELS 10**
- **Depo-Medrone** (Pfizer Ltd)
  - Methylprednisolone acetate 40 mg per 1 ml
    - Methylprednisolone acetate 40 mg per 1 ml | 40mg/1ml suspension for injection vials | 1 vial [P] \(£3.44\) DT price = \(£3.44\) | 10 vial [P] \(£34.04\)
    - Depo-Medrone 80mg/2ml suspension for injection vials | 1 vial [P] \(£6.18\) DT price = \(£6.18\) | 10 vial [P] \(£61.39\)
    - **Depo-Medrone 120mg/3ml suspension for injection vials**
      - Depo-Medrone 120mg/3ml suspension for injection vials | 1 vial [P] \(£8.96\) DT price = \(£8.96\) | 10 vial [P] \(£88.81\)

**Methylprednisolone**

**INDICATIONS AND DOSE**
- **Inflammatory and allergic disorders**
  - **BY MOUTH, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Child: 0.5–1.7 mg/kg daily in 2–4 divided doses, divide doses depending on condition and response
  - **Treatment of graft rejection reactions**
    - **BY INTRAVENOUS INJECTION**
      - Child: 10–20 mg/kg once daily for 3 days, alternatively 400–600 mg/m² once daily (max. per dose 1 g) for 3 days

---

**Dehydration**

**Preparation**

**CAUTIONS**
- With systemic use Rapid intravenous administration of large doses associated with cardiovascular collapse
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use Intravenous injection given over 30 minutes. For intravenous infusion, may be diluted with sodium chloride intravenous infusion 0.9% or 0.45%, or glucose intravenous infusion 5% or 10%.

**PATIENT AND CARER ADVICE**
- Patient counselling is advised for methylprednisolone tablets and injections (steroid card).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, tablet, injection vials, inhaled powder.
Prednisolone

**INDICATIONS AND DOSE**

**Severe croup (before transfer to hospital) | Mild croup that might cause complications (before transfer to hospital)**
- **BY MOUTH**
  - Child: 1–2 mg/kg

**Mild to moderate acute asthma (when oral corticosteroid taken for more than a few days) | Severe or life-threatening acute asthma (when oral corticosteroid taken for more than a few days)**
- **BY MOUTH**
  - Child 1 month–11 years: 2 mg/kg once daily (max. per dose 60 mg) for up to 3 days, longer if necessary
  - Child 12–17 years: 40–50 mg daily for at least 5 days

**Autoimmune inflammatory disorders (including juvenile idiopathic arthritis, connective tissue disorders and systemic lupus erythematosus)**
- **BY MOUTH**
  - Child: Initially 1–2 mg/kg once daily, to be reduced after a few days if appropriate; maximum 60 mg per day

**Autoimmune hepatitis**
- **BY MOUTH**
  - Child: Initially 2 mg/kg once daily, to then be reduced to minimum effective dose; maximum 40 mg per day

**Corticosteroid replacement therapy**
- **BY MOUTH**
  - Child 12–17 years: 2–2.5 mg/m² daily in 1–2 divided doses, adjusted according to response

**Infantile spasms**
- **BY MOUTH**
  - Child 1 month–1 year: Initially 10 mg 4 times a day for 14 days; increased to 20 mg 3 times a day for 7 days if seizures not controlled after initial 7 days, reduce dose gradually over 15 days until stopped

**Infantile spasms (dose reduction in patient taking 40 mg daily)**
- **BY MOUTH**
  - Child 1 month–1 year: Reduced in steps of 10 mg every 5 days, reduce gradually over 20 days until stopped

**Infantile spasms (dose reduction in patient taking 60 mg daily)**
- **BY MOUTH**
  - Child 1 month–1 year: Reduced to 40 mg daily for 5 days, then reduced to 20 mg daily for 5 days, then reduced to 10 mg daily for 5 days and then stop

**Idiopathic thrombocytopenic purpura**
- **BY MOUTH**
  - Child 1–9 years: 1–2 mg/kg daily for maximum of 14 days, alternatively 4 mg/kg daily for a maximum of 4 days

**Nephrotic syndrome**
- **BY MOUTH**
  - Child: Initially 60 mg/m² once daily for 4–6 weeks until proteinuria ceases, then reduced to 40 mg/m² once daily on alternate days for 4–6 weeks, then withdraw by reducing dose gradually; maximum 80 mg per day

**Nephrotic syndrome (prevention of relapse)**
- **BY MOUTH**
  - Child: 0.5–1 mg/kg once daily or on alternate days for 3–6 months

**Ulcereative colitis | Crohn’s disease**
- **BY MOUTH**
  - Child 2–17 years: 2 mg/kg once daily (max. per dose 60 mg) until remission occurs, followed by reducing doses

**Pneumocystis pneumonia in moderate to severe infections associated with HIV infection**
- **BY MOUTH**
  - Child: 2 mg/kg daily for 5 days, the dose is then reduced over the next 16 days and then stopped, corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards, the corticosteroid should be withdrawn before anti-pneumocystis treatment is complete; maximum 80 mg per day

**Proctitis**
- **BY RECTUM USING RECTAL FOAM**
  - Child 12–17 years: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

**Distal ulcerative colitis**
- **BY RECTUM USING RECTAL FOAM**
  - Child 12–17 years: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

**Rectal complications of Crohn’s disease**
- **BY RECTUM USING SUPPOSITORIES**
  - Child 2–17 years: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

**UNLICENSED USE**
- With rectal use Prednisolone rectal foam not licensed for use in children (age range not specified by manufacturer).

**CONTRA-INDICATIONS**
- With rectal use Bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

**CAUTIONS**
- With rectal use Systemic absorption may occur with rectal preparations
- With systemic use Duchenne’s muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity)

**PREGNANCY**
- As it crosses the placenta 88% of prednisolone is inactivated.
- With systemic use Pregnant women with fluid retention should be monitored closely.

**BREAST FEEDING**
- Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.
- With systemic use Infant should be monitored for adrenal suppression if mother is taking a dose higher than 40 mg.

**PATIENT AND CARER ADVICE**
- Prednisolone (oral) for nephrotic syndrome
  - With oral use [www.medicinesforchildren.org.uk/prednisolone-oral-for-nephrotic-syndrome](http://www.medicinesforchildren.org.uk/prednisolone-oral-for-nephrotic-syndrome)

- Medicines for Children leaflet: Prednisolone for asthma
  - With oral use [www.medicinesforchildren.org.uk/prednisolone-for-asthma](http://www.medicinesforchildren.org.uk/prednisolone-for-asthma)
  - With oral use Patient counselling is advised for prednisolone tablets (steroid card).
2.1 Cushing’s syndrome and disease

Cushing’s Syndrome

Management

Most types of Cushing’s syndrome are treated surgically. Metyrapone p. 415 may be useful to control the symptoms of the disease or to prepare the child for surgery. The dosages of metyrapone used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

Ketoconazole below may have a direct effect on corticotrophic tumour cells in patients with Cushing’s disease. It is used under specialist supervision in children over 12 years for treatment of endogenous Cushing’s syndrome.

ENZYME INHIBITORS

Ketoconazole

DRUG ACTION

- With oral use An imidazole derivative which acts as a potent inhibitor of cortisol and aldosterone synthesis by inhibiting the activity of 17a-hydroxylase, 11-hydroxylabon steps and at higher doses the cholesterol side-chain cleavage enzyme. It also inhibits the activity of adrenal C17-20 lyase enzymes resulting in androgen synthesis inhibition, and may have a direct effect on corticotrophic tumour cells in patients with Cushing’s disease.

INDICATIONS AND DOSE

Endogenous Cushing’s syndrome (specialist use only)

BY MOUTH

- Child 12-17 years: Initially 400–600 mg daily in 2–3 divided doses, increased to 800–1200 mg daily; maintenance 400–800 mg daily in 2–3 divided doses, for dose titrations in patients with established dose, adjustments in adrenal insufficiency, or concomitant corticosteroid replacement therapy, consult product literature; maximum 1200 mg per day
Metyrapone

**Drug Action** Metyrapone is a competitive inhibitor of 11β-hydroxylase in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. Metyrapone may be used as a test of anterior pituitary function.

**Indications and Dose** Differential diagnosis of ACTH-dependent Cushing's syndrome (specialist supervision in hospital)

- **By mouth**
  - Child: usual dose 0.25–6 g daily, dose to be tailored to cortisol production; dose is either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

**Contra-Indications** Adrenocortical insufficiency

**Caution** Avoid in Acute porphyrias p. 562 - gross hypopituitarism (risk of precipitating acute adrenal failure) - hypertension on long-term administration - hypothyroidism (delayed response)

**Interactions** Many drugs interfere with diagnostic estimation of steroids.

**Side-Effects**

- Rare: Abdominal pain, allergic skin reactions, hirsutism, hypoadrenalism
- Frequency not known: Dizziness, headache, hypotension, nausea, sedation, vomiting
- **Pregnancy** Avoid (may impair biosynthesis of fetal-placental steroids).
- **Breast-feeding** Avoid—no information available.
- **Hepatic Impairment** Use with caution in hepatic impairment (delayed response).
- **Patient and Carer Advice** Driving and skilled tasks Drowsiness may affect the performance of skilled tasks (e.g. driving).

**Medicinal Forms**

- There can be variation in the licensing of different medicines containing the same drug.
- Capsule

**Cautionary and Advisory Labels** 21

- Metyrapone (HRA Pharma Ltd)
- Metyrapone 250 mg Metopirone 250 mg capsules | 100 capsule | £136.66

---

# Diabetes mellitus

## 3 Diabetes mellitus and hypoglycaemia

### 3.1 Diabetes mellitus

**Overview**

Diabetes mellitus occurs because of a lack of insulin or resistance to its action. It is diagnosed by measuring fasting or random blood-glucose concentration (and occasionally by oral glucose tolerance test). Although there are many
subtypes, the two principle classes of diabetes are type 1 diabetes and type 2 diabetes.

Type 1 diabetes, (formerly referred to as insulin-dependent diabetes mellitus (IDDM)), is due to a deficiency of insulin following autoimmune destruction of pancreatic beta cells and is the most common form of diabetes in children. Children with type 1 diabetes require administration of insulin.

Type 2 diabetes, (formerly referred to as non-insulin dependent diabetes mellitus (NIDDM)), is rare in children but the incidence is increasing, particularly in adolescents, as obesity increases. It results from reduced secretion of insulin or from peripheral resistance to the action of insulin, or from a combination of both. Although children may be controlled on diet alone, many require oral antidiabetic drugs or insulin to maintain satisfactory control. There is limited information available on the use of oral antidiabetic drugs in children. In overweight individuals, type 2 diabetes may be prevented by losing weight and increasing physical activity.

Genetic defects of beta-cell function (formerly referred to as maturity-onset diabetes of the young (MODY)), describes a number of rare disease states, characterised by onset of mild hyperglycaemia, generally before 25 years of age. A sulfonylurea, such as gliclazide p. 421, may be effective in these patients.

Treatment of diabetes

Treatment should be aimed at alleviating symptoms and minimising the risk of long-term complications.

Diabetes is a strong risk factor for cardiovascular disease later in life. Other risk factors for cardiovascular disease (smoking, hypertension, obesity and hyperlipidaemia) should be addressed. The use of an ACE inhibitor and of a lipid-regulating drug can be beneficial in children with diabetes and a high cardiovascular disease risk. (ACE inhibitors may also have a role in the management of diabetic nephropathy).

Prevention of diabetic complications

Although rare, retinopathy, neuropathy and nephropathy can occur in children with diabetes. Screening for complications should begin 5 years after diagnosis of diabetes or from 12 years of age. Optimal glycaemic control in both type 1 diabetes and type 2 diabetes reduces, in the long term, the risk of microvascular complications including retinopathy, development of proteinuria and to some extent nephropathy.

A measure of the total glycosylated (or glycated) haemoglobin (HbA1c) or a specific fraction (HbA1c) provides a good indication of long-term glycaemic control. Overall it is ideal to aim for an HbA1c concentration of 48–59 mmol/mol or less (reference range 20–42 mmol/mol), but this cannot always be achieved and for those using insulin there is a significantly increased risk of disabling hyperglycaemia.

Measurement of HbA1c

HbA1c values are expressed in mmol of glycosylated haemoglobin per mol of haemoglobin (mmol/mol), a standardised unit specific for HbA1c created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA1c values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

Laboratory measurement of serum-fructosamine concentration is technically simpler and cheaper than the measurement of HbA1c and can be used to assess control over short periods of time, particularly when HbA1c monitoring is invalid (e.g. disturbed erythrocyte turnover or abnormal haemoglobin type).

Tight control of blood pressure in hypertensive children with type 2 diabetes may reduce mortality significantly and protects visual acuity (by reducing considerably the risks of maculopathy and retinal photocoagulation).

Driving

Information on the requirements for driving vehicles by individuals receiving treatment for diabetes is available in the BNF or from the DVLA at www.gov.uk/government/publications/at-a-glance.

Diabetic nephropathy

Regular review of diabetic children over 12 years of age should include an annual test for microalbuminuria (the earliest sign of nephropathy). If reagent strip tests (Microtest II® or Microbumintest ®) are used and prove positive, the result should be confirmed by laboratory analysis of a urine sample. Microalbuminuria can occur transiently during puberty; if it persists (at least 3 positive tests) treatment with an ACE inhibitor or an angiotensin-II receptor antagonist under specialist guidance should be considered; to minimise the risk of renal deterioration, blood pressure should be carefully controlled.

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in children with renal impairment. See also treatment of hypertension in diabetes.

Neuropathy

Clinical neuropathy is rare in children whose diabetes is well controlled.

Diabetic ketoacidosis

Management

The management of diabetic ketoacidosis involves the replacement of fluid and electrolytes and the administration of insulin. Guidelines for the Management of Diabetic Ketoacidosis, published by the British Society of Paediatric Endocrinology and Diabetes, (available at www.bsped.org.uk) should be followed. Clinically well children with mild ketoacidosis who are dehydrated up to 5% usually respond to oral rehydration and subcutaneous insulin. For those who do not respond, or are clinically unwell, or are dehydrated by more than 5%, insulin and replacement fluids are best given by intravenous infusion.

- To restore circulating volume for children in shock, give 10 mL/kg sodium chloride 0.9% as a rapid infusion, repeat as necessary up to a maximum of 30 mL/kg.
- Further fluid should be given by intravenous infusion at a rate that replaces deficit and provides maintenance over
48 hours; initially use sodium chloride 0.9%, changing to sodium chloride 0.45% and glucose 5% after 12 hours if response is adequate and plasma-sodium concentration is stable.
- Include potassium chloride in the fluids unless anuria is suspected, adjust according to plasma-potassium concentration.
- Insulin infusion is necessary to switch off ketogenesis and reverse acidosis; it should not be started until at least 1 hour after the start of intravenous rehydration fluids.
- Soluble insulin should be diluted (and mixed thoroughly) with sodium chloride 0.9% intravenous infusion to a concentration of 1 unit/mL and infused at a rate of 0.1 units/kg/hour.
- Sodium bicarbonate infusion (1.26% or 2.74%) is rarely necessary and is used only in cases of extreme acidosis (blood pH less than 6.9) and shock, since the acid-base disturbance is normally corrected by treatment with insulin.
- Once blood glucose falls to 14 mmol/litre, glucose intravenous infusion 5% or 10% should be added to the fluids.
- The insulin infusion rate can be reduced to no less than 0.05 units/kg/hour when blood-glucose concentration has fallen to 14 mmol/litre and blood pH is greater than 7.3 and a glucose infusion has been started; it is continued until the child is ready to take food by mouth. Subcutaneous insulin can then be started.
- The insulin infusion should not be stopped until 1 hour after starting subcutaneous soluble or long-acting insulin, or 10 minutes after starting subcutaneous insulin aspart p. 426, or insulin glulisine p. 427, or insulin lispro p. 427.

Hyperosmolar hyperglycaemic state or hyperosmolar nonketotic coma occurs rarely in children. Treatment is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion and slower rehydration may be required.

Insulins and anti-diabetic drugs

Insulin
Insulin is a polypeptide hormone that plays a key role in the regulation of carbohydrate, fat, and protein metabolism. There are differences in the amino-acid sequence of animal insulins, human insulins, and the human insulin analogues. Human sequence insulin may be produced semisynthetically by enzymatic modification of porcine insulin (emp) or biosynthetically by recombinant DNA technology using bacteria (crb, prb) or yeast (pyr).

Immunological resistance to insulin action is uncommon. Preparations of human sequence insulin should theoretically be less immunogenic than other insulin preparations, but no real advantage has been shown in trials.

Insulin is inactivated by gastro-intestinal enzymes, and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin is usually injected into the thighs, buttocks, or abdomen; absorption from a limb site can be increased if the limb is used in strenuous exercise after the injection. Generally, subcutaneous insulin injections cause few problems; lipodystrophy may occur and is a factor in poor glycaemic control. Lipodystrophy can be minimised by using different injection sites in rotation. Local allergic reactions are rare.

Insulin should be given to all children with type 1 diabetes; it may also be needed to treat type 2 diabetes either when other methods cannot control the condition or during periods of acute illness or peri-operatively. Insulin is required in all instances of ketoacidosis (see Diabetic ketoacidosis p. 416), which can develop rapidly in children.

Safe and Effective Use of Insulin in Hospitalised Patients
(March 2010)

Management of diabetes with insulin
The aim of treatment is to achieve the best possible control of blood-glucose concentration without making the child or carer observational and to avoid disabling hypoglycaemia; close co-operation is needed between the child or carer and the medical team to achieve good control and thereby reduce the risk of complications.

Insulin preparations can be divided into 3 types:
- those of short duration which have a relatively rapid onset of action, namely soluble insulin and the rapid-acting insulin analogues, insulin aspart p. 426, insulin glulisine p. 427, and insulin lispro p. 427;
- those with an intermediate action, e.g. isophane insulin p. 423; and
- those whose action is slower in onset and lasts for long periods, e.g. protamine zinc insulin p. 425, insulin detemir p. 424, and insulin glargine p. 424.

The duration of action of a particular type of insulin can vary from one child to another, and needs to be assessed individually.

Mixtures of insulin preparations may be required and appropriate combinations have to be determined for the individual child. Treatment should be started with several doses of short-acting insulin (soluble insulin or a rapid-acting insulin analogue) given throughout the day with a longer-acting insulin given once or twice daily. Alternatively, for those who have difficulty with, or prefer not to use, multiple daily injection regimens or in whom such regimens fail to achieve adequate glycaemic control, a mixture of premixed short- and intermediate-acting insulins (most commonly in a proportion of 30% soluble insulin and 70% [isophane insulin]) can be given twice daily. The dose of short-acting or rapid-acting insulin (or the proportion of the short-acting soluble insulin component in premixed insulin) can be increased in those with excessive postprandial hyperglycaemia. The dose of insulin is increased gradually according to the child’s individual requirements, taking care to avoid troublesome hypoglycaemia.

Initiation of insulin may be followed by a partial remission phase or ‘honeymoon period’ when lower doses of insulin are required than are subsequently necessary to maintain glycaemic control.

Examples of insulin regimens
- Multiple injection regimen: short-acting insulin or rapid-acting insulin analogue, before meals. With intermediate-acting or long-acting insulin, once or twice daily;
- Short-acting insulin or rapid-acting insulin analogue mixed with intermediate-acting insulin, twice daily (before breakfast and the main evening meal);
- Short-acting insulin or rapid-acting insulin analogue mixed with intermediate-acting insulin, before breakfast. With short-acting or rapid-acting insulin analogue alone, before afternoon snack or the main evening meal, and intermediate-acting insulin or long-acting insulin, at bedtime;
- Continuous subcutaneous insulin infusion.

Insulin requirements
Most prepubertal children require around 0.6–0.8 units/kg/day of insulin after the initial temporary remission phase. Unless the child has a very sedentary lifestyle, a requirement for higher doses may indicate poor compliance, poor absorption of insulin from the injection site (e.g. because of lipohypertrophic sites), or the beginning of puberty. During puberty up to 1.5–2 units/kg/day of insulin may be required, especially during growth spurts. Around 1 year after menarche or after the growth spurt in boys, the dose may need to be adjusted to avoid excessive weight gain. Insulin requirements can be increased by...
infection, stress, and accidental or surgical trauma. Insulin requirements can be reduced in very active individuals, in those with certain endocrine disorders (e.g. Addison’s disease, hypopituitarism), or in coeliac disease. Insulin requirements should be assessed frequently in all these circumstances.

**Hypoglycaemia**

Very tight control of diabetes lowers the blood-glucose concentration needed to trigger hypoglycaemic symptoms; an increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the child. Loss of warning of hypoglycaemia among insulin-treated children can be a serious hazard, especially for cyclists and drivers.

To restore the warning signs, episodes of hypoglycaemia must be minimised; this involves appropriate adjustment of insulin type, dose, and frequency, together with suitable timing and quantity of meals and snacks.

**Diabetes and surgery**

Children with type 1 diabetes should undergo surgery in centres with facilities for, and expertise in, the care of children with diabetes. Detailed local protocols should be available to all healthcare professionals involved in the treatment of these children.

Children with type 1 diabetes who require surgery:

- should be admitted to hospital for general anaesthesia;
- should receive insulin, even if they are fasting, to avoid ketoacidosis;
- should receive glucose infusion when fasting before an anaesthetic to prevent hypoglycaemia;
- should have careful monitoring of blood-glucose concentration because surgery may cause hyperglycaemia.

**Elective surgery**

Surgery in children with diabetes is best scheduled early on the list, preferably in the morning. If glycaemic control is poor it is advisable to admit the child well in advance of surgery. On the evening before surgery, blood-glucose should be measured frequently, especially before meals and snacks, and at bedtime; urine should be tested for ketones. The usual evening or bedtime insulin and bedtime snack should be given. Ketosis or severe hypoglycaemia require correction, preferably by overnight intravenous infusion, and the surgery may need to be postponed.

For minor procedures that require fasting, a slight modification of the usual regimen may be all that is necessary e.g. for early morning procedures delay insulin and food until immediately after the procedure.

For other types of elective surgery, consult local treatment protocols.

**Emergency surgery**

Intravenous fluids and an insulin infusion should be started immediately. If ketoacidosis is present the recommendations for diabetic ketoacidosis should be followed.

**Intravenous fluids and continuous insulin infusion**

Blood-glucose and plasma-electrolyte concentrations must be measured frequently in a child receiving intravenous support. Intravenous infusion should be continued until after the child starts to eat and drink. The following infusions should be used and adjusted according to the child’s fluid and electrolyte requirements:

- **Constant infusion of sodium chloride 0.45% and glucose 5% intravenous infusion together with potassium chloride 20 mmol/litre (provided that plasma-potassium concentration is not raised) at a rate determined by factors such as volume depletion and age; the amount of potassium chloride infused is adjusted according to plasma electrolyte measurements;**
- **Constant infusion of soluble insulin 1 unit/mL in sodium chloride 0.9% intravenous infusion initially at a rate of 0.025 units/kg/hour (up to 0.05 units/kg/hour if the child is unwell), then adjusted according to blood-glucose concentration (frequent monitoring necessary) in line with locally agreed protocols and the child’s volume depletion and age;**
- **Blood-glucose concentration should be maintained between 5 and 10 mmol/litre. If the glucose concentration falls below 5 mmol/litre, glucose 10% intravenous infusion may be required; conversely, if the glucose concentration persistently exceeds 14 mmol/litre, sodium chloride 0.9% intravenous infusion should be substituted;**
- **The insulin infusion may be stopped temporarily for 10–15 minutes if blood-glucose concentration falls below 4 mmol/litre.**

The usual subcutaneous insulin regimen should be started before the first meal (but the dose may need to be 10–20% higher than usual if the child is still bed bound or unwell) and the intravenous insulin infusion stopped 1 hour later. If glycaemic control is not adequately achieved, additional insulin can be given in the following ways:

- additional doses of soluble insulin at any of the 4 injection times (before meals or bedtime) or
- temporary addition of intravenous insulin infusion to subcutaneous regimen or
- complete reversion to intravenous insulin infusion (particularly if the child is unwell).

**Short-acting insulins**

**Soluble insulin** is a short-acting form of insulin. For maintenance regimens it is usual to inject it 15 to 30 minutes before meals.

Soluble insulin is the most appropriate form of insulin for use in diabetic emergencies and at the time of surgery. It can be given intravenously and intramuscularly, as well as subcutaneously.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 2 and 4 hours, and a duration of action of up to 8 hours. When injected intravenously, soluble insulin has a very short half-life of only about 5 minutes and its effect disappears within 30 minutes.

The rapid-acting human insulin analogues, insulin aspart p. 426, insulin glulisine p. 427, and insulin lispro p. 427, have a faster onset (10–20 minutes) and shorter duration of action (2–5 hours) than soluble insulin; as a result, compared with soluble insulin, fasting and prandial blood-glucose concentrations are a little higher, postprandial blood-glucose concentration is a little lower, and hypoglycaemia occurs slightly less frequently. These rapid-acting insulins are ideal for prandial dosing in a multiple injection regimen in combination with a long-acting insulin once or twice daily. Insulin aspart, insulin glulisine, and insulin lispro can be administered by subcutaneous infusion. Insulin aspart and insulin lispro can also be administered intravenously and can be used as alternatives to soluble insulin for diabetic emergencies and at the time of surgery.

**Intermediate- and long-acting insulins**

When given by subcutaneous injection, intermediate- and long-acting insulins have an onset of action of approximately 1–2 hours, a maximal effect at 4–12 hours, and a duration of 16–35 hours. Some are given twice daily in conjunction with short-acting (soluble) insulin, and others are given once daily. Soluble insulin can be mixed with intermediate and long-acting insulins (except insulin detemir p. 424, insulin glargine p. 424, and insulin degludec p. 424) in the syringe, essentially retaining the properties of the two components, although there may be some blunting of the initial effect of the soluble insulin component (especially on mixing with protamine zinc insulin p. 425).

Close monitoring of blood glucose is essential when introducing a change to the insulin regimen; the total daily dose as well as any concomitant treatment may need to be adjusted.
Isophane insulin p. 423 is a suspension of insulin with protamine; it is of particular value for initiation of twice-daily insulin regimens. Isophane can be mixed with soluble insulin before injection but ready-mixed preparations may be appropriate (biphasic isophane insulin p. 422, biphasic insulin aspart p. 423, or biphasic insulin lispro p. 423).

Insulin zinc suspension p. 425 (30% amorphous, 70% crystalline) has a more prolonged duration of action.

Protamine zinc insulin is usually given once daily with short-acting (soluble) insulin. It has the drawback of binding with the soluble insulin when mixed in the same syringe and is now rarely used.

Insulin detemir and insulin glargine are long-acting human insulin analogues with a prolonged duration of action; insulin detemir is given once or twice daily and insulin glargine is given once daily. These long-acting insulins are ideal for once or twice daily dosing in a multiple injection regimen in combination with a short-acting insulin before meals. NICE (December 2002) has recommended that insulin glargine should be available as an option for patients with type 1 diabetes.

NICE (May 2009) has recommended that, if insulin is required in patients with type 2 diabetes, insulin detemir or insulin glargine may be considered for those:

- who require assistance with injecting insulin or
- whose lifestyle is significantly restricted by recurrent symptomatic hypoglycaemia or
- who would otherwise need twice-daily basal insulin injections in combination with oral antidiabetic drugs or
- who cannot use the device needed to inject isophane insulin.

Insulin degludec is a long-acting human insulin analogue for once daily subcutaneous administration.

**Biphasic insulins**

Biphasic insulins are pre-mixed insulin preparations containing various combinations of short-acting (soluble) or rapid-acting (analogue) insulin and an intermediate-acting insulin.

The percentage of short-acting insulin varies from 10% to 50%. These preparations should be administered by subcutaneous injection up to 15 minutes before or soon after a meal.

**Hypodermic equipment**

Carers and children should be advised on the safe disposal of lancets, single-use syringes, and needles. Suitable arrangements for the safe disposal of contaminated waste must be made before these products are prescribed for patients who are carriers of infectious diseases.

**Antidiabetic drugs**

Oral antidiabetic drugs are used for the treatment of type 2 diabetes mellitus. They should be prescribed only if the child fails to respond adequately to restriction of energy and carbohydrate intake and an increase in physical activity. They should be used to augment the effect of diet and exercise, and not to replace them.

In children, type 2 diabetes does not usually occur until adolescence and information on the use of oral antidiabetic drugs in children is limited. Treatment with oral antidiabetic drugs should be initiated under specialist supervision only; the initial dose should be at the lower end of the adult dose range and then adjusted according to response.

Metformin hydrochloride p. 420 is the oral antidiabetic drug of choice because there is most experience with this drug in children. If dietary changes and metformin hydrochloride do not control the diabetes adequately, either a sulfonylurea or insulin can be added.

Alternatively, oral therapy may be substituted with insulin.

When insulin is added to oral therapy, it is generally given at bedtime as isophane or long-acting insulin, and when insulin replaces an oral regimen it may be given as twice-daily injections of a biphasic insulin (or isophane insulin p. 423 mixed with soluble insulin), or a multiple injection regimen. Weight gain and hypoglycaemia may be complications of insulin therapy but weight gain can be reduced if the insulin is given in combination with metformin hydrochloride.

**Pregnancy and breast-feeding**

During pregnancy, women with pre-existing diabetes can be treated with metformin hydrochloride [unlicensed use], either alone or in combination with insulin p. 425.

Metformin hydrochloride can be continued, or glibenclamide p. 421 resumed, during breast-feeding for those with pre-existing diabetes. Women with gestational diabetes may be treated, with or without concomitant insulin, with glibenclamide from 11 weeks gestation (after organogenesis) [unlicensed use] or with metformin hydrochloride [unlicensed use]. Women with gestational diabetes should discontinue hypoglycaemic treatment after giving birth.

**Sulfonylureas**

The sulfonylureas are not the first choice oral antidiabetics in children.

Sulfonylureas are considered for children in whom metformin hydrochloride is contra-indicated or not tolerated. Several sulfonylureas are available but experience in children is limited; choice is determined by side-effects and the duration of action as well as the child’s age and renal function. Glibenclamide, a long-acting sulfonylurea, is associated with a greater risk of hypoglycaemia and for this reason is generally avoided in children. Shorter-acting alternatives, such as tolbutamide p. 421, may be preferred.

Insulin therapy should be instituted temporarily during intercurrent illness (such as coma, infection, and trauma). Sulfonylureas should be omitted on the morning of surgery; insulin is often required because of the ensuing hyperglycaemia in these circumstances.

Sulfonylureas can be useful in the management of certain forms of diabetes that result from genetic defects of beta-cell function; there is most experience with gliclazide p. 421.

**Biguanides**

Metformin hydrochloride, the only available biguanide, has a different mode of action from the sulfonylureas, and is not interchangeable with them.

Metformin hydrochloride is the drug of first choice in children with type 2 diabetes, in whom strict dieting has failed to control diabetes. When the combination of strict diet and metformin hydrochloride treatment fails, other options to be considered under specialist management only, include:

- combining with insulin but weight gain and hypoglycaemia can be problems (weight gain minimised if insulin given at night);
- combining with a sulfonylurea (reports of increased hazard with this combination remain unconfirmed).

Insulin treatment is almost always required in medical and surgical emergencies; insulin should also be substituted before elective surgery (omit metformin hydrochloride on the morning of surgery and give insulin if required).

Hypoglycaemia does not usually occur with metformin hydrochloride; other advantages are the lower incidence of weight gain and lower plasma-insulin concentration. It does not exert a hypoglycaemic action in non-diabetic subjects unless given in overdose.

**Other antidiabetic drugs**

There is little experience of the use of acarbose in children. It has been used in older children; therapy should be initiated by an appropriate expert.

The use of nateglinide in combination with a sulfonylurea is generally reserved for the management of some subtypes of diabetes resulting from genetic defects of beta-cell
function or other syndromes of diabetes and requires specialist management.

Insulin and glucose

Neonatal hyperglycaemia

Newborn babies are relatively intolerant of glucose, especially in the first week of life and if premature. If intravenous glucose is necessary e.g. for total parenteral nutrition, infuse at a lower rate for 6–12 hours and the glucose intolerance should resolve. Insulin is not needed for such transient glucose intolerance, but may be needed if blood-glucose concentration is persistently high.

Neonatal diabetes

Neonatal diabetes is a rare condition that presents with acidosis, dehydration, hyperglycaemia, and rarely ketosis; it responds to continuous insulin infusion. When the neonate is stable, treatment can be switched to subcutaneous insulin given once or twice a day. Treatment is normally required for 4–6 weeks in transient forms, but may be required permanently in some cases.

BLOOD GLUCOSE LOWERING DRUGS >

BIGUANIDES

Metformin hydrochloride

> DRUG ACTION Metformin exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

> INDICATIONS AND DOSE Diabetes mellitus

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Child 8–9 years (specialist use only): Initially 200 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day
  - Child 10–17 years (specialist use only): Initially 500 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day

- UNLICENSED USE Not licensed for use in children under 10 years.

- CONTRA-INDICATIONS Ketaodisosis - use of general anaesthesia (suspend metformin on the morning of surgery and restart when renal function returns to baseline).

CONTRA-INDICATIONS, FURTHER INFORMATION

- Iodine-containing X-ray contrast media Intravascular administration of iodinated contrast agents can cause renal failure, which can increase the risk of lactic acidosis with metformin. Suspend metformin prior to the test; restart no earlier than 48 hours after the test if renal function has returned to baseline.

- CAUTIONS Can provoke lactic acidosis

- INTERACTIONS > Appendix 1 (antidiabetics).

- SIDE-EFFECTS

  - Common or very common Abdominal pain - anorexia - diarrhoea (usually transient) - nausea - taste disturbance - vomiting
  - Rare Decreased vitamin-B12 absorption - erythema - lactic acidosis (withdraw treatment) - pruritus - urticaria
  - Frequency not known Hepatitis

SIDE-EFFECTS, FURTHER INFORMATION

- Gastro-intestinal effects Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses are given. A slow increase in dose may improve tolerability.

- PREGNANCY Can be used in pregnancy for both pre-existing and gestational diabetes. Women with gestational diabetes should discontinue treatment after giving birth.

- BREAST FEEDING May be used during breast-feeding in women with pre-existing diabetes.

- HEPATIC IMPAIRMENT Withdraw if tissue hypoxia likely.

- RENAL IMPAIRMENT Use with caution in renal impairment—increased risk of lactic acidosis.

- Acidosis Withdraw or interrupt treatment in those at risk of tissue hypoxia or sudden deterioration in renal function, such as those with dehydration, severe infection, shock, sepsis, acute heart failure, respiratory failure or hepatic impairment, or those who have recently had a myocardial infarction.

Avoid in significant renal impairment.

- MONITORING REQUIREMENTS Determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected).

BLOOD GLUCOSE LOWERING DRUGS >

SULFONYLUREAS

Sulfonlureas

> DRUG ACTION The sulfonlureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action.

- CONTRA-INDICATIONS Presence of ketoadisosis

- CAUTIONS Can encourage weight gain (should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting). G6PD deficiency

- SIDE-EFFECTS

  - Uncommon Hypoglycaemia
  - Rare Agranulocytosis - aplastic anaemia - blood disorders - cholestatic jaundice - haemolytic anaemia - hepatic failure - hepatitis - leucopenia - pancytopenia - thrombocytopenia

  - Frequency not known Allergic skin reactions (usually in the first 6–8 weeks of therapy) - constipation - diarrhoea -
disturbance in liver function - erythema multiforme (usually in the first 6–8 weeks of therapy) - exfoliative dermatitis (usually in the first 6–8 weeks of therapy) - fever (usually in the first 6–8 weeks of therapy) - gastrointestinal disturbances - hypersensitivity reactions (usually in the first 6–8 weeks of therapy) - jaundice (usually in the first 6–8 weeks of therapy) - nausea - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hypoglycaemia This is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.
- **HEPATIC IMPAIRMENT** Sulfonylureas should be avoided or reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia. Jaundice may occur.
- **RENAL IMPAIRMENT** Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia. Care is required to use the lowest dose that adequately controls blood glucose. Avoid where possible in severe renal impairment.
- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks**
    - **Driving** Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.
  - **Type 1 diabetes mellitus**
    - **INDICATIONS AND DOSE**
      - **BY MOUTH**
        - Child 12–17 years: Initially 2.5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day
      - **Maturity-onset diabetes of the young (specialist use only)**
        - **BY MOUTH**
          - Child 12–17 years: Initially 2.5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 562
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** Avoid—there is theoretical possibility of hypoglycaemia in the infant.
- **RENAL IMPAIRMENT** If necessary, gliclazide which is principally metabolised in the liver, can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- Gliclazide (Non-proprietary)
  - Gliclazide 40 mg Gliclazide 40mg tablets | 28 tablet | £3.66 DT price = £3.36
  - Gliclazide 80 mg Gliclazide 80mg tablets | 28 tablet | £12.74 DT price = £10.85 | 60 tablet | £19.85
  - Diamicron (Servier Laboratories Ltd)
    - Gliclazide 80 mg Diamicon 80mg tablets | 60 tablet | £4.38
    - Zicron (Bristol Laboratories Ltd)
      - Gliclazide 40 mg Zicron 40mg tablets | 28 tablet | £3.36 DT price = £3.36

**Glibenclamide**

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus**

- **BY MOUTH**
  - Child 12-17 years: Initially 2.5 mg once daily, adjusted according to response, increased if necessary up to 160 mg once daily (max. per dose 160 mg twice daily), dose to be taken with breakfast

**Maturity-onset diabetes of the young (specialist use only)**

- **BY MOUTH**
  - Child 12-17 years: Initially 20 mg once daily, adjusted according to response, increased if necessary up to 160 mg once daily (max. per dose 160 mg twice daily), dose to be taken with breakfast

**UNLICENSED USE** Not licensed for use in children.

**CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 562

**INTERACTIONS** → Appendix 1 (antidiabetics).

**PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.

**BREAST FEEDING** The use of sulfonylureas in breastfeeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- Glibenclamide (Non-proprietary)
  - Glibenclamide 2.5 mg Glibenclamide 2.5mg tablets | 28 tablet | £7.21 DT price = £6.95
  - Glibenclamide 5 mg Glibenclamide 5mg tablets | 28 tablet | £19.99 DT price = £19.85

**Tolbutamide**

**INDICATIONS AND DOSE**

**Type 2 diabetes mellitus**

- **BY MOUTH**
  - Child 12-17 years (specialist use only): 0.5–1.5 g daily in divided doses, dose to be taken with or immediately after meals, alternatively 0.5–1.5 g once daily, dose to be taken with or immediately after breakfast; maximum 2 g per day

**UNLICENSED USE** Not licensed for use in children.

**CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 562

**INTERACTIONS** → Appendix 1 (antidiabetics).

**SIDE-EFFECTS** Headache - tinnitus

**PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.

**BREAST FEEDING** The use of sulfonylureas in breastfeeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.
RENAL IMPAIRMENT If necessary, the short-acting drug tolbutamide can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

INSULINS

Insulins

- SIDE-EFFECTS
  - Common or very common Fat hypertrophy at injection site - local reactions at injection site - transient oedema
  - Rare
    - Hypersensitivity reactions - rash - urticaria

Overdose

Overdose causes hypoglycaemia.

PREGNANCY

During pregnancy, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician. The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy.

BREAST FEEDING

During breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

HEPATIC IMPAIRMENT

Insulin requirements may be decreased in patients with hepatic impairment.

RENAL IMPAIRMENT

Insulin requirements may decrease in patients with renal impairment and therefore dose reduction may be necessary. The compensatory response to hypoglycaemia is impaired in renal impairment.

MONITORING REQUIREMENTS

- Many patients now monitor their own blood-glucose concentrations; all carers and children need to be trained to do this.
- Since blood-glucose concentration varies substantially throughout the day, ‘normoglycaemia’ cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia.
- It is therefore best to recommend that children should maintain a blood-glucose concentration of between 4 and 10 mmol/litre for most of the time (4–8 mmol/litre before meals and less than 10 mmol/litre after meals).
- While accepting that on occasions, for brief periods, the blood-glucose concentration will be above these values; strenuous efforts should be made to prevent it from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.

DIRECTIONS FOR ADMINISTRATION

Insulin is generally given by subcutaneous injection; the injection site should be rotated to prevent lipodystrophy. Injection devices (‘pens’), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form, but are less popular with children and carers. For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

PRESCRIBING AND DISPENSING INFORMATION

Units The word ‘unit’ should not be abbreviated.

Show container to patient or carer and confirm the expected version is dispensed.

PATIENT AND CARER ADVICE

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

Insulin Passport Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient’s current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:

3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham
OL9 9QH
Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores.

NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com. Further information is available at www.npsa.nhs.uk. Hypoglycaemia Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

INSULINS > INTERMEDIATE-ACTING

Biphasic isophane insulin

(Biphasic Isophane Insulin Injection—intermediate acting)

INDICATIONS AND DOSE

Diabetes mellitus

- BY SUBCUTANEOUS INJECTION
- Child: According to requirements

INTERACTIONS

Appendix 1 (antidiabetics).

SIDE-EFFECTS

Protamine may cause allergic reactions

PRESCRIBING AND DISPENSING INFORMATION

A sterile buffered suspension of either porcine or human insulin complexed with protamine sulfate (or another suitable protamine) in a solution of insulin of the same species.

Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- Humulin M3 (Eli Lilly and Company Ltd)
  - Insulin human (as Insulin soluble human) 30 unit per 1 ml,

  - Insulin lispro 50 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 50 unit per 1 ml Humalog Mix50 KwikPen 100 units/ml suspension for injection 3 ml pre-filled pen | 5 pre-filled disposable injection (PMD) £30.98

**INSULINS → LONG-ACTING**

**Insulin degludec**

(Recombinant human insulin analogue—long acting)

**INDICATIONS AND DOSE**

**Diabetes mellitus**

- By subcutaneous injection
- Child 1-17 years: Dose to be given according to requirements

**INTERACTIONS** → Appendix 1 (antidiabetics).

**PREGNANCY**

Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin in p. 423 is recommended where longer-acting insulins are needed; insulin detemir may also be considered where longer-acting insulins are needed.

**PRESCRIBING AND DISPENSING INFORMATION**

Insulin degludec (Tresiba®) is available in strengths of 100 units/ml (allows 1-unit dose adjustment) and 200 units/ml (allows 2-unit dose adjustment)—ensure correct strength prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Tresiba FlexTouch (Novo Nordisk Ltd) ▼
  - Insulin human (as Insulin degludec) 100 unit per 1 ml Tresiba FlexTouch 200 units/ml solution for injection 3 ml pre-filled pen | 3 pre-filled disposable injection (PMD) £16.40
  - Insulin human (as Insulin degludec) 200 unit per 1 ml Tresiba FlexTouch 200 units/ml solution for injection 3 ml pre-filled pen | 3 pre-filled disposable injection (PMD) £36.40
  - Tresiba Penfill (Novo Nordisk Ltd) ◄
  - Insulin human (as Insulin degludec) 100 unit per 1 ml Tresiba Penfill 100 units/ml solution for injection 3 ml cartridges | 5 cartridge (PMD) £72.00

**Insulin detemir**

(Recombinant human insulin analogue—long acting)

**INDICATIONS AND DOSE**

**Diabetes mellitus**

- By subcutaneous injection
- Child 2-17 years: According to requirements

**INTERACTIONS** → Appendix 1 (antidiabetics).

**PREGNANCY**

Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin in p. 423 is recommended where longer-acting insulins are needed; insulin detemir may also be considered where longer-acting insulins are needed.

**PRESCRIBING AND DISPENSING INFORMATION**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Levemir FlexPen (Novo Nordisk Ltd)
  - Insulin human (as Insulin detemir) 100 unit per 1 ml Levemir FlexPen 100 units/ml solution for injection 3 ml pre-filled pen | 5 pre-filled disposable injection (PMD) £42.00
  - Levemir InnoLet (Novo Nordisk Ltd)
  - Insulin human (as Insulin detemir) 100 unit per 1 ml Levemir InnoLet 100 units/ml solution for injection 3 ml pre-filled pen | 5 pre-filled disposable injection (PMD) £44.85
  - Levemir Penfill (Novo Nordisk Ltd)
  - Insulin human (as Insulin detemir) 100 unit per 1 ml Levemir Penfill 100 units/ml solution for injection 3 ml cartridges | 5 cartridge (PMD) £42.00

**Insulin glargine**

(Recombinant human insulin analogue—long acting)

**INDICATIONS AND DOSE**

**Diabetes mellitus**

- By subcutaneous injection
- Child 2-17 years: According to requirements

**INTERACTIONS** → Appendix 1 (antidiabetics).

**PREGNANCY**

Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin in p. 423 is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

**PRESCRIBING AND DISPENSING INFORMATION**

Products containing insulin glargine are not identical and although there should be no important differences in terms of safety and efficacy, when prescribing biological products it is good practice to use the brand name see Biosimilar medicines, under Guidance on prescribing p. 1. Dose adjustments and close metabolic monitoring is recommended if switching between insulin glargine preparations.

**NATIONAL FUNDING/ACCESS DECISIONS**

The Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised that Lantus® preparations (April 2013) and Toujeo® (August 2015) are accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:

- in those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins
- as a once daily insulin therapy for patients who require a carer to administer their insulin

It is not recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent
Diabetes mellitus

Intravenous insulin infusion

Indications and dose

Intravenous infusion is used during surgery, in intensive care, and for patients who cannot take or absorb oral medication. Insulin concentration should be titrated to satisfy the metabolic needs of the patient.

Infusion is started at 1 unit/kg/hour. The dose is adjusted according to blood-glucose concentration.

Duration

Insulin p. 423 is recommended where longer-acting insulins are needed; insulin detemir p. 424 may also be considered.

Prescribing and dispensing information

A sterile suspension of insulin in the form of a complex obtained by the addition of a suitable protamine and zinc chloride; this preparation was included in BP 1980 but is not included in BP 1988.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Abasaglar (Eli Lilly and Company Ltd)
  - Insulin human (as Insulin glargine) 100 unit per 1 ml
    - Lantus 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection £35.28
  - Abasaglar KwikPen (Eli Lilly and Company Ltd)
    - Insulin human (as Insulin glargine) 100 unit per 1 ml
      - Lantus 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection £35.28
  - Lantus (Sanofi)
    - Insulin human (as Insulin glargine) 100 unit per 1 ml
      - Lantus 100units/ml solution for injection 10ml vials | 1 vial £30.68
    - Lantus SoloStar (Sanofi)
      - Insulin human (as Insulin glargine) 100 unit per 1 ml
        - Lantus 100units/ml solution for injection 3ml pre-filled SoloStar pen | 1 pre-filled disposable injection £41.50
  - Toujeo (Sanofi)
    - Insulin human (as Insulin glargine) 300 unit per 1 ml
      - Toujeo 300units/ml solution for injection 1.5ml pre-filled SoloStar pen | 1 pre-filled disposable injection £33.13

Insulin (Insulin Injection; Neutral Insulin; Soluble Insulin—short acting)

Indications and dose

Diabetes mellitus

- By subcutaneous injection
  - Child: According to requirements

Hyperglycaemia during illness

- By intravenous infusion
  - Neonate: 0.02–0.125 unit/kg/hour, dose to be adjusted according to blood-glucose concentration.
  - Child: 0.025–0.1 unit/kg/hour, dose to be adjusted according to blood-glucose concentration

Neonatal hyperglycaemia/Neonatal diabetes

- By intravenous infusion
  - Neonate: 0.02–0.125 unit/kg/hour, dose to be adjusted according to blood-glucose concentration.

Diabetic ketoacidosis/Diabetes during surgery

- By intravenous infusion
  - Child: (consult local protocol)

Interactions

- Appendix 1 (antidiabetics).

Directions for administration

Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team. Some insulin preparations are not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle—consult product literature.

With intravenous use For intravenous infusion, dilute to a concentration of 1 unit/mL with Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin.

For intravenous infusion in neonatal intensive care, dilute 5 units to a final volume of 50 mL with Sodium Chloride 0.9% and mix thoroughly; an intravenous infusion rate of 0.1 mL/kg/hour provides a dose of 0.01 units/kg/hour.
Insulin aspart
(Recombinant human insulin analogue—short acting)

**INDICATIONS AND DOSE**

**Diabetes mellitus**
- **BY SUBCUTANEOUS INJECTION**
  - Child 1 month–1 year: Administer immediately before meals or when necessary shortly after meals, according to requirements.
  - Child 2–17 years: Administer immediately before meals or when necessary shortly after meals, according to requirements.
- **BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Child 1 month–1 year: According to requirements.
  - Child 2–17 years: According to requirements.

- **UNLICENSED USE** Not licensed for use in children under 2 years.
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **PREGNANCY** Not known to be harmful—may be used during pregnancy.
- **BREAST FEEDING** Not known to be harmful—may be used during lactation.

- **DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.
  - With intravenous use For intravenous infusion, dilute to a concentration of 0.05–1 unit/mL with Glucose 5% or Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151

Continuous subcutaneous insulin infusion is recommended as an option in children over 12 years with type 1 diabetes:
- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or
- whose glycaemic control remains inadequate (HbA1c over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

www.nice.org.uk/TA151

**Blood monitoring test strips**

**3.1a Diabetes, diagnosis and monitoring**

**Diabetes mellitus, diagnostic and monitoring devices**

**Urinalysis**

Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely required unless they become unwell—see Blood Monitoring.

Microalbuminuria can be detected with **Miral-Test II** but this should be followed by confirmation in the laboratory, since false positive results are common.

**Blood monitoring**

Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Carers and children should be properly trained in the use of blood glucose monitoring systems and the appropriate action to take on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Children using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the blood glucose level is high or if the child is unwell, **blood ketones** should be measured according to local guidelines in order to detect diabetic ketoacidosis. Children and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

**Oral glucose tolerance test**

The oral glucose tolerance test is used mainly for diagnosis of impaired glucose tolerance; it is not recommended or necessary for routine diagnostic use when severe symptoms of hyperglycaemia are present. However, it is used for the investigation of insulin resistance, glycogen storage disease, and excessive growth hormone secretion. In children who have less severe symptoms and blood-glucose concentrations that do not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose tolerance test may be required. Glucose is used to establish the presence of gestational diabetes; this generally involves giving anhydrous glucose by mouth to the fasting patient, and measuring blood-glucose concentration at intervals. The appropriate amount of glucose should be given with 200–300 mL fluid. Alternatively anhydrous glucose can be given as 113 mL *Polycal*® with extra fluid to administer a total volume of 200–300 mL, or as *Rapilose*® OGTT oral solution.

- **Medi-Test Protein 2 testing strips (Owen Mumford Ltd)**
  - 50 strips - NHS indicative price = £3.27 - Drug Tariff (Part IXa)
3.2 Hypoglycaemia

Hypoglycaemia

Treatment of hypoglycaemia

Prompt treatment of hypoglycaemia in children from any cause is essential as severe hypoglycaemia may cause subsequent neurological damage. Hyperinsulinism, fatty acid oxidation disorders and glycogen storage disease are less common causes of acute hypoglycaemia in children.

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from non-diabetes versions of Lucozade® Energy Original 55 mL, Coca-Cola® 100 mL, and Ribena Blackcurrant 19 mL (to be diluted), 2 teaspoons of sugar, and also from 3 sugar lumps. Proprietary products of quick-acting carbohydrate (e.g. Gluco Gel®, Dextrogel®, GSF-Syrup®, Rapilose® gel) are available on prescription for the patient to keep to hand in case of hypoglycaemia. If necessary this can be repeated in 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal, if it is due, can prevent blood-glucose concentration from falling again.

Hypoglycaemia which causes unconsciousness or seizures is an emergency. Glucagon below, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases blood-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon can be issued to parents or carers of insulin-treated children for emergency use in hypoglycaemic attacks. It is often advisable to prescribe it on an ‘if necessary’ basis for hospitalised insulin-treated children, so that it can be given rapidly by the nurses during a hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, glucose intravenous infusion 10% can be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Glucose intravenous infusion 50% is not recommended, as it is very viscous and hypertonic. Close monitoring is necessary, particularly in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Children whose hypoglycaemia is caused by an oral anti-diabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs can persist for many hours.

Glucagon is not effective in the treatment of hypoglycaemia due to fatty acid oxidation or glycogen storage disorders.

Chronic hypoglycaemia

Diazoxide p. 434 is useful in the management of chronic hypoglycaemia due to excessive insulin secretion, either from a tumour involving the islets of Langerhans or from persisting hyperinsulinaemic hypoglycaemia of infancy (nesidioblastosis). Diazoxide has no place in the management of acute hypoglycaemia. Chlorothiazide p. 103 reduces diazoxide-induced sodium and water retention and has the added benefit of potentiating the glycaemic effect of diazoxide.

If diazoxide and chlorothiazide fail to suppress excessive glucose requirements in chronic hypoglycaemia then octreotide p. 434 or nifedipine p. 100 can be added. Octreotide suppresses secretion of growth hormone, but growth is unlikely to be affected in the long term.

Neonatal hypoglycaemia

Neonatal hypoglycaemia at birth is treated with glucose intravenous infusion 10%. Mild asymptomatic persistent hypoglycaemia may respond to a single dose of glucagon. Glucagon has also been used in the short-term management of endogenous hyperinsulinism.

GLYCOGENOLYTIC HORMONES

Glucagon

- **INDICATIONS AND DOSE**
  - **Insulin-induced hypoglycaemia**
    - **BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
    - Neonate: 20 micrograms/kg.
    - Child 1 month-1 year: 500 micrograms
    - Child 2-17 years (body-weight up to 25 kg): 500 micrograms, if no response within 10 minutes intravenous glucose must be given
    - Child 2-17 years (body-weight 25 kg and above): 1 mg, if no response within 10 minutes intravenous glucose must be given
  - **ENDOGENOUS HYPERINSULINISM**
    - **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
    - Neonate: 200 micrograms/kg (max. per dose 1 mg) for 1 dose.
    - Child 1 month-1 year: 1 mg for 1 dose
    - **BY CONTINUOUS INTRAVENOUS INFUSION**
      - Neonate: 1–18 micrograms/kg/hour (max. per dose 50 micrograms/kg/hour), adjusted according to response.
      - Child 1 month-1 year: 1–10 micrograms/kg/hour, dose to be adjusted as necessary
  - **DIAGNOSIS OF GROWTH HORMONE SECRETION (SPECIALIST USE ONLY)**
    - **BY INTRAMUSCULAR INJECTION**
      - Child: 100 micrograms/kg (max. per dose 1 mg) for 1 dose, dose may vary, consult local guidelines
  - **BETA-BLOCKER POISONING (CARDIOGENIC SHOCK UNRESPONSIVE TO ATROPINE)**
    - **INITIALLY BY INTRAVENOUS INJECTION**
      - Child: 50–150 micrograms/kg (max. per dose 10 mg), to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour

**DOSE EQUIVALENCE AND CONVERSION**
1 unit of glucagon = 1 mg of glucagon.

- **UNLICENSED USE** Dose and indication for cardiogenic shock unresponsive to atropine in beta-blocker overdose not licensed. Unlicensed for growth hormone test and hyperinsulinism.

- **CONTRA-INDICATIONS** Phaeochromocytoma

- **CAUTIONS** Glucagonoma - ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency - insulinoma - when used in the diagnosis of growth hormone secretion, delayed hypoglycaemia may result—deaths reported (ensure a meal is eaten before discharge).
3.2a Chronic hypoglycaemia

**GLYCOGENOLYTIC HORMONES**

### Diazoxxide

**INDICATIONS AND DOSE**

<table>
<thead>
<tr>
<th>Resistant hypertension</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>BY MOUTH</strong></td>

<tr>
<td>Neonate: Initially 1.7 mg/kg 3 times a day, adjusted according to response; maximum 15 mg/kg per day.</td>
</tr>
<tr>
<td>Child: Initially 1.7 mg/kg 3 times a day, adjusted according to response; maximum 15 mg/kg per day.</td>
</tr>
</tbody>
</table>

**Chronic intractable hypoglycaemia**

| **BY MOUTH** |
| Neonate: Initially 5 mg/kg twice daily, adjusted according to response, initial dose used to establish response; maintenance 1.5–3 mg/kg 2–3 times a day; increased if necessary up to 7 mg/kg 3 times a day, higher doses are unlikely to be beneficial, but may be required in some cases. |
| Child: Initially 1.7 mg/kg 3 times a day, adjusted according to response; maintenance 1.5–3 mg/kg 2–3 times a day, increased if necessary up to 5 mg/kg 3 times a day; doses up to 5 mg/kg may be required in some cases, but higher doses are unlikely to be beneficial. |

**UNLICENSED USE**

Not licensed for resistant hypertension.

**CAUTIONS**

**INTERACTIONS**

Appendix 1 (diazoxxide).

**SIDE-EFFECTS**

**PREGNANCY**

Use only if essential; alopecia and hypotension reported in neonates with prolonged use; may inhibit uterine activity during labour.

**BREAST FEEDING**

Manufacturer advises avoid—no information available.

**RENAL IMPAIRMENT**

Dose reduction may be required.

**MONITORING REQUIREMENTS**

- Monitor blood pressure.
- Monitor white cell and platelet count during prolonged use.
- Regularly assess growth, bone, and psychological development during prolonged use.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution.

**Tablet**

- Eudemine (Focus Pharmaceuticals Ltd)
  - Dazioxxide 50 mg | 100 tablet | £46.45
- Dazioxxide (Non-proprietary)
  - Dazioxxide 25 mg | 100 capsule | no price available

**Oral suspension**

- Dazioxxide (Non-proprietary)
  - Dazioxxide 50 mg per 1 ml | 30 ml | no price available DT price = £126.47

**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > SOMATOSTATIN ANALOGUES**

### Somatostatin analogues

**CAUTIONS**

Diabetes mellitus (antidiabetic requirements may be reduced) - insulinoma (increased depth and duration of hypoglycaemia may occur—observe patients and monitor blood glucose levels when initiating and changing doses).

**SIDE-EFFECTS**

- Rare: Pancreatitis (shortly after administration)
- Frequency not known: Abdominal pain - anorexia - bloating - diarrhoea - flatulence - gallstones (after long-term treatment) - gastro-intestinal disturbances - hyperglycaemia (with chronic administration) - hypoglycaemia - impaired postprandial glucose tolerance (with chronic administration) - irradiation at the injection site - nausea - pain at the injection site - steatorrhea - vomiting

**DIRECTIONS FOR ADMINISTRATION**

Injection sites should be rotated.

### Octreotide

**INDICATIONS AND DOSE**

Persistent hyperinsulinaemic hypoglycaemia unresponsive to diazoxxide and glucose

**BY SUBCUTANEOUS INJECTION**

- Neonate: Initially 2–5 micrograms/kg every 6–8 hours, adjusted according to response; increased if necessary up to 7 micrograms/kg every 4 hours, dosing up to 7 micrograms/kg may rarely be required.
- Child: Initially 1–2 micrograms/kg every 4–6 hours, adjusted according to response; increased if necessary up to 7 micrograms/kg every 4 hours, dosing up to 7 micrograms/kg may rarely be required.
Disorders of bone metabolism

Bone metabolism

Disorders of bone metabolism

The two main disorders of bone metabolism that occur in children are rickets and osteoporosis. The two most common forms of rickets are Vitamin D deficiency rickets and hypophosphataemic rickets. See also calcium.

Osteoporosis

Osteoporosis in children may be primary (e.g. osteogenesis imperfecta and idiopathic juvenile osteoporosis), or secondary (e.g. due to inflammatory disorders, immobilisation, or corticosteroids); specialist management is required.

Corticosteroid-induced osteoporosis

To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible.

Calcitonin

Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homoeostasis. Calcitonin (salmon) p. 439 (synthetic or recombinant salmon calcitonin) is used by specialists to lower the plasma-calcium concentration in children with hypercalcaemia associated with malignancy.

Bisphosphonates

A bisphosphonate such as pamidronate disodium p. 437 is used in the management of severe forms of osteogenesis imperfecta and other causes of osteoporosis in children to reduce the number of fractures; the long-term effects of bisphosphonates in children have not been established.

Single doses of bisphosphonates are also used to manage hypercalcaemia. Treatment should be initiated under specialist advice only.

Bisphosphonates

**Drug Action** Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover.

**Important Safety Information**

MHRA/CHM ADVICE: BISPHOSPHONATES: ATYPICAL FEMORAL FRACTURES (JUNE 2011)

Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis.
The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.

Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget’s disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease.

All patients should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients should also maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms such as dental mobility, pain, or swelling, non-healing sores or discharge to a doctor and dentist during treatment.

Before prescribing an intravenous bisphosphonate, patients should be given a patient reminder card and informed of the risk of osteonecrosis of the jaw. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, and if the patient wears dentures, they should make sure their dentures fit properly. Patients should also maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms such as dental mobility, pain, or swelling, non-healing sores or discharge to a doctor and dentist during treatment.

Benign idiopathic osteonecrosis of the external auditory canal has been reported rarely with bisphosphonate therapy (10 years or longer).

The possibility of osteonecrosis of the external auditory canal should be considered in patients receiving bisphosphonates who present with ear symptoms, including chronic ear infections, or suspected cholesteatoma.

Risk factors for developing osteonecrosis of the external auditory canal include: steroid use, chemotherapy, infection, an ear operation, or cottonbud use.

Patients should be advised to report any ear pain, discharge from the ear, or an ear infection during treatment with a bisphosphonate.

**Alendronic acid** (Alendronate)

**INDICATIONS AND DOSE**

Osteoporosis (due to osteogenesis imperfecta and other causes) (initiated under specialist supervision)

Hypercalcaemia (initiated under specialist supervision)

**SIDE EFFECTS**

- **Common or very common** Abdominal distension - abdominal pain - alopecia - asthenia - constipation - diarrhoea - dizziness - dyspepsia - flatulence - headache - joint swelling - musculoskeletal pain - oesophageal reactions - peripheral oedema - pruritus - regurgitation - vertigo

- **Uncommon** Dysgeusia - epidermis - erythema - gastritis - malaise (on initiation) - melena - myalgia (on initiation) - nausea - rash - scleritis - uveitis - vomiting

- **Rare** Atypical femoral fractures with long-term use - fever (on initiation) - hypocalcaemia - osteonecrosis of the jaw - photosensitivity - severe skin reactions - Stevens-Johnson syndrome - toxic epidermal necrolysis

- **Very rare** Osteonecrosis of the external auditory canal - SIDE-EFFECTS, FURTHER INFORMATION

- Oesophageal reactions - Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate is less than 35 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS** Correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting treatment. Monitor serum-calcium concentration during treatment.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole and oral solution should be swallowed as a single 100 mL dose. Doses should be taken with plenty of water while sitting or standing, on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after administration.
Disorders of bone metabolism

Pamidronate disodium
(Formerly called aminohydroxypropylidenediphosphonate disodium (APD))

**INDICATIONS AND DOSE**
Osteoporosis (due to osteogenesis imperfecta and other causes) (specialist use only) | Hypercalcaemia (specialist use only)

- **BY INTRAVENOUS INFUSION**
  - Child: (consult product literature)

**UNLICENSED USE** Not licensed for use in children.

**CAUTIONS**
Atypical femoral fractures | cardiac disease | ensure adequate hydration | previous thyroid surgery (risk of hypocalcaemia)

**INTERACTIONS** Appendix 1 (bisphosphonates).
Avoid concurrent use with other bisphosphonates.

**SIDE-EFFECTS**
- **Common or very common**: Arthralgia | bone pain | fever | headache | hypomagnesaemia | hypophosphataemia | influenza-like symptoms (sometimes accompanied by malaise, rigors, fatigue and flushes) | lymphocytopenia | myalgia | nausea | transient rise in body temperature | vomiting
- **Rare**: Abdominal pain | acute renal failure | agitation | anaemia | anorexia | atypical femoral fractures | confusion | conjunctivitis | constipation | deterioration of renal disease | diarrhoea | dizziness | dyspepsia | haematuria | hallucinations | hyperkalaemia | hyperparathyroidism | hypertension | hypokalaemia | hypotension | insomnia | isolated cases of seizures | lethargy | leucopenia | muscle cramps | osteonecrosis of the jaw | other ocular symptoms | paraesthesia | pruritus | rash | somnolence | symptomatic hypocalcaemia | tetany | thrombocytopenia

**APPENDIX 1**
Disorders of bone metabolism

**Frequency not known**
Atrial fibrillation | injection-site reactions | reactivation of herpes simplex | reactivation of herpes zoster

**PREGNANCY** Avoid—toxicity in animal studies.

**BREAST FEEDING** Avoid.

**HEPATIC IMPAIRMENT** Caution in severe hepatic impairment—no information available.

**RENAL IMPAIRMENT** Monitor renal function in renal disease or predisposition to renal impairment (e.g. in tumour-induced hypercalcaemia).

**DIRECTIONS FOR ADMINISTRATION** For slow intravenous infusion (Aredia®; Pamidronate disodium, Hospira, Medac, Wockhardt), give intermittently in Glucose 5% or Sodium Chloride 0.9%; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium. For Aredia®, reconstitute initially with water for injections (15 mg in 5 ml, 30 mg or 90 mg in 10 ml), then dilute with infusion fluid to a concentration of not more than 90 mg in 250 ml. For Pamidronate disodium (Medac, Hospira, Wockhardt) dilute with infusion fluid to a concentration of not more than 90 mg in 250 ml.

**PATIENT AND CARER ADVICE**
Driving and skilled tasks | Patients should be warned against performing skilled tasks (e.g. cycling, driving or operating machinery) immediately after treatment (somnolence or dizziness can occur). A patient reminder card should be provided (risk of osteonecrosis of the jaw).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Tablet**
- Alendronic acid (Non-proprietary)
  - Alendronic acid (as Alendronate sodium) 10 mg | Alendronic acid 10 mg tablets | 28 tablet (pack £21.25 DT price = £1.78)
  - Alendronic acid (as Alendronate sodium) 70 mg | Alendronic acid 70 mg tablets | 4 tablet (pack £22.80 DT price = £0.79)
  - Fosamax (Merck Sharp & Dohme Ltd)
    - Alendronic acid (as Alendronate sodium) 10 mg | Alendronate 10 mg tablets | 28 tablet (pack £22.80 DT price = £1.78)
    - Fosamax (as Alendronate sodium) 70 mg | Fosamax Once Weekly 70 mg tablets | 4 tablet (pack £22.80 DT price = £0.79)

**Effervescent tablet**
- Binosto (Interims Pharmaceuticals Ltd)
  - Alendronic acid (as Alendronate sodium) 70 mg | Binosto 70 mg effervescent tablets sugar-free | 4 tablet (pack £22.80 DT price = £2.80

**Oral solution**
- Alendronic acid (Non-proprietary)
  - Alendronic acid 700 microgram per ml | Alendronic acid 700mg/100ml oral solution unit dose sugar-free | 4 unit dose (pack £27.36 DT price = £27.36)

**Pamidronate disodium**

(Formerly called aminohydroxypropylidenediphosphonate disodium (APD))

**INDICATIONS AND DOSE**

  - Alendronic acid 700 microgram per ml | Alendronic acid 700mg/100ml oral solution unit dose sugar-free | 4 unit dose (pack £27.36 DT price = £27.36)
CONTRA-INDICATIONS

- Hypocalcaemia
- Acute gastro-intestinal inflammatory conditions

CAUTIONS

- Atypical femoral fractures - oesophageal abnormalities - other factors which delay transit or emptying (e.g. stricture or achalasia)
- Uncommon Duodenitis - dysphagia - gastritis - oesophageal ulcer - oesophagitis - uveitis
- Rare Atypical femoral fractures - glossitis - oesophageal stricture
- Very rare Osteonecrosis of the external auditory canal
- Frequency not known Cutaneous vasculitis - gastroduodenal ulceration - hair loss - hepatic disorders - osteonecrosis of the jaw - Stevens-Johnson syndrome - toxic epidermal necrolysis

PREGNANCY

Avoid.

BREAST FEEDING

Avoid.

RENAL IMPAIRMENT

Avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².

MONITORING REQUIREMENTS

- Correct hypocalcaemia before starting.
- Correct other disturbances of bone and mineral metabolism (e.g. vitamin D deficiency) at onset of treatment.

DIRECTIONS FOR ADMINISTRATION

Swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day or, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising.

PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer risedronate sodium tablets.

Oesophageal reactions Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

Medicines for Children leaflet: Risedronate for brittle bones
www.medicinesforchildren.org.uk/risedronate-for-brittle-bones

MEDICINAL FORMS

Sodium clodronate

INDICATIONS AND DOSE

Osteoporosis (due to osteogenesis imperfecta or other causes) (specialist use only) | Hypercalcaemia (specialist use only)

- BY MOUTH
- Child: (consult local protocol)

UNLICENSED USE

Not licensed for use in children.

CONTRA-INDICATIONS

- Acute gastro-intestinal inflammatory conditions

CAUTIONS

- Atypical femoral fractures - maintain adequate fluid intake during treatment

INTERACTIONS

- Appendix 1 (bisphosphonates).

RENAL IMPAIRMENT

Reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

MONITORING REQUIREMENTS

- Monitor renal function, serum calcium and serum phosphate before and during treatment.

DIRECTIONS FOR ADMINISTRATION

Avoid food for 2 hours before and 1 hour after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake.

PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer sodium clodronate capsules and tablets.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

CALCIUM REGULATING DRUGS ▶ BONE RESORPTION INHIBITORS

Calcitonin (salmon)
(Salcatonin)

● INDICATIONS AND DOSE
Hypercalcaemia (limited experience in children) (specialist use only)
▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
▶ Child: 2.5–5 units/kg every 12 hours (max. per dose 400 units every 6–8 hours), adjusted according to response, no additional benefit with doses over 8 units/kg every 6 hours
▶ BY INTRAVENOUS INFUSION
▶ Child: 5–10 units/kg, to be administered by slow intravenous infusion over at least 6 hours

Osteoporosis (special use only)
▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
▶ Child: Refer for specialist advice, experience very limited

● UNLICENSED USE Not licensed in children.
● CONTRA-INDICATIONS Hypocalcaemia
● CAUTIONS Heart failure · history of allergy (skin test advised) · risk of malignancy · avoid prolonged use (use lowest effective dose for shortest possible time)

● SIDE-EFFECTS
▶ Common or very common Abdominal pain · diarrhoea · dizziness · fatigue · flushing · headache · malignancy (with long-term use) · musculoskeletal pain · nausea · taste disturbances · vomiting
▶ Uncommon Cough · hypersensitivity reactions · hypertension · injection-site reactions · oedema · polyuria · pruritus · rash · visual disturbances
▶ Frequency not known Tremor

● PREGNANCY Avoid unless potential benefit outweighs risk (toxicity in animal studies).
● BREAST FEEDING Avoid; inhibits lactation in animals.
● RENAL IMPAIRMENT Use with caution.
● MONITORING REQUIREMENTS Monitor bone growth.
● DIRECTIONS FOR ADMINISTRATION For intravenous infusion, dilute injection solution (e.g. 400 units in 500 mL) with Sodium Chloride 0.9% and give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration — use diluted solution without delay.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
▶ Miacalcic (Novartis Pharmaceuticals UK Ltd)
Calcitonin (salmon) 50 unit per 1 ml Miacalcic 50 units/1ml solution for injection ampoules | 5 ampoule (POM) £17.10
Calcitonin (salmon) 100 unit per 1 ml Miacalcic 100 units/1ml solution for injection ampoules | 5 ampoule (POM) £34.21
Calcitonin (salmon) 200 unit per 1 ml Miacalcic 400 units/2ml multidose solution for injection vials | 1 vial (POM) £24.60

5 Gonadotrophin responsive conditions

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES ▶ GONADOTROPIN-RELEASING HORMONES

Goserelein

● DRUG ACTION Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

● INDICATIONS AND DOSE
ZOLADEX LA®
Gonadotrophin-dependent precocious puberty
▶ BY SUBCUTANEOUS INJECTION
▶ Child: 10.8 mg every 12 weeks, to be administered into the anterior abdominal wall, injections may be required more frequently in some cases

ZOLADEX®
Gonadotrophin-dependent precocious puberty
▶ BY SUBCUTANEOUS INJECTION
▶ Child: 3.6 mg every 28 days, to be administered into the anterior abdominal wall, injections may be required more frequently in some cases

● UNLICENSED USE Not licensed for use in children.
● CONTRA-INDICATIONS Undiagnosed vaginal bleeding
● CAUTIONS Depression · patients with metabolic bone disease (decrease in bone mineral density can occur)

● SIDE-EFFECTS Anaphylaxis · asthma · breast tenderness · changes in blood pressure · changes in breast size · changes in scalp and body hair · depression · headache · hypersensitivity reactions · local reactions at injection site · mood changes · ovarian cysts (may require withdrawal) · paraesthesia · pruritus · rash · urticaria · vaginal bleeding · visual disturbances · weight change · withdrawal bleeding

● CONCEPTION AND CONTRACEPTION Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

● PREGNANCY Avoid.
● BREAST FEEDING Avoid.
● MONITORING REQUIREMENTS Monitor bone mineral density.
● DIRECTIONS FOR ADMINISTRATION Rotate injection site to prevent atrophy and nodule formation.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Implant
▶ Zoladex (AstraZeneca UK Ltd)
Goserelein (as Goserelein acetate) 3.6 mg Zoladex 3.6 mg implant Safesystem pre-filled syringes | 1 pre-filled disposable injection (POM) £65.00 DT price = £65.00
▶ Zoladex LA (AstraZeneca UK Ltd)
Goserelein (as Goserelein acetate) 10.8 mg Zoladex LA 10.8 mg implant Safesystem pre-filled syringes | 1 pre-filled disposable injection (POM) £235.00 DT price = £235.00
Leuprorelin acetate

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

- **INDICATIONS AND DOSE**
  - **PROSTAT 3 DCS®**
    - **Gonadotrophin-dependent precocious puberty**
      - By subcutaneous injection, or by intramuscular injection
      - Child: 11.25 mg every 12 weeks, injections may be required more frequently in some cases
  - **PROSTAT SR DCS®**
    - **Gonadotrophin-dependent precocious puberty**
      - By subcutaneous injection, or by intramuscular injection
      - Child: 3.75 mg every 4 weeks, half this dose is sometimes used in children with body-weight under 20 kg, injections may be required more frequently in some cases

- **SIDE-EFFECTS**
  - Abdominal pain
  - Acne
  - Anaphylaxis
  - Asthma
  - Headache
  - Hypersensitivity reactions
  - Local reactions at injection site
  - Mood changes
  - Pruritus
  - Rash
  - Urticaria
  - Visual disturbances
  - Weight changes
  - Withdrawal bleeding

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding

- **CAUTIONS** Patients with metabolic bone disease (decrease in bone mineral density can occur)

- **SIDE-EFFECTS**
  - Abdominal pain
  - Acne
  - Anaphylaxis
  - Asthma
  - Breast tenderness (males and females)
  - Changes in blood pressure
  - Changes in breast size
  - Changes in scalp and body hair
  - Depression
  - Headache
  - Hypersensitivity reactions
  - Local reactions at injection site
  - Mood changes
  - Parasthesis
  - Pruritus
  - Rash
  - Urticaria
  - Visual disturbances
  - Weight changes
  - Withdrawal bleeding

- **PREGNANCY** Avoid—teratogenic in animal studies.

- **BREAST FEEDING** Avoid.

- **MONITORING REQUIREMENTS** Monitor bone mineral density.

- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder and solvent for suspension for injection**
    - Leuprorelin acetate 11.25 mg: Prostap 3 DCS (Takeda UK Ltd) £225.72 DT price = £225.72
    - Prostap SR DCS (Takeda UK Ltd) £25.24 DT price = £75.24
  - Leuprorelin acetate 3.75 mg: Prostap SR DCS 3.75mg powder and solvent for suspension for injection pre-filled syringes 1 pre-filled disposable injection (PDP) £225.72 DT price = £225.72

### Triptorelin

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

- **INDICATIONS AND DOSE**
  - **DECAPEPTYL® SR 11.25 MG**
    - **Gonadotrophin-dependent precocious puberty**
      - Child: 11.25 mg every 3 months, discontinue when bone maturation consistent with age of 12 years in girls or 13–14 years in boys
  - **GONAPEPTYL DEPOT®**
    - **Gonadotrophin-dependent precocious puberty**
      - By subcutaneous injection, or by deep intramuscular injection
      - Child (body-weight up to 20 kg): Initially 1.875 mg every 2 weeks for 3 doses, to be administered on days 0, 14, and 28 of treatment, then 1.875 mg every 3–4 weeks, discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys
      - Child (body-weight 20–30 kg): Initially 2.5 mg every 2 weeks for 3 doses, to be administered on days 0, 14, and 28 of treatment, then 2.5 mg every 3–4 weeks, discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys
      - Child (body-weight 31 kg and above): Initially 3.75 mg every 2 weeks for 3 doses, to be administered on days 0, 14, and 28 of treatment, then 3.75 mg every 3–4 weeks, discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys

- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding

- **SIDE-EFFECTS**
  - Anaphylaxis
  - Arthralgia
  - Asthenia
  - Asthma
  - Breast tenderness (males and females)
  - Changes in blood pressure
  - Changes in breast size
  - Changes in scalp and body hair
  - Depression
  - Gastro-intestinal disturbances
  - Headache
  - Hypersensitivity reactions
  - Local reactions at injection site
  - Mood changes
  - Ovarian cysts (may require withdrawal)
  - Pruritus
  - Rash
  - Urticaria
  - Visual disturbances
  - Weight changes
  - Withdrawal bleeding (may occur in the first month of treatment)

- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **MONITORING REQUIREMENTS** Monitor bone mineral density.

- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - **DECAPEPTYL® SR 11.25 MG** Each vial includes an overage to allow accurate administration of an 11.25 mg dose.
Mecasermin p. 445, a human insulin-like growth factor-1 (rhIGF-I), is licensed to treat growth failure in children with severe primary insulin-like growth factor-I deficiency.

Hypothalamic hormones

Gonadorelin p. 442 when injected intravenously in post-pubertal girls leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. It is used in the assessment of delayed or precocious puberty.

Other growth hormone stimulation tests involve the use of insulin, glucagon p. 433, arginine p. 571, and clonidine hydrochloride p. 93 [all unlicensed uses]. The tests should be carried out in specialist centres.

6 Hypothalamic and anterior pituitary hormone related disorders

6.1 Adrenocortical function testing

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES

Tetracosactide

(Tetracosactrin)

- **INDICATIONS AND DOSE**
  - Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test), standard-dose test
    - By intramuscular injection, or by intravenous injection
    - Child: 145 micrograms/m² (max. per dose 250 micrograms) for 1 dose
  - Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test), low-dose test
    - By intramuscular injection, or by intravenous injection
    - Child: 0.3 microgram/m² for 1 dose
  - Infantile spasm
    - By intramuscular injection using depot injection
    - Child 1-23 months: Initially 500 micrograms once daily on alternate days, adjusted according to response

- **CONTRA-INDICATIONS** Acute psychosis - adrenogenital syndrome - allergic disorders - asthma - avoid injections containing benzyl alcohol in neonates - Cushing’s syndrome - infectious diseases - peptic ulcer - primary adrenocortical insufficiency - refractory heart failure

- **CAUTIONS** Active infectious diseases (should not be used unless adequate disease-specific therapy is being given) - active systemic diseases (should not be used unless adequate disease-specific therapy is being given) - diabetes mellitus - diverticulitis - history of asthma - history of atopic allergy - history of eczema - history of hayfever - history of hypersensitivity - hypertension - latent amoebiasis (may become activated) - latent tuberculosis (may become activated) - myasthenia gravis - ocular herpes simplex - osteoporosis - predisposition to thromboembolic - psychological disturbances may be triggered - recent intestinal anaesthesia - reduced immune response (should not be used unless adequate disease-specific therapy is being given) - ulcerative colitis

- **CAUTIONS, FURTHER INFORMATION**
  - Risk of anaphylaxis. Should only be administered under medical supervision. Consult product literature.

Endocrine system

Adrenocortical function testing 441

6 Hypothalamic and anterior pituitary hormone related disorders

**Hypothalamic and anterior pituitary hormones**

**Anterior pituitary hormones**

Corticotrophins

Tetracosactide below(tetracosactrin), an analogue of corticotropin (adrenocorticotropic hormone, ACTH), is used to test adrenocortical function; failure of plasma-cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency. A low-dose test is considered by some clinicians to be more sensitive when used to confirm established, partial adrenal suppression.

Tetracosactide should be given only if no other ACTH preparations have been given previously. Tetracosactide depot injection (Synacthen Depot®) is also used in the treatment of infantile spasms but it is contra-indicated in neonates because of the presence of benzyl alcohol in the injection. Corticotropin-releasing factor, corticorelin p. 442, (also known as corticotropin-releasing hormone, CRH) is used to test anterior pituitary function and secretion of corticotropin.

Gonadotrophins

Gonadotrophins are occasionally used in the treatment of hypogonadotropic hypogonadism and associated oligospermia. There is no justification for their use in primary gonadal failure.

Chorionic gonadotrophin p. 443 is used in the investigation of testicular function in suspected primary hypogonadism and incomplete masculinisation. It has also been used in delayed puberty in boys to stimulate endogenous testosterone production, but it has little advantage over testosterone.

Growth hormone

Growth hormone is used to treat proven deficiency of the hormone, Prader-Willi syndrome, Turner’s syndrome, growth disturbance in children born small for corrected gestational age, chronic renal insufficiency, and short stature homeobox-containing gene (SHOX) deficiency. Growth hormone is also used in Noonan syndrome and idiopathic short stature [unlicensed indications] under specialist management. Treatment should be initiated and monitored by a paediatrician with expertise in managing growth-hormone disorders; treatment can be continued under a shared-care protocol by a general practitioner.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, somatropin p. 443, produced using recombinant DNA technology.
6.2 Assessment of pituitary function

DIAGNOSTIC AGENTS

Corticotriol (Corticotrophin-releasing hormone; CRH)

- INDICATIONS AND DOSE
  Test of anterior pituitary function
  - BY INTRAVENOUS INJECTION
  - Child: 1 microgram/kg (max. per dose 100 micrograms) for 1 dose, to be administered over 30 seconds

- UNLICENSED USE Not licensed.

- SIDE-EFFECTS
  - Flushing of face - flushing of neck - flushing of upper body - hypotension - mild sensation of smell - mild sensation of taste

- PREGNANCY Avoid.

- BREAST FEEDING Avoid.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

Gonadotriol (Gonadotrophin-releasing hormone; GnRH; LH-RH)

- INDICATIONS AND DOSE
  Assessment of anterior pituitary function | Assessment of delayed puberty
  - BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
  - Child 1-17 years: 2.5 micrograms/kg (max. per dose 100 micrograms) for 1 dose

- UNLICENSED USE Not licensed for use in children under 1 year.

- CAUTIONS
  - Pituitary adenoma

- SIDE-EFFECTS
  - Abdominal pain - headache - hypersensitivity reaction on repeated administration of large doses - increased menstrual bleeding - irritation at injection site - nausea

- PREGNANCY Avoid.

- BREAST FEEDING Avoid.
6.3 Gonadotrophin replacement therapy

GONADOTROPHINS

**Chorionic gonadotrophin**  
(Non-proprietary: Human chorionic gonadotrophin; HCG)

- **DRUG ACTION** A preparation of a glycoprotein fraction secreted by the placenta and obtained from the urine of pregnant women having the action of the pituitary luteinising hormone.

- **INDICATIONS AND DOSE**
  - **Delayed puberty** in the male to stimulate endogenous testosterone production
    - **By intramuscular injection** or **by subcutaneous injection**
    - **Child:** consult product literature
  - **Test of testicular function, short stimulation test**
    - **By intramuscular injection**
    - **Child:** 1500–2000 units once daily for 3 days
  - **Test of testicular function, prolonged stimulation test**
    - **By intramuscular injection**
    - **Child:** 1500–2000 units twice weekly for 3 weeks
  - **Hyponadotrophic hypogonadism**
    - **By intramuscular injection**
    - **Child:** 1000–2000 units twice weekly, adjusted according to response
  - **Undescended testes**
    - **By intramuscular injection**
    - **Child:** 7–16 years: Initially 500 units 3 times a week, adjusted according to response to up to 4000 units 3 times a week for 1–2 months after testicular descent
    - **Child:** 17 years: Initially 1000 units twice weekly, adjusted according to response to up to 4000 units 3 times a week for 1–2 months after testicular descent

- **UNLICENSED USE** Unlicensed in children for test of testicular function.

- **CONTRA-INDICATIONS** Androgen-dependent tumours

- **CAUTIONS** Asthma, cardiac impairment, epilepsy, migraine, prepubertal boys (risk of premature epiphyseal closure or precocious puberty)

- **SIDE-EFFECTS** Gynaecomastia, headache, local reactions, mood changes, oedema (particularly in males—reduce dose), tiredness

- **RENAL IMPAIRMENT** Use with caution.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

- **Powder and solvent for solution for injection**
  - **Choragon (Ferring Pharmaceuticals Ltd)**
    - **Chorionic gonadotrophin human 5000 unit**
      - **Powder and solvent for solution for injection ampoules**
        - 1 ampoule (POM) £3.77 (C4-2)
    - **Chorionic gonadotrophin human 1500 unit**
      - **Pregnyl (Merck Sharp & Dohme Ltd)**
      - Powder and solvent for solution for injection ampoules
        - 1 ampoule (POM) £2.12 (C4-3)

- **Chorionic gonadotrophin human 5000 unit**
  - **Pregnyl 5,000 unit powder and solvent for solution for injection ampoules**
    - 1 ampoule (POM) £3.15 (C4-2)

---

6.4 Growth hormone disorders

**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > HUMAN GROWTH HORMONES**

**Somatropin**  
(Recombinant Human Growth Hormone)

- **INDICATIONS AND DOSE**
  - **Gonadal dysgenesis (Turner syndrome)**
    - By subcutaneous injection
    - **Child:** 1.4 mg/m² daily, alternatively 45–50 micrograms/kg daily
  - **Deficiency of growth hormone**
    - By subcutaneous injection, or by intramuscular injection
    - **Child:** 23–39 micrograms/kg daily, alternatively 0.7–1 mg/m² daily
  - **Growth disturbance in children born small for gestational age whose growth has not caught up by 4 years or later | Noonan syndrome**
    - By subcutaneous injection
    - **Child:** 4–17 years: 35 micrograms/kg daily, alternatively 1 mg/m² daily
  - **Prader-Willi syndrome, in children with growth velocity greater than 1 cm/year, in combination with energy-restricted diet**
    - By subcutaneous injection
    - **Child:** 1 mg/m² daily, alternatively 35 micrograms/kg daily; maximum 2.7 mg per day
  - **Chronic renal insufficiency (renal function decreased to less than 50%)**
    - By subcutaneous injection
    - **Child:** 45–50 micrograms/kg daily
  - **DOSE EQUIVALENCE AND CONVERSION**
    - Dose formerly expressed in units; somatropin 1 mg = 3 units.

- **UNLICENSED USE** Not licensed for use in Noonan syndrome.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates—evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting)—not to be used after renal transplantation— not to be used for growth promotion in children with closed epiphyses (or near closure in Prader-Willi syndrome) severe obesity in Prader-Willi syndrome severe respiratory impairment in Prader-Willi syndrome

- **CAUTIONS** Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) disorders of the epiphysis of the hip (monitor for limping) history of malignant disease—hypothyroidism—manufacturers recommend periodic thyroid function tests but limited evidence of clinical value initiation of treatment close to puberty not recommended in child born small for corrected gestational age—papilloedema—relative deficiencies of other pituitary
hormones · resolved intracranial hypertension (monitor closely) · Silver-Russell syndrome

- **INTERACTIONS** → Appendix 1 (somatropin).
- **SIDE-EFFECTS** Antibody formation · arthralgia · benign intracranial hypertension · carpal tunnel syndrome · fluid retention (peripheral oedema) · headache · hyperglycaemia · hypoglycaemia · hypothyroidism · insulin resistance · leukaemia in children with growth hormone deficiency · myalgia · nausea · papilloedema · paraesthesias · reactions at injection site · visual problems · vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**

- Papilloedema Funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur— if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).
- **PREGNANCY** Discontinue if pregnancy occurs— no information available.
- **BREAST FEEDING** No information available. Absorption from milk unlikely.

- **DIRECTIONS FOR ADMINISTRATION** Rotate subcutaneous injection sites to prevent lipoatrophy.

- **NUTROPIN®**, **GENOTROPIN®**, **NORDITROPIN®**, **OMNITROPE®**, **SAIZEN®** and **ZOMACTON®** PREPARATIONS For use by subcutaneous injection.

- **HUMATROPE®** Cartridges for use by subcutaneous injection. Powder for reconstitution for use by subcutaneous or intramuscular injection.

- **PRESCRIBING AND DISPENSING INFORMATION** Medicinal products containing somatropin are not identical and although there should be no important differences in terms of safety and efficacy, when prescribing biological products it is good practice to use the brand name, see *Biologics and immuno-modulators*.

- **OMNITROPE®** For use with Omnitrope Pen 5® and Omnitrope Pen 10® devices (non-NHS but available free of charge from clinics).

- **NORDITROPIN® PREPARATIONS** Cartridges are for use with appropriate NordiPen1 device (non-NHS but available free of charge from clinics).

- Multidose disposable prefilled pens for use with NovoFine® or NovoTwist® needles.

- **ZOMACTON®** 4 mg vial for use with Zomafet 2® Vision needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

- 10 mg vial for use with Zomafet Vision X® needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

- **GENOTROPIN® PREPARATIONS** Cartridges are for use with Genotropin® Pen device (non-NHS but available free of charge from clinics).

- **SAIZEN® POWDER AND SOLVENT FOR SOLUTION FOR INJECTION** For use with e.a.® autoinjector device or cool.click® needle-free autoinjector device or eazypod® autoinjector device (non-NHS but available free of charge from clinics).

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **NICE technology appraisals (TAs)**

  - Somatropin for the treatment of growth failure in children (May 2010) NICE TA188

  Somatropin is recommended for children with growth failure who:

  - have growth-hormone deficiency
  - have Turner syndrome
  - have Prader-Willi syndrome

  • have chronic renal insufficiency
  • are born small for gestational age with subsequent growth failure at 4 years of age or later
  • have short stature homeobox-containing gene (SHOX) deficiency.

  Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment.

### 6.4a Insulin-like growth factor-I deficiency

**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES**

#### Somatomedins

<table>
<thead>
<tr>
<th>Mecasermin</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>(Recombinant human factor-I; rhIGF-I)</strong></td>
</tr>
</tbody>
</table>

**Drug Action** Somatomedins are a group of polypeptide hormones structurally related to insulin and commonly known as insulin-like growth factors (IGFs). Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is the principal mediator of the somatotropic effects of human growth hormone.

**Indications and Dose**

**Treatment of growth failure in children with severe primary insulin-like growth factor-I deficiency**

- **By subcutaneous injection**
  - Child 0–6 months: Initially 1 microgram/kg daily for 1 week, increased, if tolerated, in steps of 0.5 microgram/kg (max. per day 2 micrograms/kg twice daily), discontinue if no response within 1 year, reduce dose if hypoglycaemia occurs despite adequate food intake; withhold injection if patient unable to eat
  - Child 6 months to 7 years: 1 microgram/kg daily
  - Child 7–12 years: 2 microgram/kg daily

**Contra-indications** Evidence of tumour activity (discontinue treatment)

**Caution** Correct hypothyroidism before initiating treatment. Diabetic mellitus (adjustment of antidiabetic therapy may be necessary)

**Side-effects** Antibody formation. Arthralgia, cardiomegaly, convulsions, dizziness, gynaecomastia, headache, hyperglycaemia, hypoglycaemia (especially in first month, and in younger children) impaired hearing, injection-site reactions (rotate site), myalgia, nausea, nervousness, night terrors, severe or recurrent headache, sleep apnoea, tachycardia, tonsillar hypertrophy, ventricular hypertrophy, visual disturbance, visual problems, vomiting

**Side-effects, further information**

- Papilloedema. Funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).

**Conception and Contraception** Contraception advised in women of child-bearing potential.

**Pregnancy** Avoid unless essential.

**Breast feeding** Avoid.

**Monitoring requirements**

- Monitor ECG before and on termination of treatment (and during treatment if ECG abnormal).
- Monitor for disorders of the epiphysis of the hip (monitor for limping).
- Monitor for signs of tonsillar hypertrophy (snoring, sleep apnoea, and chronic middle ear effusions).

**Directions for administration** Dose should be administered just before or after food.

**Patient and Carer advice**

- Patients or carers should be given advice on how to administer mecasermin injection.

**Missed doses** Patients or carers should be advised not to increase dose if a dose is missed.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Excipients:** May contain benzyl alcohol
  - Increreex (Ipsen Ltd) ▼
  - Mecasermin 10 mg per 1 ml Increreex 40mg/ml solution for injection vials | 1 vial (P6) £605.00

7 Sex hormone responsive conditions

**Sex hormones**

**Hormone replacement therapy**

Sex hormone replacement therapy is indicated in children for the treatment of gonadotrophin deficiency, gonadal disorders, or delayed puberty that interferes with quality of life. Indications include constitutional delay in puberty, congenital or acquired hypogonadotrophic hypogonadism, hypergonadotrophic hypogonadism (Turner’s syndrome, Klinefelter’s syndrome), endocrine disorders (Cushing’s syndrome or hyperprolactinemia), and chronic illnesses, such as cystic fibrosis or sickle-cell disease, that may affect the onset of puberty.

Replacement therapy is generally started at the appropriate age for the development of puberty and should be managed by a paediatric endocrinologist. Patients with constitutional delay, chronic illness, or eating disorders may need only small doses of hormone supplements for 4 to 6 months to induce puberty and endogenous sex hormone
production, which is then sustained. Patients with organic causes of hormone deficiency will require life-long replacement, adjusted to allow normal development. Inadequate treatment may lead to poor bone mineralisation, resulting in fractures and osteoporosis.

**Female sex hormones**

**Oestrogens**

Oestrogens are necessary for the development of female secondary sexual characteristics. If onset of puberty is delayed because of organic pathology, puberty can be induced with ethinylestradiol below in increasing doses, guided by breast staging and uterine scans. Cyclical progestogen replacement is added after 12–18 months of oestrogen treatment. Once the adult dosage of oestrogen has been reached, it may be more convenient to provide replacement either as a low-dose oestrogen containing oral contraceptive formulation [unlicensed indication] or as a combined oestrogen and progestogen hormone replacement therapy preparation [unlicensed indication]. There is limited experience in the use of transdermal patches or gels in children; compliance and skin irritation are sometimes a problem.

Ethinylestradiol is occasionally used, under specialist supervision, for the management of hereditary haemorrhagic telangiectasia (but evidence of benefit is limited), for the prevention of tall stature, and in tests of hormone deficiency will require life-long replacement, adjusted to allow normal development. Inadequate treatment may lead to poor bone mineralisation, resulting in fractures and osteoporosis.

**Topical oestrogen creams** are used in the treatment of labial adhesions.

**Progestogens**

There are two main groups of progestogen, progestosterone and its analogues (dydrogesterone and medroxyprogesterone acetate p. 478) and testosterone analogues (norethisterone p. 447 and norgestrel). The newer progestogens (desogestrel p. 474, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel p. 475 is the active isomer of norgestrel and has twice its potency. Progesterone and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

In delayed puberty cyclical progestogen is added after 12–18 months of oestrogen therapy to establish a menstrual cycle. Norethisterone is also used to postpone menstruation during a cycle; treatment is started 3 days before the expected onset of menstruation.

### 7.1 Female sex hormone responsive conditions

#### OESTROGENS

**Ethinylestradiol**

(Ethinylestradiol)

- **INDICATIONS AND DOSE**
  - **Induction of sexual maturation in girls**
    - **BY MOUTH**
      - Child (female): Initially 2 micrograms daily for 6 months, then increased to 5 micrograms daily for 6 months, then increased to 10 micrograms daily for 6 months, then increased to 20 micrograms daily, after 12–18 months of treatment give progestogen for 7 days of each 28-day cycle.

**Maintenance of sexual maturation in girls**

- **BY MOUTH**
  - Child (female): 20 micrograms daily, to be given with cyclical progestogen for 7 days of each 28-day cycle.

**Prevention of tall stature in girls**

- **BY MOUTH**
  - Child 2–11 years (female): 20–50 micrograms daily.

**Pituitary priming before growth hormone secretion test in girls with bone age over 10 years**

- **BY MOUTH**
  - Child (female): 100 micrograms daily for 3 days before test.

- **UNLICENSED USE** Unlicensed for use in children.

- **CAUTIONS** Active thrombophlebitis (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice - Cushing’s disease - gene mutations associated with breast cancer (e.g. BRCA 1) - history of severe depression (especially if induced by hormonal contraceptive) - hyperprolactinaemia (seek specialist advice) - inflammatory bowel disease (full thickness)-personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) - risk factors for arterial disease - risk factors for venous thromboembolism - systemic lupus erythematosus - transient cerebral ischaemic attacks without headache - undiagnosed vaginal bleeding - venous thromboembolism, or history of recurrent venous thromboembolism (unless already on anticoagulant).

- **FURTHER INFORMATION**
  - Other conditions: The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present, see above). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from treatment.
  - Risk of venous thromboembolism: Use with caution if any of following factors present but avoid if two or more factors present:
    - family history of venous thromboembolism in first-degree relative aged under 45 years (avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
    - obesity—body mass index ≥30 kg/m² (avoid if body mass index ≥35 kg/m² unless no suitable alternative); (In adolescents, caution if obese according BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative); long-term immobilisation e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
    - history of superficial thrombophlebitis;
    - age over 35 years (avoid if over 50 years);
    - smoking.
Risk factors for arterial disease. Use with caution if any one of following factors present but avoid if two or more factors present:
- family history of arterial disease in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
- diabetes mellitus (avoid if diabetes complications present);
- hypertension—blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg); (in adolescents, avoid if blood pressure very high);
- smoking (avoid if smoking 40 or more cigarettes daily);
- age over 35 years (avoid if over 50 years);
- obesity (avoid if body mass index ≥35 kg/m² unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
- migraine without aura (avoid if migraine with aura (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).

Women should report any increase in headache frequency or onset of focal symptoms (discontinuation immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

SIDE-EFFECTS
- Rare Gallstones - systemic lupus erythematosus
- Frequency not known Abdominal cramps - absence of withdrawal bleeding - amenorrhoea after discontinuation - breast enlargement - breast secretion - breast tenderness - cervical erosion - changes in libido - changes in lipid metabolism - changes in vaginal discharge - chloasma - chorea - contact lenses may irritate - depression - fluid retention - headache - hepatic tumours - hypertension - irritability - leg cramps (rule out venous thrombosis) - liver impairment - nausea - nervousness - photosensitivity - reduced menstrual loss - skin reactions - symptoms of endometriosis may be exacerbated - thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) - uterine fibroids may increase in size - visual disturbances - vomiting - weight changes - 'spotting' in early cycles

SIDE-EFFECTS, FURTHER INFORMATION
- PREGNANCY Avoid.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Avoid in liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and jaundice.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Tablet
- Ethinylestradiol (Non-proprietary)
- Ethinylestradiol 10 microgram tablets | 21 tablet £200.00 DT price = £200.00
- Ethinylestradiol 50 microgram tablets | 21 tablet £200.00 DT price = £200.00
- Ethinylestradiol 1 mg tablets | 28 tablet £200.00 DT price = £200.00

UNLICENSED USE
- When used for Induction and maintenance of sexual maturation in females (combined with an oestrogen after 12-18 months oestrogen therapy)
- When used for Contraception Consult product literature for the licensing status of individual preparations.

CONTRA-INDICATIONS
GENERAL CONTRA-INDICATIONS
Avoid in patients with a history of liver tumours - breast cancer (unless progestogens are being used in the management of this condition) - genital cancer (unless progestogens are being used in the management of this condition) - history during pregnancy of idiopathic jaundice - history during pregnancy of pemphigoid gestationis (non-contraceptive indications) - history during pregnancy of severe pruritus (non-contraceptive indications) - when used as a contraceptive, history of breast cancer (can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable)

SPECIFIC CONTRA-INDICATIONS
- With oral use Acute porphyrias p. 562 - severe arterial disease - undiagnosed vaginal bleeding

CAUTIONS
GENERAL CAUTIONS
Asthma - cardiac dysfunction - conditions that may worsen with fluid retention - diabetes (progestogens can decrease glucose tolerance—monitor patient closely). epilepsy - history of depression - hypertension - migraine - susceptibility to thromboembolism (particular caution with high dose)

SPECIFIC CAUTIONS
- When used for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice - arterial disease - functional ovarian cysts - history of jaundice in pregnancy - malabsorption syndromes - past ectopic pregnancy - sex-steroid dependent cancer - systemic lupus erythematosus with positive (or unknown) anti-phospholipid antibodies
With intramuscular use for contraception Disturbances of lipid metabolism - history during pregnancy of deterioration of osteosclerosis - history during pregnancy of pruritus - possible risk of breast cancer

**CAUTIONS, FURTHER INFORMATION**

Use as a contraceptive in co-morbidities. The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

Breast cancer risk with contraceptive use. There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

**INTERACTIONS** → Appendix 1 (progestogens).

With intramuscular use Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of norethisterone intramuscular injection is not affected by enzyme-inducing drugs and may be continued as normal during courses of these drugs.

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
Acne - alopecia - anaphylactoid reactions - breast tenderness - change in libido - depression - disturbance of appetite - dizziness - fluid retention - headache - hirsutism - insomnia (non-contraceptive indications) - jaundice - menstrual disturbances - nausea - premenstrual-like syndrome - pruritus - rash - skin reactions - urticaria - vomiting - weight change

**SPECIFIC SIDE-EFFECTS**

With intramuscular use Injection-site reactions

SIDE-EFFECTS, FURTHER INFORMATION

Cervical cancer Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives (use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years). The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

**PREGNANCY** Not known to be harmful in contraceptive doses. Avoid in other indications.

**BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.

With intramuscular use Withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment.

**HEPATIC IMPAIRMENT** When used as a contraceptive; caution in severe liver disease and recurrent cholestatic jaundice, avoid in liver tumour. Caution when used for sexual maturation and to postpone menstruation; avoid if severe.

**RENAL IMPAIRMENT** Use with caution in non-contraceptive indications.

**PATIENT AND CARER ADVICE**

**Missed doses**

Missed oral contraceptive pill The following advice is recommended: ‘If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.’

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Diarrhoea and vomiting with oral contraceptives Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Starting routine for oral contraceptives One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if norethisterone is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

**Contraceptives by injection** Full counselling backed by patient information leaflet required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- **Norethisterone (Non-proprietary)**
  - Norethisterone 5 mg Norethisterone 5mg tablets | 30 tablet  £4.50 DT price = £2.18
  - Micronor (Janssen-Cilag Ltd)
  - Norethisterone 5 mg Norethisterone 5mg tablets | 30 tablet  £4.50 DT price = £2.18 | 84 tablet  £1.80 DT price = £1.80
  - Noriday (Pfizer Ltd)
  - Norethisterone 350 microgram Noriday 350microgram tablets | 84 tablet  £1.80 DT price = £1.80
  - Micronor (Janssen-Cilag Ltd)
  - Norethisterone 350 microgram Micronor 350microgram tablets | 84 tablet  £1.80 DT price = £1.80 | 30 tablet  £2.26 DT price = £2.18
  - Prinolut N (Bayer Plc)
  - Norethisterone 5 mg Norethisterone 5mg tablets | 30 tablet  £2.26 DT price = £2.18 | 30 tablet  £1.80 DT price = £1.80
  - Utovlan (Pfizer Ltd)
  - Utovlan 5 mg Utovlan 5mg tablets | 30 tablet  £4.04 DT price = £2.18 | 90 tablet  £4.21
  - Norethisterone 5 mg Norethisterone 5mg tablets | 30 tablet  £4.21

**Solution for injection**

- Noristerat (Bayer Plc)
  - Noristerat 200 mg per 1 ml Noristerat 200mg/1ml solution for injection ampoules | 1 ampoule  £4.05
7.2 Male sex hormone responsive conditions

Androgens, anti-androgens and anabolic steroids

Androgens

Androgens cause masculinisation; they are used as replacement therapy in androgen deficiency, in delayed puberty, and in those who are hypogonadal due to either pituitary or testicular disease.

When given to patients with hypopituitarism androgens can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone which stimulates spermatogenesis as well as androgen production.

Intramuscular depot preparations of testosterone esters are preferred for replacement therapy. Testosterone enantate or propionate or alternatively Sustanon® which consists of a mixture of testosterone esters and has a longer duration of action, can be used. For induction of puberty, depot testosterone injections are given monthly and the doses increased every 6 to 12 months according to response. Single ester testosterone injections may be given more frequently.

Oral testosterone undecanoate is used for induction of puberty. An alternative approach that promotes growth rather than sexual maturation uses oral oxandrolone below.

Chorionic gonadotrophin has also been used in delayed puberty in the male to stimulate endogenous testosterone production, but has little advantage over testosterone.

Testosterone topical gel is also available but experience of use in children under 15 years is limited. Topical testosterone is applied to the penis in the treatment of microphallus; an extemporaneously prepared cream should be used because the alcohol in proprietary gel formulations causes irritation.

Anti-androgens and precocious puberty

The gonadorelin stimulation test is used to distinguish between gonadotrophin-dependent (central) precocious puberty and gonadotrophin-independent precocious puberty. Treatment requires specialist management.

Gonadorelin analogues, used in the management of gonadotrophin-dependent precocious puberty, delay development of secondary sexual characteristics and growth velocity.

Testolactone p. 451 and cyproterone acetate p. 450 are used in the management of gonadotrophin-independent precocious puberty, resulting from McCune-Albright syndrome, familial male precocious puberty (testotoxicosis), hormone-secreting tumours, and ovarian and testicular disorders. Testolactone inhibits the aromatisation of testosterone, the rate limiting step in oestrogen synthesis. Cyproterone acetate is a progestogen with anti-androgen properties.

Spironolactone is sometimes used in combination with testolactone because it has some androgen receptor blocking properties.

High blood concentration of sex hormones may activate release of gonadotrophin releasing hormone, leading to development of secondary, central gonadotrophin-dependent precocious puberty. This may require the addition of gonadorelin analogues to prevent progression of pubertal development and skeletal maturation.

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in girls. They are used in the treatment of some aplastic anae
as.

Oxandrolone is used to stimulate late pre-pubertal growth prior to induction of sexual maturation in boys with short stature and in girls with Turner’s syndrome; specialist management is required.

ANABOLIC STEROIDS > ANDROSTAN DERIVATIVES

Oxandrolone

- INDICATIONS AND DOSE
  - Stimulation of late pre-pubertal growth in boys (of appropriate age) with short stature
    - BY MOUTH
      - Child 10-17 years (male): 1.25–2.5 mg daily for 3–6 months.
      - Stimulation of late pre-pubertal growth in girls with Turner’s syndrome
        - BY MOUTH
          - Child (female): 0.625–2.5 mg daily, to be taken in combination with growth hormone.

- CONTRA-INDICATIONS
  - History of primary liver tumours - hypercalcaemia - nephrosis

- CAUTIONS
  - Cardiac impairment - diabetes mellitus - epilepsy - hypertension - migraine - skeletal metastases (risk of hypercalcaemia)

- INTERACTIONS
  - Appendix 1 (oxandrolone).

- SIDE-EFFECTS
  - Common or very common
  - Rare
    - Liver tumours
  - Frequency not known
    - Sleep apnoea

- PREGNANCY
  - Avoid—causes masculinisation of female fetus.

- BREAST FEEDING
  - Avoid; may cause masculinisation in the female infant or precocious development in the male infant. High doses suppress lactation.

- HEPATIC IMPAIRMENT
  - Avoid if possible—fluid retention and dose-related toxicity.

- RENAL IMPAIRMENT
  - Use with caution—potential for fluid retention.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet
  - Oxandrolone (Non-proprietary)
    - Oxandrolone 2.5 mg Oxandrin 2.5 mg tablets | 100 tablet [Post] no price available [CB4-3]
ANDROGENS

Androgens

**CONTRA-INDICATIONS** Breast cancer in males - history of liver tumours - hypercalcaemia - prostate cancer

**CAUTIONS** Cardiac impairment - diabetes mellitus - epilepsy - hypertension - migraine - pre-pubertal boys (fission of epiphyses is hastened and may result in short stature) - statural growth and sexual development should be monitored - skeletal metastases - risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored) - sleep apnoea - stop treatment or reduce dose if severe polycythaemia occurs - tumours - risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)

**INTERACTIONS** → Appendix 1 (testosterone).

**SIDE-EFFECTS**

- **Common or very common** Acne - androgenic effects (to be assessed regularly in women) - anxiety - asthenia - changes in libido - cholestatic jaundice - depression - electrolyte disturbances - excessive duration of penile erection - excessive frequency of penile erection - gastrointestinal bleeding - gynaecomastia - headache - hirsutism - hypercalcaemia - hypertension - increased bone growth - male-pattern baldness - nausea - oedema - paraesthesia - polycythaemia - precocious sexual development in pre-pubertal males - premature closure of epiphyses in pre-pubertal males - pruritus - seborrhoea - sodium retention - suppression of virilism in women - weight gain

- **Rare** Liver tumours

- **Frequency not known** Sleep apnoea

**SIDE-EFFECTS, FURTHER INFORMATION**

- Polycythaemia Stop treatment or reduce dose if severe polycythaemia occurs.
- PREGNANCY Avoid — causes masculinisation of female fetus.
- BREAST FEEDING Avoid.
- HEPATIC IMPAIRMENT Avoid if possible — fluid retention and dose-related toxicity.
- RENAL IMPAIRMENT Caution — potential for fluid retention.
- MONITORING REQUIREMENTS Monitor haematocrit and haemoglobin before treatment, every three months for the first year, and yearly thereafter.

**TESTOSTERONE ENANTATE**

**INDICATIONS AND DOSE**

Induction and maintenance of sexual maturation in males (specialist use only)

- By DEEP INTRAMUSCULAR INJECTION
  - Child: 25–50 mg/m² every 1–2 months according to response

**UNLICENSED USE** Not licensed for use in children.

**SIDE-EFFECTS** Suppression of spermatogenesis

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, cream containing the same drug. Forms available from special-order manufacturers include: solution for injection, cream containing the same drug.

**CAPSULE**

CAUTIONARY AND ADVISORY LABELS 21, 25

**Testosterone undecanoate 40 mg** Restandol 40 mg Testocaps | 30 capsule (PPh) £17.50 (G14-2) | 60 capsule (PPh) £17.10 DT price = £17.10 (G14-2)

7.2a Male sex hormone antagonism

ANTI-ANDROGENS

**CYPROTERONE ACETATE**

**INDICATIONS AND DOSE**

Gonadotrophin-independent precocious puberty (specialist use only)

- By MOUTH
  - Child: Initially 25 mg twice daily, adjusted according to response

**UNLICENSED USE** Unlicensed for use in children.

**CONTRA-INDICATIONS** Dublin-Johnson syndrome - history of thromboembolic disorders - liver-disease - malignant diseases - meningiomia or history of meningiomia - previous or existing liver tumours - Rotor syndrome - severe depression - severe diabetes (with vascular changes) - sickle-cell anaemia - wasting diseases - youths under 18 years (may arrest bone maturation and testicular development)

**CAUTIONS** Diabetes mellitus - in prostate cancer, severe depression - in prostate cancer, sickle-cell anaemia - ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known)

**SIDE-EFFECTS**

- Rare Hypersensitivity reactions - osteoporosis - rash

- Frequency not known Breathlessness - changes in hair pattern - fatigue - gynaecomastia (rarely leading to osteoporosis)
Common or very common

7.2b Precocious puberty

Drugs used for Precocious puberty not listed below
Goserelin p. 439 - Leuprorelin acetate p. 440 - Triptorelin p. 440

Hormone Antagonists and Related Agents > Aromatase Inhibitors

Testolactone

Indications and Dose
Gonadotrophin-independent precocious puberty (specialist use only)

By Mouth
Child: 5 mg/kg 3–4 times a day; increased if necessary up to 10 mg/kg 4 times a day

Interactions → Appendix 1 (testolactone).

Side-effects
Common or very common
Anorexia - changes in hair pattern - diarrhoea - hypertension - nausea - peripheral neuropathy - vomiting - weight changes

Rare
Hypersensitivity reactions - rash

Pregnancy
Avoid.

Breast Feeding
No information available.

Medicinal Forms
There can be variation in the licensing of different medicines containing the same drug.

Tablet
Testolactone (Non-proprietary)
Testolactone 50 mg Teslac 50mg tablets | 100 tablet [P] no price available

8 Thyroid disorders

8.1 Hyperthyroidism

Antithyroid Drugs

Overview
Antithyroid drugs are used for hyperthyroidism either to prepare children for thyroidectomy or for long-term management. In the UK carbimazole p. 452 is the most commonly used drug. Propylthiouracil p. 452 should be reserved for children who are intolerant of, or for those who experience sensitivity reactions to carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

Treatment in children should be undertaken by a specialist.

Carbimazole or propylthiouracil are initially given in large doses to block thyroid function. This dose is continued until the child becomes euthyroid, usually after 4 to 8 weeks, and is then gradually reduced to a maintenance dose of 30–60% of the initial dose. Alternatively high-dose treatment is continued in combination with levothyroxine sodium p. 454 replacement (blocking-replacement regimen); this is particularly useful when dose adjustment proves difficult. Treatment is usually continued for 12 to 24 months. The blocking-replacement regimen is not suitable during pregnancy. Hypothyroidism should be avoided particularly during pregnancy as it can cause fetal goitre.

Iodine has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide (131I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

Propranolol hydrochloride p. 96 is useful for rapid relief of thyrotoxic symptoms and can be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism.

Propranolol hydrochloride has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol but atenolol is also used.

Thyrotoxic crisis (‘thyroid storm’) requires emergency treatment with intravenous administration of fluids, propranolol hydrochloride and hydrocortisone as sodium succinate, as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.
Pregnancy
Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen is not suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate, therefore propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatotoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy).

Neonates
Neonatal hyperthyroidism is treated with carbimazole or propylthiouracil, usually for 8 to 12 weeks. In severe symptomatic disease iodine may be needed to block the thyroid and propranolol required to treat peripheral symptoms.

ANTITHYROID DRUGS > SULFUR-CONTAINING IMIDAZOLES

Carbimazole
- **INDICATIONS AND DOSE**
  - Hyperthyroidism (blocking-replacement regimen) in combination with levothyroxine
    - **BY MOUTH**
      - Child: Therapy usually given for 12 to 24 months (consult product literature or local protocols)
  - Hyperthyroidism (including Graves’ disease)
    - **BY MOUTH**
      - Neonate: Initially 750 micrograms/kg daily until patient is euthyroid, usually after 8 to 12 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses (up to 1 mg/kg daily) are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses.
      - Child 1 month–11 years: Initially 750 micrograms/kg daily until patient is euthyroid, usually after 4–8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses; maximum 30 mg per day
      - Child 12–17 years: Initially 30 mg daily until euthyroid, usually after 4–8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses
      - **DOSE EQUIVALENCE AND CONVERSION**
        - When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - **NEUTROPIA AND AGRANULOCYTOSIS**
    - Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.
    - Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.
    - A white blood cell count should be performed if there is any clinical evidence of infection.
  - Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.
  - **INTERACTIONS** → Appendix 1 (carbimazole).
  - **SIDE-EFFECTS**
    - Common or very common Arthralgia - fever - headache - hepatic disorders - hepatitis - jaundice - malaise - mild gastro-intestinal disturbances - nausea - pruritus - rash - taste disturbance
    - Rare Agranulocytosis - alopecia - bone marrow suppression - hypersensitivity reactions - jaundice - myopathy - pancytopenia

  - **INDICATIONS AND DOSE**
    - Hyperthyroidism (including Graves’ disease)
      - **BY MOUTH**
        - Neonate: Initially 2.5–5 mg/kg twice daily until euthyroid, usually after 8 to 12 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis.
        - Child 1–11 months: Initially 2.5 mg/kg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis.
        - Child 1–4 years: Initially 25 mg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis.
Thyroid hormones

Overview
Thyroid hormones are used in hypothyroidism (juvenile myxoedema), and also in diffuse non-toxic goitre, congenital or neonatal hypothyroidism, and Hashimoto’s thyroiditis (lymphadenoid goitre). Neonatal hypothyroidism requires prompt treatment to facilitate normal development.

Liothyronine sodium p. 454 (thyroxine sodium) is the treatment of choice for maintenance therapy.

Doses for congenital hypothyroidism and juvenile myxoedema should be titrated according to clinical response, growth assessment, and measurement of plasma thyroxine and thyroid-stimulating hormone concentrations. In congenital hypothyroidism higher initial doses may normalise metabolism more quickly, with associated beneficial effects on mental development.

Liothyronine sodium p. 455 has a similar action to levothyroxine sodium but is more rapidly metabolised and has a more rapid effect. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in severe hypothyroid states when a rapid response is desired.

Liothyronine sodium by intravenous injection is the treatment of choice in hypothyroid coma. Adjunctive therapy includes intravenous fluids, hydrocortisone, and treatment of infection; assisted ventilation is often required.
Levothyroxine sodium (Thyroid hormones)

**INDICATIONS AND DOSE**

**Hypothyroidism**
- **BY MOUTH**
  - Neonate: Initially 10–15 micrograms/kg once daily (max. per dose 50 micrograms); adjusted in steps of 5 micrograms/kg every 2 weeks, alternatively adjusted in steps of 5 micrograms/kg as required; maintenance 20–50 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time.
  - Child 1 month–1 year: Initially 5 micrograms/kg once daily (max. per dose 50 micrograms); adjusted in steps of 10–25 micrograms every 2–4 weeks until metabolism normalised; maintenance 25–75 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time.
  - Child 2–11 years: Initially 50 micrograms once daily; adjusted in steps of 25 micrograms every 2–4 weeks until metabolism normalised; maintenance 75–100 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time.
  - Child 12–17 years: Initially 50 micrograms once daily; adjusted in steps of 25–50 micrograms every 3–4 weeks until metabolism normalised; maintenance 100–200 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time.

**Hyperthyroidism (blocking-replacement regimen) in combination with carbimazole**
- **BY MOUTH**
  - Child: Therapy usually given for 12 to 24 months (consult product literature or local protocols).

**CAUTIONS**
- Cardiac disorders (monitor ECG; start at low dose and carefully titrate) - diabetes insipidus - diabetes mellitus (dose of anti-diabetic drugs including insulin may need to be increased) - long-standing hypothyroidism - pancreatitis - primary or secondary hyperaldosteronism (initiate corticosteroid therapy before starting levothyroxine) - predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine).

**INTERACTIONS**
- Appendix 1 (thyroid hormones).

**SIDE-EFFECTS**
- Anginal pain (usually at excessive dosage) - arrhythmias (usually at excessive dosage) - benign intracranial hypertension (usually at excessive dosage) - cerebellar ataxia - convulsions - decreased appetite - diarrhea - dry mouth - dyspnoea - dysuria - eosinophilia - excitement (usually at excessive dosage) - fever - flushing - headache - heat intolerance - hypersensitivity reactions - insomnia (usually at excessive dosage) - liver dysfunction - menstrual irregularities - muscle cramp - muscular weakness - nervousness - oedema - palpitation (usually at excessive dosage) - premature closure of epiphyses - pruritus - rash - restlessness (usually at excessive dosage) - sweating - tachycardia (usually at excessive dosage) - transient hair loss - tremor (usually at excessive dosage) - vomiting (usually at excessive dosage) - weight-loss

**PREGNANCY**
- Levothyroxine requirement may increase during pregnancy. Levothyroxine may cross the placenta. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.

- Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).

**BREAST FEEDING**
- Amount too small to affect tests for neonatal hypothyroidism.

**PRESCRIBING AND DISPENSING INFORMATION**
- Levothyroxine equivalent to 100 micrograms/m²/day can be used as a guide to the requirements in children.

**PATIENT AND CARER ADVICE**
- Medicines for Children leaflet: Levothyroxine for hypothyroidism www.medicinesforchildren.org.uk/levothyroxine-for-hypothyroidism

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution.

**Tablet**
- Levothyroxine sodium (Non-proprietary)
  - Levothyroxine sodium anhydrous 25 microgram
    - 28 tablet £4.00 DT price = £2.46
    - 500 tablet £56.25
    - Levothyroxine sodium 25microgram tablets lactose free 100 tablet £no price available
  - Levothyroxine sodium anhydrous 50 microgram
    - 28 tablet £3.00 DT price = £1.73 1000 tablet £68.21
  - Levothyroxine sodium anhydrous 100 microgram
    - 100 tablet £no price available
    - Levothyroxine sodium 100microgram tablets lactose free 100 tablet £no price available
    - Levothyroxine sodium 100microgram tablets 28 tablet £3.00 DT price = £1.73 1000 tablet £68.57
  - Eltroxin (AMCo)
    - Levothyroxine sodium anhydrous 25 microgram
      - Eltroxin 25microgram tablets 28 tablet £2.54 DT price = £2.46
    - Levothyroxine sodium anhydrous 50 microgram
      - Eltroxin 50microgram tablets 28 tablet £1.77 DT price = £1.73
    - Levothyroxine sodium anhydrous 100 microgram
      - Eltroxin 100microgram tablets 28 tablet £1.78 DT price = £1.73
  - Capsule
    - Levothyroxine sodium (Non-proprietary)
      - Levothyroxine sodium anhydrous 25 microgram
        - Tirosint 25microgram capsules 28 capsule £no price available
      - Levothyroxine sodium anhydrous 50 microgram
        - Tirosint 50microgram capsules 28 capsule £no price available
      - Levothyroxine sodium anhydrous 100 microgram
        - Tirosint 100microgram capsules 28 capsule £no price available
  - Oral solution
    - Levothyroxine sodium (Non-proprietary)
      - Levothyroxine sodium anhydrous 5 microgram per 1 ml
        - Levothyroxine sodium 25micrograms/5ml oral solution sugar free sugar-free 100 ml £95.00 DT price = £93.45
      - Levothyroxine sodium anhydrous 10 microgram per 1 ml
        - Levothyroxine sodium 50micrograms/5ml oral solution sugar free sugar-free 100 ml £101.79 DT price = £97.52
      - Levothyroxine sodium anhydrous 20 microgram per 1 ml
        - Levothyroxine sodium 100micrograms/5ml oral solution sugar free sugar-free 100 ml £165.00 DT price = £161.77
Liothyronine sodium
(L-Tri-iodothyronine sodium)

**INDICATIONS AND DOSE**

**Hypothyroidism**
- **BY MOUTH**
  - Child 12–17 years: Initially 10–20 micrograms daily; increased to 60 micrograms daily in 2–3 divided doses

**Hypothyroid coma**
- **BY SLOW INTRAVENOUS INJECTION**
  - Child 12–17 years: 5–20 micrograms every 12 hours, increased to 5–20 micrograms every 4 hours if required, alternatively initially 50 micrograms for 1 dose, then 25 micrograms every 8 hours, reduced to 25 micrograms twice daily

**Hypothyroidism (replacement for oral levothyroxine)**
- **BY SLOW INTRAVENOUS INJECTION**
  - Child: Convert daily levothyroxine dose to liothyronine and give in 2–3 divided doses, adjusted according to response

**DOSE EQUIVALENCE AND CONVERSION**
20–25 micrograms of liothyronine sodium is equivalent to approximately 100 micrograms of levothyroxine sodium.

Brands without a UK licence may not be bioequivalent and dose adjustment may be necessary.

**CAUTIONS**
Cardiac disorders (monitor ECG; start at low dose and carefully titrate) • diabetes insipidus • diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) • prolonged hypothyroidism (initiate corticosteroid therapy in adrenal insufficiency) • severe hypothyroidism (initiate corticosteroid therapy in adrenal insufficiency)

**INTERACTIONS**
→ Appendix 1 (thyroid hormones).

**SIDE-EFFECTS**
Anginal pain (usually at excessive dosage) • arrhythmias (usually at excessive dosage) • diarrhoea (usually at excessive dosage) • excitability (usually at excessive dosage) • flushing • headache • muscle cramp • muscular weakness • palpitation (usually at excessive dosage) • restlessness (usually at excessive dosage) • sweating • tachycardia (usually at excessive dosage) • weight-loss

**PREGNANCY**
Liothyronine requirement may increase during pregnancy. Does not cross the placenta in significant amounts. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.
Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine).

**BREAST FEEDING**
Amount too small to affect tests for neonatal hypothyroidism.

**PRESCRIBING AND DISPENSING INFORMATION**
Switching to a different brand Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent. Pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection

**Tablet**
- Liothyronine sodium (Non-proprietary)
  - Liothyronine sodium 5 microgram Cytomel 5 microgram tablets • 100 tablet [P] no price available
  - Liothyronine sodium 20 microgram Liothyronine 20microgram tablets • 28 tablet [P] £258.20 DT price + £258.20
  - Liothyronine sodium 25 microgram Cytomel 25microgram tablets • 100 tablet [P] no price available

**Powder for solution for injection**
- Liothyronine sodium (Non-proprietary)
  - Liothyronine sodium 20 microgram Liothyronine 20microgram powder for solution for injection vials • 5 vial [P] £1,425.00

1 Bladder and urinary disorders

1.1 Urinary frequency, enuresis, and incontinence

Urinary frequency, enuresis and incontinence

Urinary incontinence
Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity; oxybutynin hydrochloride p. 457 also has a direct relaxant effect on urinary smooth muscle. Oxybutynin hydrochloride can be considered first for children under 12 years. Side-effects limit the use of oxybutynin hydrochloride, but they may be reduced by starting at a lower dose and then slowly titrating upwards; alternatively oxybutynin hydrochloride can be given by intravesicular instillation. Tolterodine tartrate p. 458 is also effective for urinary incontinence; it can be considered for children over 12 years, or for younger children who have failed to respond to oxybutynin hydrochloride. Modified-release preparations of oxybutynin hydrochloride and tolterodine tartrate are available; they may have fewer side-effects. Antimuscarinic treatment should be reviewed soon after it is commenced, and then at regular intervals; a response generally occurs within 6 months but occasionally may take longer. Children with nocturnal enuresis may require specific additional measures if night-time symptoms also need to be controlled.

Nocturnal enuresis in children

Nocturnal enuresis is common in young children, but persists in a small proportion by 10 years of age. For children under 5 years, reassurance and advice on the management of nocturnal enuresis can be useful for some families. Treatment may be considered in children over 5 years depending on their maturity and motivation, the frequency of nocturnal enuresis, and the needs of the child and their family.

Initially, advice should be given on fluid intake, diet, toileting behaviour, and reward systems; for children who do not respond to this advice, further treatment may be necessary. An enuresis alarm should be first line treatment for motivated, well-supported children; alarms have a lower relapse rate than drug treatment when discontinued. Treatment should be reviewed after 4 weeks, and, if there are early signs of response, continued until a minimum of 2 weeks’ uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months, only continue if the condition is still improving and the child remains motivated to use the alarm. If initial alarm treatment is unsuccessful, consider combination treatment with desmopressin p. 403, or desmopressin alone if the alarm is no longer appropriate or desirable.

Desmopressin is given by oral or by sublingual administration. Desmopressin alone can be offered to children over 5 years of age if an alarm is inappropriate or undesirable, or when rapid or short-term results are the priority (for example to cover periods away from home); desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm. Treatment should be assessed after 4 weeks and continued for 3 months if there are signs of response. Desmopressin should be withdrawn at regular intervals (for 1 week every 3 months) for full reassessment. When stopping treatment with desmopressin, gradual withdrawal should be considered.

Nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed with antimuscarinic drugs in combination with desmopressin. Treatment should be prescribed only after specialist assessment and should be continued for 3 months; the course can be repeated if necessary.

The tricyclic antidepressant imipramine hydrochloride p. 226 may be considered for children who have not responded to all other treatments and have undergone specialist assessment, however, behavioural disturbances can occur and relapse is common after withdrawal. Treatment should not normally exceed 3 months unless a physical examination is made and the child is fully reassessed; toxicity following overdosage with tricyclics is of particular concern.
ANTIMUSCARINICS

Antimuscarinics (systemic)

- CONTRA-INDICATIONS Gastro-intestinal obstruction - intestinal atony - myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) - paralytic ileus - pyloric stenosis - severe ulcerative colitis - significant bladder outflow obstruction - toxic megacolon - urinary retention

- CAUTIONS Arrhythmias (may be worsened) - autonomic neuropathy - cardiac insufficiency (due to association with tachycardia) - cardiac surgery (due to association with tachycardia) - children (increased risk of side-effects) - conditions characterised by tachycardia - congestive heart failure (may be worsened) - coronary artery disease (may be worsened) - diarrhoea - gastro-oesophageal reflux disease - hiatus hernia with reflux oesophagitis - hypertension - hyperthyroidism (due to association with tachycardia) - individuals susceptible to angle-closure glaucoma - pyrexia - urinary retention

- INTERACTIONS + Appendix 1 (antimuscarinics).

Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urine retention, and constipation.

- SIDE-EFFECTS
  - Common or very common Constipation - dilation of pupils with loss of accommodation - dry mouth - photosensitivity - reduced bronchial secretions - skin dryness - skin flushing - transient Bradycardia (followed by tachycardia, palpitation and arrhythmias) - urinary retention - urinary urgency
  - Uncommon Confusion - giddiness - nausea - vomiting
  - Very rare Angle-closure glaucoma
  - Frequency not known Angioedema - blurred vision - blurred vision - central nervous system stimulation - convulsion - diarrhoea - difficulty in micturition - disorientation - dizziness - drowsiness - dry eyes - euphoria - fatigue - flatulence - hallucinations - headache - impaired memory - palpitation - photosensitivity - rash - reduced sweating (may lead to heat sensations and fainting in hot environments or patients with fever) - restless - taste disturbances

- PATIENT AND CARER ADVICE

Driving and skilled tasks Antimuscarinics can affect the performance of skilled tasks (e.g. driving).

Oxybutynin hydrochloride

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Child 2-4 years: 1.25–2.5 mg 2–3 times a day
  - Child 5–11 years: Initially 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day
  - Child 12–17 years: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day
- BY INTRAVESICAL INSTILLATION
  - Child 2–17 years: 5 mg 2–3 times a day
  - BY MOUTH USING MODIFIED-RELEASE TABLETS
  - Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every 1 week, adjusted according to response; maximum 15 mg per day

Nocturnal enuresis associated with overactive bladder

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Child 5–17 years: 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day, last dose to be taken before bedtime
- BY MOUTH USING MODIFIED-RELEASE TABLETS
  - Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every 1 week, adjusted according to response; maximum 15 mg per day

DOSE EQUIVALENCE AND CONVERSION

Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of Lyrinel® XL

- SIDE-EFFECTS
  - Uncommon Anorexia - facial flushing
  - Rare Night terrors
  - PREGNANCY Manufacturers advise avoid unless essential—toxicity in animal studies.

- BREAST FEEDING Manufacturers advise avoid—present in milk in animal studies.

- HEPATIC IMPAIRMENT Manufacturers advise caution.

- RENAL IMPAIRMENT Manufacturer advises caution.

- PRESCRIBING AND DISPENSING INFORMATION The need for therapy for urinary indications should be reviewed soon after it has been commenced and then at regular intervals; a response usually occurs within 6 months but may take longer.

Intravesical instillation may be available from ‘special-order’ manufacturers or specialist importing companies.

Tolterodine tartrate

INDICATIONS AND DOSE
Urinary frequency | Urinary urgency | Urinary incontinence
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
Child 2-7 years: 1 mg once daily; increased if necessary up to 2 mg twice daily, adjusted according to response
Child 2-7 years: 2 mg once daily
Nocturnal enuresis associated with overactive bladder
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
Child 5-7 years: 1 mg once daily, dose to be taken at bedtime, then increased if necessary up to 2 mg twice daily, adjusted according to response
DOSE EQUIVALENCE AND CONVERSION
Children stabilised on immediate-release tolterodine tartrate 2 mg twice daily may be transferred to modified-release tolterodine tartrate 4 mg once daily.

UNLICENSED USE
Not licensed for use in children.

CAUTIONS
History of QT-interval prolongation
INTERACTIONS
Caution with concurrent use with other drugs known to prolong QT interval.
SIDE-EFFECTS
Common or very common Bronchitis; chest pain; fatigue; paraesthesia; peripheral oedema; sinusitis; vertigo; weight gain
Uncommon Memory impairment
FREQUENCY NOT KNOWN
Flushing
PREGNANCY
Manufacturer advises avoid—toxicity in animal studies.
BREAST FEEDING
Manufacturer advises avoid—no information available.
HEPATIC IMPAIRMENT
Reduce dose. Avoid modified-release preparations.
RENAL IMPAIRMENT
Reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73m².
PRESCRIBING AND DISPENSING INFORMATION
The need for therapy for urinary indications should be reviewed soon after it has been commenced and then at regular intervals; a response usually occurs within 6 months but may take longer.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include oral suspension, oral solution, powder

1.2 Urinary retention

Drugs for urinary retention

Overview
Acute retention is painful and is treated by catheterisation. Chronic retention is painless and often long-standing. Clean intermittent catheterisation may be considered. After the cause has been established and treated, drugs may be required to increase detrusor muscle tone. Alpha-blockers such as doxazosin below and tamsulosin hydrochloride p. 459 can be used in some cases of dysfunctional voiding.

Alpha-blockers
The selective alpha-blockers doxazosin and tamsulosin hydrochloride can be used to improve bladder emptying in children with dysfunctional voiding where the post-void residual urine volume is significant; treatment should be under specialist advice only. Alpha-blockers can reduce blood pressure rapidly after the first dose and should be introduced with caution.

ALPHA-ADRENOCEPTOR BLOCKERS

Doxazosin

INDICATIONS AND DOSE
Hypertension
BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
Child 6-11 years: Initially 500 micrograms once daily, then increased to 2–4 mg once daily, dose should be increased at intervals of 1 week
Child 12-17 years: Initially 1 mg once daily for 1–2 weeks, then increased to 2 mg once daily, then increased if necessary to 4 mg once daily, rarely doses of up to 16 mg daily may be required
### Dysfunctional voiding (initiated under specialist supervision)

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 4-11 years: Initially 0.5 mg daily, adjusted according to response, dose should be increased at monthly intervals; maximum 2 mg per day
  - Child 12-17 years: Initially 1 mg daily, adjusted according to response, dose may be doubled at intervals of 1 month; usual maintenance 2–4 mg daily; maximum 8 mg per day

### SIDE-EFFECTS

- Common or very common: Asthenia, blurred vision, depression, dizziness, gastro-intestinal disturbances, headache, hypersensitivity, hypotension, oedema, palpitations, postural hypotension, priapism, pruritus, rash, rhinitis, syncope, tachycardia
- Very rare: Abnormal ejaculation, alopecia, arrhythmias, bradycardia, bronchospasm, cholestasis, gynaecomastia, hepatitis, hot flushes, jaundice, leucopenia, thrombocytopenia

### CONTRA-INDICATIONS

- History of postural hypotension
- Cataract surgery (risk of intra-operative floppy iris syndrome)
- Heart failure
- Pulmonary oedema due to aortic or mitral stenosis

### INTERACTIONS

- Use with caution if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- Avoid in severe impairment.
- Use with caution if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

### DOSE EQUIVALENCE AND CONVERSION

- Patients stabilised on immediate-release doxazosin can be transferred to the equivalent dose of modified-release doxazosin.

### MEDICINAL FORMS

**Tablet**

| Doxazosin (Non-proprietary) | Doxazosin (as Doxazosin mesilate) 1 mg | Doxazosin 1mg tablets | 28 tablet | £0.73 DT price + £0.73

1.3 Urological pain

Urological pain

Treatment

Lidocaine hydrochloride gel p. 780 is a useful topical application in urethral pain or to relieve the discomfort of catheterisation.

Alkalisation of urine

Alkalisation of urine can be undertaken with potassium citrate. The alkalising action may relieve the discomfort of cystitis caused by lower urinary tract infections.

ALKALISING DRUGS

Citric acid with potassium citrate

INDICATIONS AND DOSE

 Relief of discomfort in mild urinary-tract infections

Alkalisation of urine

BY MOUTH USING ORAL SOLUTION

Child 1-5 years: 5 mL 3 times a day, diluted well with water

Child 6-17 years: 10 mL 3 times a day, diluted well with water

CAUTIONS

Cardiac disease

INTERACTIONS

Appendix 1 (potassium salts).

SIDE-EFFECTS

Hyperkalaemia on prolonged high dosage - mild diuresis

RENAL IMPAIRMENT

Avoid in severe impairment. Close monitoring required in renal impairment - high risk of hyperkalaemia.

PRESCRIBING AND DISPENSING INFORMATION

When prepared extemporaneously, the BP states Potassium Citrate Mixture BP consists of potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 26 mmol K+/10 mL.

EXCEPTIONS TO LEGAL CATEGORY

Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 27

Citric acid with potassium citrate (Non-proprietary)

Citric acid monohydrate 50 mg per 1 mL Potassium citrate 300 mg per 1 mL Potassium citrate mixture 200 mL £1.33 DT price = £1.33

2 Bladder instillations and urological surgery

Bladder instillations and urological surgery

Bladder infection

Various solutions are available as irrigations or washouts. Aqueous chlorhexidine p. 656 can be used in the management of common infections of the bladder but it is ineffective against most Pseudomonas spp. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride solution 0.9% (physiological saline) is usually adequate and is preferred as a mechanical irrigant.

Dissolution of blood clots

Clot retention is usually treated by irrigation with sterile sodium chloride solution 0.9% but sterile sodium citrate solution for bladder irrigation 3% may also be helpful.
Maintenance of indwelling urinary catheters

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as appropriate use of catheter maintenance solutions. Repeated reproductive health, available at www.fsrh.org.

Catheter maintenance solutions

- **CATHETER MAINTENANCE SOLUTIONS**

  OptiFlo R citric acid 6% catheter maintenance solution (Bard Ltd) 50 ml - NHS indicative price = £3.56 - Drug Tariff (Part IXa) 100 ml - NHS indicative price = £3.56 - Drug Tariff (Part IXa)

  Uro-Tainer Twin Soluto R citric acid 6% catheter maintenance solution (B.Braun Medical Ltd) 50 ml - NHS indicative price = £4.81 - Drug Tariff (Part IXa)

  OptiFlo S saline 0.9% catheter maintenance solution (Bard Ltd) Sodium chloride 9 mg per 1 ml 50 ml - NHS indicative price = £3.36 - Drug Tariff (Part IXa) 100 ml - NHS indicative price = £3.36 - Drug Tariff (Part IXa)

  Uro-Tainer M sodium chloride 0.9% catheter maintenance solution (B.Braun Medical Ltd) Sodium chloride 9 mg per 1 ml 50 ml - No NHS indicative price available - Drug Tariff (Part IXa) 100 ml - No NHS indicative price available - Drug Tariff (Part IXa)

  Uro-Tainer sodium chloride 0.9% catheter maintenance solution (B.Braun Medical Ltd) Sodium chloride 9 mg per 1 ml 50 ml - NHS indicative price = £3.51 - Drug Tariff (Part IXa) 100 ml - NHS indicative price = £3.51 - Drug Tariff (Part IXa)

3 Contraception

Contraceptives, hormonal

Overview

The Fraser Guidelines (Department of Health Guidance (July 2004): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health, available at www.tinyurl.com/bpg should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at www.fsrh.org) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

- **Hormonal contraception** is the most effective method of fertility control, but can have major and minor side-effects, especially for certain groups of women. Hormonal contraception should only be used by adolescents after menarche.

- **Intra-uterine devices** are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irrespective of parity, but are less appropriate for those with an increased risk of pelvic inflammatory disease.

- **Barrier methods** alone (condoms, diaphragms, and caps) are less effective but can be reliable for well-motivated couples if used in conjunction with a spermicide. Occasionally sensitivity reactions occur. A female condom (Femidom®) is also available; it is pre-lubricated but does not contain a spermicide.

- **Combined hormonal contraceptives** Oral contraceptives containing an oestrogen and a progestogen (‘combined oral contraceptives’) are effective preparations for general use. Advantages of combined oral contraceptives include:
  - reliable and reversible;
  - reduced dysmenorrhoea and menorrhagia;
  - reduced incidence of premenstrual tension;
  - less symptomatic fibroids and functional ovarian cysts;
  - less benign breast disease;
  - reduced risk of ovarian and endometrial cancer;
  - reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed ‘monophasic’; those with varying amounts of the two hormones are termed ‘phasic’. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

### Choice

The majority of combined oral contraceptives contain ethinylestradiol p. 446 as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content which gives good cycle control and minimal side-effects in the individual woman is chosen. It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age since more suitable alternatives exist.

- **Low strength preparations** (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.
- **Standard strength preparations** (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram phased preparations) are appropriate for standard use. Phased preparations are generally reserved for women who either do not have withdrawal bleeding or who have breakthrough bleeding with monophasic products.

The progestogens ethinylestradiol with desogestrel p. 467, ethinylestradiol with drospirenone p. 468, and ethinylestradiol with gestodene p. 469 may be considered for women who have side-effects (such as acne, headache, depression, breast symptoms, and breakthrough bleeding) with other progestogens. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

Dienogest with estradiol valerate p. 467 is in the combined oral contraceptive Qlaira®. Nomegestrol is the progestogen contained in the combined oral contraceptive Zoely®, in combination with estradiol.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (Evra®). The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (NuvaaRing®).

### Surgery

Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

### Reason to stop immediately

Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting
progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body; 
- hepatitis, jaundice, liver enlargement; 
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg; (in adolescents stop if blood pressure very high); 
- prolonged immobility after surgery or leg injury; 
- detection of a risk factor which contra-indicates treatment.

Progestogen-only contraceptives

Oral progestogen-only contraceptives

Oral progestogen-only preparations alter cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Progestogen-only contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contra-indicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 95 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura).

Parenteral progestogen-only contraceptives

Medroxyprogesterone acetate (Depo-Provera®, SAYANA PRESS®) p. 478 is a long-acting progestogen given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without full counselling backed by the patient information leaflet. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased).

- In adolescents, medroxyprogesterone acetate (Depo-Provera®, SAYANA PRESS®) should be used only when other methods of contraception are inappropriate; 
- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks; 
- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

Norethisterone enantate (Noristerat®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective. An etonogestrel-releasing implant (Neplanon®) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant.

Intra-uterine progestogen-only device

The progestogen-only intra-uterine systems Mirena®, Jaydess® and Levovist® release levonorgestrel p. 475 directly into the uterine cavity. Mirena® is licensed for use as a contraceptive, for the treatment of primary menorrhagia and for the prevention of endometrial hyperplasia during oestrogen replacement therapy. Jaydess® and Levovist® are licensed for contraception, and Levovist® is additionally licensed for the treatment of menorrhagia. These may therefore be a contraceptive method of choice for women who have excessively heavy menses. The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time.

Surgery

All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Emergency contraception

Hormonal methods

Hormonal emergency contraceptives include levonorgestrel and ulipristal acetate p. 473; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 96 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal acetate, a progestosterone receptor modulator, is effective if taken within 120 hours (5 days) of unprotected intercourse.

Levonorgestrel is less effective than insertion of an intra-uterine device. Ulipristal acetate is as effective as levonorgestrel, but its efficacy compared to an intra-uterine device is not yet known.

Intra-uterine device

Insertion of an intra-uterine device is more effective than oral levonorgestrel for emergency contraception. A copper intra-uterine contraceptive device can be inserted up to 120 hours (5 days) after unprotected intercourse; sexually transmitted infections should be tested for and insertion of the device should usually be covered by antibacterial prophylaxis (e.g. azithromycin p. 308). If intercourse has occurred more than 5 days previously, the device can still be inserted up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before
implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle.

Contraceptives, interactions

Combined hormonal contraceptives interactions

The effectiveness of combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, and vaginal rings can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine p. 184, nevirapine p. 389, oxcarbazepine p. 192, phenytoin p. 193, phenobarbital p. 203, primidone p. 204, ritonavir p. 397, St John’s Wort, topiramate p. 199 and, above all, rifabutin p. 341 and rifampicin p. 342). A condom together with a long-acting method, such as an injectable contraceptive, may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

Women taking combined hormonal contraceptives who require enzyme-inducing drugs should be advised to change to a contraceptive method that is unaffected by enzyme-inducers (e.g. some parenteral progestogen-only contraceptives, intra-uterine devices) for the duration of treatment and for 4 weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed:

- For a short course (2 months or less) of an enzyme-inducing drug, continue with a combined oral contraceptive providing ethinylestradiol 30 micrograms or more daily and use a ‘tricycling’ regimen (i.e. taking 3 packets of monophasic tablets without a break followed by a shortened tablet-free interval of 4 days [unlicensed use]). Additional contraceptive precautions should also be used whilst taking the enzyme-inducing drug and for 4 weeks after stopping. Another option (except for rifampicin or rifabutin) is to follow the advice for long-term courses, below.

For women using combined hormonal contraceptive patches or vaginal rings, additional contraceptive precautions are also required whilst taking the enzyme-inducing drug and for 4 weeks after stopping. If concomitant administration runs beyond the 3 weeks of patch or vaginal ring use, a new treatment cycle should be started immediately, without a patch-free or ring-free break.

- For a long-term course (over 2 months) of an enzyme-inducing drug (except rifampicin or rifabutin), adjust the dose of combined oral contraceptive to provide ethinylestradiol 50 micrograms or more daily [unlicensed use] and use a ‘tricycling’ regimen; continue for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use], or to use additional precautions, or to change to a method unaffected by enzyme-inducing drugs.

Contraceptive patches and vaginal rings are not recommended for women taking enzyme-inducing drugs over a long period.

- For a long-term course (over 2 months) of rifampicin or rifabutin, an alternative method of contraception (such as an IUD) is always recommended because they are such potent enzyme-inducing drugs; the alternative method of contraception should be continued for 4 weeks after stopping the enzyme-inducing drug.

Antibacterials that do not induce liver enzymes

Latest recommendations are that no additional contraceptive precautions are required when combined oral contraceptives are used with antibacterials that do not induce liver enzymes (e.g. ampicillin p. 321, doxycycline p. 332), unless diarrhoea or vomiting occur. These recommendations should be discussed with the woman, who should also be advised that guidance in patient information leaflets may differ.

It is also currently recommended that no additional contraceptive precautions are required when contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes. There have been concerns that some antibacterials that do not induce liver enzymes reduce the efficacy of combined oral contraceptives by impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel; however, there is a lack of evidence to support this interaction.

Oral progestogen-only contraceptives interactions

Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an enzyme-inducing drug and for at least 4 weeks afterwards. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the progestogen-only oral method may be continued in combination with additional contraceptive precautions (e.g. barrier methods) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

Parenteral progestogen-only contraceptives interactions

Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of norethisterone intramuscular injection p. 447 and medroxyprogesterone acetate intramuscular and subcutaneous injections p. 478 is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs. However, effectiveness of the etonogestrel-releasing implant p. 477 may be reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the enzyme-inducing drug and for at least 4 weeks after stopping. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the implant may be continued in combination with additional contraceptive precautions (e.g. condom) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

Hormonal emergency contraception interactions

The effectiveness of levonorgestrel p. 475, and possibly ulipristal acetate p. 473, is reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

Contraceptives, non-hormonal

Spermicidal contraceptives

Spermicidal contraceptives are useful additional safeguards but do not give adequate protection if used alone unless fertility is already significantly diminished. They have two
Contraception, combined

3.1 Contraception, combined

OESTROGENS COMBINED WITH PROGESTOGENS

Combined hormonal contraceptives

- CONTRA-INDICATIONS
  - Acute porphyrias p. 562 - gallstones
  - heart disease associated with pulmonary hypertension or risk of embolus - history during pregnancy of cholestatic jaundice - history during pregnancy of chorea - history during pregnancy of pemphigoid gestations - history during pregnancy of pruritus - history of breast cancer (but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable) - history of haemolytic uraemic syndrome - migraine with aura - personal history of venous or arterial thrombosis - sclerosing treatment for varicose veins - severe or multiple risk factors for arterial disease - severe or multiple risk factors for venous thromboembolism - systemic lupus erythematosus - transient cerebral ischaemic attacks without headaches - undiagnosed vaginal bleeding

- CAUTIONS
  - Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice - Crohn’s disease - gene mutations associated with breast cancer (e.g. BRCA 1) - history of severe depression especially if induced by hormonal contraceptive - hyperprolactinaemia (seek specialist advice) - inflammatory bowel disease - migraine - personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) - risk factors for arterial disease - risk factors for venous thromboembolism - sickle-cell disease - undiagnosed breast mass

CAUTIONS, FURTHER INFORMATION

- Risk of venous thromboembolism
  - There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal contraceptives following a break of four weeks or more. This risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen.
  - Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.
  - Combined hormonal contraceptives also slightly increase the risk of arterial thromboembolism; however, there is no evidence to suggest that this risk varies between different preparations.

- Risk factors for venous thromboembolism
  - Use with caution if any of following factors present but avoid if two or more factors present:
    - family history of venous thromboembolism in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
    - obesity; body mass index ≥ 30 kg/m² (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
    - long-term immobilisation e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
    - history of superficial thrombophlebitis;
    - age over 35 years (avoid if over 50 years);
    - smoking.

- Combined with ethinylestradiol

- Risk factors for arterial disease
  - Use with caution if any of following factors present but avoid if two or more factors present:
Genito-urinary system

Breast cancer
- Family history of arterial disease in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
- Diabetes mellitus (avoid if diabetes complications present);
- Hypertension; blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 150 mmHg or diastolic 95 mmHg); (in adolescents, avoid if blood pressure very high);
- Smoking (avoid if smoking 40 or more cigarettes daily);
- Age over 35 years (avoid if over 50 years);
- Obesity (avoid if body mass index $\geq 35$ kg/m$^2$ unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
- Migraine without aura (avoid if migraine with aura (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).
- Migraine Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).
- Combined hormonal contraceptives should be stopped (pending investigation and treatment), if serious neurological effects occur, including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body.

**INTERACTIONS** → Appendix 1 (oestrogens, progestogens).

**SIDE-EFFECTS**

- Rare Gallstones - systemic lupus erythematosus
- Frequency not known Abdominal cramps - absence of withdrawal bleeding - amenorrhoea after discontinuation - breast enlargement - breast secretion - breast tenderness - cervical erosion - changes in libido - changes in lipid metabolism - changes in vaginal discharge - chloasma - chorea - contact lenses may irritate - depression - fluid retention - headache - hepatic tumours - hypertension - irradiation - leg cramps - liver impairment - nausea - nervousness - photosensitivity - reduced menstrual loss - skin reactions - thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) - visual disturbances - vomiting - spotting in early cycles

**SIDE-EFFECTS, FURTHER INFORMATION**

- Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years.
- Cervical cancer Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years.

The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium.

- Pregnancy Not known to be harmful.
- Breastfeeding Avoid until weaning or for 6 months after birth (adverse effects on lactation).

**HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), liver tumours.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use Each tablet should be taken at approximately same time each day; if delayed, contraceptive protection may be lost. 21-day combined preparations, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days. Every day (ED) combined preparations, 1 active tablet daily for 21 days, followed by 1 inactive tablet daily for 7 days; subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days. Changing to combined preparation containing different progestogen If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately. See individual monographs for requirements of specific preparations. Changing from progestogen-only tablet. If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days. Secondary amenorrhoea (exclude pregnancy). Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for Qlaira™).

After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 50 days of cycle or later, additional precautions (barrier methods) necessary for first 7 days (9 days for Qlaira™).

After abortion or miscarriage Start same day.

**PATIENT AND CARER ADVICE**

Missed doses

- Missed pill The critical time for loss of contraceptive protection is when a pill is omitted at the beginning or end of a cycle (which lengthens the pill-free interval).

If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary.

If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of everyday (ED) pills, omitting the 7 inactive tablets).

Emergency contraception is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

Travel Women taking oral contraceptives are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.
Diarrhoea and vomiting. Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days after recovery. If the vomiting and diarrhoea occurs during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).

### Estradiol with nomegestrol

**INDICATIONS AND DOSE**  
Contraception with 28-day combined preparations  
Menstrual symptoms with 28-day combined preparations  
- **BY MOUTH**  
  - Females of childbearing potential: 1 active tablet once daily for 26 days, followed by 1 inactive tablet daily for 2 days, withdrawal bleeding may occur during the 2-day interval of inactive tablets, tablets should be taken at approximately the same time each day.

**PREGNANCY**  
Toxicity in animal studies.

**DIRECTIONS FOR ADMINISTRATION**  
- Changing to Zoely®, start the first active Zoely® tablet on the day after taking the last active tablet of the previous brand or, at the latest, the day after the tablet-free or inactive tablet interval of the previous brand.

**PATIENT AND CARER ADVICE**  
Missed doses. A missed pill for a patient taking Zoely® is one that is 12 hours or more late; for information on how to manage missed pills in women taking Zoely®, refer to product literature.

Diarrhoea and vomiting. In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking Zoely®, refer to product literature.

**MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**  
- **Zoely** (Mercer Sharp & Doheime Ltd)  
  - Estradiol (as Estradiol hemihydrate) 1.5 mg, Nomegestrol 2.5 mg. Zoely 2.5mg/1.5mg tablets | 84 tablet (PAB) £19.90 (70 price).

### Ethinylestradiol with desogestrel

**INDICATIONS AND DOSE**  
Contraception with 21-day combined preparations  
Menstrual symptoms with 21-day combined preparations  
- **BY MOUTH**  
  - Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day.

**PREGNANCY**  
Toxicity in animal studies.

**DIRECTIONS FOR ADMINISTRATION**  
- Changing to Zoely®, start the first active Zoely® tablet on the day after taking the last active tablet of the previous brand or, at the latest, the day after the tablet-free or inactive tablet interval of the previous brand.

**PATIENT AND CARER ADVICE**  
Missed doses. A missed pill for a patient taking Zoely® is one that is 12 hours or more late; for information on how to manage missed pills in women taking Zoely®, refer to product literature.

Diarrhoea and vomiting. In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking Zoely®, refer to product literature.

**MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**  
- **Zoely** (Mercer Sharp & Doheime Ltd)  
  - Estradiol (as Estradiol hemihydrate) 1.5 mg, Nomegestrol 2.5 mg. Zoely 2.5mg/1.5mg tablets | 84 tablet (PAB) £19.90 (70 price).
Genito-urinary system

- Ethinylestradiol 30 microgram, Desogestrel 150 microgram Ethinylestradiol 30microgram/150microgram tablets | 63 tablet (Pb) £3.80
- Marvelon (Merck Sharp & Dohme Ltd)
  Ethinylestradiol 20 microgram, Desogestrel 150 microgram Marvelon tablets | 63 tablet (Pb) £6.45
- Mercilon (Merck Sharp & Dohme Ltd)
  Ethinylestradiol 20 microgram, Desogestrel 150 microgram Mercilon tablets | 63 tablet (Pb) £7.10
- Dretine (Teva Plc)
  Ethinylestradiol 30 microgram, Desogestrel 150 microgram Dretine tablets | 63 tablet (Pb) £7.67

PATIENT AND CARER ADVICE

- If ring expelled during week 1—3, allow a withdrawal bleed to occur; if not, insertion should be repeated after 7-day ring-free interval. If the ring remains outside the vagina for more than 3 hours or if the user does not know when the ring was expelled, contraceptive protection may be reduced:
  - If ring expelled during week 1 or 2 of cycle, ring may still provide contraception if inserted within 72 hours of removal; if inserted from day 3 onwards, contraceptive protection may be reduced with continuous use of the ring
  - If ring expelled during week 3 of cycle, either insert a new ring or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

- If the ring breaks during use, remove it and insert a new ring no later than 7 days after ring free interval (barrier methods) for next 7 days;
- If ring expelled during week 1—3, ring may still provide contraception if inserted within 72 hours of removal; if inserted from day 3 onwards, contraceptive protection may be reduced with continuous use of the ring

- Expulsion, delayed insertion or removal, or broken vaginal ring If the vaginal ring is expelled for less than 3 hours, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

- If the ring remains outside the vagina for more than 3 hours or if the user does not know when the ring was removed, contraceptive protection may be reduced:
  - If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
  - If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

Missed doses Expulsion, delayed insertion or removal, or broken vaginal ring If the vaginal ring is expelled for less than 3 hours, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

- If the ring remains outside the vagina for more than 3 hours or if the user does not know when the ring was removed, contraceptive protection may be reduced:
  - If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
  - If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

- If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

- No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

- If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

Contraception with 21-day combined preparations

- By mouth
  - Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval

- Ethinylestradiol with etonogestrel

- INDICATIONS AND DOSE
  - Contraception: Menstrual symptoms

  - By Vagina

  - Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring-free interval (during which withdrawal bleeding occurs)

- DIRECTIONS FOR ADMINISTRATION

  Changing from progestogen-only method From an implant or intra-uterine progestogen–only device, insert ring on the day implant or intra-uterine progestogen–only device removed; from an injection, insert ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

  - PATIENT AND CARER ADVICE

  Patients or carers should be given advice on how to administer vaginal ring.

  Counselling The presence of the ring should be checked regularly.

  Missed doses Expulsion, delayed insertion or removal, or broken vaginal ring If the vaginal ring is expelled for less than 3 hours, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

  If the ring remains outside the vagina for more than 3 hours or if the user does not know when the ring was removed, contraceptive protection may be reduced:

    - If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
    - If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

  If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

  No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

  If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

- Elevin (Medix Healthcare LLP)

After abortion or miscarriage Before 20 weeks' gestation start immediately; no additional contraception required if started immediately. After 20 weeks' gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch.

- **PATIENT AND CARER ADVICE**
  Patients and carers should be given advice on how to administer patches.

Missed doses

Delayed application or detached patch If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual 'change day'. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new 'Day 1'; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new 'Day 1'; an additional non-hormonal method of contraception should be used for the first 7 days of the new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):
- for up to 48 hours, apply a new patch immediately; next patch 'change day' remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new 'Day 1'; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual 'change day', the day after day 28; no additional contraception is required.

Travel Women using patches are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2003) that Evra® patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

Transdermal patch

**INDICATIONS AND DOSE**

**Contraception with 21-day combined preparations**

- **Menstrual symptoms with 21-day combined preparations**
  - **BY MOUTH**
  - Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding occurs during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at approximately the same time each day

**UNLICENSED USE** Consult product literature for the licensing status.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Ethinylestradiol with norethisterone (Non-proprietary)**
  - Ethinylestradiol 35 microgram, Norethisterone
    - 500 microgram Ethinylestradiol 35microgram / Norethisterone 500microgram tablets | 5 tablet (PBD) no price available | 21 tablet (PBD) no price available
    - Ethinylestradiol 35 microgram, Norethisterone
    - 750 microgram Ethinylestradiol 35microgram / Norethisterone 750microgram tablets | 21 tablet (PBD) no price available
    - Ethinylestradiol 35 microgram, Norethisterone
      - 1 mg Ethinylestradiol 35microgram / Norethisterone 1mg tablets | 9 tablet (PBD) no price available | 21 tablet (PBD) no price available
    - 35 microgram tablets
      - Brevinor (Pfizer Ltd)
        - Ethinylestradiol 35 microgram, Norethisterone
          - 500 microgram Brevinor 500microgram/35microgram tablets | 63 tablet (PBD) 1.99
        - Loestrin 20 (Galen Ltd)
          - Ethinylestradiol 20 microgram, Norethisterone acetate
            - 1 mg Loestrin 20 tablets | 63 tablet (PBD) 2.30
          - Loestrin 30 (Galen Ltd)
            - Ethinylestradiol 30 microgram, Norethisterone acetate
              - 1.5 mg Loestrin 30 tablets | 63 tablet (PBD) 3.32
            - Norimin (Pfizer Ltd)
              - Ethinylestradiol 35 microgram, Norethisterone 1 mg Norimin
                - 1mg/35microgram tablets | 63 tablet (PBD) £2.28 DT price = £2.28

**Norethisterone with mestranol**

**INDICATIONS AND DOSE**

- **Contraception**
  - **Menstrual symptoms**
    - **BY MOUTH**
    - Females of childbearing potential: 1 tablet once daily for 21 days; subsequent courses repeated after 7-day interval, withdrawal bleeding can occur during the 7-day interval, if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days, tablets should be taken at the same time each day

**UNLICENSED USE** Consult product literature for the licensing status of individual preparations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Norethisterone with mestranol**
  - Mestranol 50 microgram, Norethisterone 1 mg Mestranol-1 tablets | 63 tablet (PBD) £2.19
    - 126 tablet (PBD) 2.19

3.2 Contraception, devices

**Intra-uterine contraceptive devices (copper)**

**INDICATIONS AND DOSE**

- **Contraception**
  - **BY INTRA-UTERINE ADMINISTRATION**
  - Females of childbearing potential: (consult product literature)

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who...
are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

**CONTRA-INDICATIONS**
Active tuboplastic disease (until return to normal of urine and plasma- gonadotrophin concentration) - distorted uterine cavity - established or marked immunosuppression - genital malignancy - medical diathermy - pelvic inflammatory disease - recent sexually transmitted infection (if not fully investigated and treated) - severe anaemia - small uterine cavity - unexplained uterine bleeding - Wilson’s disease

**CAUTIONS** Anaemia - anticoagulant therapy (avoid if possible) - diabetes - disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) - drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) - endometriosis - epilepsy (risk of seizure at time of insertion) - fertility problems - history of pelvic inflammatory disease - increased risk of expulsion if inserted before uterine involution - menorrhagia (progestogen intra-uterine system might be preferable) - nulliparity - severe cervical stenosis - severe primary dysmenorrhoea - severely scarred uterus (including after endometrial resection) - young age

**SIDE-EFFECTS** Allergy - bleeding (on insertion) - cervical perforation - displacement - dysmenorrhoea - expulsion - menorrhagia - occasionally epileptic seizure (on insertion) - pain (on insertion, alleviated by NSAID such as ibuprofen 30 minutes before insertion) - pelvic infection may be exacerbated - uterine perforation - vasovagal attack (on insertion)

**SIDE-EFFECTS, FURTHER INFORMATION**
- Presence of significant symptoms (especially pain). Advise the patient to seek medical attention promptly in case of significant symptoms.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if patient has a copper allergy.

**PREGNANCY** If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Remove device; if pregnancy occurs, increased likelihood that it may be ectopic.

**BREAST FEEDING** Not known to be harmful.

**MONITORING REQUIREMENTS** Gynaecological examination before insertion, 6–8 weeks after insertion, then annually.

**DIRECTIONS FOR ADMINISTRATION** The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet. Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation.

**PRESCRIBING AND DISPENSING INFORMATION**

- **UT380 STANDARD** For uterine length 6.5–9 cm; replacement every 5 years.
- **NOVAPLUS T 380 AG ‘Mini’ size for minimum uterine length 5 cm; ‘Normal’ size for uterine length 6.5–9 cm; replacement every 5 years.
- **GYNEFIX®** Suitable for all uterine sizes; replacement every 5 years.
- **UT380 SHORT®** For uterine length 5–7 cm; replacement every 5 years.
- **NOVA-T® 380** For uterine length over 6 cm; replacement every 5 years.
- **FLEXI-T® 380** For uterine length 6.5–9 cm; replacement every 5 years.
- **NOVAPLUS T 380® CU ‘Mini’ size for minimum uterine length 5 cm; ‘Normal’ size for uterine length 6.5–9 cm; replacement every 5 years.
- **LOAD® 375** For uterine length over 7 cm; replacement every 5 years.
- **ANCORA® 375 CU** For uterine length over 6.5 cm; replacement every 5 years.
- **T-SAFE® 380B®** For uterine length 6.5–9 cm; replacement every 10 years.
- **MULTILOAD® cu375** For uterine length 6–9 cm; replacement every 5 years.
- **MINI TT380® SLIMLINE** For uterine length 6–9 cm; replacement every 5 years.
- **COOPER T380®** For uterine length 6.5–9 cm; replacement every 10 years.
- **NEO-SAFE® T380** For uterine length 6.5–9 cm; replacement every 10 years.
- **MULTI-SAFE® 375** For uterine length 6–9 cm; replacement every 5 years.
- **FLEXI-T® 300** For uterine length over 5 cm; replacement every 5 years.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Intra-uterine devices**
- **Intra-uterine contraceptive devices** (R.F. Medical Supplies Ltd, Farla Medical Ltd, Durbin Plc, Williams Medical Supplies Ltd, Bayer Plc, Organon Laboratories Ltd)
- Copper T380 A intra-uterine contraceptive device | 1 device £8.95
- Steriload intra-uterine contraceptive device | 1 device £9.65
- Load 375 intra-uterine contraceptive device | 1 device £8.52
- Novaplus T 380 Ag intra-uterine contraceptive device mini | 1 device £12.50
3.3 Contraception, emergency

**DRUG ACTION** Ulipristal acetate is a progestosterone receptor modulator with a partial progestosterone antagonist effect.

**INDICATIONS AND DOSE**

**Emergency contraception**
- BY MOUTH
- Females of childbearing potential: 30 mg for 1 dose, to be taken as soon as possible after coitus, but no later than after 120 hours

**CONTRA-INDICATIONS**
- Repeated use as an emergency contraceptive within a menstrual cycle
- Uncontrolled severe asthma

**INTERACTIONS**
- Appendix 1 (ulipristal)
- The effectiveness of ulipristal as an emergency contraceptive is possibly reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

**SIDE-EFFECTS**
- Common or very common
  - Abdominal pain - back pain
  - Diarrhoea - dizziness
  - Fatigue - gastro-intestinal disturbances - headache - menstrual irregularities - muscle spasms - nausea - vomiting
- Uncommon
  - Blurred vision
  - Breast tenderness
  - Dry mouth
  - Hot flushes
  - Pruritus
  - Rash
  - Tremor
  - Uterine spasms

**CONCEPTION AND CONTRACEPTION**
- When ulipristal is given as an emergency contraceptive the effectiveness of combined hormonal and progestogen-only contraceptives may be reduced—additional precautions (barrier methods) required for 14 days for combined and parenteral progestogen-only hormonal contraceptives (16 days for Qlaira®) and 9 days for oral progestogen-only contraceptives.
- PREGNANCY
  - Limited information available when used as an emergency contraceptive.

**BREAST FEEDING**
- In emergency contraception manufacturer advises avoid for 1 week after administration—present in milk.

**HEPATIC IMPAIRMENT**
- Manufacturer advises avoid in severe impairment—no information available.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

</tbody>
</table>

**SIDE-EFFECTS**

- Breast discomfort - changes in libido - depression - disturbance of appetite - dizziness - headache - menstrual irregularities - nausea - skin disorders - vomiting

**CAUTIONS**

- Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

- Pregnancy Not known to be harmful.

- Breast feeding Progestogen-only contraceptives do not affect lactation.

- Hepatic impairment Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

**Patient and carer advice**

Missed doses

**Missed pill** The following advice is recommended: ‘If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 12 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days’.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more tablets are missed or taken more than 12 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Surgery All progestogen-only contraceptives are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Starting routine one tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 12 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if desogestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking desogestrel, another pill should be taken as soon as possible. If a replacement pill is not taken within 12 hours of the normal time for taking desogestrel, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

**National funding/access decisions**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2003) that Cerazette® should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contra-indicated.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

  - Oral tablet
Levonorgestrel

18.2.2016

INDICATIONS AND DOSE

Emergency contraception

- BY MOUTH
  - Females of childbearing potential: 1.5 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours but no later than after 72 hours

Contraception

- BY MOUTH
  - Females of childbearing potential: 1 tablet daily starting on day 1 of the cycle then continuously, dose is to be taken at the same time each day, if administration delayed for 3 hours or more it should be regarded as a 'missed pill'

JAYDESS® 1.5MG INTRA-UTERINE DEVICE

Contraception

- BY VAGINA
  - Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester termination; postpartum insertions should be delayed until at least 6 weeks after delivery (12 weeks if uterus involution is substantially delayed); effective for 3 years

LEVOSERT® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Contraception | Menorrhagia

- BY INTRA-UTERINE ADMINISTRATION
  - Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester abortion; postpartum insertions should be delayed until at least 6 weeks after delivery; effective for 3 years

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Contraception | Menorrhagia

- BY INTRA-UTERINE ADMINISTRATION
  - Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately after first-trimester termination by curettage; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

Prevention of endometrial hyperplasia during oestrogen replacement therapy

- BY INTRA-UTERINE ADMINISTRATION
  - Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding or at any time if amenorrhoeic; effective for 4 years

UNLICENSED USE

- With oral use Consult product literature for licensing status of individual preparations.
- With vaginal use Not licensed for use in women under 18 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:
- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

CONTRA-INDICATIONS

- With intra-uterine use Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration; acute cervicitis; acute vaginitis; distorted uterine cavity; established immunosuppression; genital malignancy; history of breast cancer but can be considered for a woman in long-term remission who has menorrhagia and requires effective contraception - infected abortion during the previous three months - marked immunosuppression - not suitable for emergency contraception - pelvic inflammatory disease - postpartum endometritis - recent sexually transmitted infection (if not fully investigated and treated) - severe anaemia - small uterine cavity - unexplained uterine bleeding

- With oral use Acute porphyrias p. 562

- When used for contraception With oral use for contraception history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable - severe arterial disease - undiagnosed vaginal bleeding

CAUTIONS

- With intra-uterine use Disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) - anaemia - anticoagulant therapy (avoid if possible) - diabetes - drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) - endometriosis - epilepsy (risk of seizure at time of insertion) - fertility problems - history of pelvic inflammatory disease - increased risk of expulsion if inserted before uterine involution - menorrhagia (progestogen intra-uterine system might be preferable) - nulliparity - severe cervical stenosis - severe primary dysmenorrhoea - severely scarred uterus (including after endometrial resection) - young age

- When used for contraception With oral use for contraception active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice - arterial disease - functional ovarian cysts - history of jaundice in pregnancy - malabsorption syndromes - past ectopic pregnancy - sex-steroid dependent cancer - systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

- When used for emergency contraception With oral use for emergency contraception active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice - past ectopic pregnancy - severe malabsorption syndromes

CAUTIONS, FURTHER INFORMATION

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

Risk of infection with intra-uterine devices The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually
transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:
- they are under 25 years old
- they are over 25 years old
- have a new partner
- have had more than one partner in the past year
- their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Nesseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

- Use as a contraceptive in co-morbidities
- With oral use The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

**SIDE-EFFECTS**

**SPECIFIC SIDE-EFFECTS**

- **GENERAL SIDE-EFFECTS**
  - With intra-uterine use Depression (sometimes severe)
  - With intra-uterine use Headache
  - Frequency not known Vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- With oral use Breast discomfort
- With oral use Breast tenderness
- Changes in libido
- Disturbances of appetite
- Dizziness
- Fatigue
- Menstrual irregularities
- Skin disorders

**SIDE-EFFECTS, FURTHER INFORMATION**

- Breast Cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

Although the progestogen-only intra-uterine system produces little systemic progestogenic activity, it is usually avoided for 5 years after any evidence of breast cancer. However, the system can be considered for a woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception.

- With intra-uterine use Endometrial disorders should be ruled out before insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in progestogenic side-effects, such as mastalgia and in the bleeding pattern may often become very light or absent. Removal of the intra-uterine system should be considered if the patient experiences migraine or severe headache, jaundice, marked increase of blood pressure, or severe arterial disease.

**PREGNANCY**

- With oral use Not known to be harmful.
- With vaginal use If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible; Avoid; if pregnancy occurs remove intra-uterine system.

**BREAST FEEDING**

- Progestogen-only contraceptives do not affect lactation.

**HEPATIC IMPAIRMENT**

- Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

**MONITORING REQUIREMENTS**

- With intra-uterine use Gynaecological examination before insertion, 4–6 weeks after insertion, then annually.

**DIRECTIONS FOR ADMINISTRATION**

- With intra-uterine use The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.

**PRESCRIBING AND DISPENSING INFORMATION**

- With intra-uterine use Levonorgestrel-releasing intra-uterine devices vary in licensed indication, duration of use and insertion technique—the MHRA recommends to prescribe and dispense by brand name to avoid inadvertent switching.

**SIDE-EFFECTS, FURTHER INFORMATION**

- With oral use Breast discomfort
- Breast tenderness
- Changes in libido
- Disturbances of appetite
- Dizziness
- Fatigue
- Menstrual irregularities
- Skin disorders

**SIDE-EFFECTS, FURTHER INFORMATION**

- Breast Cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

Although the progestogen-only intra-uterine system produces little systemic progestogenic activity, it is usually avoided for 5 years after any evidence of breast cancer. However, the system can be considered for a woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception.

- With intra-uterine use Endometrial disorders should be ruled out before insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in progestogenic side-effects, such as mastalgia and in the bleeding pattern may often become very light or absent. Removal of the intra-uterine system should be considered if the patient experiences migraine or severe headache, jaundice, marked increase of blood pressure, or severe arterial disease.

**PREGNANCY**

- With oral use Not known to be harmful.
- With vaginal use If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible; Avoid; if pregnancy occurs remove intra-uterine system.

**BREAST FEEDING**

- Progestogen-only contraceptives do not affect lactation.

**HEPATIC IMPAIRMENT**

- Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

**MONITORING REQUIREMENTS**

- With intra-uterine use Gynaecological examination before insertion, 4–6 weeks after insertion, then annually.

**DIRECTIONS FOR ADMINISTRATION**

- With intra-uterine use The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.

**PRESCRIBING AND DISPENSING INFORMATION**

- With intra-uterine use Levonorgestrel-releasing intra-uterine devices vary in licensed indication, duration of use and insertion technique—the MHRA recommends to prescribe and dispense by brand name to avoid inadvertent switching.

**SIDE-EFFECTS, FURTHER INFORMATION**

- With oral use Breast discomfort

**3.5 Contraception, parenteral progestogen-only**

**Drugs used for Contraception, parenteral progestogen-only not listed below** Norethisterone p. 447

---

**PROGESTGENS**

---

**Etonogestrel**

---

**INDICATIONS AND DOSE**

Contraception (no hormonal contraceptive use in previous month)

- **BY SUBDERMAL IMPLANTATION**
  - Females of childbearing potential: 1 implant inserted during first 5 days of cycle, implant should be removed within 3 years of insertion

Contraception (postpartum)

- **BY SUBDERMAL IMPLANTATION**
  - Females of childbearing potential: 1 implant to be inserted 21–28 days after delivery, 1 implant to be inserted after 28 days postpartum in breast-feeding mothers, implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the second trimester

- **BY SUBDERMAL IMPLANTATION**
  - Females of childbearing potential: 1 implant to be inserted 21–28 days after abortion or miscarriage, implant should be removed within 3 years of insertion

---

**Exceptions to Legal Category**

Levonelle® One Step can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.
Contraception

Contraception following abortion or miscarriage in the first trimester
- BY SUBDERMAL IMPLANTATION
  - Females of childbearing potential: 1 implant to be inserted within 5 days, implant should be removed within 3 years of insertion

Contraception (changing from other hormonal contraceptive)
- BY SUBDERMAL IMPLANTATION
  - Females of childbearing potential: Implant should be removed within 3 years of insertion (consult product literature)

- CONTRA-INDICATIONS
  - Acute porphyria - history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable - severe arterial disease - undiagnosed vaginal bleeding

- CAUTIONS
  - Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration) - seek specialist advice - arterial disease - disturbances of lipid metabolism - history during pregnancy of deterioration of otosclerosis - history during pregnancy of pruritus - history of jaundice in pregnancy - malabsorption syndromes - possible risk of breast cancer - sex-steroid dependent cancer - systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

- INTERACTIONS
  - Appendix 1 (progestogens).
  - Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. Effectiveness of the etonogestrel-releasing implant may be reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the enzyme-inducing drug and for at least 4 weeks after stopping. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the implant may be continued in combination with additional contraceptive precautions (e.g. condom) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping it.

- SIDE-EFFECTS
  - Breast discomfort - changes in libido - depression - disturbance of appetite - dizziness - headache - injection-site reactions - menstrual irregularities - nausea - vomiting
  - Further information on SIDE-EFFECTS.

- Cervical cancer
  - Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives. The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

- Breast cancer
  - There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

- PREGNANCY
  - Not known to be harmful, remove implant if pregnancy occurs.

- BREAST FEEDING
  - Progestogen-only contraceptives do not affect lactation.

- DIRECTIONS FOR ADMINISTRATION
  - The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.

- PATIENT AND CARER ADVICE
  - Full counselling backed by patient information leaflet required before administration.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

- Implant
  - Etonogestrel (Non-proprietary)
    - Etonogestrel 68 mg (Etonogestrel 68mg implant) 1 device £83.43
  - Nexplanon (Merck Sharp & Dohme Ltd)
    - Etonogestrel 68 mg (Nexplanon 68mg implant) 1 device £83.43

Medroxyprogesterone acetate

- INDICATIONS AND DOSE

Contraception
- BY DEEP INTRAMUSCULAR INJECTION
  - Females of childbearing potential: 150 mg, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)

- BY SUBCUTANEOUS INJECTION
  - Females of childbearing potential: 104 mg, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Long-term contraception
- BY DEEP INTRAMUSCULAR INJECTION
  - Females of childbearing potential: 150 mg every 12 weeks, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)

- BY SUBCUTANEOUS INJECTION
  - Females of childbearing potential: 104 mg every 13 weeks, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Contraception (when patient changing from other hormonal contraception)
- BY SUBCUTANEOUS INJECTION
  - Females of childbearing potential: (consult product literature)

- CONTRA-INDICATIONS
  - Acute porphyrias p. 562 - history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable - severe arterial disease - undiagnosed vaginal bleeding

- CAUTIONS
  - History during pregnancy of disturbances in lipid metabolism - history during pregnancy of deterioration of otosclerosis - history of pruritus - possible risk of breast cancer

- INTERACTIONS
  - Appendix 1 (progestogens).
  - Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of medroxyprogesterone acetate intramuscular and subcutaneous injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs.

- SIDE-EFFECTS
  - Rare Osteoporosis - osteoporotic fractures
  - Frequency not known Breast discomfort - changes in libido - depression - dizziness - disturbance of appetite - headache - indigestion - injection site reactions - loss of vision during
treatment (discontinue treatment if papilloedema or retinal vascular lesions) • menstrual irregularities • nausea • reduced bone mineral density • skin disorders • vomiting • weight gain

SIDE-EFFECTS, FURTHER INFORMATION
Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives. The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

Reduction in bone mineral density occurs in the first 2–3 years of use then stabilises.

CONCEPTION AND CONTRACEPTION
• With intramuscular use If interval between dose is greater than 12 weeks and 5 days (in long-term contraception), rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection.
• With subcutaneous use If interval between dose is greater than 13 weeks and 7 days (in long-term contraception), rule out pregnancy before next injection.

PREGNANCY
• Not known to be harmful.

BREAST FEEDING
• Present in milk—no adverse effects reported. Progestogen-only contraceptives do not affect lactation.

The manufacturers advise that in women who are breast-feeding, the first dose should be delayed until 6 weeks after birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.

HEPATIC IMPAIRMENT
• Avoid in liver tumour. Caution in severe liver disease and recurrent cholestatic jaundice.

PATIENT AND CARER ADVICE
• Full counselling backed by patient information leaflet required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

MEDICINAL FORMS
• There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection
• Medroxyprogesterone acetate 150 mg per 1 ml Depo-Provera 150mg/1ml suspension for injection pre-filled syringes | 1 pre-filled disposable injection £6.01 DT price = £6.01

• Medroxyprogesterone acetate 160 mg per 1 ml Sayana Press 104mg/0.65 ml suspension for injection pre-filled disposable devices | 1 pre-filled disposable injection £6.90

3.6 Contraception, spermicidal

SPERMICIDALS

Nonoxinol

• INDICATIONS AND DOSE
Spermicidal contraceptive in conjunction with barrier methods of contraception such as diaphragms or caps
• BY VAGINA
• Females of childbearing potential: (consult product literature)

• SIDE-EFFECTS
Genital lesions

SIDE-EFFECTS, FURTHER INFORMATION
High frequency use of the spermicide nonoxinol ‘9’ has been associated with genitai lesions, which may increase the risk of acquiring these infections.

CONCEPTION AND CONTRACEPTION
• No evidence of harm to latex condoms and diaphragms.

PREGNANCY
• Toxicity in animal studies.

BREAST FEEDING
• Present in milk in animal studies.

MEDICINAL FORMS
• There can be variation in the licensing of different medicines containing the same drug.

Gel
EXCIPIENTS: May contain Hydroxybenzoates (parabens), propylene glycol, sorbic acid
• Gygel (Marlborough Pharmaceuticals Ltd)
Nonoxinol-9 20 mg per 1 ml Gygel 2% contraceptive jelly | 30 gram (£9.80) 54.25 | 81 gram (£9.80) £11.00

4 Erectile and ejaculatory conditions

4.1 Erectile dysfunction

Erectile dysfunction
Adolescents presenting with erectile dysfunction should be referred to a specialist.

5 Vaginal and vulval conditions

Vaginal and vulval conditions

Management
Pre-pubertal girls may be particularly susceptible to vulvovaginitis. Barrier preparations applied after cleansing can be useful when the symptoms are due to non-specific irritation, but systemic drugs are required in the treatment of bacterial infection or threadworm infestation. Intravaginal preparations, particularly those that require the use of an applicator, are not generally suitable for young girls; topical preparations may be useful in some adolescent girls.

In older girls symptoms are often restricted to the vulva, but infections almost invariably involve the vagina, which should also be treated; treatment should be as for adults.

Preparations for vaginal and vulval changes
Topical oestrogen creams containing estriol 0.01% (Gynest®) are used in the treatment of labial adhesions;
Vaginal and vulval infections

Effective specific treatments are available for the common vaginal infections.

Fungal infections

Vaginal fungal infections are not normally a problem in younger girls but can occur in adolescents. Candidal vulvitis can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. Vaginal candidiasis, rare in girls before puberty, can be treated with antifungal pessaries or cream inserted high into the vagina (including during menstruation), however, these are not recommended for pre-pubertal girls and treatment with an external cream may be more appropriate. Single-dose intravaginal preparations offer an advantage when compliance is a problem. Local irritation can occur on application of vaginal antifungal products. Imidazole drugs (clotrimazole or miconazole) are effective against candida in short courses of 1 to 3 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with fluconazole may be considered for girls post-puberty. Vulvovaginal candidiasis in pregnancy

Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole, and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. There is limited absorption of imidazoles from the skin and vagina. Oral antifungal treatment should be avoided during pregnancy.

Recurrent vulvovaginal candidiasis

Recurrent vulvovaginal candidiasis is very rare in children, but can occur if there are predisposing factors such as antibacterial therapy, pregnancy, diabetes mellitus, or possibly oral contraceptive use. Reservoirs of infection can also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus, as well as the gastro-intestinal tract and the bladder. The sexual partner may also be the source of re-infection and, if symptomatic, should be treated with a topical imidazole cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis.

Other infections

Trichomonal infections commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole. Bacterial infections with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially Bacteroides spp. and can be used prophylactically in gynaecological surgery.

Clindamycin below cream and metronidazole gel are indicated for bacterial vaginosis. The antiviral drugs aciclovir, valaciclovir, and famciclovir can be used in the treatment of genital infection due to herpes simplex virus, the HSV type 2 being a major cause of genital ulceration. They have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms.
Vaginal candidiasis (dose for superficial sites of infection in vaginal and vulval candidiasis)

- **CONCEPTION AND CONTRACEPTION**: Cream and pessaries may damage latex condoms and diaphragms.
- **PREGNANCY**: Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.
- **EXCEPTIONS TO LEGAL CATEGORY**: Brands for sale to the public include Canesten® Internal Cream.

**CONSIDERATIONS:**

- Canesten Vaginal cream, 40 ml £6.00
- Canesten Vaginal soft gel, 1 pessary £6.41
- Canesten 1000 mg cream, 1 pessary £6.35
- Canesten 500 mg cream, 1 pessary £4.14
- Canesten 200 mg cream, 1 pessary £3.03
- Canesten 100 mg cream, 1 pessary £2.32
- Canesten 50 mg cream, 1 pessary £1.64
- Canesten 5 mg cream, 1 pessary £0.43

**SIDE-EFFECTS:**

- Occasional local irritation
- Rarely, stinging or burning
- May cause skin irritation

**UNLICENSED USE:** Consult product literature for individual preparations.

**CAUTIONS:**

- Avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative
- Local irritation

**INDICATIONS AND DOSE:**

- **Superficial sites of infection in vaginal and vulval candidiasis** (dose for 1% or 2% cream)
  - By Vagina using cream
  - Child: Apply 2–3 times a day, to be applied to anogenital area
- **Vaginal candidiasis (dose for 1% intravaginal cream)**
  - By Vagina using Vaginal Cream
  - Child: 5 g for 1 dose, one applicatorful to be inserted into the vagina at night, dose can be repeated once if necessary
- **Vaginal candidiasis**
  - By Vagina using pessaries
  - Child: 200 mg for 3 nights, course can be repeated once if necessary, alternatively 500 mg for 1 night, dose can be repeated once if necessary
- **Recurrent vulvovaginal candidiasis**
  - By Vagina using pessaries
  - Child: 500 mg every 1 week for 6 months, dose to be administered following topical imidazole for 10–14 days

**EXCIPIENTS:**

- May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates
- Balancetellic acid, tocopheryl acetate, propylene glycol (parabens), propylene glycol
**Fenticonazole nitrate**

- **INDICATIONS AND DOSE**
  - **Vaginal and vulva candidiasis**
  - **BY VAGINA USING CAPSULES**
    - Child: 200 mg daily for 3 days, alternatively 600 mg daily for 1 dose, to be inserted at night
  - **BY VAGINA USING CREAM**
    - Child: 1 applicatorful twice daily for 3 days

- **DOSE EQUIVALENCE AND CONVERSION**
  - With topical use 1 applicatorful delivers a 5 g dose of fenticonazole 2%.

- **CAUTIONS**
  - Avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative

- **SIDE-EFFECTS**
  - Local irritation

- **CONCEPTION AND CONTRACEPTION**
  - Intravaginal cream and vaginal capsules damage latex condoms and diaphragms.

**Miconazole**

- **INDICATIONS AND DOSE**
  - **Vaginal and vulval candidiasis**
  - **BY VAGINA USING CAPSULES**
    - Child: 1 capsule daily, ovule to be inserted at night as a single dose, dose can be repeated once if necessary

- **CAUTIONS**
  - Avoid in Acute porphyrias p. 562 - avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative

- **INTERACTIONS**
  - Appendix 1 (antifungals, imidazole).

- **SIDE-EFFECTS**
  - Common or very common: Nausea, rash, vomiting
  - Frequency not known: Occasional local irritation

- **CONCEPTION AND CONTRACEPTION**
  - Gyno-Daktarin® damages latex condoms and diaphragms.

- **PREGNANCY**
  - Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection.

- **BREAST FEEDING**
  - Manufacturer advises caution—no information available.

Immunocompromised child

Infections in the immunocompromised child can be severe and show atypical features. Specific local protocols should be followed for the management of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicemia or tuberculosis to reach an advanced stage before being recognised. Children should be up-to-date with their childhood vaccinations before initiation of immunosuppressant therapy (e.g. before transplantation); vaccination with varicella-zoster vaccine is also necessary during this period—important: normal immunoglobulin administration should be considered as soon as possible after measles exposure, and varicella-zoster immunoglobulin (VZIG) is recommended for individuals who have significant chickenpox (varicella) exposure. Specialist advice should be sought on the use of live vaccines for those being treated with immunosuppressive drugs.

Antiproliferative immunosuppressants

Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced (to one quarter of the original dose in children) when allopurinol is given concurrently.

Cyclophosphamide is less commonly prescribed as an immunosuppressant.

Corticosteroids and other immunosuppressants

The corticosteroids prednisolone and dexamethasone are widely used in paediatric oncology; they have a marked antitumour effect. Dexamethasone is preferred for acute lymphoblastic leukaemia whilst prednisolone may be used for Hodgkin’s disease, non-Hodgkin’s lymphoma, and B-cell lymphoma and leukaemia.

Dexamethasone is the corticosteroid of choice in paediatric supportive and palliative care. For children who are not receiving a corticosteroid as a component of their chemotherapy, dexamethasone may be used to reduce raised intracranial pressure, or to help control emesis when combined with an appropriate anti-emetic.

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin, a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-toxic and is effective in patients who are not receiving a corticosteroid as a component of their chemotherapy.
myelotoxic but markedly nephrotoxic. It may be used in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease. Ciclosporin also has a role in steroid-sensitive and steroid-resistant nephrotic syndrome; in corticosteroid-sensitive nephrotic syndrome it may be given with prednisolone.

Tacrolimus is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects.

NICE technology appraisals (TAs)
Immunosuppressive therapy for renal transplantation in adults (September 2004) NICE T85
For induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects.

Mycophenolate mofetil [mycophenolic acid also available but not licensed for use in children] is recommended as part of an immunosuppressive regimen only if:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; or
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Sirolimus is recommended as a component of immunosuppressive regimen only if intolerance necessitates the withdrawal of a calcineurin inhibitor. These recommendations may not be consistent with the marketing authorisation of some of the products.

www.nice.org.uk/T85

Immunosuppressive therapy for renal transplantation in children and adolescents (April 2006) NICE T99
NICE has recommended that for induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects. Mycophenolate mofetil is recommended as part of an immunosuppressive regimen only if:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; or
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Mycophenolic acid is not recommended as part of an immunosuppressive regimen for renal transplantation in children or adolescents.

Sirolimus [not licensed for use in children] is recommended as a component of immunosuppressive regimen only if intolerance necessitates the withdrawal of a calcineurin inhibitor.

These recommendations may not be consistent with the marketing authorisation of some of the products.

www.nice.org.uk/T99

---

** IMMUNE SERA AND IMMUNOGLOBULINS 〉 IMMUNOGLOBULINS

**Antithymocyte immunoglobulin (rabbit)**

**INDICATIONS AND DOSE**

**Prophylaxis of organ rejection in heart allograft recipients**
- **BY INTRAVENOUS INFUSION**
- Child: 1–2.5 mg/kg daily for 3–5 days, start treatment on day of transplantation, to be given over at least 6 hours

**Prophylaxis of organ rejection in renal allograft recipients**
- **BY INTRAVENOUS INFUSION**
- Child 1-17 years: 1–1.5 mg/kg daily for 3–9 days, start treatment on day of transplantation, to be given over at least 6 hours

**Treatment of corticosteroid-resistant allograft rejection in renal transplantation**
- **BY INTRAVENOUS INFUSION**
- Child 1-17 years: 1.5 mg/kg daily for 7–14 days, to be given over at least 6 hours

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.

**CONTRA-INDICATIONS**
- Infection

**SIDE-EFFECTS**
- Anaphylaxis · cytokine release syndrome · diarrhoea · dysphagia · fever · hypotension · increased susceptibility to infection · increased susceptibility to malignancy · infusion-related reactions · lymphpenia · myalgia · nausea · neutropenia · pruritus · rash · serum sickness · shivering · thrombocytopenia · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

**PREGNANCY**
- Manufacturer advises use only if potential benefit outweighs risk—no information available.

**BREAST FEEDING**
- Manufacturer advises avoid—no information available.

**MONITORING REQUIREMENTS**
- Monitor blood count.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For continuous intravenous infusion reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with Glucose 5% or Sodium Chloride 0.9% to an approx. concentration of 0.5 mg/mL; begin infusion immediately after dilution; give through an inline filter (pore size 0.22 micron); incompatible with unfractionated heparin and hydrocortisone in glucose infusion—precipitation reported.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**
- Antithymocyte immunoglobulin (rabbit) (Non-proprietary) Antithymocyte immunoglobulin (rabbit) 20 mg per 1 ml Grafalon 100mg/5ml concentrate for solution for infusion vials | 1 vial

**Powder and solvent for solution for infusion**
- Thymoglobulin (Sanofi) Antithymocyte immunoglobulin (rabbit) 25 mg Thymoglobulin 25mg powder and solvent for solution for infusion vials | 1 vial

£158.77 (Hospital only)
Azathioprine

- **Drug Action**: Azathioprine is metabolised to mercaptopurine.

- **Indications and Dose**
  - Severe ulcerative colitis
  - Severe Crohn’s disease
    - **By Mouth**
    - Child ≤17 years: Initially 2 mg/kg once daily, then increased if necessary up to 2.5 mg/kg once daily
    - Systemic lupus erythematosus
    - Vasculitis
    - Autoimmune conditions usually when corticosteroid therapy alone has proved inadequate
    - **By Mouth**
    - Child: Initially 1 mg/kg daily, then adjusted according to response to 3 mg/kg daily, consider withdrawal if no improvement within 3 months; maximum 3 mg/kg per day

- **Suppression of transplant rejection**
  - By mouth, or by intravenous infusion
  - Child: Maintenance 1–3 mg/kg daily, adjusted according to response, consult local treatment protocol for details, oral route preferred, but if oral route is not possible then can be given by intravenous infusion, the total daily dose may alternatively be given in 2 divided doses

- **Cautions** Reduced thioupine methyltransferase activity
- **Interactions** → Appendix 1 (azathioprine).

- **Side-Effects**
  - Rare
    - Hepatic veno-occlusive disease
    - Lymphoma
    - Pancreatitis
    - Pneumonitis
    - Red cell aplasia
    - Frequency not known
    - Arthralgia
    - Cholestatic jaundice
    - Colitis in patients also receiving corticosteroids
    - Diarrhoea
    - Dizziness
    - Dose-related bone marrow suppression
    - Fever
    - Hair loss
    - Haemorrhage
    - Infection
    - Interstitial nephritis
    - Liver impairment
    - Malaise
    - Malignancy
    - Myalgia
    - Nausea
    - Neutropenia
    - Rash
    - Rigors
    - Thrombocytopenia
    - Vomiting

- **Side-Effects, Further Information**
  - Red cell aplasia
    - Cases of pure red cell aplasia have been reported with azathioprine; dose reduction or discontinuation should be considered under specialist supervision.
  - Neutropenia and thrombocytopenia
    - Usually resolved by reducing the dose.
  - Hypersensitivity reactions
    - Hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and interstitial nephritis) call for immediate withdrawal.

- **Allergy and Cross-Sensitivity**
  - Contra-indicated in hypersensitivity to mercaptopurine.

- **Pregnancy**
  - Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in animal studies. The use of azathioprine during pregnancy needs to be supervised in specialist units. Treatment should not generally be initiated during pregnancy.

- **Breast Feeding**
  - Present in milk in low concentration. No evidence of harm in small studies—use if potential benefit outweighs risk.

- **Hepatic Impairment**
  - Reduce dose. Monitor liver function.

- **Renal Impairment**
  - Reduce dose.

- **Pre-Treatment Screening**
  - Thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

- **Monitoring Requirements**
  - Monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.
  - Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment.

- **Directions for Administration**
  - With intravenous use: Consult local treatment protocol for details. For intravenous injection, reconstitute 50 mg with 5–15 mL Water for Injections; give over at least 1 minute.
  - For intravenous infusion, reconstitute 50 mg with 5–15 mL Water for Injections; dilute requisite dose to a concentration of 0.25–2.5 mg/mL in Glucose 5% or Sodium Chloride 0.9%. Intravenous injection is alkaline and very irritant. Intravenous route should therefore be used only if oral route not feasible and discontinued as soon as oral route can be tolerated. To reduce irritation flush line with infusion fluid.

- **Patient and Carer Advice**
  - Bone marrow suppression Patients and their carers should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection.

- **Medicinal Forms**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

- **Tablet**
  - **Cautionary and Advisory Labels**
    - **Azathioprine (Non-proprietary)**
      - Azathioprine 25 mg
        - Azathioprine 25 mg tablets | 28 tablet | £8.41 DT price = £2.24 | 100 tablet | £33.26
      - Azathioprine 50 mg
        - Azathioprine 50 mg tablets | 56 tablet | £15.85 DT price = £2.43 | 100 tablet | £29.00
      - Azapress (Ennogen Pharma Ltd)
        - Azathioprine 50 mg
          - Azapress 50mg tablets | 56 tablet | £2.83 DT price = £2.43
      - Imuran (Aspen Pharma Trading Ltd)
        - Azathioprine 25 mg
          - Imuran 25mg tablets | 100 tablet | £10.99
        - Azathioprine 50 mg
          - Imuran 50mg tablets | 100 tablet | £7.99

- **Powder for solution for injection**
  - **Imuran (Aspen Pharma Trading Ltd)**
    - Azathioprine 50 mg
      - Imuran 50mg powder for solution for injection vials | 1 vial | £15.38
IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS

Ciclosporin (Cyclosporin)

- **INDICATIONS AND DOSE**
  - Refractory ulcerative colitis
    - **BY MOUTH**
      - Child: 2–17 years: Initially 2 mg/kg twice daily (max. per dose 5 mg/kg) or 2.5 mg/kg twice daily (usual maximum duration of 8 weeks but may be used for longer under specialist supervision, if good initial response not achieved within 2 weeks, increase dose rapidly up to maximum)
    - **BY INTRAVENOUS INJECTION**
      - Child: 3–17 years: Initially 0.5–1 mg/kg twice daily, dose adjusted according to blood-ciclosporin concentration and response
  - Short-term treatment of severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)
    - **BY MOUTH**
      - Child: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily) usual maximum duration of 8 weeks but may be used for longer under specialist supervision, if good initial response not achieved within 2 weeks, increase dose rapidly up to maximum
  - Short-term treatment of very severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)
    - **BY MOUTH**
      - Child: 2.5 mg/kg twice daily usual maximum duration of 8 weeks but may be used for longer under specialist supervision
  - Severe psoriasis where conventional therapy ineffective or inappropriate (administered on expert advice)
    - **BY MOUTH**
      - Child: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily), increased gradually to maximum if no improvement within 1 month, initial dose of 2.5 mg/kg twice daily justified if condition requires rapid improvement; discontinue if inadequate response after 3 months at the optimum dose; max. duration of treatment usually 1 year unless other treatments cannot be used
  - Prevention of graft rejection following bone-marrow, kidney, liver, pancreas, heart, and lung transplantation - Prevention and treatment of graft-versus-host disease
    - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
      - Child: (consult local protocol)
  - Nephrotic syndrome
    - **BY MOUTH**
      - Child: 3 mg/kg twice daily, dose can be increased if necessary in corticosteroid-resistant disease; for maintenance reduce to lowest effective dose according to whole blood-ciclosporin concentrations, proteinuria, and renal function

- **IMPORTANT SAFETY INFORMATION**
  - Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration.

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Common or very common Abdominal pain - anorexia, diarrhoea, fatigue, gingival hyperplasia, headache, hepatic dysfunction, hypercholesterolaemia, hyperkalaemia, hyperlipidaemia, hypertension, hypertrichosis, hyperuricaemia, hypomagnesaemia, muscle cramps, myalgia, nausea, paraesthesia, renal dysfunction (renal structural changes on long-term administration), tremor, vomiting
  - Uncommon Anaemia - oedema - signs of encephalopathy,tremor - thrombocytopenia - weight gain
  - Rare Gynaeomastia, haemolytic uraemic syndrome, hyperglycaemia, menstrual disturbances, microangiopathic haemolytic anaemia, motor polyneuropathy, muscle weakness, myopathy, pancreatitis, visual disturbances secondary to benign intracranial hypertension
  - **SPECIFIC SIDE-EFFECTS**
    - With intravenous use Anaphylaxis
      - **SIDE-EFFECTS, FURTHER INFORMATION**
      - Visual disturbances Discontinue if visual disturbances secondary to benign intracranial hypertension occur.
  - **PREGNANCY** Crosses placenta. There is less experience of ciclosporin in pregnancy but it does not appear to be any more harmful than azathioprine. The use of ciclosporin during pregnancy needs to be supervised in specialist units.
  - **BREAST FEEDING** Present in milk - manufacturer advises avoid.
  - **HEPATIC IMPAIRMENT** Dosage adjustment based on bilirubin and liver enzymes may be needed.
  - **RENAL IMPAIRMENT** In patients with nephrotic syndrome and renal impairment initially 2.5 mg/kg daily. Reduce dose by 25–50% if serum creatinine more than 30% above baseline on more than one measurement.
    - In psoriasis and atopic dermatitis, reduce dose by 25–50% if serum creatinine increases more than 30% above baseline (even if within normal range) and discontinue if reduction not successful within 1 month.
  - **PRE-TREATMENT SCREENING** In psoriasis, exclude malignancies (including those of skin and cervix) before starting (biopsy any lesions not typical of psoriasis).
  - **MONITORING REQUIREMENTS**
    - Monitor whole blood ciclosporin concentration (trough level dependent on indication - consult local treatment protocol for details).
    - Dermatological and physical examination, including blood pressure and renal function measurements required at...
least twice before starting treatment for psoriasis or atopic dermatitis.

- Monitor liver function.
- Monitor serum potassium especially in renal dysfunction (risk of hyperkalaemia).
- Monitor serum magnesium.
- Measure blood lipids before treatment and after the first month of treatment.
- In psoriasis and atopic dermatitis monitor serum creatinine every 2 weeks for first 3 months then every month.
- Investigate lymphadenopathy that persists despite improvement in atopic dermatitis.
- Monitor kidney function—dose dependent increase in serum creatinine and urea during first few weeks may necessitate discontinuation (exclude rejection of kidney transplant).
- Monitor blood pressure—discontinue if hypertension develops that cannot be controlled by antihypertensives.
- In long-term management of nephrotic syndrome, perform renal biopsies every 1–2 years.

### DIRECTIONS FOR ADMINISTRATION

- With oral use Mix solution with orange juice (or squash) or apple juice (to improve taste) or with water immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. With capsules and oral solution, total daily dose should be taken in 2 divided doses.
- With intravenous use For intermittent intravenous infusion, dilute to a concentration of 0.5–2.5 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 2–6 hours; not to be used with PVC equipment. Observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.

### PRESCRIBING AND DISPENSING INFORMATION

Brand name prescribing: Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentration, serum creatinine, blood pressure, and transplant function.

- With oral use Sandimmun® capsules and oral solution are available direct from Novartis for patients who cannot be transferred to a different oral preparation.

### HANDLING AND STORAGE

Keep medicine measure away from other liquids (including water).

### PATIENT AND CARER ADVICE

Avoid excessive exposure to UV light, including sunlight. In psoriasis and atopic dermatitis, avoid use of UVB or PUVA.

Medicines for Children leaflet: Ciclosporin for nephrotic syndrome www.medicinesforchildren.org.uk/ciclosporin-nephrotic-syndrome-0

- With oral use Patients and carers should be counselled on the administration of ciclosporin capsules and oral solution.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

- **Excipients**: May contain Ethanol, ethyl lactate, propylene glycol
- **Ciclosporin (Non-proprietary)**
  - **Ciclosporin 25 mg** Ciclosporin 25mg capsules | 30 capsule [POM] no price available DT price = £18.37
  - **Ciclosporin 50 mg** Ciclosporin 50mg capsules | 30 capsule [POM] no price available DT price = £35.97
  - **Ciclosporin 100 mg** Ciclosporin 100mg capsules | 30 capsule [POM] no price available DT price = £68.28
  - **Capimune (Mylan Ltd)**
    - **Ciclosporin 25 mg** Capimune 25mg capsules | 30 capsule [POM] £13.05 DT price = £18.37

---

**Sirolimus**

#### DRUG ACTION

Sirolimus is a non-calcineurin inhibiting immunosuppressant.

#### INDICATIONS AND DOSE

As a component of immunosuppressive therapy for renal transplantation in children and adolescents only if intolerance necessitates the withdrawal of a calcineurin inhibitor

- **BY MOUTH**
  - **Child**: (consult local protocol)

**DOSE EQUIVALENCE AND CONVERSION**

The 500 microgram tablet is not bioequivalent to the 1 mg and 2 mg tablets. Multiples of 500 microgram tablets should not be used as a substitute for other tablet strengths.

#### UNLICENSED USE

Not licensed for use in children.

#### CAUTIONS

Hyperlipidaemia • increased susceptibility to infection (especially urinary-tract infection) • increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light)

#### INTERACTIONS

→ Appendix 1 (sirolimus).
Immune system and malignant disease

Tacrolimus

**DRUG ACTION** Tacrolimus is a calcineurin inhibitor.

**INDICATIONS AND DOSE**

**ADOPORT®**
- Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation
  - **BY MOUTH**
  - Neonate: Initially 150 micrograms/kg twice daily.
  - Child: Initially 150 micrograms/kg twice daily

**CAPEXION®**
- Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation
  - **BY MOUTH**
  - Neonate: Initially 150 micrograms/kg twice daily.
  - Child: Initially 150 micrograms/kg twice daily

**INDICATIONS AND DOSE**

**ADOPORT®**
- Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation
  - **BY MOUTH**
  - Neonate: Initially 150 micrograms/kg twice daily.
  - Child: Initially 150 micrograms/kg twice daily

**CAPEXION®**
- Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation
  - **BY MOUTH**
  - Neonate: Initially 50–150 micrograms/kg twice daily.
  - Child: Initially 50–150 micrograms/kg twice daily

**SIDE-EFFECTS**
- Common or very common
  - Abdominal pain, acne, anaemia, arthralgia, ascites, constipation, diarrhoea, epistaxis, haemolytic uraemic syndrome, headache, hypercholesterolaemia, hyperglycaemia, hypertension, hypertrophic cardiomyopathy, hypokalaemia, hypophosphataemia, impaired healing, leukopenia, lymphoedema, nausea, neutropenia, oedema, osteonecrosis, pleural effusion, pneumonitis, proteinuria, pyrexia, rash, stomatitis, tachycardia, thrombocytopenia, thrombotic thrombocytopenic purpura, venous thromboembolism
- Uncommon
  - Nephrotic syndrome, pancreatitis, pancytopenia, pericardial effusion, pulmonary oedema
- Rare
  - Alveolar proteinosis, anaphylactic reactions, angioedema, exfoliative dermatitis, hepatic necrosis, hypersensitivity reactions, hypersensitivity vasculitis, interstitial lung disease, lymphoedema
- Frequency not known
  - Focal segmental glomerulosclerosis, reversible impairment of male fertility

**CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment and for 12 weeks after stopping.

**PREGNANCY** Avoid unless essential—toxicity in animal studies.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Dose reduction may be necessary, consult local treatment protocols for details. Monitor whole blood-sirolimus level closely and consult local treatment protocols for details. Monitor whole blood-sirolimus level closely and consult local treatment protocols for details. Monitor whole blood-sirolimus level closely and consult local treatment protocols for details. Monitor whole blood-sirolimus level closely and consult local treatment protocols for details.

**MONITORING REQUIREMENTS**
- Monitor whole blood-sirolimus trough concentration (Africo-Caribbean patients may require higher doses).
- Monitor kidney function when given with ciclosporin; monitor lipids; monitor urine proteins.
- **DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food). Sirolimus oral solution should be mixed with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sirolimus. Patients should be advised to avoid excessive exposure to UV light.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Rapamune (Pfizer Ltd)
  - Sirolimus 500 microgram Rapamune 0.5mg tablets
    - 30 tablet [P] £69.00 DT price + £69.00
  - Sirolimus 1 mg Rapamune 1mg tablets
    - 30 tablet [P] £86.49 DT price + £86.49
  - Sirolimus 2 mg Rapamune 2mg tablets
    - 30 tablet [P] £172.98 DT price + £172.98

**Oral solution**
EXCIPIENTS: May contain Ethanol
- Rapamune (Pfizer Ltd).
  - Sirolimus 1 mg per 1 ml Rapamune 1mg/ml oral solution sugar-free
    - 60 ml [P] £162.41

**CONTRAINDICATIONS**
- Hypersensitivity reactions
- Angioedema
- Thrombocytopenia
- Pancytopenia
- Leukopenia
- Thrombocytopenic purpura
- Venous thromboembolism
- Interstitial lung disease
- Thrombotic thrombocytopenic purpura
- Focal segmental glomerulosclerosis
- Reversible impairment of male fertility
- Uncommon
  - Nephrotic syndrome, pancreatitis, pancytopenia, pericardial effusion, pulmonary oedema
- Rare
  - Alveolar proteinosis, anaphylactic reactions, angioedema, exfoliative dermatitis, hepatic necrosis, hypersensitivity reactions, hypersensitivity vasculitis, interstitial lung disease, lymphoedema
- Frequency not known
  - Focal segmental glomerulosclerosis, reversible impairment of male fertility
Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

- **BY MOUTH**
- **Neonate:** Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion).
- **Child:** Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion)

Allograft rejection resistant to conventional immunosuppressive therapy

- **BY MOUTH**
- **Child:** Seek specialist advice

**MODIGRAF®**

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

- **BY MOUTH**
- **Neonate:** Initially 150 micrograms/kg twice daily.
- **Child:** Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

- **BY MOUTH**
- **Neonate:** Initially 150 micrograms/kg twice daily.
- **Child:** Initially 150 micrograms/kg twice daily, a lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high ‘trough’ concentrations.

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

- **BY MOUTH**
- **Neonate:** Initially 50–150 micrograms/kg twice daily.
- **Child:** Initially 50–150 micrograms/kg twice daily

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

- **BY MOUTH**
- **Neonate:** Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion).
- **Child:** Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion)

Allograft rejection resistant to conventional immunosuppressive therapy

- **BY MOUTH**
- **Child:** Seek specialist advice

**PROGRAF® INFUSION**

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

- **BY CONTINUOUS INTRAVENOUS INFUSION**
- **Neonate:** Initially 50 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours.
- **Child:** Initially 50 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following kidney transplantation, starting 12 hours after transplantation when oral route not appropriate

- **BY CONTINUOUS INTRAVENOUS INFUSION**
- **Neonate:** Initially 75–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours.
- **Child:** Initially 75–100 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

- **BY CONTINUOUS INTRAVENOUS INFUSION**
- **Neonate:** Initially 30–50 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours.
- **Child:** Initially 30–50 micrograms/kg daily for up to 7 days (then transfer to oral therapy), dose to be administered over 24 hours

Allograft rejection resistant to conventional immunosuppressive therapy

- **BY CONTINUOUS INTRAVENOUS INFUSION**
- **Child:** Seek specialist advice (consult local protocol)

**TACNI®**

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

- **BY MOUTH**
- **Neonate:** Initially 150 micrograms/kg twice daily.
- **Child:** Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion).
Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation
► BY MOUTH
* Neonate: Initially 150 micrograms/kg twice daily.
* Child: Initially 150 micrograms/kg twice daily, a lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high ‘tough’ concentrations

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation
► BY MOUTH
* Neonate: Initially 50–150 micrograms/kg twice daily.
* Child: Initially 50–150 micrograms/kg twice daily

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation
► BY MOUTH
* Neonate: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion).
* Child: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion).

Allograft rejection resistant to conventional immunosuppressive therapy
► BY MOUTH
* Child: Seek specialist advice

VIVADEX®
Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation
► BY MOUTH
* Neonate: Initially 150 micrograms/kg twice daily.
* Child: Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation
► BY MOUTH
* Neonate: Initially 150 micrograms/kg twice daily.
* Child: Initially 150 micrograms/kg twice daily, a lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high ‘tough’ concentrations

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation
► BY MOUTH
* Neonate: Initially 50–150 micrograms/kg twice daily.
* Child: Initially 50–150 micrograms/kg twice daily

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation
► BY MOUTH
* Neonate: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion).
* Child: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion).

IMPORTANT SAFETY INFORMATION
MHRA/CHM ADVICE: ORAL TACROLIMUS PRODUCTS: PRESCRIBE AND DISPENSE BY BRAND NAME ONLY, TO MINIMISE THE RISK OF INADVERTENT SWITCHING BETWEEN PRODUCTS, WHICH HAS BEEN ASSOCIATED WITH REPORTS OF TOXICITY AND GRAFT REJECTION (JUNE 2012)

Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- Adoport®, Prograf®, Capaxion®, Tacni®, and Vivadex® are immediate-release capsules that are taken twice daily, once in the morning and once in the evening.
- Modigran® granules are used to prepare an immediate-release oral suspension which is taken twice daily, once in the morning and once in the evening.
- Advagraf® is a prolonged-release capsule that is taken once daily in the morning.

Switching between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist.

Important: Envarsus® is not interchangeable with other oral tacrolimus containing products; the MHRA has advised (June 2012) that oral tacrolimus products should be prescribed and dispensed by brand only.

**CAUTIONS**
Increased risk of infections - lymphoproliferative disorders - malignancies - neurotoxicity - QT-interval prolongation - UV light (avoid excessive exposure to sunlight and sunlamps)

**INTERACTIONS** Appendix 1 (tacrolimus). Contraindication—avoid concurrent administration with ciclosporin (care if patient has previously received ciclosporin).

**SIDE-EFFECTS**
► Common or very common Acne • alopecia • anaemia • anorexia • anxiety • arthralgia • ascites • bile-duct abnormalities • bloating • blood disorders • cholestatics • confusion • constipation • depression • diarrhoea • dizziness • dyspepsia • dyspnoea • electrolyte disturbances • flatulence • gastrointestinal inflammation • gastrointestinal perforation • gastro-intestinal ulceration • haemorrhage • headache • hepatic dysfunction • hyperglycaemia • hyperkalaemia • hypertension • hyperuricaemia • hypokalaemia • impaired hearing • ischaemic events • jaundice • leucopenia • mood changes • muscle cramp • nausea • oedema • pancytopenia • paraesthesia • parenchymal lung disorders • peripheral neuropathy • photophobia • pleural effusion • psychosis • renal failure • renal impairment • renal tubular necrosis • seizures • sleep disturbances • sweating • tachycardia • thrombocytopenia • thromboembolic events • tinnitus • tremor • urinary abnormalities • visual disturbances • vomiting • weight changes
► Uncommon Amnesia • arrhythmia • cardiac arrest • cardiomyopathy • cataract • cerebrovascular accident • coagulation disorders • coma • dermatitis • dysmenorrhoea • encephalopathy • gastro-intestinal reflux disease • heart failure • hypertonia • hypoglycaemia • influenza-like symptoms • palpitation • pancreatitis • paralysis • paralytic ileus • peritonitis • photosensitivity • respiratory failure • speech disorder
► Rare Blindness • dehydration • hirsutism • pericardial effusion • posterior reversible encephalopathy syndrome •
Immune system disorders and transplantation

Immune system and malignant disease

Canakinumab

● **Drug action** Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding.

● **Indications and dose** Treatment of cryopyrin-associated periodic syndromes, including severe forms of familial cold auto-inflammatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological cutaneous and articular syndrome)

  ▶ By subcutaneous injection

  Child: (consult product literature)

Active systemic juvenile idiopathic arthritis (in combination with methotrexate or alone) in children who have had an inadequate response to NSAlDs and systemic corticosteroids

  ▶ By subcutaneous injection

  Child 2-17 years (body-weight 7.5 kg and above): 4 mg/kg every 4 weeks (max. per dose 300 mg)

● **Contra-indications** Active infection - leucopenia - neutropenia

● **Caution** History of recurrent infection - latent and active tuberculosis - predisposition to infection

Caution, further information

• Vaccinations Patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature for further information.
**Immune system disorders and transplantation**

**Basiliximab**

**Drug Action** Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation.

**Indications and Dose**

**Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with cyclosporin and corticosteroid-containing immunosuppression regimens (specialist use only)**

- **By intravenous injection, or by intravenous infusion**
  - Child 1-17 years (body-weight up to 35 kg): Initially 10 mg, dose to be administered within 2 hours before transplant surgery, followed by 10 mg after 4 days, dose administered after transplant surgery, withhold second dose if severe hypersensitivity or graft loss occurs
  - Child 1-17 years (body-weight 35 kg and above): Initially 20 mg, administered within 2 hours before transplant surgery, followed by 20 mg after 4 days, dose to be administered after surgery, withhold second dose if severe hypersensitivity or graft loss occurs

**Side Effects**

**General side-effects**

- Common or very common: Back pain, increased susceptibility to infection (including serious infection), injection-site reactions, malaise, neutropenia, vertigo

- Uncommon: Gastro-oesophageal reflux

- Frequency not known: Malignancy, vomiting

**Special Side-effects**

- When used for active systemic juvenile idiopathic arthritis (in combination with methotrexate or alone) in children who have had an inadequate response to non-steroidal anti-inflammatory drugs or other systemic corticosteroids, Abdominal pain, arthralgia, musculoskeletal pain, rhinitis

**Conception and Contraception** Effective contraception required during treatment and for up to 3 months after last dose.

**Pregnancy**

- Manufacturer advises avoid—no information available.

**Breastfeeding**

- Manufacturer advises avoid—no information available.

**Directions for Administration**

- With intravenous use For intravenous infusion, dilute reconstituted solution to a concentration not exceeding 400 micrograms/mL, with Glucose 5% or Sodium Chloride 0.9%; give over 20–30 minutes.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- Ilaris (Novartis Pharmaceuticals UK Ltd)

**Canakinumab 150 mg** Ilaris 150mg powder for solution for injection vials | 1 vial £842.38 (Hospital only)

**IMMUNOSUPPRESSANTS > PURINE SYNTHESIS INHIBITORS**

**Mycophenolate mofetil**

**Indications and Dose**

**Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and ciclosporin)** (under expert supervision)

- **By mouth**
  - Child: 500 mg/m² twice daily, consult local protocol for details; maximum 2 g per day

**Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and tacrolimus)** (under expert supervision)

- **By mouth**
  - Child: 300 mg/m² twice daily, consult local protocol for details; maximum 2 g per day

**Prophylaxis of acute rejection in hepatic transplantation (in combination with a corticosteroid and ciclosporin or tacrolimus)** (under expert supervision)

- **By mouth**
  - Child: 10 mg/kg twice daily, increased to 20 mg/kg twice daily, consult local protocol for details; maximum 2 g per day

**Dose equivalence and conversion**

**MYFORTIC®** Mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences.

**Unlicensed use**

**Caution**

- Active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation), children (higher incidence of side-effects may call for temporary reduction of dose or interruption), delayed graft function, increased susceptibility to skin cancer (avoid exposure to strong sunlight), risk of hypogammaglobulinaemia or
bronchiectasis when used in combination with other immunosuppressants

**CONTRAINDICATIONS**
- Hypogammaglobulinaemia or bronchiectasis. Measure serum immunoglobulin levels if recurrent infections develop, and consider bronchiectasis or pulmonary fibrosis if persistent respiratory symptoms such as cough and dyspnoea develop.

**INTERACTIONS**
- Appendix 1 (mycophenolate). Possible decreased effectiveness of vaccination—avoid live vaccines.

**SIDE-EFFECTS**
- Common or very common Abdominal pain, acne, agitation, alopecia, anaemia, anorexia, anxiety, arthralgia, blood disorders, confusion, constipation, convulsions, cough, depression, diarrhoea, disturbances of blood lipids, disturbances of electrolytes and blood lipids, dizziness, dyspnoea, flatulence, gastrointestinal bleeding, gastrointestinal inflammation, gastrointestinal ulceration, gingival hyperplasia, headache, hepatitis, hyperglycaemia, hypertension, hypotension, ileus, infections, influenza-like syndrome, insomnia, jaundice, leucopenia, malignancy (particularly of the skin), myasthenic syndrome, nausea, oedema, pancreatitis, pancytopenia, paraesthesia, pleural effusion, rash, red cell aplasia, renal impairment, skin hypertrophy, stomatitis, tachycardia, taste disturbance, thrombocytopenia, tremor, vasodilatation, vomiting, weight loss.
- Frequency not known Interstitial lung disease—intestinal villous atrophy—progressive multifocal leucoencephalopathy—pulmonary fibrosis.

**SIDE-EFFECTS, FURTHER INFORMATION**
Cases of pure red cell aplasia have been reported with mycophenolate mofetil; dose reduction or discontinuation should be considered under specialist supervision.

**CONCEPTION AND CONTRACEPTION**

Women should use 2 methods of effective contraception during treatment, and for 6 weeks after discontinuation. Men should use condoms during treatment and for at least 90 days after discontinuation of treatment; female partners of male patients should also use effective contraception during treatment and for 90 days after discontinuation.

**PREGNANCY**
Avoid unless no suitable alternative—congenital malformations and spontaneous abortions reported.

**BREAST FEEDING**
Manufacturer advises avoid—present in milk in animal studies.

**RENAL IMPAIRMENT**
Manufacturer advises consider dose reduction if estimated glomerular filtration rate less than 25 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**
Monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops).

**PRESCRIBING AND DISPENSING INFORMATION**
Tablets and capsules not appropriate for dose titration in children with body surface area less than 1.25 m².

**PATIENT AND CARER ADVICE**
Bone marrow suppression. Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexcusable bruising or bleeding.

**IMMUNOSUPPRESSANTS**
- MONOCLONAL ANTIBODIES

**Antibody responsive malignancy**

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**
- **Mycophenolate mofetil (Non-proprietary)**
  - Mycophenolate mofetil 500 mg. Mycophenolate mofetil 500 mg tablets | 50 tablet (Roche) £82.26 DT price = £8.05
  - **CellCept** (Roche Products Ltd)
    - Mycophenolate mofetil 500 mg CellCept 500 mg tablets | 50 tablet (Roche) £82.26 DT price = £8.05
  - **Myfenax** (Teva UK Ltd)
    - Mycophenolate mofetil 500 mg Myfenax 500 mg tablets | 50 tablet (Teva) £78.15 DT price = £8.05

**Gastro-resistant tablet**

**CAUTIONARY AND ADVISORY LABELS**
- **25**
  - **Myfortic** (Novartis Pharmaceuticals UK Ltd)
    - Mycophenolic acid (as Mycophenolate sodium) 180 mg Myfortic 180 mg gastro-resistant tablets | 120 tablet (Roche) £96.72
  - Mycophenolic acid (as Mycophenolate sodium) 360 mg Myfortic 360 mg gastro-resistant tablets | 120 tablet (Roche) £193.43

**Capsule**
- **Mycophenolate mofetil (Non-proprietary)**
  - Mycophenolate mofetil 250 mg Mycophenolate mofetil 250 mg capsules | 100 capsule (Roche) £82.26 DT price = £8.26
  - **CellCept** (Roche Products Ltd)
    - Mycophenolate mofetil 250 mg CellCept 250 mg capsules | 100 capsule (Roche) £82.26 DT price = £8.26
  - **Myfenax** (Teva UK Ltd)
    - Mycophenolate mofetil 250 mg Myfenax 250 mg capsules | 100 capsule (Teva) £82.26 DT price = £8.26

**Oral suspension**

**EXCIPIENTS:** May contain Aspartame.
- **CellCept** (Roche Products Ltd)
  - Mycophenolate mofetil 200 mg per 1 ml CellCept 1g/5ml oral suspension sugar-free | 175 ml (Roche) £115.16

**Malignant disease**

**1 Antibody responsive malignancy**

**IMMUNOSUPPRESSANTS**
- MONOCLONAL ANTIBODIES

**Anti-lymphocyte monoclonal antibodies**

**DRUG ACTION**
The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

**IMPORTANT SAFETY INFORMATION**
All anti-lymphocyte monoclonal antibodies should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities are immediately available.

**SIDE-EFFECTS**
- Common or very common Allergic reactions—angioedema—bronchospasm—chills—cytokine release syndrome—dyspnoea—fever—flushing—nausea—pruritus—rash—tumour pain—vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
Infusion-related side effects. Infusion-related side-effects occur predominantly during the first infusion. Patients should be given paracetamol and an antihistamine before each dose of anti-lymphocyte monoclonal antibodies to reduce infusion-related side-effects. Premedication with a
corticosteroid should also be considered. The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management.

Evidence of pulmonary infiltration and features of tumour lysis syndrome should be sought if infusion-related effects occur.

- Cytokine release syndrome Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored very closely (and a slower rate of infusion considered).

- PRE-TREATMENT SCREENING All patients should be screened for hepatitis B before treatment.

Rituximab

- INDICATIONS AND DOSE
  Post-transplantation lymphoproliferative disease (under expert supervision) Non-Hodgkin’s lymphoma (under expert supervision) Hodgkin’s lymphoma (under expert supervision) Severe cases of resistant immune modulated disease including idiopathic thrombocytopenia purpura, haemolytic anaemia, and systemic lupus erythematosus (under expert supervision)
  - BY INTRAVENOUS INFUSION
  - Child: Patients should receive premedication before each dose (consult product literature for details) (consult local protocol)

- UNLICENSED USE Not licensed for use in children.

- CAUTIONS History of cardiovascular disease; in adults exacerbation of angina, arrhythmia, and heart failure have been reported; transient hypotension occurs frequently during infusion (anti-hypertensives may need to be withheld for 12 hours before infusion)

- CAUTIONS, FURTHER INFORMATION
  - Hepatitis B infection and reactivation Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking rituximab. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

  - For full details on cautions, consult product literature or local treatment protocol.

- INTERACTIONS + Appendix 1 (rituximab).

- SIDE-EFFECTS
  - Abdominal pain • anaemia • antibody formation • aplastic anaemia • arthralgia • asthenia • blood disorders • depression • dyspepsia • headache • hypertension • hypotension • injection-site reactions • leucopenia • lupus erythematosus-like syndrome • migraine • muscle spasm • pancytopenia • paraesthesia • progressive multifocal leucoencephalopathy • pruritus • rhinitis • severe fatal skin reactions • severe skin reactions (permanently discontinue treatment if occurs) • sore throat • Stevens-Johnson syndrome (permanently discontinue treatment if occurs) • thrombocytopenia • toxic epidermal necrolysis (permanently discontinue treatment if occurs) • urticaria • worsening heart failure

SIDE-EFFECTS, FURTHER INFORMATION
Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

- Progressive multifocal leucoencephalopathy Progressive multifocal leucoencephalopathy (which is usually fatal or causes severe disability) has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded.

- For full details, including management of side-effects, consult product literature.

- CONCEPTION AND CONTRACEPTION Effective contraception (in both sexes) required during and for 12 months after treatment.

- PREGNANCY Avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus.

- BREAST FEEDING Avoid breast-feeding during and for 12 months after treatment.

- MONITORING REQUIREMENTS For full details on monitoring requirements consult product literature.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  Solution for infusion
  - MabThera (Roche Products Ltd)
    Rituximab 10 mg per 1 ml MabThera 100mg/10ml concentrate for solution for infusion vials | 2 vial (£70.50)
    MabThera 500mg/50ml concentrate for solution for infusion vials | 1 vial (£20.50) £673.15

2 Cytotoxic responsive malignancy

Cytotoxic drugs

Overview
The management of childhood cancer is complex and is generally confined to specialist regional centres and some associated shared-care units.

Cytotoxic drugs have both anti-cancer activity and the potential for damage to normal tissue. In children, chemotherapy is almost always started with curative intent, but may be continued as palliation if the disease is refractory.

Chemotherapy with a combination of two or more cytotoxic drugs aims to reduce the development of resistance and to improve cytotoxic effect. Treatment protocols generally incorporate a series of treatment courses at defined intervals with clear criteria for starting each course, such as adequate bone-marrow recovery and renal or cardiac function. The principal component of treatment for leukaemias in children is cytotoxic therapy, whereas solid tumours may be managed with surgery or radiotherapy in addition to chemotherapy.

Only medical or nursing staff who have received appropriate training should administer parenteral cytotoxics. In most instances central venous access will be required for the intravenous administration of cytotoxics to children; care is required to avoid the risk of extravasation (see Side-effects of Cytotoxic Drugs and their Management).

Guidelines for handling cytotoxic drugs

- Trained personnel should reconstitute cytotoxics
- Reconstitution should be carried out in designated pharmacy areas
Protective clothing (including gloves, gowns, and masks) should be worn.
The eyes should be protected and means of first aid should be specified.
Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard).
Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material.
Staff exposure to cytotoxic drugs should be monitored.

Intrathecal chemotherapy
A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available.

Safe systems for cytotoxic medicines:
Safe system requirements for cytotoxic medicines:
- Cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care that is coordinated by a multi-disciplinary team.
- Cytotoxic drugs should be prescribed, dispensed and administered only in the context of a written protocol or treatment plan.
- Injectable cytotoxic drugs should only be dispensed if they are prepared for administration.
- Oral cytotoxic medicines should be dispensed with clear directions for use.

IMPORTANT SAFETY INFORMATION
RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy. Standards to be followed to achieve this include:
- non-specialists who prescribe or administer on-going oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity;
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital.

Doses
Doses of cytotoxic drugs are determined using a variety of different methods including age, body-surface area, or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient’s neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from many of the drug entries in this chapter.

Pregnancy and reproductive function
Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Exclude pregnancy before treatment with cytotoxic drugs. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Contraceptive advice should be given to men and women before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended). Alkylating drugs can have an adverse effect on gametogenesis, which may be reversible particularly in females. Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy. Amenorrhoea may occur, which also may be reversible.

Side-effects of cytotoxic drugs and their management
Gastro-intestinal effects
Management of gastrointestinal effects of cytotoxic drugs includes the use of antacids, H₂-receptor antagonists, and proton pump inhibitors to protect the gastric mucosa, laxatives to treat constipation, and enteral and parenteral nutritional support.

Oral mucositis
Good oral hygiene keeps the mouth clean and moist and helps to prevent mucositis; prevention is more effective than treatment of the complication. Good oral hygiene measures for children over 6 months include brushing teeth with a soft small brush with fluoride toothpaste 2-3 times daily, and rinsing the mouth frequently. Daily fluoride supplements can be used on the advice of the child’s dental team. For children under 6 months or when it is not possible to brush teeth, carers should be instructed how to clean the mouth using an oral sponge moistened with water or with an antimicrobial solution such as diluted chlorhexidine. Mucositis related to chemotherapy can be extremely painful and may, in some circumstances, require opioid analgesia. Secondary infection with candida is frequent; treatment with a systemically absorbed antifungal, such as fluconazole p. 352, is effective.

Nausea and vomiting
Nausea and vomiting cause considerable distress to many children who receive chemotherapy, and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Susceptibility to nausea and vomiting may increase with repeated exposure to the cytotoxic drug. Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs...
administered, and to the individual’s susceptibility to emetogenic stimuli.  

Mildly emetogenic treatment—fluorouracil, etoposide p. 510, low doses of methotrexate p. 506, the vinca alkaloids, and abdominal radiotherapy.  

Highly emetogenic treatment—cisplatin p. 510, dacarbazine p. 499, and high doses of alkylating drugs. 

Anti-emetic drugs, when given regularly, help prevent or ameliorate emesis associated with chemotherapy in children. 

Prevention of acute symptoms: For patients at low risk of emesis, pretreatment with a 5HT3-receptor antagonist may be of benefit.  

For patients at high risk of emesis or when other treatment is inadequate, a 5HT3-receptor antagonist is often highly effective. The addition of dexamethasone p. 410 and other anti-emetics may also be required. 

Prevention of delayed symptoms: dexamethasone, given by mouth, is the drug of choice for preventing delayed symptoms; it is used alone or with metoclopramide hydrochloride p. 246. Due to the risks of neurological side-effects, metoclopramide hydrochloride should only be used in children as a second-line option. The 5HT3-receptor antagonists may have a role in preventing uncontrolled symptoms. 

Prevention of anticipatory symptoms: Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam p. 209 can be helpful for its amnesiac, sedative, and anxiolytic effects. 

Bone-marrow suppression 

All cytotoxic drugs except vincristine sulfate p. 511 and bleomycin p. 509 cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as melphalan p. 500. Peripher al blood counts must be checked before each treatment. The duration and severity of neutropenia can be reduced by the use of granulocyte-colony stimulating factors; their use should be reserved for children who have previously experienced severe neutropenia. 

Cytotoxic drugs may be contra-indicated in children with acute infection; any infection should be treated before, or when starting, cytotoxic drugs. 

Infection in a child with neutropenia requires immediate broad-spectrum antibacterial treatment that covers all likely pathogens. Appropriate bacteriological investigations should be conducted as soon as possible. Children taking cytotoxic drugs who have signs or symptoms of infection (or their carers) should be advised to seek prompt medical attention. All children should be investigated and treated under the supervision of an appropriate oncology or haematology specialist. Antifungal treatment may be required in a child with prolonged neutropenia or fever lasting longer than 4–5 days. Chickenpox and measles can be particularly hazardous in immunocompromised children. 

Varicella-zoster immunoglobulin p. 730 is indicated if the child does not have immunity against varicella and has had close contact with infectious chickenpox or herpes zoster. Antiviral prophylaxis can be considered in addition to varicella-zoster immunoglobulin or as an alternative if varicella-zoster immunoglobulin is inappropriate. If an immunocompromised child has come into close contact with an infectious individual with measles, normal immunoglobulin p. 727 should be given. 

For advice on the use of live vaccines in individuals with impaired immune response, see Vaccines. 

Alopecia 

Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients. 

Long-term and delayed toxicity 

Cytotoxic drugs may produce specific organ-related toxicity in children (e.g. cardiotoxicity with doxorubicin hydrochloride or nephrotoxicity with cisplatin and ifosfamide p. 499). Manifestations of such toxicity may not appear for several months or even years after cancer treatment. Careful follow-up of survivors of childhood cancer is therefore vital; national and local guidelines have been developed to facilitate this. 

Thromboembolism 

Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk. 

Tumour lysis syndrome 

Tumour lysis syndrome occurs secondary to spontaneous or treatment related rapid destruction of malignant cells. 

Patients at risk of tumour lysis syndrome include those with non-Hodgkin’s lymphoma (especially if high grade and bulky disease), Burkitt’s lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration and renal impairment are also predisposing factors. Features, include hyperkalaemia, hyperuricaemia, and hyperphosphataemia with hypeocalcaemia; renal damage and arrhythmias can follow. Early recognition of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential. 

Treatment for cytotoxic-induced side effects 

Hyperuricaemia 

Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure. 

Allopurinol p. 516 is used routinely in children at low to moderate risk of hyperuricaemia. It should be started 24 hours before treatment; patients should be adequately hydrated (consideration should be given to omitting phosphate and potassium from hydration fluids). The dose of mercaptopurine p. 505 or azathioprine p. 485 should be reduced if allopurinol is given concomitantly. 

Rasburicase p. 516 is a recombinant urate oxidase used in children who are at high-risk of developing hyperuricaemia. It rapidly reduces plasma-uric acid concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas. 

Methotrexate-induced mucositis and myelosuppression 

Folinic acid p. 515 (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate and thus speed recovery from methotrexate-induced mucositis or myelosuppression (‘folinic acid rescue’). 

The calcium salt of levo folinic acid p. 516, a single isomer of folic acid, is also used following methotrexate administration. The dose of calcium levo folinate is generally half that of calcium folinate. 

The disodium salts of folic acid and levo folic acid are also used for rescue therapy following methotrexate administration. 

The efficacy of high dose methotrexate is enhanced by delaying initiation of folic acid for at least 24 hours, local protocols define the correct time. Folic acid is normally continued until the plasma-methotrexate concentration falls to 45–90 nanograms/mL (100–200 nanomol/litre). 

In the treatment of methotrexate p. 506 overdose, folinate should be administered immediately; other measures to enhance the elimination of methotrexate are also necessary. 

Urothelial toxicity 

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide p. 498 and ifosfamide p. 499; it is caused by the metabolite acrolein. Adequate hydration is essential to reduce the risk of urothelial toxicity. Mesna p. 515 reacts
specifically with acrolein in the urinary tract, preventing toxicity. Mesna is given for the same duration as cyclophosphamide or ifosfamide. It is generally given intravenously; the dose of mesna is equal to or greater than that of the oxazaphosphorine. See the role of nebulised mesna as a mucolytic in cystic fibrosis.

**Cytotoxic antibiotics**

Cytotoxic antibiotics are widely used. Many act as radiomimetics and simultaneous use of radiotherapy should be avoided because it may markedly increase toxicity. Daunorubicin p. 501, doxorubicin hydrochloride p. 502, and epirubicin hydrochloride p. 502 are anthracycline antibiotics. Mitoxantrone p. 503 (mitozantron) is an anthracycline derivative. Epirubicin hydrochloride and mitoxantrone are considered less toxic than the other anthracycline antibiotics, and may be suitable for children who have received high cumulative doses of other anthracyclines.

**Vinca alkaloids**

The vinca alkaloids, vinblastine sulfate p. 511 and vincristine sulfate p. 511 are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours.

**Antimetabolites**

Antimetabolites are incorporated into new nuclear material or they combine irreversibly with cellular enzymes and prevent normal cellular division. Cytarabine p. 504, fludarabine phosphate p. 505, mercaptopurine p. 505, methotrexate, and tioguanine p. 506 are commonly used in paediatric chemotherapy.

**Other antineoplastic drugs**

**Asparaginase**

Asparaginase is used almost exclusively in the treatment of acute lymphoblastic leukaemia. Hypersensitivity reactions may occur and facilities for the management of anaphylaxis are used. A number of different preparations of asparaginase exist and only the product specified in the treatment protocol should be used.

**ANTINEOPLASTIC DRUGS**

***Busulfan*** *(Busulphan)*

**INDICATIONS AND DOSE**

Conditioning treatment before haematopoietic progenitor cell transplantation

- By mouth, or by intravenous infusion
- Child: (consult local protocol)

**DOSES AT EXTREMES OF BODY-WIGHT**

Dose may need to be calculated based on body surface area or adjusted ideal body weight in obese patients—consult product literature.

**INTERACTIONS**

→ Appendix 1 (busulfan).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Cardiac tamponade in thalassaemia; hepatic fibrosis; hepatic veno-occlusive disease; hepatotoxicity; hyperbilirubinaemia; jaundice; pneumonia; skin hyperpigmentation
- **Rare** Aplastic anaemia; erythema; hypersensitivity reactions; progressive pulmonary fibrosis; seizures; urticaria; visual disturbances
- **Very rare** Gynaecomastia; myasthenia gravis
- **Frequency not known** Alopecia; amenorrhoea (may be reversible); bone-marrow suppression; dilutional hyponatraemia; fluid retention; gastro-intestinal effects; hyperuricaemia; irreversible bone-marrow aplasia; lung toxicity; male sterility; nausea; oedema; oral mucositis; organ-related toxicity (long-term and delayed); premature menopause; secondary malignancy; thromboembolism; tumour lysis syndrome; vomiting

**SPECIFIC SIDE-EFFECTS**

- With intravenous use Extravasation

**SIDE-EFFECTS, FURTHER INFORMATION**

- Lung toxicity Discontinue if lung toxicity develops.
- Secondary malignancy Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
- Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

**CONCEPTION AND CONTRACEPTION**

Manufacturers advise effective contraception during and for 6 months after treatment in men or women. See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

**PREGNANCY**

Avoid (teratogenic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

**BREAST FEEDING**

Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

Manufacturer advises caution. In patients with hepatic impairment, manufacturer advises regular liver function tests—consult product literature.

**MONITORING REQUIREMENTS**

- Monitor cardiac and liver function.
- Monitor full blood count regularly throughout treatment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Tablet**

- **Busulfan (Non-proprietary)**
  - **Busulfan 2 mg** Busulfan 2mg tablets | 25 tablet ₣89.02

**Solution for infusion**

- **Busilvex** *(Pierre Fabre Ltd)*
  - **Busulfan 6 mg per 1 ml** Busilvex 60mg/10ml concentrate for solution for infusion ampoules | 8 ampoule ₣1,610.00 (Hospital only)
**Chlorambucil**

**INDICATIONS AND DOSE**

Hodgkin’s disease | Non-Hodgkin’s lymphoma
- **BY MOUTH**
  - Child: (consult local protocol)

Relapsing steroid-sensitive nephrotic syndrome (initiated in specialist centres)
- **BY MOUTH**
  - Child 3 months–17 years: 200 micrograms/kg daily for 8 weeks

**UNLICENSED USE** Not licensed for use in nephrotic syndrome.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES** See Cytotoxic drugs p. 494.

**CAUTIONS** Avoid in Acute porphyrias p. 562 - children with nephrotic syndrome (increased seizure risk) - history of epilepsy (increased seizure risk)

**SIDE-EFFECTS**
- **Uncommon** Skin rash
- **Rare** Hepatotoxicity - jaundice - seizures
- **Very rare** Irreversible bone-marrow suppression - male sterility (in prepubertal and pubertal males) - peripheral neuropathy - pulmonary fibrosis - sterile cystitis - tremor
- **Frequency not known** Alopecia - amenorrhoea - bone-marrow suppression - dilutional hyponatraemia - fluid retention - gastro-intestinal effects - hyperuricaemia - nausea - oedema - oral mucositis - organ-related toxicity (long-term and delayed) - premature menopause - secondary malignancy - Stevens-Johnson syndrome - thromboembolism - toxic epidermal necrolysis - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
- Secondary malignancy Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
- Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

**CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

**PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Manufacturer advises consider dose reduction in severe impairment—limited information available.

**MONITORING REQUIREMENTS** Monitor full blood count regularly throughout treatment.

**PANCREATIC ADVICE**

Medicines for Children leaflet: Chlorambucil for nephrotic syndrome www.medicinesforchildren.org.uk/chlorambucil-nephrotic-syndrome-0

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Chlorambucil (Non-proprietary)
  - Chlorambucil 2 mg Chlorambucil 2mg tablets | 25 tablet
  - £42.87 DT price + £42.87

---

**Cyclophosphamide**

**INDICATIONS AND DOSE**

Acute lymphoblastic leukaemia, non-Hodgkin’s lymphoma, retinoblastoma, neuroblastoma, rhabdomyosarcoma, soft-tissue sarcomas, Ewing tumour, neuroectodermal tumours (including medulloblastoma), infant brain tumours, ependymoma, high-dose conditioning for bone marrow transplantation, lupus nephritis
- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Child: (consult local protocol)

Steroid-sensitive nephrotic syndrome
- **BY MOUTH**
  - Child 3 months–17 years: 2–3 mg/kg daily for 8 weeks
  - **BY INTRAVENOUS INFUSION**
  - Child 3 months–17 years: 500 mg/m² once a month for 6 months

**UNLICENSED USE** Not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES** See Cytotoxic drugs p. 494.

**CONTRA-INDICATIONS** Haemorrhagic cystitis

**CAUTIONS** Avoid in Acute porphyrias p. 562 - diabetes mellitus - previous or concurrent mediastinal irradiation — risk of cardiotoxicity

**INTERACTIONS** → Appendix 1 (cyclophosphamide).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- **Common or very common** Anorexia - cardiotoxicity at high doses - disturbances of carbohydrate metabolism - inappropriate secretion of anti-diuretic hormone - interstitial pulmonary fibrosis - pancreatitis - pigmentation of nails - pigmentation of palms - pigmentation of soles - urothelial toxicity
  - **Rare** Hepatotoxicity - renal dysfunction
  - **Frequency not known** Alopecia - amenorrhoea - bone-marrow suppression - dilutional hyponatraemia - fluid retention - gastro-intestinal effects - haemorrhagic cystitis - hyperuricaemia - male sterility - nausea - oedema - oral mucositis - organ-related toxicity (long-term and delayed) - premature menopause - secondary malignancy - thromboembolism - tumour lysis syndrome - vomiting

**SPECIFIC SIDE-EFFECTS**
- **With intravenous use** Extravasation

**SIDE-EFFECTS, FURTHER INFORMATION**
- Haemorrhagic cystitis and urothelial toxicity Haemorrhagic cystitis is a common manifestation of urothelial toxicity; adequate hydration is essential to reduce the risk of urothelial toxicity with intravenous use of cyclophosphamide; mesna provides further protection against urototoxic effects.
  - Secondary malignancy Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
  - Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

**PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
Cytotoxic responsive malignancy

Dacarbazine

- **INDICATIONS AND DOSE**
  - Hodgkin’s disease | Paediatric solid tumours
    - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Child: (consult local protocol)
  - **CAUTIONS**
    - Caution in handling — irritant to tissues
  - **INTERACTIONS** → Appendix 1 (dacarbazine).
  - **SIDE-EFFECTS**
    - **Common or very common**
      - Anorexia
    - **Uncommon**
      - Blurred vision - confusion - facial flushing - facial paraesthesia - headache - influenza-like symptoms - rash - renal impairment - seizures
    - **Rare**
      - Diarrhoea - hepatic vein thrombosis - hepatotoxicity - injection-site reactions - irritant to skin - irritant to tissues - liver necrosis - photosensitivity
    - **Frequency not known**
      - Alopecia - bone-marrow suppression - extravasation - gastro-intestinal effects - hyperuricaemia - nausea - oral mucositis - organ-related toxicity (long-term and delayed) - thromboembolism - tumour lysis syndrome - vomiting
  - **CONCEPTION AND CONTRACEPTION**
    - Ensure effective contraception during and for at least 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
  - **PREGNANCY**
    - Avoid (carcinogenic and teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
  - **BREAST FEEDING**
    - Discontinue breast-feeding.
  - **HEPATIC IMPAIRMENT**
    - Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.
  - **RENAL IMPAIRMENT**
    - Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.
  - **PRESCRIBING AND DISPENSING INFORMATION**
    - Dacarbazine is a component of a commonly used combination for Hodgkin’s disease (ABVDD—doxorubicin [previously Adriamycin®], bleomycin, vinblastine, and dacarbazine).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, solution for injection, solution for infusion.
  - **Tablet**
    - CAUTIONARY AND ADVISORY LABELS 25, 27
      - Cyclophosphamide (Non-proprietary)
        - Cyclophosphamide (as Cyclophosphamide monohydrate) 50 mg Cyclophosphamide 50mg tablets | 100 tablet [POM] £138.00
        - Cyclophosphamide (as Cyclophosphamide monohydrate) 1 gram Cyclophosphamide 1g powder for solution for injection vials | 1 vial [POM] £117.06–118.47
      - Cytoxan (Imported (United States))
        - Cyclophosphamide 25 mg Cytoxan 25mg tablets | 100 tablet [POM] no price available
  - **Powder for solution for injection**
    - Cyclophosphamide (Non-proprietary)
      - Cyclophosphamide (as Cyclophosphamide monohydrate) 500 mg Cyclophosphamide 500mg powder for solution for injection vials | 1 vial [POM] £5.66–9.95
      - Cyclophosphamide (as Cyclophosphamide monohydrate) 1 gram Cyclophosphamide 1g powder for solution for injection vials | 1 vial [POM] £17.06–118.47
      - Cyclophosphamide (as Cyclophosphamide monohydrate) 2 gram Cyclophosphamide 2g powder for solution for injection vials | 1 vial [POM] £34.12
    - Dacarbazine (as Dacarbazine citrate) 1 gram Dacarbazine 1g powder for solution for infusion vials | 1 vial [POM] £37.50
    - Dacarbazine (as Dacarbazine citrate) 500 mg Dacarbazine 500mg powder for solution for infusion vials | 1 vial [POM] £70.00

Ifosfamide

- **INDICATIONS AND DOSE**
  - Rhabdomyosarcoma | Soft-tissue sarcomas | Ewing tumour
  - Germ cell tumour | Osteogenic sarcoma
  - **BY INTRAVENOUS INFUSION**
  - Child: (consult local protocol)

- **SIDE-EFFECTS**
  - **Common or very common**
    - Confusion - disorientation - drowsiness - psychosis - renal toxicity (may lead to tubular dysfunction, Fanconi’s syndrome, or diabetes insipidus) - restlessness - urothelial toxicity causing haemorrhagic cystitis and dysuria
  - **Uncommon**
    - Severe encephalopathy
  - **Rare**
    - Anorexia - constipation - convulsions - diarrhoea
    - Psychosis
    - Tumour lysis syndrome
  - **Very rare**
    - Jaundice - syndrome of inappropriate antidiuretic hormone secretion - thrombophlebitis
  - **Frequency not known**
  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - **Urothelial toxicity**
      - Adequate hydration may reduce the risk of urothelial toxicity with intravenous use of ifosfamide; mesna provides further protection against urotoxic effects.
    - **Secondary malignancy**
      - Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
    - **Fluid retention**
      - Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

- **CONCEPTION AND CONTRACEPTION**
  - Manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
**PREGNANCY** Avoid (teratogenic and carcinogenic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Avoid.

**RENAL IMPAIRMENT** Avoid.

**MONITORING REQUIREMENTS** Ensure satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi’s syndrome or diabetes insipidus if renal toxicity not treated promptly).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- Ifosfamide (Non-proprietary)
  - Ifosfamide 1 gram Ifosfamide 1g powder for concentrate for solution for injection vials | 1 vial £91.32
  - Ifosfamide 2 gram Ifosfamide 2g powder for concentrate for solution for injection vials | 1 vial £179.88

**SIDE-EFFECTS**
- Fluid retention
- Secondary malignancy
- Frequency not known Alopecia - amenorrhea - bone-marrow suppression (delayed) - dilutional hyponatraemia - extravasation - fluid retention - gastro-intestinal effects - hyperuricaemia - male sterility - nausea - oedema - oral mucositis - organ-related toxicity (long-term and delayed) - premature menopause - secondary malignancy - thromboembolism - tumour lysis syndrome - vomiting

**INTERACTIONS**
- Rare Interstitial pneumonitis - life threatening pulmonary fibrosis
- Frequency not known Alopecia - amenorrhea - bone-marrow suppression (delayed) - dilutional hyponatraemia - extravasation - fluid retention - gastro-intestinal effects - hyperuricaemia - male sterility - nausea - oedema - oral mucositis - organ-related toxicity (long-term and delayed) - premature menopause - secondary malignancy - thromboembolism - tumour lysis syndrome - vomiting

**INDICATIONS AND DOSE**
- Treatment of recurrent or progressive malignant glioma
  - By mouth
  - Child 3-17 years: (consult local protocol)

**CAUTIONS**
- Pneumocystis jirovecii pneumonia—consult product literature for monitoring and prophylaxis requirements

**SIDE-EFFECTS, FURTHER INFORMATION**
- See further information on side-effects consult product literature.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

**PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Use with caution in severe impairment—no information available.

**RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

**MONITORING REQUIREMENTS**
- Monitor liver function before treatment initiation, after each treatment cycle and midway through 42-day treatment cycles—consider the balance of benefits and risks of treatment if results are abnormal at any point (fatal liver injury reported).
- Monitor for myelodysplastic syndrome.
- Monitor for secondary malignancies.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Capsule**

**CAUTIONARY AND ADVISORY LABELS** 23, 25

**Temozolomide**

**DRUG ACTION** Temozolomide is structurally related to dacarbazine.

**INDICATIONS AND DOSE**
- Treatment of recurrent or progressive malignant glioma
  - By mouth
  - Child 3-17 years: (consult local protocol)

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 494.

**CAUTIONS**
- Pneumocystis jirovecii pneumonia—consult product literature for monitoring and prophylaxis requirements

**SIDE-EFFECTS**
- Alopecia - bone-marrow suppression - gastro-intestinal effects - hyperuricaemia - nausea - oral mucositis - organ-related toxicity (long-term and delayed) - thromboembolism - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
- See further information on side-effects consult product literature.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

**PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Use with caution in severe impairment—no information available.

**RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

**MONITORING REQUIREMENTS**
- Monitor liver function before treatment initiation, after each treatment cycle and midway through 42-day treatment cycles—consider the balance of benefits and risks of treatment if results are abnormal at any point (fatal liver injury reported).
- Monitor for myelodysplastic syndrome.
- Monitor for secondary malignancies.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Capsule**

**CAUTIONARY AND ADVISORY LABELS** 23, 25

**Temozolomide**

**DRUG ACTION** Temozolomide is structurally related to dacarbazine.

**INDICATIONS AND DOSE**
- Treatment of recurrent or progressive malignant glioma
  - By mouth
  - Child 3-17 years: (consult local protocol)

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 494.

**CAUTIONS**
- Pneumocystis jirovecii pneumonia—consult product literature for monitoring and prophylaxis requirements

**SIDE-EFFECTS**
- Alopecia - bone-marrow suppression - gastro-intestinal effects - hyperuricaemia - nausea - oral mucositis - organ-related toxicity (long-term and delayed) - thromboembolism - tumour lysis syndrome - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
- See further information on side-effects consult product literature.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment. See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

**PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

**BREAST FEEDING** Discontinue breast-feeding.

**HEPATIC IMPAIRMENT** Use with caution in severe impairment—no information available.

**DRUG ACTION** Temozolomide is structurally related to dacarbazine.

**INDICATIONS AND DOSE**
- Treatment of recurrent or progressive malignant glioma
  - By mouth
  - Child 3-17 years: (consult local protocol)

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 494.
Thiotepa

● INDICATIONS AND DOSE
Conditioning treatment before haematopoietic stem cell transplantation in the treatment of haematological disease or solid tumours, in combination with other chemotherapy

- BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

● CAUTIONS
Avoid in Acute porphyrias p. 562

● INTERACTIONS
- Appendix 1 (thiotepa).

● SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION
- Secondary malignancy
- Alkyllating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
- Fluid retention
- Alkyllating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

- CONCEPTION AND CONTRA-INDICATIONS
Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 494.

- PREGNANCY
Avoid (teratogenic and embryotoxic in animals). See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

- BREAST FEEDING
Discontinue breast-feeding.

- NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (June 2012) that thiopeta (Tepadin®) is not recommended for use within NHS Scotland in combination with other chemotherapy as conditioning treatment in adults or children with haematological diseases, or solid tumours prior to haematopoietic stem cell transplantation.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

- Powder for solution for infusion
  - Tepadin (Adienne Pharma & Biotech)
  - Thiotepa 15 mg Tepadin 15mg powder for concentrate for solution for infusion vials | 1 vial [POM] no price available
  - Thiotepa 100 mg Tepadin 100mg powder for concentrate for solution for infusion vials | 1 vial [POM] no price available

ANTINEOPLASTIC DRUGS > ANTHRACYCLINES AND RELATED DRUGS

Daunorubicin

- INDICATIONS AND DOSE
Acute myelogenous leukaemia | Acute lymphocytic leukaemia
- BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

- UNLICENSED USE
DaunoXome® is not licensed for use in children.

- CONTRA-INDICATIONS
Myocardial insufficiency - previous treatment with maximum cumulative doses of daunorubicin or other anthracycline - recent myocardial infarction - severe arrhythmia

CONTRA-INDICATIONS, FURTHER INFORMATION
Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.

- CAUTIONS
Caution in handling—irritant to tissues

- INTERACTIONS
- Appendix 1 (daunorubicin).
- Caution is necessary with concomitant use of cardiotoxic drugs, or drugs that reduce cardiac contractility. Cardiac function should be monitored closely on the concomitant use of anthracyclines with trastuzumab.

- SIDE-EFFECTS
- Common or very common
  - Leucopenia
- Uncommon
  - Mucositis
- Frequency not known
  - Alopecia - bone-marrow suppression - cardiac toxicity (usually 1–6 months after initiation of therapy) - extravasation - fever - gastro-intestinal effects - hyperuricaemia - nausea - oral mucositis - organ-related toxicity (long-term and delayed) - red urine discoloration - thromboembolism - tumour lysis syndrome - vomiting

SIDE-EFFECTS, FURTHER INFORMATION
- Cardioxicity
  - All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible

- CONCEPTION AND CONTRA-INDICATIONS
Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 494.

- PREGNANCY
Avoid (teratogenic and carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

- BREAST FEEDING
Discontinue breast-feeding.

- HEPATIC IMPAIRMENT
Reduce dose according to serum bilirubin concentration—consult local protocol for details. Avoid in severe impairment.

- RENAL IMPAIRMENT
Reduce dose—consult local treatment protocol for details. Avoid in severe impairment.

Thiotepa 140 mg Temozolomide 140mg capsules | 5 capsule [POM] £65.00 | 5 capsule [POM] £484.49 (Hospital only)
Thiotepa 180 mg Temozolomide 180mg capsules | 5 capsule [POM] £610.92 | 5 capsule [POM] £652.80 (Hospital only)
Thiotepa 250 mg Temozolomide 250mg capsules | 5 capsule [POM] £814.00 | 5 capsule [POM] £865.00 (Hospital only)

Temozolomide 5 mg Temozolomide 5mg capsules | 5 capsule [POM] £10.59 (Hospital only)
Temozolomide 20 mg Temozolod 20mg capsules | 5 capsule [POM] £42.35 (Hospital only)

Temozolomide 150 mg solution for infusion vials | 100 mg powder for concentrate for solution for infusion vials | 1 vial [POM] £16.49
Temozolomide 180 mg solution for infusion vials | 140 mg powder for concentrate for solution for infusion vials | 1 vial [POM] £21.17
Temozolomide 200 mg solution for infusion vials | 150 mg powder for concentrate for solution for infusion vials | 1 vial [POM] £26.87
Temozolomide 250 mg solution for infusion vials | 200 mg powder for concentrate for solution for infusion vials | 1 vial [POM] £38.50

Thiotepa 15 mg Tepadin 15mg powder for concentrate for solution for infusion vials | 1 vial [POM] no price available
Thiotepa 100 mg Tepadin 100mg powder for concentrate for solution for infusion vials | 1 vial [POM] no price available

Temodal (Merck Sharp & Dohme Ltd)
Doxorubicin hydrochloride

**INDICATIONS AND DOSE**

- Some paediatric malignancies | Ewing's sarcoma
- Osteogenic sarcoma | Wilms' tumour | Neuroblastoma | Retinoblastoma | Some liver tumours | Acute lymphoblastic leukaemia | Hodgkin's lymphoma
- **BY INTRAVENOUS INFUSION**
- Child: (consult local protocol)

**CONTRA-INDICATIONS**

- Acute inflammatory heart disease
- Consult product literature
- Increased haemorrhagic tendency
- Marked persisting myelosuppression induced by previous treatment
- Marked persisting stomatitis induced by previous treatment
- Previous myocardial infarction
- Previous treatment with maximum cumulative doses of doxorubicin
- Previous treatment with maximum cumulative doses of other anthracycline
- Severe arrhythmia
- Severe myocardial insufficiency

**CAUTIONS**

- Caution in handling—irritant to tissues
- Consult product literature

**INTERACTIONS**

- Appendix 1 (doxorubicin)
- Caution is necessary with concomitant use of cardiotoxic drugs, or drugs that reduce cardiac contractility. Cardiac function should be monitored closely on the concomitant use of anthracyclines with trastuzumab.

**SIDE-EFFECTS**

- Common or very common
- Red colouration of the urine
- Frequency not known
- Alopecia | Bone-marrow suppression
- Consult product literature
- Extravasation
- Gastrointestinal effects
- Hyperuricaemia
- Nausea
- Oral mucositis
- Organ-related toxicity
- Long-term and delayed
- Thromboembolism
- Tumour lysis syndrome
- Vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Extravasation
- Extravasation can cause severe tissue necrosis.

- Cardiotoxic
- All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.

**CONCEPTION AND CONTRA-INDICATIONS**

- Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

**PREGNANCY**

- Avoid (teratogenic and toxic in animal studies).
- See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

**BREAST FEEDING**

- Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

- Reduce dose according to bilirubin concentration—consult product literature or local treatment protocol for details. Avoid in severe impairment.

**RENAL IMPAIRMENT**

- Consult product literature in severe impairment.

**MONITORING REQUIREMENTS**

- Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- Doxorubicin hydrochloride (Non-proprietary)
  - Daunorubicin (as Daunorubicin hydrochloride)
  - DaunoXome (Gales Ltd)
  - Caelyx
  - Doxil
  - Doxorubicin 20 mg
  - Doxil: 10 mg per 1 ml

**Emulsion for infusion**

- DaunoXome 50 mg

**Solution for injection**

- Doxorubicin hydrochloride
- Epirubicin hydrochloride

**MEDICATIONS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

**Solution for injection**

- Doxorubicin hydrochloride
  - 20 mg per 1 ml
  - 50 mg per 5 ml

- Epirubicin hydrochloride
  - 10 mg per 1 ml

**Powder for solution for injection**

- Doxorubicin
  - 10 mg
  - 50 mg

**Powder and solvent for suspension for infusion**

- Doxorubicin
  - 10 mg per 1 ml
  - 25 mg per 5 ml

**Electrolytes**

- May contain Sodium

- Myocet (Teva UK Ltd)

**Epirubicin hydrochloride**

**INDICATIONS AND DOSE**

- Recurrent acute lymphoblastic leukaemia
- Rhabdomyosarcoma
- Other soft-tissue tumours of childhood

**BY INTRAVENOUS INFUSION**

- Child: (consult local protocol)

**UNLICENSED USE**

- Not licensed for use in children.

**CONTRA-INDICATIONS**

- Bladder inflammation or contraction (when used as a bladder instillation)
- Catherterisation difficulties (when used as a bladder instillation)
- Haematuria (when used as a bladder instillation)
- Invasive tumours penetrating the bladder (when used as a bladder instillation)
- Myocardopathy...
previous treatment with maximum cumulative doses of epirubicin or other anthracycline • recent myocardial infarction • severe arrhythmia • severe myocardial insufficiency • unstable angina • urinary tract infections (when used as a bladder instillation)

**CONTRA-INDICATIONS, FURTHER INFORMATION**

Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.

- **CAUTIONS** Caution in handling • irritant to tissues
- **INTERACTIONS** → Appendix 1 (epirubicin).

Caution is necessary with concomitant use of cardioactive drugs, or drugs that reduce cardiac contractility. Cardiac function should be monitored closely on the concomitant use of anthracyclines with trastuzumab.

- **SIDE-EFFECTS** Alopecia • anaaphylaxis • bone-marrow suppression • cardiotoxicity • extravasation • gastrointestinal effects • hyperuricaemia • nausea • oral mucositis • organ-related toxicity (long-term and delayed) • red colouration of the urine • thromboembolism • tumour lysis syndrome • vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Cardiotoxicity All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.
- Cumulative doses of other anthracyline Epirubicin is considered less toxic than other anthracycline antibiotics, and may be suitable for children who have received high cumulative doses of other anthracyclines.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 494.
- **PREGNANCY** Avoid (carcinogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose according to bilirubin concentration—consult local treatment protocol for details. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Dose reduction may be necessary in severe impairment.
- **MONITORING REQUIREMENTS** Cardiac toxicity Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

**Solution for injection**

- **Epirubicin hydrochloride (Non-proprietary)**
  - Epirubicin hydrochloride 2 mg per 1 ml Epirubicin 50mg/25ml solution for injection vials | 1 vial (POD) £100.88
  - Epirubicin 10mg/5ml solution for injection vials | 1 vial (POD) £21.24
- **Pharmorubicin (Pfizer Ltd)**
  - Epirubicin hydrochloride 2 mg per 1 ml Pharmorubicin 50mg/25ml solution for injection vials | 1 vial (POD) £106.19
  - Pharmorubicin 10mg/5ml solution for injection vials | 1 vial (POD) £21.24

**Solution for infusion**

- **Epirubicin hydrochloride (Non-proprietary)**
  - Epirubicin hydrochloride 2 mg per 1 ml Epirubicin 100mg/50ml solution for infusion vials | 1 vial (POD) £169.92
  - Epirubicin 200mg/100ml solution for infusion vials | 1 vial (POD) £396.16
- **Pharmorubicin (Pfizer Ltd)**
  - Epirubicin hydrochloride 2 mg per 1 ml Pharmorubicin 200mg/100ml solution for infusion vials | 1 vial (POD) £396.16

**Mitoxantrone**

(Mitoxantrone)

- **INDICATIONS AND DOSE**

  **Acute myeloid leukaemia / Recurrent acute lymphoblastic leukaemia**

  - *BY INTRAVENOUS INFUSION*
    - Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS, FURTHER INFORMATION**

  Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.

- **INTERACTIONS** → Appendix 1 (mitoxantrone).

  Caution is necessary with concomitant use of cardioactive drugs, or drugs that reduce cardiac contractility. Cardiac function should be monitored closely on the concomitant use of anthracyclines with trastuzumab.

- **SIDE-EFFECTS**
  - Common or very common Transient blue-green discolouration of urine
  - Uncommon Allergic reactions • amenorrhoea • anorexia • dyspnoea • fatigue • fever • gastro-intestinal bleeding • transient blue discoloration of nails • transient blue discoloration of skin
  - Frequency not known Alopecia • bone-marrow suppression • dose-related cardiotoxicity • extravasation • gastrointestinal effects • hyperuricaemia • myelosuppression • nausea • oral mucositis • organ-related toxicity (long-term and delayed) • thromboembolism • tumour lysis syndrome • vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**

  Cardiotoxicity All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

- **PREGNANCY** Avoid. See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Use with caution—consult local treatment protocol.

- **MONITORING REQUIREMENTS**

  Cardiac toxicity Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Mitoxantrone (Non-proprietary)**
  - Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Mitoxantrone 20mg/10ml concentrate for solution for infusion vials | 1 vial (POD) £121.85
  - Onkotrone (Baxter Healthcare Ltd) Onkotrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Onkotrone 20mg/10ml solution for infusion vials | 1 vial (POD) no price available

  Onkotrone 25mg/12.5ml solution for infusion vials | 1 vial (POD) no price available
Cytarabine (Non-proprietary) Cytarabine 20 mg per 1 ml Cytarabine 500mg/25ml solution for injection vials | 1 vial | £10.50
Cytarabine 100mg/5ml solution for injection vials | 1 vial | £20.98–£30.00
Cytarabine 100 mg per 1 ml Cytarabine 500mg/5ml solution for injection vials | 5 vial | £100.00
Cytarabine 100mg/1ml solution for injection vials | 5 vial | £30.00
Cytarabine 2g/20ml solution for injection vials | 1 vial | £79.00
Cytarabine 1g/10ml solution for injection vials | 1 vial | £40.00

Suspension for injection

DepoCyt (Kapp Pharmaceuticals Ltd) Cytarabine 10 mg per 1 ml DepoCyt 50mg/5ml suspension for injection vials | 1 vial | £1,223.75 (Hospital only)
Fludarabine phosphate

**INDICATIONS AND DOSE**

- Poor prognosis or relapsed acute myeloid leukaemia | Relapsed acute lymphoblastic leukaemia | Conditioning before bone marrow transplantation
- BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

**CONTRA-INDICATIONS** Haemolytic anaemia

**CAUTIONS** Increased susceptibility to skin cancer - worsening of existing skin cancer

**CAUTIONS, FURTHER INFORMATION**

- Immunosuppression Fludarabine has a potent and prolonged immunosuppressive effect. Patients treated with fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

**INTERACTIONS** → Appendix 1 (fludarabine).

**SIDE-EFFECTS**

- Common or very common Acute myeloid leukaemia - anorexia - chills - cough - diarrhoea - fever - immunosuppression - malaise - myelodysplastic syndrome - myelosuppression (may be cumulative) - oedema - peripheral neuropathy - pneumonia - rash - visual disturbances - weakness
- Uncommon Autoimmune disorder - confusion - fibrosis - haemorrhage - pneumonitis - pulmonary toxicity
- Rare Agitation - arrhythmia - blindness - coma - heart failure - optic neuropathy - seizures - skin cancer - Stevens-Johnson syndrome - toxic epidermal necrolysis
- Frequency not known Alopecia - bone marrow suppression - extravasation - gastro-intestinal effects - haemorrhagic cystitis - hyperuricaemia - nausea - oral mucositis - organ-related toxicity (long-term and delayed) - thromboembolism - tumour lysis syndrome - vomiting

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

**PREGNANCY** Avoid (embryotoxic and teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

**BREAST FEEDING** Discontinue breast-feeding.

**RENAL IMPAIRMENT** Reduce dose by up to 50% if creatinine clearance 30–70 mL/minute/1.73 m². Avoid if creatinine clearance less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Monitor for signs of haemolysis.
- Monitor for neurological toxicity.

**DIRECTIONS FOR ADMINISTRATION** Concentrate for intravenous injection or infusion must be diluted before administration (consult product literature).

---

**Mercaptopurine**

(6-Mercaptopurine)

**INDICATIONS AND DOSE**

Severe ulcerative colitis | Severe Crohn’s disease
- BY MOUTH
- Child 2-17 years: Initially 1–1.5 mg/kg once daily (max. per dose 50 mg), then increased if necessary up to 75 mg once daily

Acute lymphoblastic leukaemia | Lymphoblastic lymphomas
- BY MOUTH
- Child: (consult local protocol)

**DOSE EQUIVALENCE AND CONVERSION**

Mercaptopurine tablets and Xaluprine® oral suspension are not bioequivalent, haematological monitoring is advised when switching formulations.

---

**CONTRA-INDICATIONS** Absent thiopurine methyltransferase activity

**CAUTIONS** Reduced thiopurine methyltransferase activity

**CAUTIONS, FURTHER INFORMATION**

- Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

**INTERACTIONS** → Appendix 1 (mercaptopurine).

**SIDE-EFFECTS**

- Rare Crystalluria with haematuria - fever - hyperpigmentation - intestinal ulceration - pancreatitis - rash
- Very rare Lymphoma
Frequency not known  Alopecia  bone-marrow suppression  gastrointestinal effects  hepatotoxicity (more frequent at higher doses)  hyperuricaemia  nausea  oral mucositis  organ-related toxicity (long-term and delayed)  thromboembolism  tumour lysis syndrome  vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Gastrointestinal side-effects  Thioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine.

CONCEPTION AND CONTRACEPTION  Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 494.

PREGNANCY  Avoid (teratogenic). See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

BREAST FEEDING  Discontinue breast-feeding.

HEPATIC IMPAIRMENT  May need dose reduction.

RENAL IMPAIRMENT  Manufacturer advises consider reducing dose.

PRE-TREATMENT SCREENING  Consider measuring thiopurine methyltransferase (TPMT) activity before starting mercaptopurine therapy.

MONITORING REQUIREMENTS

Monitor liver function—discontinue if jaundice develops.

When used for Severe ulcerative colitis or Severe Crohn’s disease  Monitor for toxicity throughout treatment. Monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.

PRESCRIBING AND DISPENSING INFORMATION  Flavours of oral liquid formulations may include raspberry.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Tablet  Mercaptopurine (Non-proprietary)  Mercaptopurine 50 mg  Mercaptopurine 50mg tablets | 25 tablet [P] £9.15 07 price + £4.15

Oral suspension

EXCIPIENTS:  May contain Aspartame  Xaluprine (Nova Laboratories Ltd)  Mercaptopurine 20 mg per 1 ml  Xaluprine 20mg/ml oral suspension | 100 ml [P] £17.00

Methotrexate

DRUG ACTION  Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines.

INDICATIONS AND DOSE

Severe Crohn’s disease

BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION  Child 7–17 years: 15 mg/m² once weekly (max. per dose 25 mg)

Maintenance of remission of severe Crohn’s disease

BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION  Child 7–17 years: 15 mg/m² once weekly (max. per dose 25 mg), dose reduced according to response to lowest effective dose

Juvenile idiopathic arthritis  Juvenile dermatomyositis  Vasculitis  Uveitis  Systemic lupus erythematosus  Localised scleroderma  Sarcoidosis

BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION  Child: Initially 10–15 mg/m² once weekly, then increased if necessary up to 25 mg/m² once weekly

Maintenance and remission of acute lymphoblastic leukaemia, lymphoblastic lymphoma

BY MOUTH  Child: (consult local protocol)

Treatment of early stage Burkitt’s lymphoma, non-Hodgkin’s lymphoma, osteogenic sarcoma, some CNS tumours including infant brain tumours, acute lymphoblastic leukaemia

BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION  Child: (consult local protocol)

Meningeal leukaemia, treatment and prevention of CNS involvement of leukaemia

BY INTRATHECAL INJECTION  Child: (consult local protocol)

Severe psoriasis unresponsive to conventional therapy (specialist use only)

BY MOUTH  Child 2-17 years: Initially 200 micrograms/kg once weekly (max. per dose 10 mg), then increased if necessary to 400 micrograms/kg once weekly (max. per dose 25 mg), adjusted according to response, stop treatment if inadequate response after 3 months at the optimum dose

UNLICENSED USE  Metoject® is licensed for use in children over 3 years for polyarticular forms of juvenile idiopathic arthritis; other preparations not licensed for use in children for non-malignant conditions.

IMPORTANT SAFETY INFORMATION

Note that the dose is a weekly dose. To avoid error with low-dose methotrexate, it is recommended that:

• the child or their carer is carefully advised of the dose and frequency and the reason for taking methotrexate and any other prescribed medication (e.g. folic acid);

• only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;

• the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;

• the child or their carer is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

CONTRA-INDICATIONS  Active infection (in non-malignant conditions)  ascites  immunodeficiency syndromes (in non-malignant conditions)  significant pleural effusion

CAUTIONS  Acute porphyrrias p. 562  photosensitivity—psoriasis lesions aggravated by UV radiation (skin ulceration reported)  diarrhoea  extreme caution in blood disorders (avoid if severe)  peptic ulceration  risk of accumulation in pleural effusion or ascites—drain before treatment  ulcerative colitis  ulcerative stomatitis

CAUTIONS, FURTHER INFORMATION

Blood count  Bone marrow suppression can occur abruptly; factors likely to increase toxicity include advanced age, renal impairment, and concomitant use with another antifolate drug (e.g. trimethoprim). A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy.
Cytotoxic responsive malignancy

- Gastro-intestinal toxicity Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity.
- Liver toxicity Persistent 2–fold rise in liver transaminases may necessitate dose reduction or rarely discontinuation; abrupt withdrawal should be avoided as this can lead to disease flare.
- Pulmonary toxicity Acute pulmonary toxicity is rare in children treated for juvenile idiopathic arthritis, but children and carers should seek medical attention if dyspnoea, cough or fever develops; discontinue if pneumonitis suspected.

**INTERACTIONS** → Appendix 1 (methotrexate).

If aspirin or other NSAIDs are given concurrently the dose and use of NSAIDs.

**SIDE-EFFECTS**

- Rare Pneumonitis

**SIDE-EFFECTS, FURTHER INFORMATION**

In patients taking methotrexate for non-malignant conditions who experience side-effects, folic acid given on a different day from the methotrexate, may help to reduce the frequency of such side-effects. Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity.

Treatment with folic acid (as calcium folinate) may be required in acute toxicity.

**CONCEPTION AND CONTRACEPTION**

Effective contraception required during and for at least 3 months after treatment in men or women.

**PREGNANCY**

Avoid (teratogenic; fertility may be reduced after treatment but this may be reversible).

**BREAST FEEDING**

Discontinue breast-feeding—present in milk.

**HEPATIC IMPAIRMENT**

When used for malignancy, avoid in severe hepatic impairment—consult local treatment protocol for details. Avoid with hepatic impairment in non-malignant conditions—dose-related toxicity.

**RENAL IMPAIRMENT**

Reduce dose. Risk of nephrotoxicity at high doses. Avoid in severe impairment.

**PRE-TREATMENT SCREENING**

Exclude pregnancy before treatment.

Patients should have full blood count and renal and liver function tests before starting treatment.

Check immunity to varicella-zoster and consider vaccination before initiating therapy.

**MONITORING REQUIREMENTS**

Full blood count and liver function tests repeated fortnightly for at least the first 4 weeks of treatment and at this frequency after any change in dose until therapy stabilised, thereafter monthly; renal function tests should be performed regularly during treatment.

**PRESCRIBING AND DISPENSING INFORMATION**

Folinic acid following methotrexate administration helps to prevent methotrexate-induced mucositis and myelosuppression.

**PATIENT AND CARER ADVICE**

Patients and their carers should be warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort and dark urine), and respiratory effects (e.g. shortness of breath).

Children and carers should be advised to avoid self-medication with over-the-counter ibuprofen. Children and their carers should be counselled on the dose and use of NSAIDs.

Medicines for Children leaflet: Methotrexate for skin conditions www.medicinesforchildren.org.uk/
methotrexate-for-skin-conditions

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection.

**Tablet**

- Methotrexate (Non-proprietary)
  - Methotrexate 2.5 mg Methotrexate 2.5mg tablets | 24 tablet (£) £3.75 | 28 tablet (£) £3.82 DT price = £1.97 | 100 tablet (£) £14.19

Nelarabine

DIAGNOSIS AND DOSE

T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in children who have relapsed or who are refractory after receiving at least two previous regimens

BY INTRAVENOUS INFUSION

Child: (consult local protocol)

CAUTIONS

Previous or concurrent craniospinal irradiation (increased risk of neurotoxicity) • previous or concurrent intrathecal chemotherapy (increased risk of neurotoxicity)

SIDE-EFFECTS

Common or very common Neurotoxicity (discontinue) • Frequency not known Alopecia • arthralgia • asthenia • ataxia • benign and malignant tumours • bone-marrow suppression • confusion • constipation • demyelination • diarrhoea • drowsiness • electrolyte disturbances • extravasation • fatigue • gastro-intestinal effects • headache • hyperuricaemia • hypoesthesia • hypoglycaemia • nausea • oral mucositis • organ-related toxicity (long-term and delayed) • paraesthesia • peripheral neurological disorders • pyrexia • seizures • thromboembolism • tremor • tumour lysis syndrome • vomiting

CONCEPTION AND CONTRACEPTION Manufacturer advises effective contraception during and for at least 3 months after treatment in men and women.

Pregnancy

Avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

Breast-feeding

Discontinue breast-feeding.

Monitoring requirements

Neurotoxicity

Close monitoring for neurological events is strongly recommended—discontinue if neurotoxicity occurs.

Patient and carer advice

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. cycling or driving).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

→ Atriance (Novartis Pharmaceuticals UK Ltd)

NELARABINE 5 mg per 1 ml Atriance 250mg/50ml solution for infusion vials | 6 vial £1332.00

Tioguanine (Thioguanine)

INDICATIONS AND DOSE

Infant acute lymphoblastic leukaemia

BY MOUTH

Child: Can be given at various stages of treatment in short-term cycles (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 494.

CONTRA-INDICATIONS

Absence thionpurine methyltransferase activity

CAUTIONS

Thionpurine methyltransferase status

CAUTIONS, FURTHER INFORMATION

Thionpurine methyltransferase

The enzyme thionpurine methyltransferase (TPMT) metabolises thionpurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

Long-term therapy

Long-term therapy is no longer recommended because of the high risk of liver toxicity.

INTERACTIONS

→ Atriance (tioguanine).

SIDE-EFFETS

Rare Intestinal necrosis • Intestinal perforation

Frequency not known Alopecia • bone-marrow suppression • gastro-intestinal effects • hepatotoxicity (discontinue) • hyperuricaemia • nausea • oral mucositis • organ-related toxicity (long-term and delayed) • stomatitis • thromboembolism • tumour lysis syndrome • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Gastro-intestinal side-effects

Tioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine.

CONCEPTION AND CONTRACEPTION

Ensure effective contraception during treatment in men or women.

Pregnancy

Avoid (teratogenicity reported when men receiving tioguanine have fathered children). See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

Breast-feeding

Discontinue breast-feeding.

Hepatic impairment

Reduce dose.

Renal impairment

Reduce dose.

Pre-treatment screening

Consider measuring thionpurine methyltransferase (TPMT) activity before starting tioguanine therapy.

Monitoring requirements

Monitor liver function weekly—discontinue if liver toxicity develops.
Bleomycin

**INDICATIONS AND DOSE**

Some germ cell tumours | Hodgkin’s lymphoma

- By intravenous infusion
- Child: (consult local protocol)

**UNLICENSED USE**

Not licensed for use in children.

**CONTRA-INDICATIONS**

Acute pulmonary infection • significantly reduced lung function

**CAUTIONS**

Caution in handling — irritant to tissues

**INTERACTIONS**

Appendix 1 (bleomycin).

**SIDE-EFFECTS**

- Common or very common: Dermatological toxicity, mucositis
- Rare: Cardiorespiratory collapse, hyperpyrexia
- Frequency not known: Alopecia, anorexia, chills (after drug administration), extravasation, fatigue, fever (after drug administration), gastro-intestinal effects, hypersensitivity reactions, hyperuricaemia, increased pigmentation particularly affecting the flexures and subcutaneous sclerotic plaques • less bone marrow suppression, nausea, oral mucositis, organ-related toxicity (long-term and delayed), progressive pulmonary fibrosis, (dose-related), pulmonary toxicity, thromboembolism, tumour lysis syndrome • vomiting

**CONCEPTION AND CONTRACEPTION**

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 494.

**PREGNANCY**

Avoid (teratogenic in animal studies). Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

**BREAST FEEDING**

Discontinue breast feeding.

**RENAL IMPAIRMENT**

Reduce dose—consult local treatment protocol for details.

**MONITORING REQUIREMENTS**

Ensure monitoring of pulmonary function—investigate any shortness of breath before initiation.

**PRESCRIBING AND DISPENSING INFORMATION**

To conform to the European Pharmacopoeia vials previously labelled as containing ‘15 units’ of bleomycin are now labelled as containing 15,000 units. The amount of bleomycin in the vial has not changed.

**UNLICENSED USE**

Not licensed for use in children under 12 years.

**CAUTIONS**

Caution in handling—irritant to tissues

**INTERACTIONS**

Appendix 1 (bleomycin).

**SIDE-EFFECTS**

- Uncommon: Acne, anaemia, cheilitis, dysphagia, fever, hypoglycaemia, lethargy, malaise, myalgia
- Rare: Hepatotoxicity (possibly dose-related)
- Frequency not known: Alopecia, bone-marrow suppression, extravasation, gastro-intestinal effects, hyperuricaemia, nausea, oral mucositis, organ-related toxicity, thromboembolism, tumour lysis syndrome • vomiting

**CONCEPTION AND CONTRACEPTION**

Exclude pregnancy before treatment with cytotoxic drugs. Contraceptive advice should be given to men and women before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended). Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

**PREGNANCY**

Avoid (teratogenic in animal studies). Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

**BREAST FEEDING**

Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

Consider dose reduction if raised serum bilirubin or biliary obstruction; consult local treatment protocols.

**MEDIcular forms**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- Bleo-Kyowa (Orphan Europe (UK) Ltd)
  - Dactinomycin 500 microgram
- Cosmegen Lyovac 500microgram powder for solution for injection vials | 1 vial (PSt) £52.58

**ANTINEOPLASTIC DRUGS > PLATINUM COMPOUNDS**

**Carboplatin**

**INDICATIONS AND DOSE**

- Stage 4 neuroblastoma | Germ cell tumours | Low-grade gliomas (including astrocytomas) | Neuroectodermal tumours (including medulloblastoma) | Rhabdomyosarcoma (metastatic and non-metastatic disease) | Soft-tissue sarcomas | Retinoblastoma | High risk Wilms’ tumour | Some liver tumours

- By intravenous infusion
- Child: (consult local protocol)
Cytotoxic responsive malignancy

510

| UNLICENSED USE | Not licensed for use in children.
| INTERACTIONS | Appendix 1 (platinum compounds).
| SIDE-EFFECTS | Alopecia • bone-marrow suppression • extravasation • gastro-intestinal effects • hyperuricaemia • hyperuricaemia • hypocalcaemia • hypokalaemia • hypomagnesaemia • hypophosphataemia • nephrotoxicity (dose-related and potentially cumulative) • neurotoxicity (dose-related and potentially cumulative) • oral mucositis • organ-related toxicity (long-term and delayed) • ototoxicity (dose-related and potentially cumulative) • peripheral neuropathy • severe nausea • severe vomiting (may be delayed and difficult to control) • thromboembolism • tumour lysis syndrome
| CONCEPTION AND CONTRACEPTION | Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
| PREGNANCY | Avoid (teratogenic and toxic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.
| BREAST FEEDING | Discontinue breast-feeding.
| RENAL IMPAIRMENT | Avoid if possible—nephrotoxic.

Baseline testing of renal function is required; for children with pre-existing renal impairment, consideration should be given to withholding treatment or using another drug.

| MONITORING REQUIREMENTS | Monitor full blood count.
| | Monitor audiology.
| | Monitor plasma electrolytes.
| | Baseline testing of hearing is required; for children with pre-existing hearing impairment, consideration should be given to withholding treatment or using another drug.
| | For children with pre-existing marked bone-marrow suppression, consideration should be given to withholding treatment or using another drug.
| | Monitor renal function.

| MEDICINAL FORMS | There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- Carboplatin (Non-proprietary)
  - Carboplatin 10 mg per 1 ml Carboplatin 50mg/5ml concentrate for solution for infusion vials | 1 vial (P) £22.04 (Hospital only) | 1 vial (P) £20.00
  - Carboplatin 150mg/35ml concentrate for solution for infusion vials | 1 vial (P) £56.92 (Hospital only) | 1 vial (P) £50.00
  - Carboplatin 600mg/60ml concentrate for solution for infusion vials | 1 vial (P) £260.00
  - Carboplatin 600mg/60ml solution for infusion vials | 1 vial (P) £260.00
  - Carboplatin 450mg/45ml concentrate for solution for infusion vials | 1 vial (P) £116.85 (Hospital only) | 1 vial (P) £160.00
  - Carboplatin 450mg/45ml solution for infusion vials | 1 vial (P) £116.85 (Hospital only) | 1 vial (P) £160.00
  - Carboplatin 50mg/5ml solution for infusion vials | 1 vial (P) £22.86

- Cisplatin (Non-proprietary)
  - Cisplatin 1 mg per 1 ml Cisplatin 50mg/50ml solution for infusion vials | 1 vial (P) no price available
  - Cisplatin 100mg/100ml solution for infusion vials | 1 vial (P) £50.00 (Hospital only) | 1 vial (P) £50.22 (Hospital only)
  - Cisplatin 10mg/10ml solution for infusion vials | 1 vial (P) £5.90 (Hospital only) | 1 vial (P) £5.90
  - Cisplatin 50mg/50ml solution for infusion vials | 1 vial (P) £25.37 (Hospital only) | 1 vial (P) £25.37 (Hospital only)
  - Cisplatin 10mg/10ml solution for infusion vials | 1 vial (P) £50.22 (Hospital only) | 1 vial (P) no price available

ANTINEOPLASTIC DRUGS > PODOPHYLLOTOXIN DERIVATIVES

Etoposide

- INDICATIONS AND DOSE Stage 4 neuroblastoma • Germ-cell tumours • Intracranial germ-cell tumours • Rhabdomyosarcoma • Soft-tissue sarcomas • Neuroectodermal tumours (including medulloblastoma) • Relapsed Hodgkin's disease • Non-Hodgkin's lymphoma • Ewing tumour • Acute lymphoblastic leukaemia • Acute myeloid leukaemia

| BY MOUTH, OR BY INTRAVENOUS INFUSION | Child: (consult local protocol)

| UNLICENSED USE | Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 494.

Cisplatin

- INDICATIONS AND DOSE Osteogenic sarcoma | Stage 4 neuroblastoma | Some liver tumours | Infant brain tumours | Intra-cranial germ-cell tumours

| BY INTRAVENOUS INFUSION | Child: (consult local protocol)

- UNLICENSED USE | Not licensed for use in children.

CAUTIONS

CAUTIONS, FURTHER INFORMATION

Hydration Cisplatin requires intensive intravenous hydration; routine use of intravenous fluids containing potassium or magnesium may also be required to help control hypokalaemia and hypomagnesaemia. Treatment may be complicated by severe nausea and vomiting; delayed vomiting may occur and is difficult to control.

| INTERACTIONS | Appendix 1 (platinum compounds).
**ANTINEOPLASTIC DRUGS**

### VINCALKALOIDS

**Vincristine sulfate**

- **INDICATIONS AND DOSE**
  - Hodgkin’s disease and other lymphomas
    - **BY INTRAVENOUS INJECTION**
  - Child: (consult local protocol)

- **UNLICENSED USE**
  - Licensed for use in children (age range not specified by manufacturer).

---

**Vincristine sulfate**

- **INDICATIONS AND DOSE**
  - *Acute leukaemias | Lymphomas | Paediatric solid tumours*
    - **BY INTRAVENOUS INJECTION**
  - Child: (consult local protocol)

- **UNLICENSED USE**
  - Licensed for use in children (age range not specified by manufacturer).

---

**IMPORTANT SAFETY INFORMATION**

Vincristine is for intravenous administration only. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

---

**CONTRA-INDICATIONS**

- Intrathecal injection contra-indicated.

**CAUTIONS**

- Caution in handling—irritant to tissues

**INTERACTIONS**

- Appendix 1 (vinblastine).

---

**SIDE-EFFECTS**

- **GENERAL SIDE-EFFECTS**
  - Alopecia - bone-marrow suppression - dose limiting myelosuppression - gastro-intestinal effects - hyperuricaemia - irrtant to tissues - nausea - oral mucositis (more common if given with doxorubicin) - organ-related toxicity (long-term and delayed) - thromboembolism - tumour lysis syndrome - vomiting

  **SPECIFIC SIDE-EFFECTS**
  - With intravenous use - Anaphylaxis (associated with concentrated infusions) - hypotension associated with rapid infusion - irritant to tissues (if extravasated)

  **CONCEPTION AND CONTRACEPTION**
  - Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 494.

- **PREGNANCY**
  - Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Avoid in severe impairment.

- **RENAL IMPAIRMENT**
  - Consider dose reduction—consult local treatment protocol for details.

- **DIRECTIONS FOR ADMINISTRATION**
  - Etoposide is usually given by slow intravenous infusion. It may also be given by mouth, but it is unpredictably absorbed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

### Etoposide (Non-proprietary)

- **Solution for infusion**
  - Etoposide 20 mg per 1 ml
  - Etoposide 50 mg per 1 ml
  - Etoposide 100 mg per 1 ml

- **Powder for solution for injection**
  - Etoposide 50 mg
  - Etoposide 100 mg

- **Solution for infusion**
  - Etoposide 100 mg/5ml concentration for solution for infusion vials | 1 vial (POD) £6.75 (Hospital only)
  - Etoposide 500 mg/25ml concentration for solution for infusion vials | 1 vial (POD) £13.50 (Hospital only)

- **Epothin (medac UK)**
  - Etoposide 20 mg per 1 ml
  - Etoposide 50 mg per 1 ml
  - Etoposide 100 mg per 1 ml

- **Vepesid** (Bristol-Myers Squibb)
  - Vepesid 50 mg
  - Vepesid 100 mg
  - Vepesid 150 mg

- **Etopophos** (Bristol-Myers Squibb)
  - Etopophos 20 mg/1 ml
  - Etopophos 50 mg/1 ml
  - Etopophos 100 mg/1 ml

- **Etopisin** (Squibb UK/medac)
  - Etopisin 20 mg/1 ml
  - Etopisin 50 mg/1 ml
  - Etopisin 100 mg/1 ml

---

**SIDE-EFFECTS, FURTHER INFORMATION**

- Neurotoxicity
  - Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids; it occurs less often with vinblastine than with vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; otoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced.

  Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

  - Constipation
  - Prophylactic use of laxatives may be considered.

- **CONCEPTION AND CONTRACEPTION**
  - Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 494.

- **PREGNANCY**
  - Avoid (limited experience suggests fetal harm; teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

- **BREAST FEEDING**
  - Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT**
  - Dose reduction may be necessary—consult local treatment protocol for details.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
Cytotoxic responsive malignancy

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minilab. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

**CONTRA-INDICATIONS**

**CONTRA-INDICATIONS, FURTHER INFORMATION**

Intrathecal injection contra-indicated.

**CAUTIONS**

Caution in handling—irritant to tissues. ileus. neuromuscular disease

**INTERACTIONS** → Appendix 1 (vincristine).

**SIDE-EFFECTS**

- Common or very common Constipation
- Rare Convulsions followed by coma. Inappropriate secretion of antidiuretic hormone

**SIDE-EFFECTS, FURTHER INFORMATION**

- Neurotoxicity Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine. Children with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation. ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced, but children generally tolerate vincristine better than adults. Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.
- Constipation Prophylactic use of laxatives may be considered.

**CONCEPTION AND CONTRACEPTION**

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 494.

**PREGNANCY**

Avoid. See also, Pregnancy and reproductive function in Cytotoxic drugs p. 494.

**BREAST FEEDING**

Discontinue breast-feeding.

**HEPATIC IMPAIRMENT**

Dose reduction may be necessary—consult local treatment protocol for details.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

  - Gynaecomastia
  - Intestinal disturbances
  - Myalgia
  - Myelosuppression
  - Rash
  - Thromboembolism
  - Transient hypertension
  - Vomiting

**CAUTIONS** Avoid in Acute porphyrias p. 562 - risk of accumulation in overweight patients

**PRESCRIBING AND DISPENSING INFORMATION**

- Corticosteroid replacement therapy

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

- Tablet
  - Sikkos (Nordic Pharma Ltd)
    - Hydroxycarbamide 100 mg | Sikkos 100mg tablets | 60 tablet | £10.00 DT price + £10.00
    - Hydroxycarbamide 1 gram | Sikkos 1000mg tablets | 30 tablet | £50.00

- Capsule
  - Hydroxycarbamide (Non-proprietary)
    - Hydroxycarbamide 500 mg | Hydroxycarbamide 500mg capsules | 100 capsule | £16.00 DT price + £11.70
    - Droxia (Imported (United States))
      - Hydroxycarbamide 300 mg | Droxia 300mg capsules | 60 capsule | no price available

- Manufactures include: capsule, oral suspension, oral solution

- There can be variation in the licensing of different medicines

- Appendix 1 (hydroxycarbamide).

- Appendix 1 (mitotane).

- Pregnancy
  - Avoid (teratogenic in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 454.

- Breastfeeding
  - Discontinue breast-feeding.

- Hepatic impairment
  - Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment, unless used for malignant conditions.

- Renal impairment
  - In sickle-cell disease, reduce initial dose by 50% if estimated glomerular filtration rate less than 60 mL/minute/1.73 m². In sickle-cell disease, avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- Monitoring requirements
  - Monitor renal and hepatic function before and during treatment.
  - Monitor full blood count before treatment, and repeatedly throughout use; in sickle-cell disease monitor every 2 weeks for the first 2 months and then every 2 months thereafter (or every 2 weeks if on maximum dose).
  - Patients receiving long-term therapy for malignant disease should be monitored for secondary malignancies.

- Patient and carer advice
  - Medicines for Children leaflet: Hydroxycarbamide for sickle cell disease www.medicinesforchildren.org.uk/hydroxycarbamide-for-sickle-cell-disease

- Patients receiving long-term therapy with hydroxycarbamide should be advised to protect skin from sun exposure.
514 Cytotoxic responsive malignancy

RETINOID AND RELATED DRUGS

Tretinoin

INDICATIONS AND DOSE

Induction of remission in acute promyelocytic leukaemia (used in previously untreated patients as well as in those who have relapsed after standard chemotherapy or who are refractory to it)

BY MOUTH

Child: (consult local protocol)

CAUTIONS

Increased risk of thromboembolism during first month of treatment.

INTERACTIONS

Appendix 1 (retinoids).

SIDE-EFFECTS

Alopecia • anxiety • arrhythmias • benign intracranial hypertension (children particularly susceptible—consider dose reduction if intractable headache in children) • bone pain • chelitis • chest pain • confusion • depression • dizziness • dry mucous membranes • dry skin • erythema • flushing • gastro-intestinal disturbances • genital ulceration • headache • hearing disturbances • hypercalcaemia • insomnia • oedema • pancreatitis • paraesthesia • pruritus • raised lipids • raised liver enzymes • raised serum creatinine • rash • retinoic acid syndrome • shivering • sweating • thromboembolism • visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

Retinoic acid syndrome Fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleucocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure requires immediate treatment—consult product literature.

Nervous system effects Children particularly susceptible to nervous system effects.

CONCEPTION AND CONTRACEPTION

Effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives not considered effective).

PREGNANCY

Teratogenic. See Pregnancy and reproductive function in Cytotoxic drugs p. 494.

BREAST FEEDING

Avoid (discontinue breast-feeding).

HEPATIC IMPAIRMENT

Reduce dose—consult local treatment protocol for details.

RENAL IMPAIRMENT

Reduce dose—consult local treatment protocol for details.

MONITORING REQUIREMENTS

Monitor haematological and organ-related toxicity (long-term treatment may require, see local protocol).

CONTRA-INDICATIONS

Pre-existing severe leucopenia • pre-existing severe thrombocytopaenia.

CAUTIONS

Cardiovascular disease • cerebrovascular disease • epilepsy • phaeochromocytoma • procarbazine is a mild monoamineoxidase inhibitor (dietary restriction is rarely considered necessary)

INTERACTIONS

Appendix 1 (procarbazine).

SIDE-EFFECTS

Common or very common Loss of appetite

Frequency not known Alopecia • bone-marrow suppression • gastro-intestinal effects • hypersensitivity rash (discontinue treatment) • hyperuricaemia • jaundice • nausea • oral mucositis • organ-related toxicity (long-term and delayed) • thrombocytopenia • tumour lysis syndrome • vomiting

CONCEPTION AND CONTRACEPTION

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 494.

PREGNANCY

Avoid (teratogenic in animal studies and isolated reports in humans). See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

BREAST FEEDING

Discontinue breast-feeding.

HEPATIC IMPAIRMENT

Caution in mild to moderate impairment. Avoid in severe impairment.

RENAL IMPAIRMENT

Caution in mild to moderate impairment. Avoid in severe impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 4

Procarbazine (as Procarbazine hydrochloride) 50 mg Procarbazine 50 mg capsules 50 capsule £339.95

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 10, 21

Lysodren (HRA Pharma UK Ltd) Mitotane 500 mg Lysodren 500 mg tablets 100 tablet £920.97

PROCAARBINZINE

Procarbazine is a mild monoamine-oxidase inhibitor.

INDICATIONS AND DOSE

Hodgkin’s lymphoma

BY MOUTH

Child: (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 494.

CONTRA-INDICATIONS

Pre-existing severe leucopenia • pre-existing severe thrombocytopaenia.

CAUTIONS

Cardiovascular disease • cerebrovascular disease • epilepsy • phaeochromocytoma • procarbazine is a mild monoamineoxidase inhibitor (dietary restriction is rarely considered necessary)

INTERACTIONS

Appendix 1 (procarbazine).

SIDE-EFFECTS

Common or very common Loss of appetite

Frequency not known Alopecia • bone-marrow suppression • gastro-intestinal effects • hypersensitivity rash (discontinue treatment) • hyperuricaemia • jaundice • nausea • oral mucositis • organ-related toxicity (long-term and delayed) • thrombocytopenia • tumour lysis syndrome • vomiting

CONCEPTION AND CONTRACEPTION

Contraceptive advice required, see Pregnancy and reproductive function in Cytotoxic drugs p. 494.

PREGNANCY

Avoid (teratogenic in animal studies and isolated reports in humans). See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

BREAST FEEDING

Discontinue breast-feeding.

HEPATIC IMPAIRMENT

Caution in mild to moderate impairment. Avoid in severe impairment.

RENAL IMPAIRMENT

Caution in mild to moderate impairment. Avoid in severe impairment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 4

Procarbazine (as Procarbazine hydrochloride) 50 mg Procarbazine 50 mg capsules 50 capsule £339.95

Driving and skilled tasks

Central nervous system toxicity may affect performance of skilled tasks (e.g. driving).
2.1 Cytotoxic drug-induced side effects

**DETOXIFYING DRUGS > UROPROTECTIVE DRUGS**

### Mesna

**INDICATIONS AND DOSE**

- **Urothelial toxicity following oxazaphosphorine therapy**
  - **BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION**
  - Child: (consult local protocol)

- **Mucolytic in cystic fibrosis**
  - **BY INHALATION OF NEBULISED SOLUTION**
  - Child: 3–6 mL twice daily, use a 20% solution

**UNLICENSED USE**

Not licensed for use in children.

**SIDE-EFFECTS**

- **Common or very common**
  - Colic - depression - diarrhoea - fatigue - headache - hypotension - irritability - joint pains - limb pains - nausea - rash - tachycardia - vomiting
  - **Rare** Hypersensitivity reactions (more common in patients with auto-immune disorders)

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated if history of hypersensitivity to thiol-containing compounds.

**PREGNANCY**

Not known to be harmful. See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

**DIRECTIONS FOR ADMINISTRATION**

For oral administration of the injection, contents of ampoule are taken in a flavoured drink such as orange juice or cola which may be stored in a refrigerator for up to 24 hours in a sealed container.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Tablet**

- **Mesna (Non-proprietary)**
  - Mesna 400 mg Mesna 400mg tablets | 10 tablet | £134.30–£134.40
  - Mesna 600 mg Mesna 600mg tablets | 10 tablet | £190.60

**Solution for injection**

- **Mesna (Non-proprietary)**
  - Mesna 100 mg per 1 ml Mesna 1g/10ml solution for injection ampoules | 15 ampoule | £441.15
  - Mesna 400mg/4ml solution for injection ampoules | 15 ampoule | £201.15

### VITAMINS AND TRACE ELEMENTS > FOLATES

**Folinic acid**

**INDICATIONS AND DOSE**

- **Reduction of methotrexate-induced toxicity**
  - **BY MOUTH, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Child: (consult local protocol)

- **Methotrexate overdose**
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INJECTION**
  - Child: (consult local protocol)

- **Megaloblastic anaemia due to folate deficiency**
  - **BY MOUTH**
  - Child 1 month–11 years: 250 micrograms/kg once daily
  - Child 12–17 years: 15 mg once daily

- **Metabolic disorders leading to folate deficiency**
  - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Child: 15 mg once daily, larger doses may be required in older children

**SODIOFOLIN®**

As an antidote to methotrexate

- **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Child: (consult product literature)

**UNLICENSED USE**

Consult product literature for licensing status of individual preparations.

**CONTRA-INDICATIONS**

Intrathecal injection

**CAUTIONS**

Avoid simultaneous administration of methotrexate; not indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B12 deficiency

**INTERACTIONS**

Appendix 1 (folates).

**SIDE-EFFECTS**

- **Rare** Agitation (after high doses) - depression (after high doses) - gastro-intestinal disturbances (after high doses) - insomnia (after high doses) - pyrexia (after parenteral use)

**PREGNANCY**

Not known to be harmful; benefit outweighs risk.

**BREAST FEEDING**

Presence in milk unknown but benefit outweighs risk.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- Folinic acid (Non-proprietary)
  - Folinic acid (as Calcium folinate) 15 mg Calcium folinate 15mg tablets | 10 tablet | £49.10
  - Refolinon (Pfizer Ltd)
    - Folinic acid (as Calcium folinate) 15 mg Refolinon 15mg tablets | 30 tablet | £85.74

**Solution for injection**

- Folinic acid (Non-proprietary)
  - Folinic acid (as Calcium folinate) 3 mg per 1 ml Calcium folinate 3mg/1ml solution for injection ampoules | 5 ampoule | £30.00
  - Folinic acid (as Calcium folinate) 7.5 mg per 1 ml Calcium folinate 7.5mg/2ml solution for injection ampoules | 5 ampoule | £38.99–£39.00
  - Folinic acid (as Calcium folinate) 10 mg per 1 ml Calcium folinate 10mg/5ml solution for injection vials | 1 vial | £18.44 (Hospital only) | 1 vial | £20.00
  - Calcium folinate 300mg/30ml solution for injection vials | 1 vial | £89.95 (Hospital only) | 1 vial | £100.00
  - Calcium folinate 100mg/10ml solution for injection vials | 1 vial | £34.94 (Hospital only) | 1 vial | £37.50
  - Folinic acid (as Disodium folinate) 50 mg per 1 ml Disodium folinate 50mg/1ml solution for injection vials | 1 vial | £24.70
  - Disodium folinate 200mg/4ml solution for injection vials | 1 vial | £80.40
  - Refolinon (Pfizer Ltd)
    - Folinic acid (as Calcium folinate) 3 mg per 1 ml Refolinon 30mg/10ml solution for injection ampoules | 5 ampoule | £23.12
    - Refolinon (Pfizer Ltd)
      - Folinic acid (as Disodium folinate) 50 mg per 1 ml Sodiofolin 400mg/8ml solution for injection vials | 1 vial | £126.25 (Hospital only)
      - Sodiofolin 100mg/2ml solution for injection vials | 1 vial | £35.09 (Hospital only)

Prevention of megaloblastic anaemia associated with pyrimethamine and sulfadiazine treatment of congenital toxoplasmosis

- **BY MOUTH**
  - Neonate: 5 mg 3 times a week; increased if necessary up to 20 mg 3 times a week, if the patient is neutropenic.
  - Child 1-11 months: 10 mg 3 times a week

**SIDE-EFFECTS**

- **Folinic acid**
  - Fatigue
  - Depression (after high doses)
  - Gastro-intestinal disturbances
  - Insomnia (after high doses)
  - Pyrexia (after parenteral use)

**PRECAUTIONS**

- Not licensed for use in children.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- Folinic acid (Non-proprietary)
  - Folinic acid (as Calcium folinate) 15 mg Calcium folinate 15mg tablets | 10 tablet | £49.10
  - Refolinon (Pfizer Ltd)
    - Folinic acid (as Calcium folinate) 15 mg Refolinon 15mg tablets | 30 tablet | £85.74

**Solution for injection**

- Folinic acid (Non-proprietary)
  - Folinic acid (as Calcium folinate) 3 mg per 1 ml Calcium folinate 3mg/1ml solution for injection ampoules | 5 ampoule | £30.00
  - Folinic acid (as Calcium folinate) 7.5 mg per 1 ml Calcium folinate 7.5mg/2ml solution for injection ampoules | 5 ampoule | £38.99–£39.00
  - Folinic acid (as Calcium folinate) 10 mg per 1 ml Calcium folinate 10mg/5ml solution for injection vials | 1 vial | £18.44 (Hospital only) | 1 vial | £20.00
  - Calcium folinate 300mg/30ml solution for injection vials | 1 vial | £89.95 (Hospital only) | 1 vial | £100.00
  - Calcium folinate 100mg/10ml solution for injection vials | 1 vial | £34.94 (Hospital only) | 1 vial | £37.50
  - Folinic acid (as Disodium folinate) 50 mg per 1 ml Disodium folinate 50mg/1ml solution for injection vials | 1 vial | £24.70
  - Disodium folinate 200mg/4ml solution for injection vials | 1 vial | £80.40
  - Refolinon (Pfizer Ltd)
    - Folinic acid (as Calcium folinate) 3 mg per 1 ml Refolinon 30mg/10ml solution for injection ampoules | 5 ampoule | £23.12
    - Refolinon (Pfizer Ltd)
      - Folinic acid (as Disodium folinate) 50 mg per 1 ml Sodiofolin 400mg/8ml solution for injection vials | 1 vial | £126.25 (Hospital only)
      - Sodiofolin 100mg/2ml solution for injection vials | 1 vial | £35.09 (Hospital only)
Levofolinic acid

- **DRUG ACTION** Levofolinic acid is an isomer of folinic acid.

- **INDICATIONS AND DOSE**
  - Reduction of methotrexate-induced toxicity
    - By intramuscular injection, or by intravenous infusion
    - Child: (consult local protocol)
  - Methotrexate overdose
    - By intramuscular injection, or by intravenous infusion
    - Child: (consult local protocol)

- **CONTRA-INDICATIONS** Intrathecal injection
- **CAUTIONS** Avoid simultaneous administration of methotrexate - not indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B₁₂ deficiency
- **INTERACTIONS** → Appendix 1 (folates).
- **SIDE-EFFECTS**
  - Rare: Agitation (after high doses) - depression (after high doses) - gastro-intestinal disturbances (after high doses) - insomnia (after high doses) - pyrexia (after parenteral use)
- **PREGNANCY** Not known to be harmful; benefit outweighs risk.
- **BREAST FEEDING** Presence in milk unknown but benefit outweighs risk.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Solution for injection
    - Isovinorin (Pfizer Ltd)
      - Levofolinic acid (as Calcium levofolinate) 10 mg per 1 ml
      - Isovinorin 175mg/17.5ml solution for injection vials | 1 vial £81.33 (Hospital only)
      - Isovinorin 25mg/2.5ml solution for injection vials | 1 vial £11.62 (Hospital only)

### 2.1a Hyperuricaemia associated with cytotoxic drugs

#### DETOXIFYING DRUGS

### URATE OXIDASES

### Rasburicase

- **INDICATIONS AND DOSE**
  - Prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematological malignancy
    - By intravenous infusion
    - Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** G6PD deficiency
- **CAUTIONS** Atopic allergies
- **SIDE-EFFECTS**
  - Common or very common: Fever, nausea, vomiting
  - Uncommon: Anaphylaxis, bronchospasm, diarrhoea, haemolytic anaemia, headache, hypersensitivity reactions, methaemoglobinemia, rash
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor closely for hypersensitivity.
- **EFFECT ON LABORATORY TESTS** May interfere with test for uric acid—consult product literature.

### Allopurinol

- **INDICATIONS AND DOSE**
  - Prophylaxis of hyperuricaemia associated with cancer chemotherapy
  - Prophylaxis of hyperuricaemic nephropathy, enzyme disorders causing increased serum urate e.g. Lesch-Nyhan syndrome
    - By mouth
      - Child 1 month-14 years: 10 – 20 mg/kg daily, dose to be taken preferably after food; maximum 400 mg per day
      - Child 15–17 years: Initially 100 mg daily, taken preferably after food; dose to be increased according to response, up to 900 mg daily in divided doses (max. per dose 300 mg)
- **CAUTIONS** Ensure adequate fluid intake - for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy
- **INTERACTIONS** → Appendix 1 (allopurinol).
- **SIDE-EFFECTS**
  - Very rare: Seizures
- **PREGNANCY** Toxicity not reported. Manufacturer advises use only if no safer alternative and disease carries risk for mother or child.
- **HEPATIC IMPAIRMENT** Reduce dose. Monitor hepatic function.
- **RENAL IMPAIRMENT** Manufacturer advises reduce dose or increase dose interval in severe impairment; adjust dose to maintain plasma-oxipurinol concentration below 100 micromol/litre.
- **PATIENT AND CARER ADVICE**

#### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.
  - Powder and solvent for solution for infusion
    - Fasturtec (Sanofi)
      - Rasburicase 1.5 mg
      - Fasturcse 1.5mg powder and solvent for solution for infusion vials | 3 vial £208.39 (Hospital only)
      - Rasburicase 7.5 mg
      - Fasturcse 7.5mg powder and solvent for solution for infusion vials | 1 vial £347.32 (Hospital only)

#### XANTHINE OXIDASE INHIBITORS

### Allopurinol

- **INDICATIONS AND DOSE**
  - Prophylaxis of hyperuricaemia associated with cancer chemotherapy
  - Prophylaxis of hyperuricaemic nephropathy, enzyme disorders causing increased serum urate e.g. Lesch-Nyhan syndrome
    - By intravenous infusion
      - Allopurinol (Non-proprietary)
        - Allopurinol 100 mg
        - Allopurinol 100mg tablets | 28 tablet £1.64 DT price = £0.80
3 Immunotherapy responsive malignancy

IMMUNOSTIMULANTS

Interferon alfa

**DRUG ACTION**
Interferon alfa has shown some antitumour effect in certain lymphomas and solid tumours.

**INDICATIONS AND DOSE**
Induction of early regression of life-threatening corticosteroid resistant haemangiomata of infancy
- **BY SUBCUTANEOUS INJECTION**
- Child: (consult local protocol)

**INDICATIONS AND DOSE**
Chronic active hepatitis B
- **BY SUBCUTANEOUS INJECTION**
- Child 2-17 years: 5 000 000–10 000 000 units/m² 3 times a week

**INDICATIONS AND DOSE**
Chronic active hepatitis C (in combination with oral ribavirin)
- **BY SUBCUTANEOUS INJECTION**
- Child 3-17 years: 3 000 000 units/m² 3 times a week

**INDICATIONS AND DOSE**
Chronic active hepatitis B
- **BY SUBCUTANEOUS INJECTION**
- Child 2-17 years: 5 000 000–10 000 000 units/m² 3 times a week

**INDICATIONS AND DOSE**
Chronic active hepatitis C (in combination with ribavirin)
- **BY SUBCUTANEOUS INJECTION**
- Child 3-17 years: 3 000 000 units/m² 3 times a week

**INDICATIONS AND DOSE**
Chronic active hepatitis B
- **BY SUBCUTANEOUS INJECTION**
- Child 2-17 years: 2 500 000–5 000 000 units/m² 3 times a week, up to 10 000 000 units/m² has been used 3 times a week

**UNLICENSED USE**
Not licensed for use in children for chronic active hepatitis B.

**CONTRA-INDICATIONS**
Avoid injections containing benzyl alcohol in neonates - history of severe psychiatric illness

**CONTRA-INDICATIONS, FURTHER INFORMATION**
For contra-indications consult product literature and local treatment protocol.

**CAUTIONS**
For cautions consult product literature and local treatment protocol.

Interferon alfa should always be used under the close supervision of a specialist; the decision to treat should be made only after careful assessment of the expected benefits versus the potential risks, in particular the risk of growth inhibition caused by combination therapy.

**INTERACTIONS**
Appendix 1 (interferons).

**SIDE-EFFECTS**
- **Common or very common**
  - Anorexia
  - Influenza-like symptoms
  - Lethargy
  - Nausea
- **Rare**
  - Pneumonia
  - Pneumonitis
  - Pulmonary infiltrates
- **Frequency not known**
  - Alopecia
  - Arthritis
  - Cardiovascular problems
  - Coma
  - Confusion
  - Depression
  - Hepatotoxicity
  - Hyperglycaemia
  - Hyperinsensitivity reactions
  - Hypertension
  - Hypertriglyceridaemia
- **Severe**
  - Hypothenia
  - Myelosuppression
  - Myosthenia
  - Myalgia
  - Myalgia
  - Myophagia
  - Myopathy

**SIDE-EFFECTS, FURTHER INFORMATION**
Consult product literature and local treatment protocols for information on side-effects.

Respiratory symptoms should be investigated and if pulmonary infiltrates are suspected or lung function is impaired the discontinuation of interferon alfa should be considered.

**CONCEPTION AND CONTRACEPTION**
Effective contraception required during treatment—consult product literature.

**PREGNANCY**
Avoid use as potential benefit outweighs risk to the foetus.

**BREAST FEEDING**
Avoid use as potential benefit outweighs risk to the infant.

**HEPATIC IMPAIRMENT**
Avoid use as potential benefit outweighs risk to the liver.

**RENAL IMPAIRMENT**
Avoid use as potential benefit outweighs risk to the kidneys.

**MONITORING REQUIREMENTS**
Monitoring of lipid concentration is recommended.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **EXCIPIENTS**: May contain Benzyl alcohol
  - **IntronA** (Merck Sharp & Dohme Ltd)
    - Interferon alfa-2b 10 mega u per 1 ml
    - Interferon alfa-2b 15 mega u per 1 ml
    - Interferon alfa-2b 25 mega u per 1 ml
    - Interferon alfa-2b 50 mega u per 1 ml
    - Interferon alfa-2b 100 mega u per 1 ml
    - Interferon alfa-2b 200 mega u per 1 ml
    - Interferon alfa-2b 300 mega u per 1 ml
    - Interferon alfa-2b 500 mega u per 1 ml

- **Roferon-A** (Roche Products Ltd)
  - Interferon alfa-2a 6 mega u per 1 ml
  - Interferon alfa-2a 9 mega u per 1 ml
  - Interferon alfa-2a 12 mega u per 1 ml
  - Interferon alfa-2a 18 mega u per 1 ml
  - Interferon alfa-2a 30 mega u per 1 ml
  - Interferon alfa-2a 50 mega u per 1 ml

**URICOSURIC DRUGS**
- **Allopurinol 300 mg**
  - Allopurinol 300mg tablets | 28 tablet | £1.72 per DT | £0.90
  - Allopurinol 100 mg | 28 tablet | £1.25 per DT | £0.80
  - Allopurinol 300 mg | 100 tablet | £10.19
  - Allopurinol 300 mg | 28 tablet | £7.31 per DT | £0.90

**Zyloric**
- **Zyloric** (Ennogen Pharma Ltd)
  - Allopurinol 300mg tablets | 28 tablet | £7.31 per DT | £0.90

**BNFC 2016–2017**

**Immunotherapy responsive malignancy**

**Interferons**

**Zaferon**

**Zyloric**

**IntronA**

**Roferon-A**

**Uricto**

**BNFC 2016–2017**

**Immune system and malignant disease**
Interferon gamma-1b
(Immun interferon)

**INDICATIONS AND DOSE**
- To reduce the frequency of serious infection in chronic granulomatous disease
  - **BY SUBCUTANEOUS INJECTION**
  - Child 6 months-17 years (body surface area up to 0.6 m²): 1.5 micrograms/kg 3 times a week
  - Child 6 months-17 years (body surface area 0.6 m² and above): 50 micrograms/m² 3 times a week
- To reduce the frequency of serious infection in severe malignant osteoporosis
  - **BY SUBCUTANEOUS INJECTION**
  - Child (body surface area up to 0.6 m²): 1.5 micrograms/kg 3 times a week
  - Child (body surface area 0.6 m² and above): 50 micrograms/m² 3 times a week

**CAUTIONS**
- Arrhythmias, cardiac disease, congestive heart failure, ischaemia, seizure disorders (including seizures associated with fever)
- INTERACTIONS → Appendix 1 (interferons).

**SIDE-EFFECTS**
- Common or very common: Abdominal pain, arthralgia, chill, depression, diarrhoea, fatigue, fever, headache, injection-site reactions, myalgia, nausea, rash, vomiting
- Rare: Confusion, systemic lupus erythematosus
- Frequency not known: Neutropenia, proteinuria, raised liver enzymes, thrombocytopenia

**CONCEPTION AND CONTRACEPTION**
- Effective contraception required during treatment—consult product literature.

**PREGNANCY**
- Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in animal studies).

**BREAST FEEDING**
- Manufacturers advise avoid—no information available.

**HEPATIC IMPAIRMENT**
- Manufacturer advises caution in severe impairment—risk of accumulation.

**RENAL IMPAIRMENT**
- Manufacturer advises caution in severe impairment—risk of accumulation.

**MONITORING REQUIREMENTS**
- Monitor before and during treatment: haematological tests (including full blood count, differential white cell count, and platelet count), blood chemistry tests (including renal and liver function tests) and urinalysis.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- **Solution for injection**
  - Immukin (Boehringer Ingelheim Ltd)
  - Interferon gamma-1b (recombinant human) 200 microgram per 1 ml Immukin 100micrograms/0.5ml solution for injection vials | 6 vial pack £450.00

---

Mifamurtide

**INDICATIONS AND DOSE**
- Treatment of high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection (in combination with chemotherapy)
  - **BY INTRAVENOUS INFUSION**
  - Child 2-17 years: Infusion to be given over 1 hour (consult product literature or local protocols)

**UNLICENSED USE**
- Not licensed for use in patients under 2 years of age at initial diagnosis.

**CAUTIONS**
- Asthma—consider prophylactic bronchodilator therapy.
- Chronic obstructive pulmonary disease—consider prophylactic bronchodilator therapy—history of autoimmune disease—history of collagen disease—history of inflammatory disease

**INTERACTIONS** → Appendix 1 (mifamurtide).

**SIDE-EFFECTS**
- Abdominal pain, alopecia, anaemia, anorexia, anxiety, blurred vision, confusion, constipation, cough, depression, diarrhoea, dizziness, drowsiness, dry skin, dyspepsia, dysphonia, dysuria, epistaxis, flushing, gastro-intestinal disturbances, granulocytopenia, haematuria, haemoptyisis, headache, hearing loss, hypertension, hypoaesthesia, hypokalaemia, hypotension, insomnia, leucopenia, musculoskeletal pain, nausea, oedema, palpitations, parasthesia, phlebitis, pleural effusion, pollakiuria, rash, respiratory disorders, sweating, tachycardia, tachypnoea, thrombocytopenia, tinnitus, tremor, vertigo, vomiting

**CONCEPTION AND CONTRACEPTION**
- Effective contraception required.

**PREGNANCY**
- Avoid.

**BREAST FEEDING**
- Avoid—no information available.

**HEPATIC IMPAIRMENT**
- Use with caution—no information available.

**RENAL IMPAIRMENT**
- Use with caution—no information available.

**MONITORING REQUIREMENTS**
- Monitor renal function, hepatic function and clotting parameters.
- Monitor patients with history of venous thrombosis, vasculitis, or unstable cardiovascular disorders for persistent or worsening symptoms during administration—consult product literature.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**
- Mifamurtide for the treatment of osteosarcoma (October 2011) NICE TA235
  - Mifamurtide in combination with postoperative multi-agent chemotherapy is recommended (within its licensed indication), as an option for the treatment of high-grade resectable non-metastatic osteosarcoma after macroscopically complete surgical resection in children, adolescents and young adults and when mifamurtide is made available at a reduced cost to the NHS under the patient access scheme.
  - www.nice.org.uk/TA235

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- **Powder for suspension for infusion**
  - Mepact (Takeda UK Ltd)
  - Mifamurtide 4 mg Mepact 4mg powder for suspension for infusion vials | 1 vial pack no price available
4 Targeted therapy responsive malignancy

**ANTINEOPLASTIC DRUGS**

**Protein Kinase Inhibitors**

**Everolimus**

- **Drug Action** Everolimus is a protein kinase inhibitor.

- **Indications and Dose**
  - Votubia® Subependymal giant cell astrocytoma associated with tuberous sclerosis complex
    - By mouth
    - Child: consult product literature

**Important Safety Information**

**Risks of Incorrect Dosing of Oral Anti-Cancer Medicines**
See Cytotoxic drugs p. 494.

**Caution** History of bleeding disorders.

**Interactions** Appendix 1 (everolimus). Caution with concomitant use of drugs that increase risk of bleeding.

**Side-effects**

- **Common or Very Common** Abdominal pain - anorexia - arthralgia - asthenia - chest pain - convulsions - dehydration - diarrhoea - dry mouth - dysphagia - electrolyte disturbance - epistaxis - eyelid oedema - fatigue - hand-foot syndrome - headache - hypercholesterolaemia - hyperglycaemia - hyperlipidaemia - hypertension - hypoglycaemia - increased susceptibility to aspergillosis - increased susceptibility to candidiasis - increased susceptibility to infections - increased susceptibility to pneumonia - insomnia - interstitial lung disease - irritable bowel syndrome - peripheral oedema - pneumonitis - renal failure - skin disorders - taste disturbance

- **Uncommon** Aggression - agitation - congestive heart failure - flushing - impaired wound healing - rhabdomyolysis

- **Frequency Not Known** Alopecia - bone-marrow suppression - gastro-intestinal effects - haemorrhage - hepatitis B reactivation - hyperuricaemia - nausea - oral mucositis - organ-related toxicity (long-term and delayed) - thromboembolism - tumour lysis syndrome - vomiting

**Side-effects, Further Information**

Reduce dose or discontinue if severe side-effects occur - consult product literature.

**Conception and Contraception** Effective contraception must be used during and for up to 8 weeks after treatment.

**Pregnancy** Manufacturer advises avoid (toxicity in animal studies). See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

**Breast Feeding** Manufacturer advises avoid.

**Hepatic Impairment** Consult product literature.

**Monitoring Requirements**

- Monitor blood-glucose concentration, serum-triglycerides and serum-cholesterol before treatment and periodically thereafter.

- Monitor renal function before treatment and periodically thereafter.

**Directions for Administration**

Votubia® Tablets may be dispersed in approximately 30 mL of water by gently stirring, immediately before drinking. After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed.

**Patient and Carer Advice**

Pneumonitis Non-infectious pneumonitis reported. Patients should be advised to seek urgent medical advice if new or worsening respiratory symptoms occur.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS** 25
  - **Votubia** (Novartis Pharmaceuticals UK Ltd)
    - Everolimus 2.5 mg Votubia 2.5mg tablets | 30 tablet pack £1,200.00
    - Everolimus 5 mg Votubia 5mg tablets | 30 tablet pack £2,250.00
    - Everolimus 10 mg Votubia 10mg tablets | 30 tablet pack £2,970.00

**Imatinib**

- **Drug Action** Imatinib is a tyrosine kinase inhibitor.

- **Indications and Dose**
  - **Treatment of newly diagnosed Philadelphia-chromosome-positive chronic myeloid leukaemia when bone marrow transplantation is not considered first line treatment**
  - **Treatment of Philadelphia-chromosome-positive chronic myeloid leukaemia in chronic phase after failure of interferon alfa, or in accelerated phase, or in blast crisis**
  - **Treatment of newly diagnosed Philadelphia-chromosome-positive acute lymphoblastic leukaemia in combination with chemotherapy**
    - By mouth
    - Child: consult local protocol

**Important Safety Information**

**Risks of Incorrect Dosing of Oral Anti-Cancer Medicines**
See Cytotoxic drugs p. 494.

**Caution** Cardiac disease - history of renal failure - risk factors for heart failure.

**Interactions** Appendix 1 (imatinib).

**Side-effects**

Frequency not known  Alopecia • bone-marrow suppression • drug rash with eosinophilia and systemic symptoms (DRESS) • gastro-intestinal effects • growth retardation in children • hyperuricaemia • nausea • oral mucositis • organ-related toxicity (long-term and delayed) • thromboembolism • tumour lysis syndrome • vomiting

CONCEPTION AND CONTRACEPTION  Effective contraception required during treatment.

PREGNANCY  Manufacturer advises avoid unless potential benefit outweighs risk. See also Pregnancy and reproductive function in Cytotoxic drugs p. 494.

BREAST FEEDING  Discontinue breast-feeding.

HEPATIC IMPAIRMENT  Start with minimum recommended dose; reduce dose further if not tolerated; consult local treatment protocol.

RENAL IMPAIRMENT  Start with minimum recommended dose; reduce dose further if not tolerated; consult local treatment protocol.

MONITORING REQUIREMENTS
- Monitor for gastrointestinal haemorrhage.
- Monitor complete blood counts regularly.
- Monitor for fluid retention.
- Monitor liver function.
- Monitor growth in children (may cause growth retardation).

DIRECTIONS FOR ADMINISTRATION  Tablets may be dispersed in water or apple juice.

PATIENT AND CARER ADVICE  Patients or carers should be given advice on how to administer imatinib tablets.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Blood and blood-forming organs

1 Anaemias

Anaemias

Initiation of treatment
Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

Sickle-cell anaemia
Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include sickle-cell crisis, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine, haemophilus influenzae type b vaccine, an annual influenza vaccine and prophylactic penicillin reduce the risk of infection. Hepatitis B vaccine should be considered if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary.

Hydroxycarbamide p. S12 can reduce the frequency of crises and the need for blood transfusions in sickle-cell disease. The beneficial effects of hydroxycarbamide may not become evident for several months.

G6PD deficiency
Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, Vicia faba); this is termed favism and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:

• G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies;
thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;
• manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals;
• the risk and severity of haemolysis is almost always dose-related.

Hence, information about G6PD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6PD deficiency is common.

A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.

Drugs with definite risk of haemolysis in most G6PD-deficient individuals
• Dapsone and other sulphones (higher doses for dermatitis herpetiformis more likely to cause problems)
• Methyleneiminium chloride
• Niridazole [not on UK market]
• Nitrofurantoin
• Pamaquin [not on UK market]
• Primaquine (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people)
• Quinolones (including ciprofloxacin, moxifloxacin, nalidixic acid, norfloxacin, and ofloxacin)
• Rasburicase
• Sulfonamides (including co-trimoxazole; some sulfonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6PD-deficient individuals)

Drugs with possible risk of haemolysis in some G6PD-deficient individuals
• Aspirin (acceptable up to a dose of at least 1 g daily in most G6PD-deficient individuals)
• Chloroquine (acceptable in acute malaria and malaria chemophylaxis)
• Menadione, water-soluble derivatives (e.g. menadiol sodium phosphate)
• Quinidine (acceptable in acute malaria) [not on UK market]
• Quinine (acceptable in acute malaria)
• Sulfonylureas

Naphthalene in mothballs also causes haemolysis in individuals with G6PD deficiency.

Drugs used in hypoplastic, haemolytic, and renal anaemias

Anabolic steroids, pyridoxine hydrochloride p. 585, antilymphocyte immunoglobulin, and various corticosteroids are used in hypoplastic and haemolytic anaemias.

Antilymphocyte immunoglobulin given intravenously through a central line over 12–18 hours each day for 5 days produces a response in about 50% of cases of acquired aplastic anaemia; the response rate may be increased when ciclosporin p. 486 is given as well. Severe reactions are common in the first 2 days and profound immunosuppression can occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities. Alternatively, oxymetholone tablets (available from ‘special order’ manufacturers or specialist importing companies) can be used in aplastic anaemia for 3 to 6 months.

It is unlikely that dietary deprivation of pyridoxine hydrochloride produces clinically relevant haematological effects. However, certain forms of sideroblastic anaemia respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine hydrochloride is indicated in both idiopathic acquired and hereditary sideroblastic anaemias. Although complete cures have not been reported, some increase in haemoglobin can occur with high doses. Reversible sideroblastic anaemias respond to treatment of the underlying cause but pyridoxine hydrochloride is indicated in pregnancy, haemolytic anaemias, or during isoniazid p. 345 treatment.

Corticosteroids have an important place in the management of haematological disorders including autoimmune haemolytic anaemia, idiopathic thrombocytopenias and neutropenias, and major transfusion reactions. They are also used in chemotherapy schedules for many types of lymphoma, lymphoid leukaemias, and paraproteinaemias, including multiple myeloma.

Erythropoietins

Epoetins (recombinant human erythropoietins) are used to treat the anaemia associated with erythropoietin deficiency in chronic renal failure.

Epoetin beta p. 525 is also used for the prevention of anaemia in preterm neonates of low birth-weight; a therapeutic response may take several weeks. There is insufficient information to support the use of erythropoietins in children with leukaemia or in those receiving cancer chemotheraphy.

Darbepoetin is a glycosylated derivative of epoetin; it persists longer in the body and can be administered less frequently than epoetin.

1.1 Hypoplastic, haemolytic, and renal anaemias

ANABOLIC STEROIDS ANDROSTAN DERIVATIVES

Oxymetholone

● INDICATIONS AND DOSE

Aplastic anaemia
▷ BY MOUTH
▷ Child: 1–5 mg/kg daily for 3 to 6 months

● MEDICINAL FORMS

Capsule
▷ Oxymetholone (Non-proprietary)
Oxymetholone 50 mg | Oxymetholone 50mg capsules 50 capsule (BR) £47.50 (34%)
increase the risk of serious cardiovascular events and death; haemoglobin concentrations higher than 12 g/100 mL should be avoided in children.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates - pure red cell aplasia following erythropoietin therapy - uncontrolled hypertension
- **CAUTIONS** Aluminium toxicity (can impair the response to erythropoietin) - concurrent infection (can impair the response to erythropoietin) - correct factors that contribute to the anaemia of chronic renal failure, such as iron or folate deficiency, before treatment - during dialysis (increase in unfractiionated or low molecular weight heparin dose may be needed) - epilepsy - inadequately treated or poorly controlled blood pressure - interrupt treatment if blood pressure uncontrolled - ischaemic vascular disease - malignant disease - other inflammatory disease (can impair the response to erythropoietin) - sickle-cell disease (lower target haemoglobin concentration may be appropriate) - sudden stabbing migraine-like pain (warning of a hypertensive crisis) - thrombocytosis (monitor platelet count for first 8 weeks)
- **SIDE-EFFECTS**
  - **Common or very common** Aggravation of hypertension (dose-dependent) - cardiovascular events - diarrhoea - dose-dependent increase in platelet count regressing during treatment (but thrombocytosis rare) - headache - hypertensive crisis (in isolated patients with normal or low blood pressure) - increase in blood pressure (dose-dependent) - influenza-like symptoms (may be reduced if intravenous injection given over 5 minutes) - nausea - shunt thrombosis especially if tendency to hypotension or arteriovenous shunt complications - vomiting
  - **Very rare** Sudden loss of efficacy because of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure
  - **Frequency not known** Anaphylaxis - angioedema - hyperkalaemia - hypersensitivity reactions - injection-site reactions - peripheral oedema - skin reactions

**SIDE-EFFECTS, FURTHER INFORMATION**
- Hypertensive crisis In isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention has occurred with epoetin.
- Pure red cell aplasia There have been very rare reports of pure red cell aplasia in patients treated with erythropoetins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoetins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should not be switched to another form of erythropoietin.

**MONITORING REQUIREMENTS**
- Monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes—interrupt treatment if blood pressure uncontrolled.
- Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients and in preterm neonates.

**INDICATIONS AND DOSE**

**Symptomatic anaemia associated with chronic renal failure in patients on dialysis**
- **BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION**
  - **Child 11–17 years:** Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose to be given once weekly or once every 2 weeks, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

**Symptomatic anaemia associated with chronic renal failure in patients not on dialysis**
- **BY SUBCUTANEOUS INJECTION**
  - **Child 11–17 years:** Initially 450 nanograms/kg once weekly, alternatively initially 750 nanograms/kg every 2 weeks, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose can be given once weekly, every 2 weeks, or once a month, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

**Symptomatic anaemia associated with chronic renal failure in patients not on dialysis**
- **BY INTRAVENOUS INJECTION**
  - **Child 11–17 years:** Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose given once weekly, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

**SIDE-EFFECTS** Injection-site pain - oedema

**PREGNANCY** No evidence of harm in animal studies—manufacturer advises caution.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises caution.

Epoetin beta

INDICATIONS AND DOSE
Symptomatic anaemia associated with chronic renal failure

BY SUBCUTANEOUS INJECTION

Neonate: Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week, according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.

Child: Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week, according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.

BY INTRAVENOUS INJECTION

Neonate: Initially 40 units/kg 3 times a week for 4 weeks, then increased to 80 units/kg 3 times a week, then increased in steps of 20 units/kg 3 times a week if required, at intervals of 4 weeks; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks. Intravenous injection to be administered over 2 minutes. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.

Child: Initially 40 units/kg 3 times a week for 4 weeks, then increased to 80 units/kg 3 times a week, then increased in steps of 20 units/kg 3 times a week if required, at intervals of 4 weeks; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks. Intravenous injection to be administered over 2 minutes. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.

Child: Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week, according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses. Epoetin zeta

**INDICATIONS AND DOSE**

Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

- **BY INTRAVENOUS INJECTION**
  - **Child (body-weight up to 10 kg):** Initially 50 units/kg 3 times a week, adjusted according to response, adjusted in steps of 25 units/kg 3 times a week, dose to be adjusted at intervals of at least 4 weeks; maintenance 75–150 units/kg 3 times a week, to be administered over 1–5 minutes; avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks
  - **Child (body-weight 10–30 kg):** Initially 50 units/kg 3 times a week, adjusted according to response, adjusted in steps of 25 units/kg 3 times a week, dose to be adjusted at intervals of at least 4 weeks; maintenance 60–150 units/kg 3 times a week, to be administered over 1–5 minutes, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks

- **BY SUBCUTANEOUS INJECTION**
  - **Neonate up to 33 weeks corrected gestational age (body-weight 0.75–1.5 kg):** 250 units/kg 3 times a week preferably started within 3 days of birth and continued for 6 weeks, using single-dose unpreserved injection.

**PRECAUTIONS**

- **PREGNANCY** No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.
- **BREAST FEEDING** Unlikely to be present in milk. Minimal effect on infant.
- **HEPATIC IMPAIRMENT** Manufacturers advise caution in chronic hepatic failure.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**EXCP.VENTS:** May contain Phenylalanine

**BNFC 2016–2017**
1.1a Atypical haemolytic uraemic syndrome and paroxysmal nocturnal haemoglobinuria

IMMUNOSUPPRESSANTS ▶ MONOClonal ANTIBODIES

Eculizumab

▶ DRUG ACTION: Eculizumab, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein and thereby reduces haemolysis and thrombotic microangiopathy.

▶ INDICATIONS AND DOSE

Reduce haemolysis in paroxysmal nocturnal haemoglobinuria (PNH), in those with a history of blood transfusions (under expert supervision)

▶ BY INTRAVENOUS INFUSION

Child: Refer for specialist advice, experience very limited

Reduce thrombotic microangiopathy in atypical haemolytic uraemic syndrome (aHUS) (specialist use only)

▶ BY INTRAVENOUS INFUSION

Child 2 months-17 years (body-weight 5–9 kg): Initially 300 mg once weekly for 2 weeks, followed by 300 mg every 3 weeks

Child 2 months-17 years (body-weight 10–19 kg): Initially 600 mg once weekly for 1 week, then reduced to 300 mg once weekly for 1 week, followed by 300 mg every 2 weeks

Child 2 months-17 years (body-weight 20–29 kg): Initially 600 mg once weekly for 3 weeks, followed by 600 mg every 2 weeks

Child 2 months-17 years (body-weight 30–39 kg): Initially 600 mg once weekly for 2 weeks, then increased to 900 mg once weekly for 1 week, followed by 900 mg every 2 weeks

Child 2 months-17 years (body-weight 40 kg and above): Initially 900 mg once weekly for 4 weeks, then increased to 1.2 g once weekly for 1 week, followed by 1.2 g every 2 weeks

▶ UNLICENSED USE Not licensed for use in children for paroxysmal nocturnal haemoglobinuria.

▶ CONTRA-INDICATIONS Patients unvaccinated against Neisseria meningitidis - unresolved Neisseria meningitidis infection

▶ CAUTIONS Active systemic infection

CAUTIONS, FURTHER INFORMATION

Meningococcal infection: Vaccinate against Neisseria meningitidis at least 2 weeks before treatment (tetravalent vaccine against serotypes A, C, W135 and Y recommended); revaccinate according to current medical guidelines. Patients receiving eculizumab less than 2 weeks after receiving meningococcal vaccine must be given prophylactic antibiotics until 2 weeks after vaccination. Advise patient to report promptly any signs of meningococcal infection. Other immunisations should also be up to date.

▶ SIDE-EFFECTS

Common or very common: Alopecia · arthralgia · blood disorders · cough · dizziness · dysgeusia · dysuria · fatigue · gastro-intestinal disturbances · headache · infection (including meningococcal infection) · influenza-like symptoms · infusion-related reactions · leucopenia · myalgia · nasopharyngitis · oedema · paraesthesia · pruritus · rash · spontaneous erection · thrombocytopenia · vertigo

Uncommon: Anorexia · anxiety · chest pain · depression · epistaxis · gingival pain · Graves’ disease · haematoma · hot flushing · hypohydrosis · hypotension · jaundice · malignant melanoma · menstrual disorders · mood changes · muscle spasms · myelodysplastic syndrome · palpitations · petechiae · renal impairment · skin depigmentation · sleep disturbances · syncope · tinnitus · tremor · visual disturbances

▶ CONCEPTION AND CONTRACEPTION: Manufacturer advises effective contraception during and for 5 months after treatment.

▶ PREGNANCY: No information available—use only if potential benefit outweighs risk. Human IgG antibodies known to cross placenta.

▶ BREAST FEEDING: No information available—manufacturer advises avoid breast-feeding during and for 5 months after treatment.

▶ MONITORING REQUIREMENTS

Monitor for 1 hour after infusion.

For paroxysmal nocturnal haemoglobinuria, monitor for intravascular haemolysis (including serum-lactate dehydrogenase concentration) during treatment and for at least 8 weeks after discontinuation.

For atypical haemolytic uraemic syndrome, monitor for thrombotic microangiopathy (measure platelet count, serum-lactate dehydrogenase concentration, and serum creatinine) during treatment and for at least 12 weeks after discontinuation.

▶ DIRECTIONS FOR ADMINISTRATION

With intravenous use Dilute requisite dose to a concentration of 5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and mix gently; give over 25–45 minutes. If infusion-related reactions occur, infusion time may be increased to 4 hours in child under 12 years or 2 hours in child over 12 years.

▶ PRESCRIBING AND DISPENSING INFORMATION Consult product literature for details of supplemental doses with concomitant plasmapheresis, plasma exchange, or plasma infusion.

▶ PATIENT AND CARER ADVICE A patient information card should be provided.

Patient or carers should be advised to report promptly any signs of meningococcal infection.

▶ MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

Soliris (Alexion Pharma UK Ltd)

Eculizumab 10 mg per 1 ml Soliris 300mg/30ml concentrate for solution for infusion vials | 1 vial (£3.150.00 (Hospital only)

1.2 Iron deficiency anaemia

Anaemia, iron deficiency

Treatment and prophylaxis

Treatment with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastrointestinal bleeding). The possibility of thalassaemia should be considered in children of Mediterranean or Indian subcontinent descent.

Prophylaxis with an iron preparation may be appropriate in those with a poor diet, malabsorption, menorrhagia,
pregnancy, in haemodialysis patients, and in the management of low birth-weight infants such as preterm neonates.

**Oral iron**

Iron salts should be given by mouth unless there are good reasons for using another route. Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of preparation is thus usually decided by formulation, palatability, incidence of side-effects, and cost.

**Treatment of iron-deficiency anaemia**

The daily dose of elemental iron to treat deficiency is 3–6 mg/kg (max. 200 mg) daily given in 2–3 divided doses. Iron supplementation may also be required to produce an optimum response to erythropoietins in iron-deficient children with chronic renal failure or in preterm neonates. When prescribing, express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription. The iron content of artificial formula feeds should also be considered.

### Iron content of different iron salts

<table>
<thead>
<tr>
<th>Iron salt/amount</th>
<th>Content of ferrous iron</th>
</tr>
</thead>
<tbody>
<tr>
<td>ferrous fumarate 200 mg</td>
<td>65 mg</td>
</tr>
<tr>
<td>ferrous gluconate 300 mg</td>
<td>35 mg</td>

<tr>
<td>ferrous sulfate 300 mg</td>
<td>60 mg</td>
</tr>
<tr>
<td>ferrous sulfate dried 200 mg</td>
<td>65 mg</td>
</tr>
<tr>
<td>sodium feredetate 190 mg</td>
<td>27.5 mg</td>
</tr>
</tbody>
</table>

**Prophylaxis of iron deficiency**

In neonates, haemoglobin and haematocrit concentrations change rapidly. These changes are not due to iron deficiency and can be corrected by iron supplementation. Similarly, neonatal anaemia resulting from repeated blood sampling does not respond to iron therapy.

All babies, including preterm neonates, are born with substantial iron stores but these stores can become depleted unless dietary intake is adequate. All babies require an iron intake of 400–700 nanograms daily to maintain body stores. Iron in breast milk is well absorbed but that in artificial feeds or in cow’s milk is less so. Most artificial formula feeds are sufficiently fortified with iron to prevent deficiency and their iron content should be taken into account when considering further iron supplementation.

Prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established.

Infants with a poor diet may become anaemic in the second year of life, particularly if cow’s milk, rather than fortified formula feed, is a major part of the diet.

**Compound preparations**

Some oral preparations contain ascorbic acid p. 587 to aid absorption of the iron, but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the B group of vitamins, except folic acid for pregnant women.

**Parenteral iron**

Iron can be administered parenterally as iron dextran p. 529, iron sucrose p. 529 or ferric carboxymaltose p. 529.

Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the child cannot tolerate oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption. Many children with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis.

With the exception of children with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately. If parenteral iron is necessary, the dose should be calculated according to the child’s body-weight and total iron deficit. Depending on the preparation used, parenteral iron is given as a total dose or in divided doses. Further treatment should be guided by monitoring haemoglobin and serum iron concentrations.

**MINERALS AND TRACE ELEMENTS**

### Iron (injectable)

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS WITH INTRAVENOUS IRON (AUGUST 2013)

Serious hypersensitivity reactions, including life-threatening and fatal anaphylactic reactions, have been reported in patients receiving intravenous iron. These reactions can occur even when a previous administration has been tolerated (including a negative test dose). Test doses are no longer recommended and caution is needed with every dose of intravenous iron.

Intravenous iron products should only be administered when appropriately trained staff and resuscitation facilities are immediately available; patients should be closely monitored for signs of hypersensitivity during and for at least 30 minutes after every administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

The risk of hypersensitivity is increased in patients with known allergies, immune or inflammatory conditions, or those with a history of severe asthma, eczema, or other atopic allergy; in these patients, intravenous iron should only be used if the benefits outweigh the risks.

Intravenous iron should be avoided in the first trimester of pregnancy and used in the second or third trimesters only if the benefit outweighs the potential risks for both mother and fetus.

**SIDE-EFFECTS**

Hypersensitivity reactions

**SIDE-EFFECTS, FURTHER INFORMATION**

Anaphylactic reactions Anaphylactic reactions can occur with parenteral administration of iron complexes and facilities for cardiopulmonary resuscitation must be available. If children complain of acute symptoms particularly nausea, back pain, breathlessness, or develop hypotension, the infusion should be stopped.

**Overdose**

For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 786.
## Ferric carboxymaltose

### INDICATIONS AND DOSE

**Iron-deficiency anaemia**
- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- **Child**: Dose calculated according to body-weight and iron deficit (consult product literature)

**SIDE-EFFECTS**
- **Common or very common** Dizziness - gastro-intestinal disturbances - headache - injection-site reactions - rash - fatigue - flushing - hypertension - hypotension - malaise - myalgia - paraesthesia - peripheral oedema - pruritus - pyrexia - rigors - urticaria
- **Rare** Dyspnoea

**PREGNANCY** Avoid in first trimester; crosses the placenta in animal studies. May influence skeletal development.

**HEPATIC IMPAIRMENT** Use with caution. Avoid in conditions where iron overload increases risk of impairment.

**PRESCRIBING AND DISPENSING INFORMATION** A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **Ferinject** (Vifor Pharma UK Ltd)
  - Iron (as Ferric carboxymaltose) 50 mg per 1 ml
  - Ferinject 1000mg/20ml solution for injection vials | 1 vial [POM] £154.23
  - Ferinject 100mg/2ml solution for injection vials | 5 vial [POM] £81.18
  - Ferinject 500mg/10ml solution for injection vials | 5 vial [POM] £405.88

**UNLICENSED USE** Not licensed for use in children under 14 years.

**CONTRA-INDICATIONS** Anaphylaxis - asthma - eczema - history of allergic disorders

**CAUTIONS** Hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available - oral iron should not be given until 5 days after last injection.

## Iron dextran

### INDICATIONS AND DOSE

**Iron-deficiency anaemia**
- **BY DEEP INTRAMUSCULAR INJECTION**
- **Child 14-17 years**: Intramuscular injection to be administered into the gluteal muscle, doses calculated according to body-weight and iron deficit (consult product literature)
- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- **Child**: Doses calculated according to body-weight and iron deficit (consult product literature)

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain - anaphylaxis - blurred vision - cramps - dyspnoea - flushing - nausea - numbness - pruritus - rash - vomiting
- **Rare** Angioedema - arrhythmias - arthralgia - chest pain - diarrohoea - dizziness - fatigue - hypotension - impaired consciousness - injection-site reactions - myalgia - restlessness - seizures - sweating - tachycardia - tremor
- **Very rare** Haemolysis - headache - hypertension - palpititation - paraesthesia - transient deafness

**PREGNANCY** Avoid in first trimester.

**HEPATIC IMPAIRMENT** Use with caution. Avoid in conditions where iron overload increases risk of impairment.

**PRESCRIBING AND DISPENSING INFORMATION** A complex of ferric hydroxide with dextran containing 5% (50 mg/mL) of iron.

**UNLICENSED USE** Not licensed for use in children under 14 years.

**CONTRA-INDICATIONS** Active rheumatoid arthritis - asthma - eczema - history of allergic disorders - infection

**CAUTIONS** Hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available - oral iron should not be given until 5 days after last injection.

## Iron sucrose

### INDICATIONS AND DOSE

**Iron-deficiency anaemia**
- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- **Child (body-weight up to 67 kg)**: Dose calculated according to body-weight and iron deficit, each divided dose should not exceed 3 mg/kg/dose (consult product literature)
- **Child (body-weight 67 kg and above)**: Dose calculated according to body-weight and iron deficit, each divided dose should not exceed max. 200 mg/dose (consult product literature)

**SIDE-EFFECTS**
- **Common or very common** Taste disturbances
- **Rare** Anaphylaxis - asthma - fatigue - hypertension - paraesthesia - peripheral oedema
- **Frequency not known** Arthralgia - bradycardia - confusion - increased sweating

**PREGNANCY** Avoid in first trimester.

**HEPATIC IMPAIRMENT** Use with caution. Avoid in conditions where iron overload increases risk of impairment.

**PRESCRIBING AND DISPENSING INFORMATION** A complex of ferric hydroxide with sucrose containing 2% (20 mg/mL) of iron.

**UNLICENSED USE** Not licensed for use in children.

**CONTRA-INDICATIONS** Anaphylaxis - asthma - eczema - history of allergic disorders

**CAUTIONS** Hypersensitivity reactions can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available - infection (discontinue if ongoing bacteraemia) - oral iron should not be given until 5 days after last injection.
Blood and nutrition

PRESCRIBING AND DISPENSING INFORMATION

MONITORING REQUIREMENTS

▶ Altered bowel habit

Managing side-effects

If side-effects occur, the dose may be reduced; alternatively, another iron salt may be used, but an improvement in tolerance may simply be a result of a lower content of elemental iron. The incidence of side-effects due to ferrous sulfate is no greater than with other iron salts when compared on the basis of equivalent amounts of elemental iron.

▶ Altered bowel habit

Iron preparations taken orally can be constipating and occasionally lead to faecal impaction. Oral iron, particularly modified-release preparations, can exacerbate diarrhoea in patients with inflammatory bowel disease; care is also needed in patients with intestinal strictures and diverticular disease.

The relationship between dose and altered bowel habit (constipation or diarrhoea) is less clear than for nausea and epigastric pain.

Overdose

For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 786.

Iron preparations are an important cause of accidental overdose in children and as little as 20 mg/kg of elemental iron can lead to symptoms of toxicity.

MONITORING REQUIREMENTS

▶ Therapeutic response

The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the normal range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow.

PRESCRIBING AND DISPENSING INFORMATION

Express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription.

The iron content of artificial formula feeds should also be considered.

The most common reason for lack of response in children is poor compliance; poor absorption is rare in children.

PATIENT AND CARER ADVICE

Although iron preparations are best absorbed on an empty stomach they can be taken after food to reduce gastro-intestinal side-effects. May discoulour stools.

MINERALS AND TRACE ELEMENTS

IRON, ORAL

SIDE-EFFECTS

Constipation - diarrhoea - epigastric pain (dose related) - faecal impaction - gastro-intestinal irritation - nausea (dose related)

SIDE-EFFECTS, FURTHER INFORMATION

Express the amounts of elemental iron.

Side-effects due to ferrous fumarate are no greater than with other iron salts when compared on the basis of equivalent amounts of elemental iron.

Overdose in children and as little as 20 mg/kg of elemental iron.

Overdose

For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 786.

Iron preparations are an important cause of accidental overdose in children and as little as 20 mg/kg of elemental iron can lead to symptoms of toxicity.

INTERACTIONS

Appendix 1 (iron salts).

PRESCRIBING AND DISPENSING INFORMATION

Non-proprietary ferrous fumarate tablets may contain 210 mg (68 mg iron), syrup may contain approx. 140 mg (45 mg iron)/5 mL; Galfer® capsules contain ferrous fumarate 305 mg (100 mg iron); Fersaday® tablets contain ferrous fumarate 322 mg (100 mg iron).

PATIENT AND CARER ADVICE

1.3 Megaloblastic anaemia

Anaemia, megaloblastic

Overview

Megaloblastic anaemias are rare in children; they may result from a lack of either vitamin B12 or folate and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

Vitamin B12 is used in the treatment of megaloblastosis caused by prolonged nitrous oxide anaesthesia, which inactivates the vitamin, and in the rare disorders of congenital transcobalamin II deficiency and homocystinuria.

Vitamin B12 should be given prophylactically after total ileal resection.

Aside from dietary deficiency, all other causes of vitamin B12 deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B12 orally and none for vitamin B12 intrinsic factor complexes given by mouth. Vitamin B12 in large oral doses [unlicensed] may be effective.
Hydroxocobalamin p. 534 has completely replaced cyanocobalamin p. 534 as the form of vitamin B12 of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B12 neuropathy.

Folic acid below has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B12 is administered concurrently otherwise neuropathy may be precipitated.

In folate-deficient megaloblastic anaemia (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores; higher doses may be necessary in malabsorption states. In pregnancy, folic acid daily is continued to term.

For prophylaxis in chronic haemolytic states, malabsorption, or in renal dialysis, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

Folic acid is also used for the prevention of methotrexate-induced side-effects in juvenile idiopathic arthritis, severe Crohn's disease and severe psoriasis.

Folic acid is actively excreted in breast milk and is well absorbed by the infant. It is also present in cow's milk and artificial formula feeds but is heat labile. Serum and red cell folate concentrations fall after delivery and urinary losses are high, particularly in low birth-weight neonates. Although symptomatic deficiency is rare in the absence of malabsorption or prolonged diarrhoea, it is common for neonatal units to give supplements of folic acid to all preterm neonates from 2 weeks of age until full-term corrected age is reached, particularly if heated breast milk is used without an artificial formula fortifier.

Folicin acid p. 515 is also effective in the treatment of folate deficient megaloblastic anaemia but it is normally only used in association with cytotoxic drugs; it is given as calcium folinate.

There is no justification for prescribing multiple ingredient vitamin preparations containing vitamin B12 or folic acid. For the use of folic acid before and during pregnancy, see Neural tube defects (prevention in pregnancy) p. 594.

**VITAMINS AND TRACE ELEMENTS▶ FOLATES**

### Folic acid

**INDICATIONS AND DOSE**

**Folate-deficient megaloblastic anaemia**

- **By mouth**
  - Neonate: Initially 500 micrograms/kg once daily for up to 4 months.
  - Child 1-11 months: Initially 500 micrograms/kg once daily (max. per dose 5 mg) for up to 4 months, doses up to 10 mg daily may be required in malabsorption states
  - Child 1-17 years: 5 mg daily for 4 months (until term in pregnant women), doses up to 15 mg daily may be required in malabsorption states

**SIDE-EFFECTS**

- Rare Gastro-intestinal disturbances

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Folic acid for megaloblastic anaemia caused by folate deficiency and haemolytic anaemia
www.medicinesforchildren.org.uk/
folic-acid-megaloblastic-anaemia-caused-folate-deficiency-and-haemolytic-anaemia

**EXCEPTIONS TO LEGAL CATEGORY**

Can be sold to the public provided daily doses do not exceed 500 micrograms.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Tablet**

- Folic acid (Non-proprietary)
  - Folic acid 400 microgram: Folic acid 400 microgram tablets | 90 tablet [POD] no price available DT price = £2.71 | 90 tablet [POD] £2.71
  - Folic acid 5 mg: Folic acid 5 mg tablets | 28 tablet [POD] £2.00 DT price = £0.83 | 1000 tablet [POD] £41.75

**UNLICENSED USE**

Unlicensed for limiting methotrexate toxicity.

**CAUTIONS**

Should never be given alone for pernicious anaemia (may precipitate subacute combined degeneration of the spinal cord).

**INTERACTIONS**

Appendix 1 (folic acid).

**SIDE-EFFECTS**

Rare Gastro-intestinal disturbances

**PREVENTION OF NEURAL TUBE DEFECTS (IN THOSE WITH SICKLE-CELL DISEASE)**

- **By mouth**
  - Females of childbearing potential: 5 mg daily, patient should continue taking their normal dose of folic acid 5 mg daily (or increase the dose to 5 mg daily) before conception and continue this throughout pregnancy.

**PREVENTION OF METHOTREXATE SIDE-EFFECTS IN SEVERE CROHN'S DISEASE**

- **By mouth**
  - Child: 1 mg once daily, alternatively 5 mg once weekly, dose to be adjusted according to local guidelines, weekly dose to be taken on a different day to methotrexate dose.

**PREVENTION OF FOLATE DEFICIENCY IN DIALYSIS**

- **By mouth**
  - Child 1 month-11 years: 250 micrograms/kg once daily (max. per dose 10 mg)
  - Child 12-17 years: 5–10 mg once daily.

**HAEMOLYTIC ANAEMIA▶ METABOLIC DISORDERS**

- **By mouth**
  - Child 1 month-11 years: 2.5–5 mg once daily
  - Child 12-17 years: 5–10 mg once daily.

**PREVENTION OF METHOTREXATE SIDE-EFFECTS IN JUVENILE IDIOPATHIC ARTHRITIS**

- **By mouth**
  - Child: 1 mg daily, alternatively 5 mg once weekly, dose to be adjusted according to local guidelines, weekly dose to be taken on a different day to methotrexate dose.

- **NEONATE: 50 micrograms once daily.**

**PREVENTION OF NEURAL TUBE DEFECTS (IN THOSE AT A LOW RISK OF CONCEIVING A CHILD WITH A NEURAL TUBE DEFECT SEE P. 594)**

- **By mouth**
  - Females of childbearing potential: 400 micrograms daily, to be taken before conception and until week 12 of pregnancy.

**PREVENTION OF NEURAL TUBE DEFECTS (IN THOSE IN THE HIGH-RISK GROUP WHO WISH TO BECOME PREGNANT OR WHO ARE AT RISK OF BECOMING PREGNANT SEE P. 594)**

- **By mouth**
  - Females of childbearing potential: 5 mg daily, to be taken before conception and until week 12 of pregnancy.

**PREVENTION OF METHOTREXATE SIDE-EFFECTS IN SEVERE PSORIASIS**

- **By mouth**
  - Child: 5 mg once weekly, dose to be taken on a different day to methotrexate dose.
**VITAMINS AND TRACE ELEMENTS**

### Cyanocobalamin

**INDICATIONS AND DOSE**
- **Vitamin B<sub>12</sub> deficiency of dietary origin**
  - **Child:** 50–105 micrograms daily in 1–3 divided doses

**PRESCRIBING AND DISPENSING INFORMATION**
The BP directs that when vitamin B<sub>12</sub> injection is prescribed or demanded hydroxocobalamin injection shall be dispensed or supplied. Currently available brands of the tablet may not be suitable for vegans.

**NATIONAL FUNDING/ACCESS DECISIONS**
Cyanocobalamin liquid, Cytacon® tablets, and Cytamen® injection are not available on prescription under the NHS.

**LESS SUITABLE FOR PRESCRIBING**
Cyanocobalamin is less suitable for prescribing.

**MEDICINAL FORMS**

**Tablet**
- Cyanocobalamin (non-proprietary) 50 microgram tablets | 50 tablet [P]
  - price = £8.99 |
- Cyanocobalamin 1 mg tablets | 100 tablet [P] no price available
- Cytacon (AMCO) 50 microgram tablets | 50 tablet [P]
  - price = £8.99

**Oral solution**
- Cyanocobalamin (non-proprietary) 35 microgram/5 ml oral solution | 200 ml [P] £8.75

**Hydroxocobalamin**

**INDICATIONS AND DOSE**
- **Macrocytic anaemia without neurological involvement**
  - **By Intramuscular Injection**
    - **Child:** Initially 0.25–1 mg 3 times a week for 2 weeks, then 0.25 mg once weekly until blood count normal, then 1 mg every 3 months

**Macrocytic anaemia with neurological involvement**
- **By Intramuscular Injection**
  - **Child:** Initially 1 mg once daily on alternate days until no further improvement, then 1 mg every 2 months

**Prophylaxis of macrocytic anaemias associated with vitamin B<sub>12</sub> deficiency**
- **By Intramuscular Injection**
  - **Child:** 1 mg every 2–3 months

**Leber’s optic atrophy**
- **By Intramuscular Injection**
  - **Child:** Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months

**CONGENITAL TRANSCOBALAMIN II DEFICIENCY**
- **By Intramuscular Injection**
  - **Neonate:** 1 mg 3 times a week for 1 year, then reduced to 1 mg once weekly, adjusted as appropriate.
  - **Child:** 1 mg 3 times a week for 1 year, then reduced to 1 mg once weekly, adjusted as appropriate

**METHYLMALONIC ACIDEMIA AND HOMOCYSTINURIA**
- **By Intramuscular Injection**
  - **Child:** Initially 1 mg daily for 5–7 days, then adjusted according to response to up to 1 mg 1–2 times a week, this is the maintenance dose

**Poisoning with cyanides**
- **By Intravenous Infusion**
  - **Child (body-weight 5 kg and above):** Initially 70 mg/kg supped, to be given over 15 minutes, then 70 mg/kg (max. per dose 5 g) if required, this second dose can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability

**GENERAL SIDE-EFFECTS**
- **Dizziness, headache, pruritus**

**SPECIFIC SIDE-EFFECTS**
- **Dyspnoea, eye disorders, gastrointestinal disturbances, hot flush, lymphocytopenia, peripheral oedema, pustular rashes, red coloration of urine, restlessless, reversible red coloration of skin and mucus membranes, transient hypertension**

**WITH ORAL USE**
- **Chromaturia, fever, hypersensitivity reactions, hypokalaemia (during initial treatment), injection-site reactions, rash, thrombocytosis (during initial treatment)**

**WITH INTRAMUSCULAR USE**
- **Sodium chloride may interfere with laboratory tests.**

**EFFECT ON LABORATORY TESTS**
- **Increased red blood cell count, increased haemoglobin, increased serum iron, decreased serum ferritin, increased serum transferrin, increased serum iron uptake, decreased total iron binding capacity, decreased transferrin saturation**

**EFFECT ON PREGNANCY**
- **Unknown risk to fetus**

**DIRECTIONS FOR ADMINISTRATION**
- **For intravenous infusion (Cyanokit®)**
  - **Given intermittently in Sodium chloride 0.9%, reconstitute 5 g vial with 200 ml Sodium Chloride 0.9%; gently invert vial for at least 1 minute to mix (do not shake).**
  - **For oral use**
    - **Administration by mouth**
      - Injection solution may be given orally; it will not have prolonged effect via this route.

**PRESCRIBING AND DISPENSING INFORMATION**
- **With intramuscular use**
  - The BP directs that when vitamin B<sub>12</sub> injection is prescribed or demanded, hydroxocobalamin injection shall be dispensed or supplied. Poisoning by cyanides
  - **With intravenous use**
    - Cyanokit® is the only preparation of hydroxocobalamin that is suitable for use in victims of
smoke inhalation who show signs of significant cyanide poisoning.

**NATIONAL FUNDING/ACCESS DECISIONS**

Cobalin-H® is not prescribable under National Health Service (NHS). Neo-Cytamen® is not prescribable under National Health Service (NHS).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Solution for injection**

- Hydroxocobalamin (Non-proprietary)
  - Hydroxocobalamin 1 mg per 1 ml
    - 5 ampoule [PDF] £12.49 DT price = £7.18
  - Hydroxocobalamin 2.5 mg per 1 ml
    - Hepavit 5mg/2ml solution for injection ampoules | 2 ampoule [PDF] no price available
  - Hydroxocobalamin 5 mg per 1 ml
    - Megaminbedoce 10mg/2ml solution for injection ampoules | 10 ampoule [PDF] no price available
- Cobalin (AMCo)
- Neo-Cytamen (Focus Pharmaceuticals Ltd)
  - Hydroxocobalamin 1 mg per 1 ml Cobalin-H 1mg/1ml solution for injection ampoules | 5 ampoule [PDF] £9.50 DT price = £7.18
- Powder for solution for infusion
  - Cyanokit (Swedish Orphan Biovitrum Ltd)
  - Hydroxocobalamin 5 gram Cyanokit 5g powder for solution for infusion vials | 1 vial [PDF] no price available

### 2 Iron overload

**Iron overload**

**Overview**

Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially thalassaemia major, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, and in thalassaemia, the long-term administration of the iron chelating compound deferasiroxime mesilate p. 536 is useful. Deferasiroxime mesilate (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the deferasiroxime mesilate is not added to the blood and is not given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by deferasiroxime mesilate is enhanced by ascorbic acid p. 587 (vitamin C) daily by mouth; it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to children with cardiac dysfunction; in children with normal cardiac function ascorbic acid should be introduced 1 month after starting deferasiroxime mesilate.

Deferasiroxime mesilate infusion can be used to treat aluminium overload in dialysis patients; theoretically 100 mg of deferasiroxime binds with 4.1 mg of aluminium.

### ANTIDOTES AND CHELATORS ➤ IRON CHELATORS

**Deferasirox**

**INDICATIONS AND DOSE**

Transfusion-related chronic iron overload when deferasiroxime is contra-indicated or inadequate in children aged 2–5 years with thalassaemia major who receive frequent blood transfusions: Transfusion-related chronic iron overload when deferasiroxime is contra-indicated or inadequate in patients over 2 years with thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells) Transfusion-related chronic iron overload when deferasiroxime is contra-indicated or inadequate in patients over 2 years with other anaemias: Treatment of chronic iron overload in patients over 6 years with thalassaemia major who receive frequent blood transfusions (more than 7 mL/kg/month of packed red blood cells)

- **BY MOUTH**
  - Child 2–17 years: Initially 10–30 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature; adjusted in steps of 5–10 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 40 mg/kg per day; usual maximum 30 micrograms/kg

Treatment of chronic iron overload when deferasiroxime is contra-indicated or inadequate (with non-transfusion-dependent thalassaemia syndromes)

- **BY MOUTH**
  - Child 10–17 years: Initially 10 mg/kg once daily, maintenance dose adjusted according to serum-ferritin concentration and liver-iron concentration (consult product literature); maximum 10 mg/kg per day

**UNLICENSED USE** Not licensed for treatment of chronic iron overload in children under 6 years with thalassaemia major who receive frequent blood transfusions (more than 7 mL/kg/month of packed red blood cells).

**CAUTIONS** History of liver cirrhosis · not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes) · platelet count less than 50x10⁹/litre · risk of gastro-intestinal ulceration and haemorrhage · unexplained cytopenia—consider treatment interruption

**INTERACTIONS** ➤ Appendix 1 (deferasirox).

**SIDE-EFFECTS**

- **Common or very common** Fatal gastro-intestinal haemorrhage · gastro-intestinal disturbances · gastro-intestinal ulceration · headache · proteinuria · pruritus · rash
- **Uncommon** Anxiety · cholelithiasis · disturbances of hearing and vision · dizziness · fatigue · glycosuria · hepatitis · lens opacity · maculopathy · oedema · pharyngitis · pyrexia · renal tubulopathy · skin pigmentation · sleep disorder
- **Frequency not known** Acute renal failure · agranulocytosis · alopecia · anaemia · anaphylaxis · angioedema · blood disorders · hepatic failure · hypersensitivity reactions · neutropenia · pancytopenia · thrombocytopenia · tubulointerstitial nephritis
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Use with caution in moderate impairment, reduce dose considerably then gradually
Iron overload

Deferiprone

**DRUG ACTION** Deferiprone is an oral iron chelator.

**INDICATIONS AND DOSE**

Treatment of iron overload in patients with thalassaemia major in whom deferasirox is contra-indicated or is inadequate

**BY MOUTH**

- Child 6–17 years: 25 mg/kg 3 times a day; maximum 100 mg/kg per day

**UNLICENSED USE** Not licensed for use in children under 6 years.

**CONTRA-INDICATIONS** History of agranulocytosis or recurrent neutropenia

**INTERACTIONS** → Appendix 1 (deferiprone).

**SIDE-EFFECTS** Agranulocytosis • arthropathy • blood dyscrasias • gastro-intestinal disturbances (reducing dose and increasing gradually may improve tolerance) • headache • increased appetite • neutropenia • red-brown urine discoloration • zinc deficiency

**CONCEPTION AND CONTRACEPTION** Manufacturer advises avoid before intended conception—teratogenic and embryotoxic in *animal* studies. Contraception advised in females of child-bearing potential.

**PREGNANCY** Manufacturer advises avoid during pregnancy—teratogenic and embryotoxic in *animal* studies.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase.

**RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

**MONITORING REQUIREMENTS** Monitor neutrophil count weekly and discontinue treatment if neutropenia develops.

**PATIENT AND CARER ADVICE** Blood disorders. Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop.

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Tablet**

**CAUTIONARY AND ADVISORY LABELS 14**

- Ferriprox (Swedish Orphan Biovitrum Ltd)

Deferiprone 500 mg | £152.39
Deferiprone 1 gram | £175.25

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS 14**

- Ferriprox (Swedish Orphan Biovitrum Ltd)

Deferiprone 100 mg per 1 ml | £112.39

**Desferrioxamine mesilate**

(Deferoxamine Mesilate)

**INDICATIONS AND DOSE**

**Iron poisoning**

- By continuous intravenous infusion

- Neonate: Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service.

- Child: Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service

**Aluminium overload in dialysis patients**

- By intravenous infusion

- Child: 5 mg/kg once weekly

**Chronic iron overload (low iron overload)**

- By subcutaneous infusion

- Child: Initially up to 30 mg/kg 3–7 times a week, to be given over 8–12 hours, the dose should reflect the degree of iron overload

**Chronic iron overload (established overload)**

- By subcutaneous infusion

- Child: 20–50 mg/kg daily

**UNLICENSED USE**

- When used for iron poisoning. Licensed for use in children (age range not specified by manufacturer).

**CAUTIONS** Aluminium-related encephalopathy (may exacerbate neurological dysfunction)

**INTERACTIONS** → Appendix 1 (desferrioxamine).
3 Neutropenia and stem cell mobilisation

3.1 Neutropenia

Neutropenia

Management

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. Filgrastim p. 538 (unglycosylated rhG-CSF) and lenograstim p. 539 (glycosylated rhG-CSF) have similar effects; both have been used in a variety of clinical settings, including cytotoxic-induced neutropenia, and neutropenia following bone marrow transplantation, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually increases the neutrophil count with an appropriate clinical response. Prolonged use may be associated with an increased risk of myeloid malignancy.

Treatment with granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

Neonatal neutropenia

Filgrastim has been used to treat sepsis-induced neutropenia in preterm neonates. There is no clear evidence that granulocyte-colony stimulating factors improve survival or long-term outcomes.

IMMUNOSTIMULANTS ➔ GRANULOCYTE-COLONY STIMULATING FACTORS

Granulocyte-colony stimulating factors

- **Drug Action** Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils.

- **Caution** Malignant myeloid conditions - pre-malignant myeloid conditions - risk of splenomegaly and rupture — spleen size should be monitored; sickle-cell disease

**Caution, further information**

- Acute respiratory distress syndrome There have been reports of pulmonary infiltrates leading to acute respiratory distress syndrome— patients with a recent history of pulmonary infiltrates or pneumonia may be at higher risk.

- **Side-effects**

  - Common or very common Alopecia - anorexia - asthenia - bone pain - chest pain - fever - gastro-intestinal disturbances - headache - injection-site reactions - leucocytosis - musculoskeletal pain - rash - thrombocytopenia

  - Rare Acute febrile neutrophilic dermatosis - cutaneous vasculitis - pulmonary side-effects (particularly interstitial pneumonia)

**Side-effects, further information**

- Pulmonary infiltration Treatment should be withdrawn in patients who develop signs of pulmonary infiltration.

- **Pregnancy** There have been reports of toxicity in animal studies and manufacturers advise not to use granulocyte-colony stimulating factors during pregnancy unless the potential benefit outweighs the risk.

- **Breast-feeding** There is no evidence for the use of granulocyte-colony stimulating factors during breast-feeding and manufacturers advise avoiding their use.

**Monitoring requirements**

- Full blood counts including differential white cell and platelet counts should be monitored.

- Spleen size should be monitored during treatment—risk of splenomegaly and rupture.
Filgrastim
(Recombinant human granulocyte-colony stimulating factor; G-CSF)

**INDICATIONS AND DOSE**

**Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)**

- BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: 5 micrograms/kg daily until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia), to be started at least 24 hours after cytotoxic chemotherapy. Preferably given by subcutaneous injection; if given by intravenous infusion, administer over 30 minutes

**Reduction in duration of neutropenia (and associated sequelae) in myeloablative therapy followed by bone marrow transplantation (specialist use only)**

- BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: 10 micrograms/kg daily, to be started at least 24 hours following cytotoxic chemotherapy and within 24 hours of bone–marrow infusion, then adjusted according to neutrophil count—consult product literature, doses administered over 30 minutes or 24 hours via intravenous route and over 24 hours via subcutaneous route

**Mobilisation of peripheral blood progenitor cells for autologous use, used alone (specialist use only)**

- BY SUBCUTANEOUS INJECTION, OR BY SUBCUTANEOUS INFUSION
- Child: 10 micrograms/kg daily for 5–7 days, to be administered over 24 hours if given by subcutaneous infusion

**Mobilisation of peripheral blood progenitor cells for autologous use, used following adjunctive myelosuppressive chemotherapy—to improve yield (specialist use only)**

- BY SUBCUTANEOUS INJECTION
- Child: 5 micrograms/kg daily until neutrophil count in normal range, to be started the day after completing chemotherapy, for timing of leucopheresis, consult product literature

**Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic transplantation (specialist use only)**

- BY SUBCUTANEOUS INJECTION
- Child: 16–17 years: 10 micrograms/kg daily for 4–5 days, for timing of leucopheresis, consult product literature

**Severe congenital neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)**

- BY SUBCUTANEOUS INJECTION
- Child: Initially 12 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

**Severe cyclic neutropenia, or idiopathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)**

- BY SUBCUTANEOUS INJECTION
- Child: Initially 5 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

**Glycogen storage disease type 1b (specialist use only)**

- BY SUBCUTANEOUS INJECTION
- Child: Initially 5 micrograms/kg daily, dose to be adjusted as necessary

**PERSISTENT NEUTROPENIA IN HIV INFECTION (SPECIALIST USE only)**

- BY SUBCUTANEOUS INJECTION
- Child: Initially 1 microgram/kg daily, subsequent doses increased as necessary until neutrophil count in normal range, then adjusted to maintain neutrophil count in normal range—consult product literature; maximum 4 micrograms/kg per day

**Neonatal neutropenia (specialist use only)**

- BY SUBCUTANEOUS INJECTION
- Neonate: 10 micrograms/kg daily, to be discontinued if white cell count exceeds 50 x 10^9/litre.

**SIDE-EFFECTS**

- Common or very common
  - Anaemia
  - Dysuria
  - Epistaxis
  - Exacerbation of rheumatoid arthritis
  - Haematuria
  - Hepatomegaly
  - Mucositis
  - Osteoporosis
  - Proteinuria
  - Pseudogout
  - Raised uric acid
  - Splenic enlargement
  - Transient decrease in blood glucose
  - Transient hypotension
  - Urinary abnormalities

- Uncommon
  - Capillary leak syndrome (including fatal cases)
  - Rare
  - Splenic rupture

**MONITORING REQUIREMENTS**

- Regular morphological and cytogenetic bone–marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia).

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use or subcutaneous use For subcutaneous or intravenous infusion, dilute with Glucose 5% to a concentration of not less than 15 micrograms/mL; to dilute to a concentration of 2–15 micrograms/mL, add albumin solution (human albumin solution) to produce a final albumin solution of 2 mg/mL; not compatible with Sodium Chloride solutions.

**PRESCRIBING AND DISPENSING INFORMATION**

Products containing filgrastim are not identical and although theoretically there should be no important differences in terms of safety and efficacy, when prescribing biological products it is good practice to use the brand name, see Biosimilar medicines, under Guidance on prescribing p. 1. 1 million units of filgrastim solution for injection contains 10 micrograms filgrastim.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Accofil (Accord Healthcare Ltd)**
  - Filgrastim 60 mega u per 1 ml Accofil 30 million units/0.5 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection | £284.20
  - Filgrastim 96 mega u per 1 ml Accofil 48 million units/0.5 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection | £455.70
- **Neupogen (Amgen Ltd)**
  - Filgrastim 30 mega u per 1 ml Neupogen 30 million units/1 ml solution for injection vials | 5 vial | £263.52

**UNLICENSED USE**

- Not licensed for treatment of glycogen storage disease or neonatal neutropenia.

**CONTRA-INDICATIONS**

- Severe congenital neutropenia (Kostmann’s syndrome) with abnormal cytogenetics

**CAUTIONS**

- Osteoporotic bone disease (monitor bone density if given for more than 6 months) secondary acute myeloid leukaemia

**INTERACTIONS**

- Appendix 1 (filgrastim).

**BNFC 2016–2017**

**Blood and nutrition**

**9**
### Platelet disorders

#### Platelet disorders

**Idiopathic thrombocytopenic purpura**

Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. A corticosteroid, such as prednisolone p. 413, is sometimes used if idiopathic thrombocytopenic purpura does not resolve spontaneously or if it is associated with severe cutaneous symptoms or mucous membrane bleeding; corticosteroid treatment should not be continued longer than 14 days regardless of the response.

**Immunoglobulin** preparations may be used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are often used in preference to a corticosteroid. Anti-D (RhD) immunoglobulin p. 725 is licensed for the management of idiopathic thrombocytopenic purpura.

Other therapy that has been tried under specialist supervision in refractory idiopathic thrombocytopenic purpura includes azathioprine, cyclophosphamide, vincristine sulfate, and ciclosporin. Rituximab p. 494 is also used in specialist centres but experience of its use in children is limited. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid p. 76 may be given to reduce the severity of haemorrhage.

Splenectomy is considered in chronic thrombocytopenic purpura if a satisfactory platelet count is not achieved with regular immunoglobulin infusions, if there is a relapse on withdrawing or reducing the dose of corticosteroid, and if other therapies are considered inappropriate.

**Essential thrombocythaemia**

Anagrelide p. 540 reduces platelets in essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs.

---

### Lenograstim

**(Recombinant human granulocyte-colony stimulating factor; rHuG-CSF)**

- **INDICATIONS AND DOSE**
  - Reduction in the duration of neutropenia and associated complications following bone-marrow transplantation for non-myeloid malignancy (specialist use only)
  - Reduction in the duration of neutropenia and associated complications following peripheral stem cells transplantation for non-myeloid malignancy (specialist use only)
    - **BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION**
      - Child 2-17 years: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started the day after transplantation. Intravenous infusion to be given over 30 minutes
    - **Reduction in the duration of neutropenia and associated complications following treatment with cytotoxic chemotherapy associated with a significant incidence of febrile neutropenia (specialist use only)**
      - **BY SUBCUTANEOUS INJECTION**
        - Child 2-17 years: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started on the day after completion of chemotherapy
    - **Mobilisation of peripheral blood progenitor cells for harvesting and subsequent infusion, used alone (specialist use only)**
      - **BY SUBCUTANEOUS INJECTION**
        - Child 2-17 years: 10 micrograms/kg daily for 4–6 days (5–6 days in healthy donors)
  - **Mobilisation of peripheral blood progenitor cells, used following adjunctive myelosuppressive chemotherapy (to improve yield) (specialist use only)**
    - **BY SUBCUTANEOUS INJECTION**
      - Child 2-17 years: 150 micrograms/m² daily until neutrophil count stable in acceptable range, to be started 1–5 days after completion of chemotherapy, for timing of leukopheresis, consult product literature

- **SIDE-EFFECTS**
  - Mucositis - splenic rupture - toxic epidermal necrosis
- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion, dilute reconstituted solution to a concentration of not less than 2 micrograms/mL (Granocyte-13) or 2.5 micrograms/mL (Granocyte-34) with Sodium Chloride 0.9%.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - Granocyte® solution for injection contains 105 micrograms of lenograstim per 13.4 mega unit vial and 263 micrograms lenograstim per 33.6 mega unit vial.
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

**EXCIPENTS:** May contain Phenylalanine

- Granocyte (Hughes Pharma UK Ltd)
  - Lenograstim 13.4 mega u Granocyte-13 powder and solvent for solution for injection vials | 1 vial £50.40 | 5 vial (Hospital only) £200.55
  - Lenograstim 33.6 mega u Granocyte-34 powder and solvent for solution for injection vials | 1 vial £62.54 | 5 vial (Hospital only) £312.69

---

**Blood and nutrition**
4.1 Essential thrombocythaemia

ANTITHROMBOTIC DRUGS > CYCLIC AMP PHOSPHODIESTERASE III INHIBITORS

Anagrelide

- INDICATIONS AND DOSE
  Essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs (initiated under specialist supervision)
  - BY MOUTH
    - Child 7-17 years: Initially 500 micrograms daily, dose to be adjusted at weekly intervals according to response, increased in steps of 500 micrograms daily; usual dose 1-3 mg daily in divided doses (max. per dose 2.5 mg); maximum 10 mg per day

- UNLICENSED USE
  Not licensed for use in children.

- CAUTIONS
  Cardiovascular disease—assess cardiac function before and regularly during treatment - concomitant use of drugs that prolong QT-interval—assess cardiac function before and regularly during treatment - risk factors for QT-interval prolongation—assess cardiac function before and regularly during treatment

- INTERACTIONS
  Appendix 1 (anagrelide).

- SIDE-EFFECTS
  Common or very common: Anaemia, dizziness, fatigue, fluid retention, gastro-intestinal disturbances, headache, palpitation, rash, tachycardia
  Uncommon: Alopecia, amnesia, anorexia, arthralgia, back pain, blood disorders, chest pain, confusion, congestive heart failure, depression, dry mouth, dyspnoea, ecchymosis, epistaxis, fever, gastrointestinal haemorrhage, haemorrhage, hypertension, hypoaesthesia, impotence, malaise, myalgia, nervousness, oedema, pancreatitis, paraesthesia, pneumonia pleural effusion, pruritus, skin discoloration, sleep disturbances, syncope, weight changes
  Rare: Angina, asthma, cardiomegaly, cardiomyopathy, colitis, dry skin, dysarthria, gastritis, gingival bleeding, impaired coordination, migraine, myocardial infarction, nocturia, pericardial effusion, postural hypotension, pulmonary hypertension, pulmonary infiltrates, renal failure, somnolence, tinnitus, vasodilatation, visual disturbances
  Frequency not known: Hepatitis, interstitial lung disease, Torsade de pointes, tubulointerstitial nephritis

- CONCEPTION AND CONTRACEPTION
  Effective contraception required during treatment.

- PREGNANCY
  Manufacturer advises avoid (toxicity in animal studies).

- BREAST FEEDING
  Manufacturer advises avoid—present in milk in animal studies.

- HEPATIC IMPAIRMENT
  Manufacturer advises caution in mild impairment. Avoid in moderate to severe impairment.

- RENAL IMPAIRMENT
  Manufacturer advises avoid if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²

- MONITORING REQUIREMENTS
  - Monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established).
  - Monitor liver function.
  - Monitor serum creatinine.
  - Monitor urea.
  - Monitor electrolytes (including potassium, magnesium and calcium) before and during treatment.
  - Monitor closely for further signs of disease progression such as malignant transformation.

- PRESCRIBING AND DISPENSING INFORMATION
  Initiate only when signs of disease progression or patient suffers from thrombosis. Consider stopping treatment after 3 months if inadequate response.

- PATIENT AND CARER ADVICE
  Driving and skilled tasks
  Dizziness may affect performance of skilled tasks (e.g. cycling, driving).

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  Capsule
  - Xagrid (Shire Pharmaceuticals Ltd) • Anagrelide (as Anagrelide hydrochloride) 500 microgram Xagrid 500microgram capsules | 10 capsule £6.04.57

Nutrition and metabolic disorders

1 Acid-base imbalance

1.1 Metabolic acidosis

ALKALISING DRUGS > OTHER

Trometamol
(Tris(hydroxymethyl)aminomethane, THAM)

- INDICATIONS AND DOSE
  Metabolic acidosis
  - BY INTRAVENOUS INFUSION
  - Child: To be administered at an amount appropriate to the body base deficit

- UNLICENSED USE
  Unlicensed preparation.

- CONTRA-INDICATIONS
  Anuria - chronic respiratory acidosis

- CAUTIONS
  Extravasation can cause severe tissue damage

- SIDE-EFFECTS
  Hyperkalaemia in renal impairment, hypoglycaemia - liver necrosis (following administration via umbilical vein) (in neonates) - respiratory depression

- SIDE-EFFECTS, FURTHER INFORMATION
  Respiratory depression  Respiratory support may be required because trometamol induces respiratory depression.

- PREGNANCY
  Limited information available, hypoglycaemia may harm fetus.

- BREAST FEEDING
  No information available.

- RENAL IMPAIRMENT
  Use with caution, may cause hyperkalaemia.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

  Solution for infusion
  - Trometamol (Non-proprietary)
  - Trometamol 363.4 mg per 1 ml Tris 36.34% solution for infusion 20ml ampoules | 10 ampoule [Pen] no price available
2 Fluid and electrolyte imbalances

Fluids and electrolytes

Electrolyte replacement therapy

The electrolyte concentrations (intravenous fluid) and the electrolyte content (gastro-inestinal secretions) table may be helpful in planning replacement electrolyte therapy; faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected.

Oral preparations for fluid and electrolyte imbalance

Sodium and potassium salts, may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree.

Oral potassium

Compensation for potassium loss is especially necessary:

- in children in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, renal tubule disorder, the nephrotic syndrome, and severe heart failure;
- in children with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse;
- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias.

Measures to compensate for potassium loss may be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are seldom required with the small doses of diuretics given to treat hypertension; potassium-sparing diuretics (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide p. 132 or the thiazides when these are given to eliminate oedema.

If potassium salts are used for the prevention of hypokalaemia, then doses of potassium chloride p. 561 daily by mouth are suitable in patients taking a normal diet. Smaller doses must be used if there is renal insufficiency to reduce the risk of hyperkalaemia.

Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness (small divided doses may minimise gastric irritation); when appropriate, potassium-sparing diuretics are preferable.

When there is established potassium depletion larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

Management of hyperkalaemia

Acute severe hyperkalaemia calls for urgent treatment with intravenous infusion of soluble insulin (0.3–0.6 units/kg/hour in neonates and 0.05–0.2 units/kg/hour in children over 1 month) with glucose 0.5–1 g/kg/hour (5–10 mL/kg of glucose 10%; 2.5–5 mL/kg of glucose 20% via a central venous catheter may also be considered). If insulin cannot be used, salbutamol p. 146 can be given by intravenous injection, but it has a slower onset of action and may be less effective for reducing plasma-potassium concentration.

Calcium gluconate p. 553 is given by slow intravenous injection to manage cardiac excitability caused by hyperkalaemia.

The correction of causal or compounding acidosis with sodium bicarbonate infusion p. 544 should be considered (important: preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Intravenous furosemide can also be given but is less effective in children with renal impairment. Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; dialysis may occasionally be required.

Ion-exchange resins may be used to remove excess potassium in mild hyperkalaemia or in moderate hyperkalaemia when there are no ECG changes. Calcium polystyrene sulfonate is preferred unless plasma-calcium concentrations are high.

Oral sodium and water

Sodium chloride p. 547 is indicated in states of sodium depletion. In preterm neonates in the first few weeks of life and in chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride may be sufficient. Sodium chloride solutions suitable for use by mouth in neonates are available from ‘special-order’ manufacturers or specialist importing companies, they should be used with care because they are hypertonic. Supplementation with sodium chloride may be required to replace losses in children with cystic fibrosis particularly in warm weather.

Oral rehydration therapy (ORT)

Diarrhoea in children is usually self-limiting, however, in children under 6 months of age, and more particularly in those under 3 months, symptoms of dehydration may be less obvious and there is a risk of rapid and severe deterioration. Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through diarrhoea can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch.

Oral rehydration solutions should:

- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalinising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to prevent the possible induction of osmotic diarrhoea;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

The WHO oral rehydration solutions formulation contains sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. It is dissolved in sufficient water to produce 1 litre (providing Na+ 75 mmol, K+ 20 mmol, Cl– 65 mmol, citrate 10 mmol, glucose 75 mmol/litre). This formulation is recommended by the WHO and the United Nations Children’s fund, but it is not commonly used in the UK.

Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.

Rehydration should be rapid over 3 to 4 hours (except in hypernatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breast-
feeding or formula feeds should be offered between oral rehydration drinks.

Oral bicarbonate

Sodium bicarbonate is given by mouth for chronic acidotic states such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed. For severe metabolic acidosis, sodium bicarbonate can be given intravenously. Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally. Where hyperchloraemic acidosis is associated with potassium deficiency, as in some renal tubular and gastrointestinal disorders it may be appropriate to give oral potassium bicarbonate, although acute or severe deficiency should be managed by intravenous therapy.

Parenteral preparations for fluid and electrolyte imbalance

Electrolytes and water

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses when it is not possible or desirable to use the oral route. When intravenous administration is not possible, fluid (as sodium chloride 0.9% p. 547 or glucose 5% p. 549) can also be given subcutaneously by hypodermoclysis.

In an individual patient the nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical examination. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid–base balance.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, for example 15% glucose, are best given through an indwelling catheter positioned in a large vein.

Maintenance fluid requirements in children are usually derived from the relationship that exists between body-weight and metabolic rate; the figures in the table below may be used as a guide outside the neonatal period. The glucose requirement is that needed to minimise gluconeogenesis from amino acids obtained as substrate from muscle breakdown. Maintenance fluids are intended only to provide hydration for a short period until enteral or parenteral nutrition can be established.

It is usual to meet these requirements by using a standard solution of sodium chloride with glucose. Solutions containing 20 mmol/litre of potassium chloride meet usual potassium requirements when given in the suggested volumes; adjustments may be needed if there is an inability to excrete fluids or electrolytes, excessive renal loss or continuing extra-renal losses. The exact requirements depend upon the nature of the clinical situation and types of losses incurred.

## Fluid requirements for children over 1 month:

<table>
<thead>

<td>100 mL/kg for the first 10 kg + 50 mL/kg for each 1 kg body-weight between 10-20 kg + 20 mL/kg for each 1 kg body-weight over 20 kg (max. 2 litres in females, 2.5 litres in males)</td>
</tr>
</tbody>
</table>

### Important

The baseline fluid requirements shown in the table should be adjusted to take account of factors that reduce water loss (e.g. increased antidiuretic hormone, renal failure, hypothermia, and high ambient humidity) or increase water loss (e.g. pyrexia or burns).

**Replacement therapy:** initial intravenous replacement fluid is generally required if the child is over 10% dehydrated, or if 5–10% dehydrated and oral or enteral rehydration is not tolerated or possible. Oral rehydration is adequate, if tolerated, in the majority of those less than 10% dehydrated. Subsequent fluid and electrolyte requirements are determined by clinical assessment of fluid balance.

### Intravenous sodium

**Intravenous sodium chloride in isotonic (0.9%) solution provides** the most important extracellular ions in near physiological concentrations and is indicated in *sodium depletion*. It may be given for initial treatment of acute fluid loss and to replace ongoing gastro-intestinal losses from the upper gastro-intestinal tract. Intravenous sodium chloride is commonly given as a component of maintenance and replacement therapy, usually in combination with other electrolytes and glucose.

**Chronic hyponatraemia** should ideally be corrected by fluid restriction. However, if sodium chloride is required, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome; the rise in plasma sodium concentration should be no more than 10 mmol/litre in 24 hours.

Sodium chloride with glucose solutions are indicated when there is combined *water and sodium depletion*. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma Na⁺ remains extracellular.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate

**Compound sodium lactate** (Hartmann’s solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded.

**Intravenous glucose**

Glucose solutions are used mainly to replace water deficit. Water depletion (dehydration) tends to occur when losses are not matched by a comparable intake, as may occur in coma or dysphagia.

Water loss rarely exceeds electrolyte losses but this can occur in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder; the rate of infusion should be adjusted to return the plasma-sodium concentration to normal over 48 hours.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those
Sodium bicarbonate is used to control severe metabolic acidosis, unresponsive to correction of anoxia or hypovolaemia, severe shock, or when the acidosis remains unresolved as tissue and renal perfusion are restored. In more appropriate circumstances sodium bicarbonate is best given intravenously as a small volume of hypertonic solution, such as 8.4%; plasma pH and electrolytes should be monitored. For chronic acidic states, sodium bicarbonate can be given by mouth.

Trometamol (tris(hydroxymethyl)aminomethane, THAM) p. 540, an organic buffer, corrects metabolic acidosis by causing an increase in urinary pH and an osmotic diuresis. It is indicated when sodium bicarbonate is unsuitable as in carbon dioxide retention, hypernatraemia, or renal impairment. It is also used during cardiac bypass surgery and, very rarely, in cardiac arrest.

too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition.

Glucose solutions are given with insulin for the emergency management of hyperkalaemia. They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuous insulin infusion.

**Intravenous potassium**

Potassium chloride with sodium chloride intravenous infusion is the initial treatment for the correction of severe hypokalaemia and when sufficient potassium cannot be taken by mouth.

Repeated measurements of plasma-potassium concentration are necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should not involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

**Bicarbonate and trometamol**

Sodium bicarbonate is used to control severe metabolic acidosis (pH < 7.1) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anoxia or hypovolaemia, sodium bicarbonate (1.26%) p. 544 can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In
conditions such as burns or septicemia; it may also be used as an immediate short-term measure to treat haemorrhage until blood is available. Gelatin is rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion; see also the management of shock. Plasma substitutes should not be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of some plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

Parenteral preparations for fluid and electrolyte imbalance in neonates

Electrolytes and water
Neonates lose water through the skin and nose, particularly if preterm or if the skin is damaged. The basic fluid requirement for a term baby in average ambient humidity is 40–60 mL/kg/ day plus urinary losses. Preterm babies have very high transepidermal losses particularly in the first few days of life; they may need more fluid replacement than full term babies and up to 180 mL/kg/day may be required. Local guidelines for fluid management in the neonatal period should be consulted.

Intravenous sodium
The sodium requirement for most healthy neonates is 3 mmol/kg daily. Preterm neonates, particularly below 30 weeks gestation, may require up to 6 mmol/kg daily. Hyponatraemia may be caused by excessive renal loss of sodium; it may also be dilutional and restriction of fluid intake may be appropriate. Sodium supplementation is likely to be required if the serum sodium concentration is significantly reduced.

Hyponatraemia may also occur, most often due to dehydration (e.g. breast milk insufficiency). Severe hyponatraemia and hyponatraemia can cause fits and rarely brain damage. Sodium in drug preparations, delivered via continuous infusions, or in infusions to maintain the potency of intravascular or umbilical lines, can result in significant amounts of sodium being delivered, (e.g. 1 mL/hour of 0.9% sodium chloride infused over 24 hours is equivalent to 3.6 mmol/day of sodium).

BICARBONATE

Sodium bicarbonate

- INDICATIONS AND DOSE
  - Chronic acidic states such as uraemic acidosis or renal tubular acidosis
    - BY MOUTH
      - Neonate: Initially 1–2 mmol/kg daily in divided doses, adjusted according to response.
      - Child: Initially 1–2 mmol/kg daily in divided doses, adjusted according to response.
    - Severe metabolic acidosis
      - BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
      - Child: Administer an amount appropriate to the body base deficit, to be given by slow intravenous injection of a strong solution (up to 8.4%), or by continuous intravenous infusion of a weaker solution (usually 1.26%).
  - Renal hyperkalaemia
    - BY SLOW INTRAVENOUS INJECTION
      - Neonate: 1 mmol/kg daily.
      - Child: 1 mmol/kg daily.
- CONTRA-INDICATIONS
- CAUTIONS
- INTERACTIONS → Appendix 1 (antacids).
- SIDE-EFFECTS
  - When used for chronic acidic states such as uraemic acidosis or renal tubular acidosis
  - Oral use for chronic acidic states such as uraemic acidosis or renal tubular acidosis
  - With oral use for Plasma-pH and electrolytes should be monitored.
- DIRECTIONS FOR ADMINISTRATION
- MONITORING REQUIREMENTS
- WITH INTRAVENOUS INFUSION
  - When intravenous infusion dilute 8.4% solution at least 1 in 10.
  - For central line infusion dilute 1 in 5 with Glucose 5% or 10% or Sodium Chloride 0.9%.
  - Extravasation can cause severe tissue damage.
- WITH ORAL USE
  - Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.
- PRESCRIBING AND DISPENSING INFORMATION
  - With oral use Sodium bicarbonate 500mg capsules contain approximately 6 mmol each of Na⁺ and HCO₃⁻; Sodium bicarbonate 600mg capsules contain approximately 7 mmol each of Na⁺ and HCO₃⁻. Oral solutions of sodium bicarbonate are required occasionally; these are available from 'special-order' manufacturers or specialist importing companies; the strength of sodium bicarbonate should be stated on the prescription.
  - With intravenous use Usual strength Sodium bicarbonate 1.26% (12.6 g, 150 mmol each of Na⁺ and HCO₃⁻/litre), various other strengths available.
- PATIENT AND CARER ADVICE
  - Medicines for Children leaflet: Sodium bicarbonate for acidosis
  - www.medicinesforchildren.org.uk/
sodium-bicarbonate-for-acidosis
  - With oral use Patients or carers should be given advice on the administration of sodium bicarbonate oral medicines.

## Potassium chloride with calcium chloride dihydrate and sodium chloride (Ringer’s solution)

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 561, sodium chloride p. 547.

### ELECTROLYTES AND MINERALS

#### POTASSIUM

**Potassium chloride with calcium chloride and sodium chloride and sodium lactate**

*(Sodium Lactate Intravenous Infusion, Compound; Compound, Hartmann’s Solution for Injection; Ringer-Lactate Solution for Injection)*

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 561, sodium chloride p. 547, calcium chloride p. 553.

### INDICATIONS AND DOSE

For prophylaxis, and replacement therapy, requiring the use of sodium chloride and lactate, with minimal amounts of calcium and potassium

**BY INTRAVENOUS INFUSION**

**Child:** Dosed according to the deficit or daily maintenance requirements (consult product literature)

### PRESCRIBING AND DISPENSING INFORMATION

Compound sodium lactate intravenous infusion contains Na⁺ 131 mmol, K⁺ 5 mmol, Ca²⁺ 2 mmol, HCO₃⁻ (as lactate) 29 mmol, Cl⁻ 111 mmol/litre.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Infusion**

Potassium chloride with calcium chloride and sodium chloride and sodium lactate (Non-proprietary)

- Calcium chloride 270 microgram per 1 ml, Potassium chloride 400 microgram per 1 ml, Sodium lactate 3.17 mg per 1 ml, Sodium chloride 6 mg per 1 ml

Potassium chloride with sodium lactate solution contains Na⁺ 111 mmol/litre, K⁺ 5 mmol/litre, Ca²⁺ 2 mmol/litre, HCO₃⁻ (as lactate) 29 mmol/litre, Cl⁻ 111 mmol/litre.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

**Infusion**

Potassium chloride with glucose (Non-proprietary)

- Potassium chloride 3 mg per 1 ml, Glucose anhydrous 50 mg per 1 ml

Potassium chloride 0.3% contains 40 mmol each of K⁺ and Cl⁻/litre or 0.15% contains 20 mmol each of K⁺ and Cl⁻/litre with 5% of anhydrous glucose.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

| Steriflex No.9 ringers infusion 500ml bags | 1 bag [POM] £1.96 | 15 bag [POM] no price available

### INDICATIONS AND DOSE

**Electrolyte imbalance**

**BY INTRAVENOUS INFUSION**

**Child:** Dosed according to the deficit or daily maintenance requirements (consult product literature)

### PRESCRIBING AND DISPENSING INFORMATION

Ringer’s solution for injection provides the following ions (in mmol/litre), Ca²⁺ 2.2, K⁺ 4, Na⁺ 147, Cl⁻ 156.

| Sodium bicarbonate 8.4% (1ml)/mL solution for injection 10ml ampoules | 1 ampoule [POM] £1.47 | 10 ampoule [POM] £7.40

| Sodium bicarbonate 8.4% solution for injection 10ml Minijet pre-filled syringes | 1 pre-filled disposable injection [POM] £3.71

| Sodium bicarbonate 8.4% (1ml)/mL solution for injection 250ml bottles | 10 bottle [POM] £65.34

| Sodium bicarbonate 8.4% (1ml)/mL solution for injection 100ml bottles | 10 bottle [POM] £62.04

| Sodium bicarbonate with glucose (Non-proprietary)

- Polyfusor V sodium bicarbonate 2.74% infusion 500ml bottles | 1 bottle [POM] £9.86 | 12 bottle [POM] no price available

| Potassium chloride with calcium chloride dihydrate and sodium chloride

- (Sodium Lactate Intravenous Infusion, Compound; Compound, Hartmann’s Solution for Injection; Ringer-Lactate Solution for Injection)
Steriflex No.16 potassium chloride 0.3% (potassium 20mmol/500ml) / glucose 5% infusion 500ml bags | 1 bag P fos | 15 bag P fos no price available

**Potassium chloride with potassium bicarbonate**

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 561.

**Indications and Dose**
- **Potassium depletion**
  - **By mouth**
  - Child: Dosed according to the deficit or daily maintenance requirements (consult product literature)

**Prescribing and Dispensing Information**
- Each Sando- K® tablet contains potassium 470 mg (12 mmol of K⁺) and chloride 285mg (8 mmol of Cl⁻).

**Medicinal Forms**
- There can be variation in the licensing of different medicines containing the same drug.
- **Effervescent tablet**
  - **Cautionary and advisory labels** 13, 21
  - Sando-K (IK Pharma Ltd) Potassium bicarbonate 400 mg, Potassium chloride 600 mg Sando-K effervescent tablets | 100 tablet P £7.65 DT price + £1.65

**Potassium chloride with sodium chloride**

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 561, sodium chloride p. 547.

**Indications and Dose**
- **Electrolyte imbalance**
  - **By intravenous infusion**
  - Child: Depending on the deficit or the daily maintenance requirements (consult product literature)
PRESCRIBING AND DISPENING INFORMATION

Potassium chloride 0.15% with sodium chloride 0.9% contains K+ 20 mmol, Na+ 150 mmol, and Cl− 170 mmol/litre or potassium chloride 0.3% with sodium chloride 0.9% contains K+ 40 mmol, Na+ 150 mmol, and Cl− 190 mmol/litre.

MEDIUCIAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion and diluent for instillation of drugs to the bladder.

Infusion

Potassium chloride with sodium chloride (Non-proprietary)

Potassium chloride 3 mg per 1 ml, Sodium chloride 9 mg per 1 ml Steriflex No.15 potassium chloride 0.3% (potassium 20mmol/500ml) / sodium chloride 0.9% infusion 500ml bags | 1 bag (£1.67) | 15 bag (£1.42) no price available

Potassium chloride 0.3% (potassium 20mmol/500ml) / Sodium chloride 0.9% infusion 500ml bags | 1 bag (£1.67) | 15 bag (£1.42) no price available

Potassium chloride 0.9% infusion 500ml bags | 1 bag (£1.67) | 15 bag (£1.42) no price available

Potassium chloride 0.3% (potassium 20mmol/500ml) / Sodium chloride 0.9% infusion 500ml bags | 1 bag (£1.67) | 15 bag (£1.42) no price available

Potassium chloride 0.9% infusion 500ml Viaflo bags | 1 bag (£1.67) | 15 bag (£1.42) no price available

Potassium chloride 3 mg per 1 ml, Sodium chloride 9 mg per 1 ml Steriflex No.12 potassium chloride 0.15% (potassium 10mmol/500ml) / sodium chloride 0.9% infusion 500ml bags | 1 bag (£2.20) | 10 bag (£2.00) no price available

Steriflex No.12 potassium chloride 0.15% (potassium 10mmol/500ml) / sodium chloride 0.9% infusion 500ml bags | 1 bag (£2.20) | 15 bag (£2.00) no price available

Potassium chloride 0.15% (potassium 10mmol/500ml) / Sodium chloride 0.9% infusion 500ml Viaflo bags | 1 bag (£2.20) no price available

Potassium chloride 0.9% infusion 1 litre bags | 1 bag (£2.20) no price available

Potassium chloride 0.15% (potassium 10mmol/500ml) / Sodium chloride 0.9% infusion 1 litre bags | 1 bag (£2.20) no price available

SODIUM SUPPLEMENTATION IN NEONATES

INITIALLY BY MOUTH

Neonate up to 36 weeks corrected gestational age: 2 mmol, dose to be administered in 100 ml of formula feed (consult dietician), alternatively (by mouth using modified-release tablets) 3–4 mmol, dose to be administered in 100 ml of breast milk (consult dietician).

SODIUM REPLACEMENT

BY MOUTH USING MODIFIED-RELEASE TABLETS

Child: 1–2 mmol/kg daily in divided doses, adjusted according to requirements, higher doses may be needed in severe depletion.

MANAGEMENT OF DIABETIC KETOSIS (TO RESTORE CIRCULATING VOLUME IF SYSTOLIC BLOOD PRESSURE IS BELOW 90 MMHG AND ADJUSTED FOR AGE, SEX, AND MEDICATION AS APPROPRIATE)

BY INTRAVENOUS INFUSION

Child: (consult local protocol)

DIURETIC FOR INSTILLATION OF DRUGS TO THE BLADDER

Child: (consult product literature)

CAUTIONS

- With intravenous use Avoid excessive administration - cardiac failure - cardiorespiratory diseases - children receiving glucocorticoids - dilutional hyponatraemia - hepatic cirrhosis - hypertension - peripheral oedema - pulmonary oedema - reduced fluid loss - renal insufficiency - restricted intake in impaired renal function - toxæmia of pregnancy

CAUTIONS, FURTHER INFORMATION

- Reduced fluid loss

- With intravenous use The volume of fluid infused should take into account the possibility of reduced fluid loss owing to increased antidiuretic hormone and factors such as renal failure, hyperthermia, and high humidity.

- Dilutional hyponatraemia

- With intravenous use Dilutional hyponatraemia is a rare but potentially fatal risk of parenteral hydration. It may be caused by inappropriate use of hypotonic fluids such as sodium chloride 0.18% and glucose 4% intravenous infusion, especially in the postoperative period when antidiuretic hormone secretion is increased. Dilutional hyponatraemia is characterized by a rapid fall in plasma-sodium concentration leading to cerebral oedema and seizures; any child with severe hyponatraemia or rapidly changing plasma-sodium concentration should be referred urgently to a paediatric high dependency facility.

SIDE-EFFECTS

- With intravenous use Administration of large doses may give rise to sodium accumulation - oedema

- MONITORING REQUIREMENTS

- With intravenous use During parenteral hydration, fluids and electrolytes should be monitored closely and any disturbance corrected by slow infusion of an appropriate solution.

- PRESCRIBING AND DISPENSING INFORMATION

- With intravenous use Sodium chloride 0.9% intravenous infusion contains Na+ and Cl− each 150 mmol/litre. The term ‘normal saline’ should not be used to describe sodium chloride intravenous infusion 0.9%; the term ‘physiological saline’ is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).

- With oral use Each Slow Sodium® tablet contains approximately 10 mmol each of Na+ and Cl−; tablets can be crushed before administration.
### Modified-release tablet

**CAUTIONARY AND ADVISORY LABELS**

- **Slow Sodium** (Hik Pharma Ltd)

### Solution for injection

- **Sodium chloride (non-proprietary)**
  - Sodium chloride 9 mg per 1 ml: Sodium chloride 0.9% solution for injection 5ml Sure-Amp ampoules | 20 ampoule (PST) £1.75
  - Sodium chloride 0.9% solution for injection 50ml vials | 1 vial (PST) £0.41 DT price + £0.41 25 vial (PST) £75.00–95.00
  - Sodium chloride 0.9% solution for injection 10ml ampoules | 10 ampoule (PST) £2.30–2.96 DT price + £2.96 50 ampoule (PST) £14.75
  - Sodium chloride 0.9% solution for injection 20ml Mini-Plasco ampoules | 20 ampoule (PST) £8.96

### Solution for infusion

- **Sodium chloride (non-proprietary)**
  - Sodium chloride 300 mg per 1 ml: Sodium chloride 30% concentrate for solution for infusion 100ml vials | 10 vial (PST) £44.20
  - Sodium chloride 30% concentrate for solution for infusion 50ml vials | 10 vial (PST) £27.70
  - Sodium chloride 30% concentrate for solution for infusion 10ml ampoules | 10 ampoule (PST) £16.40

### Intravenous solution

- **Sodium chloride (non-proprietary)**
  - Sodium chloride 9 mg per 1 ml: Sodium chloride 0.9% intravenous solution 50ml bags | 1 bag (PST) £5.00

**Combinations available:** Potassium chloride with calcium.
**Sodium chloride with glucose**

The properties listed below are those particular to the combination only. For the properties of the components please consider, sodium chloride p. 547, glucose below.

- **INDICATIONS AND DOSE**
  - Combined water and sodium depletion
  - Child: (consult product literature)

- **CAUTIONS**
  - Cautions, Further Information

- **MONITORING REQUIREMENTS**
  - Maintenance fluid should accurately reflect daily requirements and close monitoring is required to avoid fluid and electrolyte imbalance.
  - During parenteral hydration, fluids and electrolytes should be monitored closely and any disturbance corrected by slow infusion of an appropriate solution.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

**Infusion**

- **Sodium chloride with glucose (Non-proprietary)**
  - Sodium chloride 4.5 mg per 1 ml, Glucose anhydrous 25 mg per 1 ml
  - Sodium chloride 0.9% / Glucose 2.5% infusion 500ml Viaflex bags | 1 bag | £546.00 | 10
  - Sodium chloride 0.45% / Glucose 2.5% infusion 500ml Vialflo bags | 1 bag | £500.00 | 10

- **Sodium chloride 1.8 mg per 1 ml, Glucose anhydrous 40 mg per 1 ml**
  - Polyhar 1 glucose 4% / sodium chloride 0.18% infusion 500ml bottles | 1 bottle | £2.40 | 12 bottle
  - Sodium chloride 0.18% / Glucose 4% infusion 500ml Macoflex bags | 1 bag | £200.00 | 20
  - Sodium chloride 0.18% / Glucose 4% infusion 1 litre Macoflex bags | 1 bag | £200.00 | 10
  - Sodium chloride 0.18% / Glucose 4% infusion 500ml Vialflo bags | 1 bag | £200.00 | 10

- **Sodium chloride 9 mg per 1 ml, Glucose 50 mg per 1 ml**
  - Steriflex No.3 glucose 5% / sodium chloride 0.9% infusion 1 litre bags | 1 bag | £1.47 | 15 bag
  - Sodium chloride 0.9% / Glucose 5% infusion 500ml bags | 1 bag | £1.27
  - Sodium chloride 0.9% / Glucose 5% infusion 500ml Vialflex bags | 1 bag | £2.10 | 10 bag

- **Sodium chloride 4.5 mg per 1 ml, Glucose anhydrous 50 mg per 1 ml**
  - Sodium chloride 0.45% / Glucose 5% infusion 500ml Viaflex bags | 1 bag | £2.02 | 15 bag
  - Sodium chloride 0.45% / Glucose 5% infusion 500ml Vialflo bags | 1 bag | £2.02 | 15 bag

**DOSE EQUIVALENT AND CONVERSION**

- 75 g anhydrous glucose is equivalent to Glucose BP 82.5 g.
monohydrate, potency being expressed in terms of anhydrous glucose.

**EXCEPTIONS TO LEGAL CATEGORY**

- With intravenous use: Prescription only medicine restriction does not apply to 50% solution where administration is for saving life in emergency.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

### Oral solution

- **Rapilose OGTT (Aspire Pharma Ltd)**
  - Glucose 250 mg per 1 ml Rapilose OGTT solution | 300 ml | £3.48

### Solution for infusion

- **Glucose (Non-proprietary)**
  - **Glucose anhydrous 200 mg per 1 ml** Glucose 10% solution for infusion 1000ml vials | 1 vial | £3.50
  - Glucose anhydrous 500 mg per 1 ml Glucose 5% solution for infusion 1000ml bags | 1 bag | no price available

### Combinations available:

- **Potassium chloride with glucose**, p. 545 - **Potassium chloride with glucose and sodium chloride**, p. 546 - **Sodium chloride with glucose**, p. 549

### ORAL REHYDRATION SALTS

**Disodium hydrogen citrate with glucose, potassium chloride and sodium chloride**

(Formulated as oral rehydration salts)

**INDICATIONS AND DOSE**

**Fluid and electrolyte loss in diarrhoea**

- **BY MOUTH**
  - Child 1-11 months: 1–1½ times usual feed volume to be given
  - Child 1-11 years: 200 ml, to be given after every loose motion
  - Child 12-17 years: 200–400 ml, to be given after every loose motion, dose according to fluid loss

**DIRECTIONS FOR ADMINISTRATION**

Reconstitute 1 sachet with 200ml of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 60 mmol, citrate 10 mmol, and glucose 90 mmol.

**PRESCRIBING AND DISPENSING INFORMATION**

Flavours of oral powder formulations may include blackcurrant, citrus, or natural.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Oral rehydration salts

www.medicinesforchildren.org.uk/oral-rehydration-salts
After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder**
- Dioralyte® (Sanofi)
  - Potassium chloride 300 mg, Sodium chloride 470 mg, Disodium hydrogen citrate 530 mg, Glucose 3.56 gram
  - Dioralyte oral powder sachets citrus | 20 sachet £6.72
  - Dioralyte oral powder sachets plain | 20 sachet £6.72
  - Dioralyte oral powder sachets blackcurrant | 20 sachet £6.72

**INDICATIONS AND DOSE**
(Formulated as oral rehydration salts)

**Fluid and electrolyte loss in diarrhoea**
- **BY MOUTH**
  - Child 1-11 months: 1–1½ times usual feed volume to be given
  - Child 1-11 years: 200 mL, to be given after every loose motion
  - Child 12-17 years: 200–400 mL, to be given after every loose motion, dose according to fluid loss

**DIRECTIONS FOR ADMINISTRATION**
Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 50 mmol and citrate 10 mmol.

**PRESCRIBING AND DISPENSING INFORMATION**
Flavours of oral powder formulations may include apricot, black currant, or raspberry.

**PATIENT AND CARER ADVICE**
Patients and carers should be advised how to reconstitute Dioralyte® Relief oral powder.
After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

---

**Calcium imbalance 551**

**Calcium**

**Calcium supplements**
Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand. Hypocalcaemia may be caused by vitamin D deficiency (see Vitamin D under Vitamins p. 581), impaired metabolism, a failure of secretion (hypoparathyroidism), or resistance to parathyroid hormone (pseudohypoparathyroidism).

Mild asymptomatic hypocalcaemia may be managed with oral calcium supplements. Severe symptomatic hypocalcaemia requires an intravenous infusion of calcium gluconate 10% p. 553 over 5 to 10 minutes, repeating the dose if symptoms persist; in exceptional cases it may be necessary to maintain a continuous calcium infusion over a day or more. Calcium chloride injection p. 553 is also available, but is more irritant; care should be taken to prevent extravasation.

See the role of calcium gluconate in temporarily reducing the toxic effects of hypercalcemia. Persistent hypocalcaemia requires oral calcium supplements and either a vitamin D analogue (alfacalcidol p. 588 or calcitriol p. 588) for hypoparathyroidism and pseudohypoparathyroidism or natural vitamin D (calciferyl) if due to vitamin D deficiency. It is important to monitor plasma and urinary calcium during long-term maintenance therapy.

**Severe hypercalcemia**
Severe hypercalcemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of sodium chloride 0.9% p. 547. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If severe hypercalcemia persists drugs which inhibit mobilisation of calcium from the skeleton may be required. The bisphosphonates are useful and pamidronate disodium p. 437 is probably the most effective.
Corticosteroids are widely given, but may only be useful where hypercalcaemia is due to sarcoidosis or vitamin D intoxication; they often take several days to achieve the desired effect.

Calcitonin (salmon) p. 439 can be used by specialists for the treatment of hypercalcaemia associated with malignancy; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. Further treatment is governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcaemia should be avoided; oral administration of a bisphosphonate may be useful. Parathyroidectomy may be indicated for hyperparathyroidism.

Hypercalciuria
Hypercalciuria should be investigated for an underlying cause, which should be treated. Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

Neonates
Calcium supplements
Hypocalcaemia is common in the first few days of life, particularly following birth asphyxia or respiratory distress. Late onset at 4–10 days after birth may be secondary to vitamin D deficiency, hypoparathyroidism or hypomagnesaemia and may be associated with seizures.

2.1a Hypocalcaemia

**ELECTROLYTES AND MINERALS > CALCIUM**

**Calcium salts**

- **CONTRA-INDICATIONS** Conditions associated with hypercalcaemia (e.g. some forms of malignant disease) - conditions associated with hypercalciuria (e.g. some forms of malignant disease)
- **CAUTIONS** History of nephrolithiasis - sarcoidosis
- **INTERACTIONS** > Appendix 1 (antacids, calcium salts).
- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - Rare Gastro-intestinal disturbances
    - Frequency not known Hypercalcaemia
  - **SPECIFIC SIDE-EFFECTS**
    - With intravenous use Arrhythmias - bradycardia - fall in blood pressure - injection-site reactions - peripheral vasodilatation - severe tissue damage with extravasation - sweating
  - **RENAL IMPAIRMENT** Use with caution. Risk of hypercalcaemia and renal calculi.

**Calcium carbonate**

- **INDICATIONS AND DOSE**
  - Phosphate binding in renal failure and hyper-phosphataemia
  - **BY MOUTH**
    - Child 1-11 months: 120 mg 3–4 times a day, dose to be adjusted as necessary, to be taken with feeds
    - Child 1-5 years: 300 mg 3–4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals
    - Child 6-11 years: 600 mg 3–4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals

**Calcium carbonate with calcium lactate gluconate**

The properties listed below are those particular to the combination only. For the properties of the components please consider, calcium carbonate above.

- **INDICATIONS AND DOSE**
  - **Calcium deficiency**
    - **BY MOUTH**
      - Neonate: 0.25 mmol/kg 4 times a day, adjusted according to response.
      - Child 1 month-4 years: 0.25 mmol/kg 4 times a day, adjusted according to response

- **PRESCRIBING AND DISPENSING INFORMATION**
  - **Adcal®** contains calcium carbonate 1.5 g (calcium 600 mg or Ca$^{2+}$ 15 mmol); **Calcichew** contains calcium carbonate 1.25 g (calcium 500 mg or Ca$^{2+}$ 12.5 mmol); **Calcichew Forte** contains calcium carbonate 2.5 g (calcium 1 g or Ca$^{2+}$ 25 mmol); **Cacit®** contains calcium carbonate 1.25 g, providing calcium citrate when dispersed in water (calcium 500 mg or Ca$^{2+}$ 12.5 mmol); consult product literature for details of other available products.

Flavours of chewable tablet formulations may include orange or fruit flavour.

PRESCRIBING AND DISPENSING INFORMATION

Each Sandocal® tablet contains 1 g calcium (Ca²⁺ 25 mmol); flavours of soluble tablet formulations may include orange.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Effervescent tablet

Calcium carbonate 1.75 gram, Calcium lactate gluconate 2.263 gram Sandocal 1000 effervescent tablets sugar-free | 30 tablet P 7.05 DT price = £7.05

Calcium chloride dihydrate 147 mg per 1 ml Sandocal (Novartis Consumer Health UK Ltd) 7.5% solution for infusion containing the same drug. Forms available from special-order manufacturers include: solution for infusion packaging, solution for injection packaging, oral route as soon as possible due to risk of extravasation.

Calcium chloride dihydrate 100 mg per 1 ml Calcium chloride 10% solution for injection 10ml pre-filled syringes | 10 ampoule P 95.22 Calcium chloride dihydrate 147 mg per 1 ml Calcium chloride 14.7% solution for injection 5ml ampoules | 10 ampoule P 64.69-66.38

Calcium gluconate

Calcium gluconate 100 mg per 1 ml Calcium gluconate 10% solution for injection 10ml ampoules | 10 ampoule P 66.50-7.50

INDICATIONS AND DOSE

Acute hypocalcaemia

BY INTRAVENOUS INJECTION
Child: (consult product literature)

MEDIcular forms

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Calcium chloride dihydrate 73.5 mg per 1 ml Calcium chloride 7.35% solution for injection 10ml ampoules | 10 ampoule P 66.38
Calcium chloride dihydrate 100 mg per 1 ml Calcium chloride 10% solution for injection 10ml pre-filled syringes | 1 pre-filled disposable injection P 9.42
Calcium chloride dihydrate 147 mg per 1 ml Calcium chloride 14.7% solution for injection 10ml ampoules | 10 ampoule P 64.69-66.38

Calcium gluconate

INDICATIONS AND DOSE

Calcium deficiency / Mild asymptomatic hypocalcaemia

BY MOUTH

Neonate: 0.25 mmol/kg 4 times a day, adjusted according to response.

Child 1 month-4 years: 0.25 mmol/kg 4 times a day, adjusted according to response
Child 5-11 years: 0.2 mmol/kg 4 times a day, adjusted according to response
Child 12-17 years: 10 mmol 4 times a day, adjusted according to response

MEDIcular forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for infusion.

Effervescent tablet

Calcium gluconate (Non-proprietary) Calcium gluconate 1 gram Calcium gluconate 1g effervescent tablets | 28 tablet P 15.68 DT price = £15.68

Solution for injection

Calcium gluconate (Non-proprietary) Calcium gluconate 100 mg per 1 ml Calcium gluconate 10% solution for injection 10ml ampoules | 10 ampoule P 6.50-7.50

INDICATIONS AND DOSE

Acute hypocalcaemia, urgent correction | Hyperkalaemia (prevention of arrhythmias)

BY SLOW INTRAVENOUS INJECTION

Neonate: 0.11 mmol/kg for 1 dose, to be given over 5–10 minutes, some units use a dose of 0.46 mmol/kg (2 ml/kg calcium gluconate 10%) for hypocalcaemia in line with US practice.

Child: 0.11 mmol/kg, to be given over 5–10 minutes, maximum 4.5 mmol (20 ml calcium gluconate 10%)

Acute hypocalcaemia, maintenance

BY CONTINUOUS INTRAVENOUS INFUSION

Neonate: 0.5 mmol/kg daily, adjusted according to response, dose to be given over 24 hours, use oral route as soon as possible due to risk of extravasation.

Child 1 month-1 year: 1 mmol/kg daily, adjusted according to response, dose to be given over 24 hours, use oral route as soon as possible due to risk of extravasation

DOSE EQUIVALENCE AND CONVERSION

0.11 mmol/kg is equivalent to 0.5 ml/kg of calcium gluconate 10%.

IMPORTANT SAFETY INFORMATION

The MHRA has advised that repeated or prolonged administration of calcium gluconate injection packaged in 10 ml glass containers is contra-indicated in children under 18 years and in patients with renal impairment owing to the risk of aluminium accumulation; in these patients the use of calcium gluconate injection packaged in plastic containers is recommended.

MONITORING REQUIREMENTS

With intravenous use Plasma – calcium and ECG monitoring required for administration by slow intravenous injection (risk of arrhythmias if given too rapidly).

DIRECTIONS FOR ADMINISTRATION

With intravenous use For intravenous infusion dilute to at least 45 micromol/mL with Glucose 5% or Sodium Chloride 0.9%. Maximum administration rate 45 micromol/kg/hour (or in neonates max. 22 micromol/kg/hour). May be given more concentrated via a central venous catheter. May be used undiluted (10% calcium gluconate) in emergencies. Avoid extravasation; should not be given by intramuscular injection. Incompatible with sodium bicarbonate and phosphate solutions.

PRESCRIBING AND DISPENSING INFORMATION

Calcium gluconate 1 g contains calcium 89 mg or Ca²⁺ 2.23 mmol.

MEDIcular forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for infusion.

2.2 Low blood volume

BLOOD AND RELATED PRODUCTS > PLASMA PRODUCTS

Albumin solution (Human Albumin Solution)

- INDICATIONS AND DOSE
  Acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery (with isotonic solutions) | Plasma exchange (with isotonic solutions) | Severe hypoalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required (with concentrated solutions 20%) | Paracentesis of large volume ascites associated with portal hypertension (with concentrated solutions 20%)
  ▶ BY INTRAVENOUS INFUSION
  - Child: (consult product literature)
  Adjunct in the treatment of hyperbilirubinaemia by exchange transfusion in the newborn (with concentrated solutions 20%)
  ▶ BY INTRAVENOUS INFUSION
  - Child: (consult product literature)

- CONTRA-INDICATIONS
  Cardiac failure · severe anaemia

- CAUTIONS
  Correct dehydration when administering concentrated solution · history of cardiac disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) · history of circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) · increased capillary permeability

- SIDE-EFFECTS
  Anaphylaxis · chills · fever · hypersensitivity reactions · hypotension · increased salivation · nausea · tachycardia · vomiting

- MONITORING REQUIREMENTS
  Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient’s condition at all times.

- PRESCRIBING AND DISPENSING INFORMATION
  A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).

- MEDICINAL FORMS

...
Magnesium imbalance

Magnesium

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulfate as an osmotic laxative.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant hypermagnesaemia (causing muscle weakness and arrhythmias) is rare.

Hypermagnesaemia

Since magnesium is secreted in large amounts in the gastrointestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of hypermagnesaemia; deficiency may also occur as a result of treatment with certain drugs. Hypermagnesaemia often causes secondary hypocalcaemia (with which it may be confused), particularly in neonates, and also hypokalaemia and hypoparaethreina.

Symptomatic hypermagnesaemia is associated with a deficit of 0.5–1 mmol/kg. Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion and the dose should be reduced in renal impairment. To prevent recurrence of the deficit, magnesium may be given by mouth in divided doses, but there is limited evidence of benefit. Magnesium aspartate powder for oral solution p. 556 is available as a licensed preparation.

Arrhythmias

Magnesium sulfate injection has also been recommended for the emergency treatment of serious arrhythmias, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as torsade de pointes.

2.3 Magnesium imbalance

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulfate as an osmotic laxative.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant hypermagnesaemia (causing muscle weakness and arrhythmias) is rare.

Hypermagnesaemia

Since magnesium is secreted in large amounts in the gastrointestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of hypermagnesaemia; deficiency may also occur as a result of treatment with certain drugs. Hypermagnesaemia often causes secondary hypocalcaemia (with which it may be confused), particularly in neonates, and also hypokalaemia and hypoparaethreina.

Magnesium aspartate powder for oral solution p. 556 is available as a licensed preparation.
2.3a Hypomagnesaemia

ELECTROLYTES AND MINERALS > MAGNESIUM

Magnesium aspartate

- INDICATIONS AND DOSE
  Treatment and prevention of magnesium deficiency
  - BY MOUTH
    - Child 2-3 years: 4.5 mmol daily, given as one level 5 mL spoonful of Magnaspartate® powder.
    - Child 4-9 years: 4.5 mmol daily, given as a 5 mL level spoonful of Magnaspartate® powder, alternatively 10 mmol daily, given as 1 sachet of Magnaspartate® powder.
    - Child 10-17 years: 10 mmol daily, given as 1 sachet of Magnaspartate® powder.

- CONTRA-INDICATIONS
  Disorders of cardiac conduction

- INTERACTIONS
  → Appendix 1 (magnesium salts, oral).

- SIDE-EFFECTS
  - Uncommon: Diarrhoea
  - Rare: Hypermagnesaemia
  - Frequency not known: Dental caries (on long term use) • gastrointestinal irritation

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects generally occur at higher doses; if side-effects (such as diarrhoea) occur, consider interrupting treatment and restarting at a reduced dose.

Overdose

Symptoms of hypermagnesaemia may include nausea, vomiting, flushing of the skin, thirst, hypotension due to peripheral vasoconstriction, drowsiness, confusion, loss of tendon reflexes and respiratory depression due to neuromuscular blockade, slurred speech, double vision, muscle weakness, bradycardia, cardiac arrhythmias, coma, and cardiac arrest.

- RENAL IMPAIRMENT
  Avoid in severe impairment (estimated glomerular filtration rate less than 30 mL/minute/1.73²).

- DIRECTIONS FOR ADMINISTRATION
  Dissolve sachet contents in 50–200 mL water, tea or orange juice and take immediately.

- PRESCRIBING AND DISPENSING INFORMATION
  Magnaspartate® contains magnesium aspartate 6.5 g (10 mmol Mg²⁺)/sachet.

- PATIENT AND CARER ADVICE
  Patients and carers should be given advice on how to administer magnesium aspartate powder.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet, capsule, oral suspension, oral solution, powder

Tablet
  - Magnesium glycerophosphate (Non-proprietary) Magnesium (as Magnesium glycerophosphate) 97.2 mg Magn-4 (magnesium 97.2 mg (4 mmol)) tablets 30 tablet £84.50
  - Chewable tablet
    - Magnesium glycerophosphate (Non-proprietary) Magnesium (as Magnesium glycerophosphate) 97.2 mg YourMAG (magnesium 97.2 mg (4 mmol)) chewable tablets 50 tablet £20.00
    - Magnesium glycerophosphate (Non-proprietary) Magnesium (as Magnesium glycerophosphate) 97.2 mg Neomag (magnesium 97.2 mg (4 mmol)) chewable tablets sugar-free 30 tablet £84.50
  - Magnaphate (Arjun Products Ltd) Magnesium (as Magnesium glycerophosphate) 97.2 mg Magnaphate (magnesium 97.2 mg (4 mmol)) chewable tablets sugar-free 50 tablet £22.64

Capsule
  - Magnesium glycerophosphate (Non-proprietary) Magnesium (as Magnesium glycerophosphate) 48.6 mg Magn-4 (magnesium 48.6 mg (2 mmol)) capsules 30 capsule £18.70
  - Oral solution
    - LiquaMag GP (Fontus Health Ltd) Magnesium (as Magnesium glycerophosphate) 24.25 mg per 1 ml LiquaMag GP (magnesium 24.25 mg (5 mmol)/5 ml) oral solution sugar-free 250 ml £55.00

Magnesium sulfate

- INDICATIONS AND DOSE
  - Severe acute asthma
  - Continuing respiratory deterioration in anaphylaxis

- BY INTRAVENOUS INFUSION
  - Child 2-17 years: 40 mg/kg (max. per dose 2 g), to be given over 20 minutes
With intravenous use For neonatal hypocalcaemia, hypomagnesaemia, and torsade de points, dilute to 10% (100 mg sodium magnesium sulfate heptahydrate (0.4 mmol Mg²⁺) in 1 mL with Glucose 5% or 10%, Sodium Chloride 0.45% or 0.9% or Glucose and Sodium Chloride combinations. Up to 20% solution may be given in fluid restriction. Rate of administration should not exceed 10 mg/kg/minute (0.04 mmol/kg/minute Mg²⁺) of magnesium sulfate heptahydrate.

PRESCRIBING AND DISPENSING INFORMATION

With intramuscular use or intravenous use The BP directs that the label states the strength as the % w/v of magnesium sulfate heptahydrate and as the approximate concentration of magnesium ions (Mg²⁺) in mmol/mL. Magnesium Sulfate Injection BP is a sterile solution of Magnesium Sulfate Heptahydrate.

MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion.

Solution for injection

- **Magnesium sulfate (Non-proprietary)**
  - Magnesium sulfate heptahydrate 500 mg per 1 ml Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 10ml ampoules | 10 ampoule (£9.50) 11.85-12.35
  - Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 20ml vials | 10 vial (£8.80) 16.60
  - Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 5ml ampoules | 10 ampoule (£6.00) 12.00
  - Magnesium sulfate 50% (magnesium 2mmol/ml) solution for infusion 50ml vials | 10 vial (£11.72-£17.90) 37.70

Solution for infusion

- **Magnesium sulfate (Non-proprietary)**
  - Magnesium sulfate heptahydrate 100 mg per 1 ml Magnesium sulfate 10% (magnesium 0.4mmol/ml) solution for injection 10ml ampoules | 10 ampoule (£57.12-£58.80)
  - Magnesium sulfate heptahydrate 500 mg per 1 ml Magnesium sulfate 50% (magnesium 2mmol/ml) solution for infusion 50ml vials | 10 vial (£6.30) 16.30

2.4 Phosphate imbalance

Phosphorus

Phosphate supplements

Oral phosphate supplements p. 559 may be required in addition to vitamin D in children with hypophosphataemic vitamin D-resistant rickets, see also Vitamin D, under Vitamins p. 581.

Phosphate infusion is occasionally needed in phosphate deficiency arising from use of parenteral nutrition deficiency in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis. It is difficult to provide detailed guidelines for the treatment of severe hypophosphataemia because the extent of total body deficits and response to therapy are difficult to predict. High doses of phosphate may result in a transient serum elevation followed by redistribution into intracellular compartments or bone tissue. It is recommended that severe hypophosphataemia be treated intravenously as large doses of oral phosphate may cause diarrhoea; intestinal absorption may be unreliable and dose adjustment may be necessary.

Phosphate is not the first choice for the treatment of hypercalcaemia because of the risk of precipitation of calcium phosphate in the kidney and other tissues. If used, the child should be well hydrated and electrolytes monitored.

Neonates

Phosphate deficiency may occur in very low-birthweight infants and may compromise bone growth if not corrected. Parenterally fed infants may be at risk of phosphate...
deficiency due to the limited solubility of phosphate. Some units routinely supplement expressed breast milk with phosphate, although the effect on the osmolality of the milk should be considered.

Phosphate-binding agents
Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-containing preparations are rarely used as phosphate-binding agents and can cause aluminium accumulation.

Sevelamer hydrochloride is licensed for the treatment of hyperphosphataemia in adults on haemodialysis or peritoneal dialysis. Although experience is limited in children sevelamer hydrochloride may be useful when hypercalcaemia prevents the use of calcium carbonate p. 552.

2.4a Hyperphosphataemia

ELECTROLYTES AND MINERALS > ALUMINIUM

Aluminium hydroxide

- INDICATIONS AND DOSE
  Hyperphosphataemia in renal failure
  - BY MOUTH USING CAPSULES
    - Child 5-11 years: 1–2 capsules 3–4 times a day, dose adjusted as necessary
    - Child 12-17 years: 1–5 capsules 3–4 times a day, dose adjusted as necessary
  
- CONTRA-INDICATIONS
  - Hypophosphataemia
  - Infants
  - Neonates

CONTRA-INDICATIONS, FURTHER INFORMATION
- Neonates and infants: Aluminium-containing antacids should not be used because accumulation may lead to increased plasma-aluminium concentrations.

- INTERACTIONS
  - Appendix 1 (antacids).
  - Antacids should preferably not be taken at the same time as other drugs since they may impair absorption.
  - Antacids may damage enteric coatings designed to prevent dissolution in the stomach.

- SIDE-EFFECTS
  - Constipation
  - Hyperaluminaemia

- HEPATIC IMPAIRMENT
  - Avoid; can cause constipation which can precipitate coma.

- RENAL IMPAIRMENT
  - There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  
  Capsule
  - Alu-Cap (Meda Pharmaceuticals Ltd)
  - Aluminium hydroxide 475 mg
  - Alu-Cap 475mg capsules | 120 capsule
  - £13.71 DT price + £13.71

PHOSPHATE BINDERS

Sevelamer

- INDICATIONS AND DOSE
  Phosphate binding in renal failure and hyperphosphataemia
  - BY MOUTH
  - Child: Dose to be adjusted according to requirements of patient, dose to be taken with meals (consult product literature)

- DIRECTIONS FOR ADMINISTRATION
  - Phosex® tablets are taken with meals.
  - Tablets can be broken to aid swallowing, but not chewed (bitter taste).

- PRESCRIBING AND DISPENSING INFORMATION
  - Phosex® tablets contain calcium acetate 1 g (equivalent to calcium 250 mg or Ca²⁺ 6.2 mmol).

- PATIENT AND CARER ADVICE
  - Medicines for Children leaflet: Calcium salts for kidney disease www.medicinesforchildren.org.uk/calcium-salts-kidney-disease-0

PHOSEX® TABLETS
- Patients or carers should be given advice on how to administer Phosex® tablets.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

  Tablet
  - CAUTIONARY AND ADVISORY LABELS
  - 25
  - Phosex® (Pharmacosmos UK Ltd)
  - Calcium acetate 1 gram
  - Phosex 1g tablets | 180 tablet
  - £19.79 DT price + £19.79
**Phosphate**

- **INDICATIONS AND DOSE**
  - **Hypophosphataemia**
  - **Osteomalacia**
    - **BY MOUTH USING EFFERVESCENT TABLETS**
      - Neonate: 1 mmol/kg daily in 1–2 divided doses, dose can be taken as a supplement in breast milk—caution advised as solubility in breast milk is limited to 1.2 mmol in 100 ml. If calcium also added, contact pharmacy department for details.
      - Child 1 month–4 years: 2–3 mmol/kg daily in 2–4 divided doses, dose to be adjusted as necessary; dose can be taken as a supplement in breast milk—caution advised as solubility in breast milk is limited to 1.2 mmol in 100 ml. If calcium also added, contact pharmacy department for details; maximum 48 mmol per day.
      - Child 5–17 years: 2–3 mmol/kg daily in 2–4 divided doses, dose to be adjusted as necessary; maximum 97 mmol per day.
    - **BY INTRAVENOUS INFUSION**
      - Neonate: 1 mmol/kg daily, dose to be adjusted as necessary.
      - Child 1 month–1 year: 0.7 mmol/kg daily, dose to be adjusted as necessary.
      - Child 2–17 years: 0.4 mmol/kg daily, dose to be adjusted as necessary.

**IMPORTANT SAFETY INFORMATION**

- With intravenous use
  - Some phosphate injection preparations also contain potassium. For peripheral intravenous administration the concentration of potassium should not usually exceed 40 mmol/litre. The infusion solution should be thoroughly mixed. Local policies on avoiding inadvertent use of potassium concentrate should be followed. The potassium content of some phosphate preparations may also limit the rate at which they may be administered.

- **CAUTIONS**
  - **GENERAL CAUTIONS**
    - Cardiac disease · dehydration · diabetes mellitus · sodium and potassium concentrations of preparations
  - **SPECIFIC CAUTIONS**
    - With intravenous use Avoid extravasation · severe tissue necrosis
  - **SIDE-EFFECTS**
    - Common or very common Diarrhoea
    - Frequency not known Acute renal failure · hypocalcaemia · hypotension · metastatic calcification · nausea · oedema · phlebitis · tissue necrosis on extravasation
  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Diarrhoea is a common side-effect and should prompt a reduction in dosage.

- **REMEDIES FOR ADVERSE REACTIONS**
  - **Hypophosphataemia**
  - **Osteomalacia**

**Phosphate**

- **INDICATIONS AND DOSE**
  - **Hypophosphataemia**
  - **Osteomalacia**
    - **BY MOUTH USING EFFERVESCENT TABLETS**

  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Diarrhoea is a common side-effect and should prompt a reduction in dosage.
Blood and nutrition

DIRECTIONS FOR ADMINISTRATION

MONITORING REQUIREMENTS

With rectal use Mix each 1 g of resin with 5 mL of water or 10% glucose.

SORBITERIT® POWDER By mouth, administer in a small amount of water or soft drink—do not give with fruit juice or squash, which have a high potassium content. By rectum, mix each 1 g of resin with 4 mL of 5% glucose.

CONTRA-INDICATIONS Hyperparathyroidism · metastatic carcinoma · multiple myeloma · obstructive bowel disease · reduced gut motility (in neonates) · sarcoidosis

CAUTIONS Impaction of resin with excessive dosage or inadequate dilution

INTERACTIONS Appendix 1 (polystyrene sulfonate resins).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Anorexia · constipation (discontinue treatment—avoid magnesium-containing laxatives) · diarrhoea · gastric irritation · gastro-intestinal obstruction · hypercalcemia (including in dialysed patients and occasionally in those with renal impairment) · hypomagnesaemia · intestinal necrosis (reported with concomitant sorbitol) · ischaemic colitis · nausea · necrosis · ulceration · vomiting

SPECIFIC SIDE-EFFECTS

With oral use Gastro-intestinal concretions

With rectal use Faecal impaction

PREGNANCY Manufacturers advise use only if potential benefit outweighs risk—no information available.

BREAST FEEDING Manufacturers advise use only if potential benefit outweighs risk—no information available.

RENAI IMPAIRMENT Use with caution.

MONITORING REQUIREMENTS Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).

DIRECTIONS FOR ADMINISTRATION

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: enema

Powder

CAUTIONARY AND ADVISORY LABELS 13 (Sorbiterit® powder only)

EXCIPIENTS: May contain Sucrose

Calcium Resonium (Sanofi)
Calcium polystyrene sulfonate 999.34 mg per 1 gram

Resonium A powder sugar-free | 454 gram

Sodium polystyrene sulfonate

INDICATIONS AND DOSE

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

BY MOUTH

Child: 0.5–1 g/kg daily in divided doses; maximum 60 g per day

BY RECTUM

Neonate: 0.5–1 g/kg daily, irrigate colon to remove resin after 8–12 hours.

Child: 0.5–1 g/kg daily, irrigate colon to remove resin after 8–12 hours; maximum 30 g per day

CONTRA-INDICATIONS Obstructive bowel disease · reduced gut motility (in neonates)

CAUTIONS Congestive heart failure · hypertension · impaction of resin with excessive dosage or inadequate dilution · oedema

INTERACTIONS Appendix 1 (polystyrene sulfonate resins).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Anorexia · constipation (discontinue treatment—avoid magnesium-containing laxatives) · diarrhoea · gastric irritation · gastro-intestinal obstruction · hypocalcaemia · hypomagnesaemia · intestinal necrosis (reported with concomitant use of sorbitol) · ischaemic colitis · nausea · necrosis · sodium retention · ulceration · vomiting

SPECIFIC SIDE-EFFECTS

With oral use Gastro-intestinal concretions

With rectal use Faecal impaction

PREGNANCY Manufacturers advise use only if potential benefit outweighs risk—no information available.

BREAST FEEDING Manufacturers advise use only if potential benefit outweighs risk—no information available.

RENAI IMPAIRMENT Use with caution.

MONITORING REQUIREMENTS Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).

DIRECTIONS FOR ADMINISTRATION

Resonium A (Sanofi)
Sodium polystyrene sulfonate 999.34 mg per 1 gram

Resonium A powder sugar-free | 454 gram

£11.11
2.5b Hypokalaemia

**ELECTROLYTES AND MINERALS > POTASSIUM**

**Potassium bicarbonate with potassium acid tartrate**

- **INDICATIONS AND DOSE**
  - Hyperchloraemic acidosis associated with potassium deficiency (as in some renal tubular and gastrointestinal disorders)
  - **BY MOUTH**
  - Child: (consult product literature)

- **CONTRA-INDICATIONS**
  - Hypochloraemia
  - Plasma-potassium concentration above 5 mmol/litre

- **CAUTIONS**
  - Cardiac disease

- **INTERACTIONS**
  - Appendix 1 (potassium salts).

- **SIDE-EFFECTS**
  - Abdominal pain
  - Diarrhoea
  - Flatulence
  - Nausea
  - Vomiting

- **RENAI IMPAIRMENT**
  - Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.

- **DIRECTIONS FOR ADMINISTRATION**
  - To be dissolved in water before administration.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - These tablets do not contain chloride.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Effervescent tablet**
  - CAUTIONARY AND ADVISORY LABELS 13, 21
  - Potassium bicarbonate with potassium acid tartrate (Non-proprietary)
  - Potassium acid tartrate 300 mg, Potassium bicarbonate 500 mg
  - Potassium (potassium 6.5mmol) effervescent tablets BPC 1968 | 56 tablet (LoSalt) £77.77/£95.15 OT price = £52.02

**Potassium chloride**

- **INDICATIONS AND DOSE**
  - Prevention of hypokalaemia (patients with normal diet)
  - **BY MOUTH**
  - Child: 1–2 mmol/kg daily; Usual maximum 50 mmol

  **Electrolyte imbalance**
  - **BY INTRAVENOUS INFUSION**

  - Neonate: 1–2 mmol/kg daily, dose dependent on deficit or the daily maintenance requirements.

  - Child: 1–2 mmol/kg daily, dose dependent on deficit or the daily maintenance requirements

  **Potassium depletion**
  - **BY MOUTH**

  - Neonate: 0.5–1 mmol/kg twice daily, total daily dose may alternatively be given in 3 divided doses, dose to be adjusted according to plasma-potassium concentration.

  - Child: 0.5–1 mmol/kg twice daily, total daily dose may alternatively be given in 3 divided doses, dose to be adjusted according to plasma-potassium concentration.

- **INTERACTIONS**
  - Appendix 1 (potassium salts).

- **SIDE-EFFECTS**
  - Abdominal pain
  - Diarrhoea
  - Flatulence
  - Nausea
  - Vomiting

- **RENAI IMPAIRMENT**
  - Smaller doses must be used in the prevention of hypokalaemia, to reduce the risk of hyperkalaemia. Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.

- **MONITORING REQUIREMENTS**
  - Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements.
  - With intravenous use ECG monitoring should be performed in difficult cases.

- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use in neonates Potassium chloride solutions suitable for use by mouth in neonates are available from ‘special order’ manufacturers or specialist importing companies; they should be used with care because they are hypertonic and can damage the gastric mucosa.

  - With oral use Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to hyperchloraemic states).

  - With intravenous use Potassium chloride concentrate must be diluted with not less than 50 times its volume of sodium chloride intravenous infusion 0.9% or other suitable diluent and mixed well.

  - With intravenous use Ready-mixed infusion solutions should be used when possible. For peripheral intravenous infusion, the concentration of potassium should not usually exceed 40 mmol/L. Potassium infusions should be given slowly over at least 2–3 hours and at a rate not exceeding 0.2 mmol/kg/hour with specialist advice and ECG monitoring in difficult cases. Higher concentrations of potassium chloride or faster infusion rates may be given in very severe depletion, but require specialist advice.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Kay-Cee-1®, contains 1 mmol/mL each of K+ and Cl-.
  - Potassium Tablets
  - With oral use Do not confuse Effervescent Potassium Tablets BPC 1968 with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperchloraemic states.

- **PATIENT AND CARER ADVICE**
  - Patient or carers should be given advice on how to administer potassium chloride modified-release tablets. Salt substitutes. A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. LoSalt® and
3 Metabolic disorders

Metabolic disorders

Use of medicines in metabolic disorders

Metabolic disorders should be managed under the guidance of a specialist. As many preparations are unlicensed and may be difficult to obtain, arrangements for continued prescribing and supply should be made in primary care. General advice on the use of medicines in metabolic disorders can be obtained from:

- Alder Hey Children’s Hospital, Medicines Information Centre (0151) 252 5381
- Great Ormond Street Hospital for Children, pharmacy (020) 7405 9200

Urea cycle disorders

Sodium benzoate p. 572 and sodium phenylbutyrate p. 573 are used in the management of urea cycle disorders. Both, either singly or in combination, are indicated as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy. Sodium benzoate is also used in non-ketotic hyperglycinemia.

The long-term management of urea cycle disorders includes oral maintenance treatment with sodium benzoate and sodium phenylbutyrate combined with a low protein diet and other drugs such as arginine p. 571 or citrulline p. 572, depending on the specific disorder.

Emergency management

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at: www.bimdgc.org.uk.

3.1 Acute porphyrias

Acute porphyrias

Overview

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 10 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyric crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs. Acute attacks of porphyria are exceptionally rare before puberty. When acute porphyria is suspected in a child, support from an expert porphyria service should be sought.

Treatment of serious or life-threatening conditions should not be withheld from patients with acute porphyria. When there is no safe alternative, treatment should be started and urinary porphobilinogen excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute attack of porphyria occurs during pregnancy, contact an expert porphyria service for further advice.

In the United Kingdom the National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from three centres (University Hospital of Wales, Addenbrooke’s Hospital, and King’s College Hospital). To access the service telephone (020) 2074 7747 and ask for the Acute Porphyria Service.

Drugs unsafe for use in acute porphyrias

The following list contains drugs on the UK market that have been classified as ‘unsafe’ in porphyria because they have been shown to be porphyrinogenic in animals or in vitro, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available.

An up-to-date list of drugs considered safe in acute porphyria is available at www.wmic.wales.nhs.uk/porphyria.info.php.

Further information may be obtained from:

- Welsh Medicines Information Centre
  - University Hospital of Wales
  - CF14 4XW
  - Cardiff (029) 2074 2979/3877

Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

Unsafe Drug Groups (check first)

- Alkylating drugs (contact Welsh Medicines Information Centre for further advice)
- Anabolic steroids
- Antidepressants (includes tricyclic (and related) antidepressants and MAOIs; fluoxetine, duloxetine, venlafaxine, and trazodone thought to be safe)
- Antihistamines (alimemazine, chlorphenamine, desloratadine, fexofenadine, ketotifen, loratadine, and promethazine thought to be safe)
Acute porphyrias 563

- Barbiturates (includes primidone and thiopental)
- Calcium channel blockers (amlodipine, felodipine, and nifedipine thought to be safe)
- Contraceptives, hormonal (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in young women who have had a previous attack. Long-acting progestogen preparations should never be used in those at risk of acute porphyria).
- Ergot derivatives (includes ergometrine (oxytocin probably safe) and pergolide)
- Imidazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)
- Non-nucleoside reverse transcriptase inhibitors (contact Welsh Medicines Information Centre for further advice)
- Progestogens (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in young women who have had a previous attack. Long-acting progestogen preparations should never be used in those at risk of acute porphyria.)
- Protease inhibitors (contact Welsh Medicines Information Centre for further advice)
- Sulfonamides (includes co-trimoxazole and sulfasalazine)
- Sulfonylureas (glinizide is thought to be safe)
- Taxanes (contact Welsh Medicines Information Centre for further advice)
- Thiazolidinediones (contact Welsh Medicines Information Centre for further advice)
- Triazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)

Unsafe drugs (check groups above first)

- Aceclofenac
- Alcohol
- Amiodarone
- Aprepitant (contact Welsh Medicines Information Centre for further advice)
- Artemether with lumefantrine
- Bexarotene
- Bosantan
- Bromocriptine
- Buspirone
- Cabergoline
- Carbamazepine
- Chloral hydrate (although evidence of hazard is uncertain, manufacturer advises avoid)
- Chloramphenicol
- Chloroform (small amounts in medicines probably safe)
- Clindamycin
- Cocaine
- Colistimethate sodium
- Danazol
- Dapsone
- Dexfenfluramine
- Disopyramide
- Disulfiram
- Erythromycin
- Etamsylate
- Ethosuximide
- Etoposide
- Fenfluramine
- Flupentixol
- Flutamide
- Fosaprepitant (contact Welsh Medicines Information Centre for further advice)
- Fosphenytoin
- Griseofulvin
- Hydralazine
- Indapamide
- Isomethoptene mucate
- Isoxazol (safety uncertain, contact Welsh Medicines Information Centre for further advice)
- Ketamine
- Mefenamic acid (may be used with caution if safer alternative not available)
- Meprobamate
- Methyldopa
- Metolazone
- Metryrapone
- Mifepristone
- Minoxidil (may be used with caution if safer alternative not available)
- Mitotane
- Nalidixic acid
- Nitazepam
- Nitrofurantoin
- Orphenadrine
- Oxcarbazepine
- Oxybutynin
- Pentazocine (buprenorphine, codeine, diamorphine, dihydrocodeine, fentanyl, methadone, morphine, oxycodeone, pethidine, and tramadol are thought to be safe)
- Pentoxifylline
- Phenoxybenzamine
- Phenytoin
- Pimelic acid
- Porfiner
- Potassium canrenoate (evidence of hazard uncertain—contact Welsh Medicines Information Centre for further advice)
- Raloxifene
- Rifabutin (safety uncertain, contact Welsh Medicines Information Centre for further advice)
- Rifampicin
- Riluzole
- Risperidone
- Selegiline
- Spirinolactone
- Sulfinpyrazone
- Tamoxifen
- Telithromycin
- Temoporfin
- Tiagabine
- Tobilone
- Tinidazole
- Topiramate
- Toremifene
- Trimethoprim
- Valproate
- Xipamide
- Zidovudine (contact Welsh Medicines Information Centre for further advice)
- Zuclopenthixol
3.2 Carnitine deficiency

**Levocarnitine**
(Carnitine)

**INDICATIONS AND DOSE**
Primary carnitine deficiency due to inborn errors of metabolism

- **BY MOUTH**
  - Neonate: Up to 200 mg/kg daily in 2–4 divided doses.
  - Child: Up to 200 mg/kg daily in 2–4 divided doses; maximum 3 g per day
  - Initially by intravenous infusion

- Neonate: Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour.

- Child: Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour.
  - By slow intravenous injection

- Neonate: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes.

- Child: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes

**SIDE-EFFECTS**
Common or very common Pain at injection site · thrombophlebitis at injection site
Rare Fever · hypersensitivity reactions
Frequency not known Headache

**REMNISCUES**
Manufacturer advises avoid unless essential.

**DIRECTIONS FOR ADMINISTRATION**
With intravenous use Administer over at least 30 minutes through a filter via large antecubital or central vein; dilute requisite dose in 100 mL Sodium Chloride 0.9% in glass bottle; administer within 1 hour after dilution; max concentration 2.5 mg/mL.

**SIDE-EFFECTS, FURTHER INFORMATION**

- **UNLICENSED USE** Not licensed for use in organic acidaemias.
  - With intravenous use Not licensed for use by intravenous infusion.
  - With oral use Tablets, chewable tablets, and oral liquid (10%) not licensed in children under 12 years. Paediatric oral solution (30%) not licensed in children over 12 years.

- **CAUTIONS** Diabetes mellitus

**SIDE-EFFECTS, FURTHER INFORMATION**
Side-effects may be dose-related—monitor tolerance during first week and after any dose increase.

**PREGNANCY** Appropriate to use; no evidence of teratogenicity in animal studies.

**RENA L IMPAIRMENT** Accumulation of metabolites may occur with chronic oral administration in severe impairment.

**MONITORING REQUIREMENTS**
- Monitoring of free and acyl carnitine in blood and urine recommended.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For intravenous infusion, dilute injection with Sodium Chloride 0.9% or Glucose 5% or 10%.

**PRESCRIBING AND DISPENSING INFORMATION**
- When used for Organic acidaemias Levocarnitine is used in the treatment of some organic acidaemias; however, use in fatty acid oxidation is controversial.

**PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Carnitine for metabolic disorders www.medicinesforchildren.org.uk/ carnitine-metabolic-disorders-0

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

**Tablet**
- Carnitor (Sigma-Tau Pharma Ltd)
  - L-Carnitine 330 mg Carnitor 330mg tablets | 90 tablet £103.95
3.3 Fabry’s disease

**ENZYMES**

### Agalsidase alfa

#### DRUG ACTION
Agalsidase alfa, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry’s disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

#### INDICATIONS AND DOSE

**Fabry’s disease (specialist use only)**

- **BY INTRAVENOUS INFUSION**
  - Child 7-17 years: 200 micrograms/kg every 2 weeks

#### INTERACTIONS
- Appendix 1 (agalsidase alfa and beta).

#### SIDE-EFFECTS
- **Common or very common**
  - Acne
  - angioedema
  - arthralgia
  - asthenia
  - bradycardia
  - chest pain
  - cough
  - dizziness
  - dyspnoea
  - eye irritation
  - fatigue
  - flushing
  - gastrointestinal disturbances
  - headache
  - hypersensitivity reactions
  - hypertension
  - hypotension
  - influenza-like symptoms
  - muscle spasms
  - myalgia
  - nasopharyngitis
  - neuropathic pain
  - oedema
  - palpitation
  - paraesthesia
  - pruritus
  - rash
  - rhinorrhoea
  - sleep disturbances
  - syncope
  - tachycardia
  - taste disturbances
  - tinnitus
  - tremor
  - urticaria
- **Uncommon**
  - Cold extremities
  - ear pain
  - ear swelling
  - injection-site reactions
  - parosmia
  - skin discoloration

#### SIDE-EFFECTS, FURTHER INFORMATION
- Infusion-related reactions
- Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

#### PREGNANCY
Use with caution.

#### BREAST FEEDING
Use with caution—no information available.

#### DIRECTIONS FOR ADMINISTRATION
- **For intravenous infusion**
  - For intravenous infusion, given intermittently in Sodium chloride 0.9%, reconstitute initially with Water for Injections (5 mg in 1.1 mL, 35 mg in 7.2 mL) to produce a solution containing 5 mg/mL. Dilute with Sodium Chloride 0.9% (for doses less than 35 mg dilute with at least 50 mL; doses 35–70 mg dilute with at least 100 mL; doses 70–100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established.

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion
- **Replagal (Shire Pharmaceuticals Ltd)**
  - Agalsidase alfa 1 mg per 1 mL Replagal 3.5mg/3.5ml solution for infusion vials | 1 vial [Cost] £1,068.64

#### Agalsidase beta

#### DRUG ACTION
Agalsidase beta, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry’s disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

#### INDICATIONS AND DOSE

**Fabry’s disease (specialist use only)**

- **BY INTRAVENOUS INFUSION**
  - Child 8-17 years: 1 mg/kg every 2 weeks

#### INTERACTIONS
- Appendix 1 (agalsidase alfa and beta).

#### SIDE-EFFECTS
- **Common or very common**
  - Acne
  - angioedema
  - arthralgia
  - asthenia
  - bradycardia
  - chest pain
  - cough
  - dizziness
  - dyspnoea
  - eye irritation
  - fatigue
  - flushing
  - gastrointestinal disturbances
  - headache
  - hypersensitivity reactions
  - hypertension
  - hypotension
  - influenza-like symptoms
  - muscle spasms
  - myalgia
  - nasopharyngitis
  - neuropathic pain
  - oedema
  - palpitation
  - paraesthesia
  - pruritus
  - rash
  - rhinorrhoea
  - sleep disturbances
  - syncope
  - tachycardia
  - taste disturbances
  - tinnitus
  - tremor
  - urticaria
- **Uncommon**
  - Cold extremities
  - ear pain
  - ear swelling
  - injection-site reactions
  - parosmia
  - skin discoloration

#### SIDE-EFFECTS, FURTHER INFORMATION
- Infusion-related reactions
- Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

#### PREGNANCY
Use with caution.

#### BREAST FEEDING
Use with caution—no information available.

#### DIRECTIONS FOR ADMINISTRATION
- **For intravenous infusion**
  - Fabrazyme (Genzyme Therapeutics Ltd)
  - Agalsidase beta 5 mg Fabrazyme 5mg powder for solution for infusion vials | 1 vial [Cost] £135.08
  - Agalsidase beta 35 mg Fabrazyme 35mg powder for solution for infusion vials | 1 vial [Cost] £2,196.39
3.4 Gaucher’s disease

ENZYMES

Imiglucerase

- **Drug Action** Imiglucerase is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for non-neurological manifestations of type 1 or type III Gaucher’s disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

**indications and dose**

**Gaucher’s disease type I (special use only)**

- **By Intravenous infusion**
  - Neonate: Initially 60 units/kg every 2 weeks, adjusted according to response, doses as low as 30 units/kg once every 2 weeks may be appropriate.
  - Child: Initially 60 units/kg every 2 weeks, adjusted according to response, doses as low as 30 units/kg once every 2 weeks may be appropriate.

**Gaucher’s disease type III (special use only)**

- **By Intravenous infusion**
  - Neonate: Initially 60–120 units/kg every 2 weeks, adjusted according to response.
  - Child: Initially 60–120 units/kg every 2 weeks, adjusted according to response.

**Side-effects**

- **Common or very common** Angioedema, backache, cyanosis, flushing, hypersensitivity reactions, hypotension, paraesthesia, tachycardia, urticaria.
- **Uncommon** Abdominal cramps, arthralgia, diarrhoea, dizziness, fatigue, fever, headache, injection-site reactions, nausea, vomiting.

**Pregnancy** Manufacturer advises use with caution—limited information available.

**Breast-feeding** Manufacturer advises use with caution—no information available.

**Monitoring requirements**

- Monitor for immunoglobulin G (IgG) antibodies to imiglucerase.
- When stabilised, monitor all parameters and response to treatment at intervals of 6–12 months.

**Directions for administration**

- With intravenous use: For *intravenous infusion* (Cerezyme®), give intermittently in Sodium chloride 0.9%; initially reconstitute with water for injections (200 units in 5.1 mL, 400 units in 10.2 mL) to give 40 units/mL solution; dilute requisite dose with infusion fluid to a final volume of 100–200 mL and give initial dose at a rate not exceeding 0.5 units/kg/minute, subsequent doses to be given at a rate not exceeding 1 unit/kg/minute; administer within 3 hours after reconstitution.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- **Cerezyme (Genzyme Therapeutics Ltd)**
  - Imiglucerase 400 unit: Cerezyme 400 unit powder for solution for infusion vials | 1 vial | £1.410.20

3.5 Homocystinuria

**Methyl donors**

Betaine

- **Indications and dose** Adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism (special use only)

  - **By mouth**
    - Neonate: Initially 50 mg/kg twice daily (max. per dose 75 mg/kg), adjusted according to response; maximum 150 mg/kg per day.
    - Child 1 month–9 years: Initially 50 mg/kg twice daily (max. per dose 75 mg/kg), adjusted according to response; maximum 150 mg/kg per day.
    - Child 10–17 years: 3 g twice daily (max. per dose 10 g), adjusted according to response; maximum 20 g per day.

**Velaglucerase alfa**

- **Drug Action** Velaglucerase alfa is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for the treatment of type I Gaucher’s disease.

**Indications and dose**

**Type I Gaucher’s disease (special use only)**

- **By intravenous infusion**
  - Child 4–17 years: Initially 60 units/kg every 2 weeks; adjusted according to response to 15–60 units/kg every 2 weeks.

**Side-effects**

- Abdominal pain, arthralgia, back pain, bone pain, dizziness, flushing, headache, hypersensitivity reactions, hypertension, malaise, nausea, pyrexia, rash, tachycardia, urticaria.

**Further information**

- Infusion-related reactions: Infusion-related reactions very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

**Pregnancy** Manufacturer advises use with caution—limited information available.

**Breast-feeding** Manufacturer advises use with caution—no information available.

**Monitoring requirements**

- Monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions or if there is a lack or loss of effect with velaglucerase alfa.

**Directions for administration**

- With intravenous use: For *intravenous infusion*, reconstitute each 400-unit vial with 4.3 mL water for injections; dilute requisite dose in 100 mL Sodium Chloride 0.9% and give over 60 minutes through a 0.22 micron filter; start infusion within 24 hours of reconstitution.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- **Electrolytes**: May contain Sodium
  - Velaglucerase alfa 400 unit | VPRIV 400 units powder for solution for infusion vials | 1 vial | £1.410.20
3.6 Mitochondrial disorders

**CO-ENZYMES**

**Ubidecarenone**

(Ubiquinone; Co-enzyme Q10)

- **INDICATIONS AND DOSE**
- **Mitochondrial disorders**
  - **BY MOUTH**
    - Neonate: Initially 5 mg 1–2 times a day, adjusted according to response, dose too be taken with food, increased if necessary up to 200 mg daily.
    - Child: Initially 5 mg 1–2 times a day, adjusted according to response, dose to be taken with food, increased if necessary up to 300 mg daily

- **UNLICENSED USE** Not licensed.

- **CAUTIONS** May reduce insulin requirement in diabetes mellitus

- **INTERACTIONS** Appendix 1 (ubidecarenone).

- **SIDE-EFFECTS**
  - Common or very common
    - Diarrhoea
    - Heartburn
    - Nausea
  - Rare
    - Agitation
    - Dizziness
    - Headache
    - Irritability

- **HEPATIC IMPAIRMENT** Reduce dose in moderate and severe impairment.

- **PATIENT AND CARER ADVICE**

3.7 Mucopolysaccharidosis

**ENZYMES**

**Galsulfase**

- **DRUG ACTION** Galsulfase is a recombinant form of human N-acetylgalactosamine-4-sulfatase.

- **INDICATIONS AND DOSE**
  - Mucopolysaccharidosis VI (specialist use only)
  - **BY INTRAVENOUS INFUSION**
    - Child 5-17 years: 1 mg/kg once weekly

- **CAUTIONS** Acute febrile illness (consider delaying treatment); acute respiratory illness (consider delaying treatment); infusion-related reactions can occur - respiratory disease
Blood and nutrition

PREGNANCY

Manufacturer advises avoid unless essential.

BREAST FEEDING

Manufacturer advises avoid—no information available.

DIRECTIONS FOR ADMINISTRATION

With intravenous use For intravenous infusion, dilute requisite dose with Sodium Chloride 0.9% and mix gently (do not shake); give over 3 hours (gradually reduced to 1 hour if no infusion-related reactions).

SIDÉ-ÉFFETS, FURTHER INFORMATION

Infusion-related reactions Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

3.8 Nephropathic cystinosis

AMINO ACIDS AND DERIVATIVES

Mercaptamine (Cysteamine)

- **INDICATIONS AND DOSE**
  - **Nephropathic cystinosis (specialist use only)**
    - **BY MOUTH**
      - Neonate: Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses.
      - Child 1 month–11 years (body-weight up to 50 kg): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses.
      - Child 12–17 years (body-weight up to 50 kg): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses.
      - Child 12–17 years (body-weight 50 kg and above): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 2 g daily in 4 divided doses.

- **DOSE EQUIVALENT AND CONVERSION**
  - 1.3 g/m² is approximately equivalent to 50 mg/kg.

- **UNLICENSED USE**
  - When used by eye: Mercaptamine eye drops for the treatment of progressive neurological manifestations of Niemann-Pick type C disease (specialist use only).

**IMPORTANT SAFETY INFORMATION**

SAFE PRACTICE
Mercaptamine has been confused with mercaptopurine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CAUTIONS**
  - Dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine.

- **SIDE-EFFECTS**
  - Common or very common: Abdominal pain, anorexia, breath and body odour, diarrhoea, dyspepsia, encephalopathy, fever, gastroenteritis, headache, malaise, nausea, rash, vomiting.
  - Uncommon: Drowsiness, gastro-intestinal ulcer, hallucinations, leucopenia, nephrotic syndrome, nervousness, seizures.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Contra-indicated if history of hypersensitivity to penicillamine.

- **PREGNANCY**
  - Avoid—teratogenic and toxic in animal studies.

- **BREAST FEEDING**
  - Avoid.

- **MONITORING REQUIREMENTS**
  - Leucocyte-cystine concentration and haematological monitoring required—consult product literature.

- **ALLERGIC AND CROSS-SENSITIVITY**
  - Contra-indicated if history of hypersensitivity to penicillamine.

3.9 Niemann-pick type C disease

ENZYME INHIBITORS > GLUCOSYLCERAMIDE SYNTHASE INHIBITORS

Miglustat

- **DRUG ACTION**
  - Miglustat is an inhibitor of glucosylceramide synthase.

- **INDICATIONS AND DOSE**
  - Treatment of progressive neurological manifestations of Niemann-Pick type C disease (under expert supervision)
    - **BY MOUTH**
      - Child 4–11 years (body surface area up to 0.48 m²): 100 mg once daily
      - Child 4–11 years (body surface area 0.48–0.73 m²): 100 mg twice daily
      - Child 4–11 years (body surface area 0.74–0.88 m²): 100 mg 3 times a day
      - Child 4–11 years (body surface area 0.89–1.25 m²): 200 mg twice daily
      - Child 4–11 years (body surface area 1.26 m² and above): 200 mg 3 times a day
      - Child 12–17 years: 200 mg 3 times a day

- **SIDE-EFFECTS**
  - Abdominal pain, anorexia, ataxia, chills, constipation, decreased libido, depression, diarrhoea, diziness, dyspepsia, flatulence, headache, hypoaesthesia, insomnia, malaise, muscle spasm, muscle weakness, nausea, paraesthesia, peripheral neuropathy, thrombocytopenia, tremor, vomiting, weight changes.

- **CONCEPTION AND CONTRACEPTION**
  - Effective contraception must be used during treatment. Men should avoid fathering a child during and for 3 months after treatment.

- **PREGNANCY**
  - Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT**
  - No information available—manufacturer advises caution.
3.10 Pompe disease

ENZYMES

Alglucosidase alfa

**DRUG ACTION** Alglucosidase alfa is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

**INDICATIONS AND DOSE**

**Pompe disease (specialist use only)**

- **BY INTRAVENOUS INFUSION**
  - Neonate: 20 mg/kg every 2 weeks.
  - Child: 20 mg/kg every 2 weeks

**CAUTIONS** Cardiac dysfunction - infusion-related reactions—consult product literature - respiratory dysfunction

**SIDE-EFFECTS**

- **Frequency not known** Infusion-related reactions - necrotising skin lesions - severe skin reactions - ulcerative skin lesions

**SIDE-EFFECTS, FURTHER INFORMATION**

- Infusion-related reactions
- Infusion-related reactions very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details.

**PREGNANCY**

Toxicity in animal studies, but treatment should not be withheld.

**BREAST FEEDING**

Manufacturer advises avoid — no information available.

**MONITORING REQUIREMENTS**

- Monitor closely if cardiac dysfunction.
- Monitor closely if respiratory dysfunction.
- Monitor immunoglobulin G (IgG) antibody concentration.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use: For intravenous infusion, reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with Sodium Chloride 0.9% to give a final concentration of 0.5–4 mg/mL; give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for infusion**
  - Myozyme (Genzyme Therapeutics Ltd)
  - Alglucosidase alfa 50 mg Myozyme 50mg powder for concentrate for solution for infusion vials | 1 vial £565.06 (Hospital only)

3.11 Tyrosinaemia type I

</tr>
</tbody>
</table>

**SIDE-EFFECTS**

- **Common or very common** Conjunctivitis - corneal opacity - eye pain - granulocytopenia - keratitis - leucopenia - photophobia - thrombocytopenia
- **Uncommon** Blepharitis - erythematous rash - exfoliative dermatitis - leucocytosis - pruritus

**PREGNANCY**

Manufacturer advises avoid unless potential benefit outweighs risk — toxicity in animal studies.

**BREAST FEEDING**

Manufacturer advises avoid — adverse effects in animal studies.

**PRE-TREATMENT SCREENING**

Slit-lamp examination of eyes recommended before treatment.

**MONITORING REQUIREMENTS**

- Monitor liver function regularly.
- Monitor platelet and white blood cell count every 6 months.

**DIRECTIONS FOR ADMINISTRATION**

Capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - Orfadin (Swedish Orphan Biovitrum Ltd)
  - Nitisinone 2 mg Orfadin 2mg capsules | 60 capsule £564.00

  - Nitisinone 4 mg per 1 mL Orfadin 4mg/1ml oral suspension sugar-free | 90 mL £1,692.00
3.12 Urea cycle disorders

AMINO ACIDS AND DERIVATIVES

Arginine

- **INDICATIONS AND DOSE**
  - Acute hyperammonaemia in carbamylphosphate synthetase deficiency (specialist use only)
  - Acute hyperammonaemia in ornithine transcarbamylase deficiency (specialist use only)
  - BY INTRAVENOUS INFUSION
    - Neonate: 6 mg/kg/hour.
    - Child (body-weight up to 40 kg): 6 mg/kg/hour
    - Child (body-weight 40 kg and above): 4 mg/kg/hour
  - Maintenance treatment of hyperammonaemia in carbamylphosphate synthetase deficiency (specialist use only)
  - Maintenance treatment of hyperammonaemia in ornithine transcarbamylase deficiency (specialist use only)
  - BY MOUTH
    - Neonate: 100–200 mg/kg daily in 3–4 divided doses, dose to be taken with feeds.
    - Child (body-weight up to 20 kg): 100–200 mg/kg daily in 3–4 divided doses, dose to be given with feeds or meals
    - Child (body-weight 20 kg and above): 2.5–6 g/m² daily in 3–4 divided doses, dose to be taken with meals; maximum 6 g per day
  - Acute hyperammonaemia in citrullinaemia (specialist use only)
  - Acute hyperammonaemia in arginosuccinic aciduria (specialist use only)
  - BY INTRAVENOUS INFUSION
    - Neonate: Initially 300 mg/kg, to be administered over 90 minutes, followed by 12.5 mg/kg/hour, to be administered over 24 hours (maximum 25 mg/kg/hour thereafter).
    - Child (body-weight up to 40 kg): Initially 300 mg/kg, to be administered over 90 minutes, followed by 12.5 mg/kg/hour, to be administered over 24 hours (maximum 25 mg/kg/hour thereafter)
    - Child (body-weight 40 kg and above): 21 mg/kg/hour
  - Maintenance treatment of hyperammonaemia in citrullinaemia (specialist use only)
  - Maintenance treatment of hyperammonaemia in arginosuccinic aciduria (specialist use only)
  - BY MOUTH
    - Neonate: 100–300 mg/kg daily in 3–4 divided doses, dose to be taken with feeds.
    - Child (body-weight up to 20 kg): 100–300 mg/kg daily in 3–4 divided doses, dose to be taken with feed or meals
    - Child (body-weight 20 kg and above): 2.5–6 g/m² daily in 3–4 divided doses, dose to be taken with meals; maximum 6 g per day

- **UNLICENSED USE**
  - With intravenous use Injection not licensed in children.

- **CONTRA-INDICATIONS**
  - Not to be used in the treatment of arginase deficiency

- **SIDE-EFFECTS**
  - With intravenous use Flushing · headache · hyperchloremic metabolic acidosis · hypotension · irritation at injection site · nausea · numbness · vomiting

- **PREGNANCY**
  - No information available.

- **BREAST FEEDING**
  - No information available.

- **MONITORING REQUIREMENTS**
  - Monitor plasma pH and chloride.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For intravenous infusion, dilute to a max. concentration of 50 mg/mL with glucose 10%.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - With oral use Powder to be prescribed as a borderline substance (ACBS). For use as a supplement in urea cycle disorders other than arginase deficiency, such as hyperammonaemia types I and II, citrullinaemia, arginosuccinic aciduria, and deficiency of N-acetyl glutamate synthetase.

Carglumic acid

- **INDICATIONS AND DOSE**
  - Hyperammonaemia due to N-acetylglutamate synthase deficiency (under expert supervision)
  - BY MOUTH
    - Neonate: Initially 50–125 mg/kg twice daily, to be taken immediately before feeds, dose adjusted according to plasma–ammonia concentration; maintenance 5–50 mg/kg twice daily, the total daily dose may alternatively be given in 3–4 divided doses.
    - Child: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma–ammonia concentration; maintenance 5–50 mg/kg twice daily, the total daily dose may alternatively be given in 3–4 divided doses

  **Hyperammonaemia due to organic acidaemia (under expert supervision)**
  - BY MOUTH
    - Neonate: Initially 50–125 mg/kg twice daily, to be taken immediately before feeds, dose adjusted according to plasma–ammonia concentration, the total daily dose may alternatively be given in 3–4 divided doses.
    - Child: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma–ammonia concentration, the total daily dose may alternatively be given in 3–4 divided doses

         - Child: Up to 250 mg/kg daily in 3–4 divided doses, dose to be taken with feeds or meals; maximum 12 g per day

- **SIDE-EFFECTS** Abnormal oxalate metabolism - metabolic acidosis - polyneuropathy on prolonged use
- **PREGNANCY** No information available.
- **BREAST FEEDING** No information available.

- **UNLICENSED USE** Not licensed for use in children.
Sodium phenylbutyrate

**INDICATIONS AND DOSE**

**Acute hyperammonaemia due to urea cycle disorders (specialist use only)**

- **BY INTRAVENOUS INFUSION**
  - Neonate: Initially 250 mg/kg, to be administered over 90 minutes, followed by 10 mg/kg/hour, adjusted according to response.
  - Child: Initially 250 mg/kg, to be administered over 90 minutes, followed by 10 mg/kg/hour, adjusted according to response.
  - Maintenance treatment of hyperammonaemia due to urea cycle disorders (specialist use only)
    - **BY MOUTH**
    - Neonate: Up to 250 mg/kg daily in 3–4 divided doses, with feeds.
    - Child (body-weight up to 20 kg): Up to 250 mg/kg daily in 3–4 divided doses, with feeds or meals.
    - Child (body-weight 20 kg and above): 5 g/m² daily in 3–4 divided doses, with meals; maximum 12 g per day.

- **SIDE-EFFECTS**
  - Common or very common Ammonorrhoea, body odour, decreased appetite, depression, gastro-intestinal disturbances, headache, irregular menstrual cycles, oedema, rash, renal tubular acidosis, syncpe, taste disturbance, weight gain
  - Uncommon Abdominal pain, aplastic anaemia, arrhythmias, echymoses, nausea, oedema, pancreatitis, peptic ulcer, rectal bleeding, vomiting
  - Side-effects, further information Gastro-intestinal side-effects may be reduced by giving smaller doses more frequently.

- **CAUTIONS**
  - Conditions involving sodium retention with oedema (preparations contain significant amounts of sodium) - congestive heart failure (preparations contain significant amounts of sodium)
  - INTERACTIONS → Appendix 1 (sodium phenylbutyrate).

**UNLICENSED USE**

- With intravenous use Injection not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**

**EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS**

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

**DRUGS FOR METABOLIC DISORDERS › AMMONIA LOWERING DRUGS**

**Zinc acetate**

- **INDICATIONS AND DOSE**
  - **Wilson’s disease (initiated under specialist supervision)**
    - **BY MOUTH**
      - Child 1–5 years: 25 mg twice daily
      - Child 6–15 years (body-weight up to 57 kg): 25 mg 3 times a day
      - Child 6–15 years (body-weight 57 kg and above): 50 mg 3 times a day
      - Child 16–17 years: 50 mg 3 times a day
  - **DOSE EQUIVALENT AND CONVERSION**
    - Doses expressed as elemental zinc.

**PHARMACOKINETICS**

- Symptomatic Wilson’s disease patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

- **CAUTIONS**
  - Portal hypertension (risk of hepatic decompensation when switching from chelating agent)

**INTERACTIONS** → Appendix 1 (zinc).

**SIDE-EFFECTS**

- Common or very common Gastric irritation (usually transient)
- Uncommon Leucopenia - sideroblastic anaemia

**SIDE-EFFECTS, FURTHER INFORMATION**

- Transient gastric irritation may be reduced if first dose is taken mid-morning or with a little protein.

**PREGNANCY**

- Usual dose 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion.

**BREAST FEEDING**

- Manufacturer advises avoid; present in milk – may cause zinc-induced copper deficiency in infant.
Penicillamine

**DRUG ACTION** Penicillamine aids the elimination of copper ions in Wilson’s disease (hepatolenticular degeneration).

**INDICATIONS AND DOSE**

**Wilson’s disease**
- **BY MOUTH**
  - Child 1-month–11 years: 20 mg/kg daily in 2–3 divided doses, to be taken 1 hour before food; maximum 2 g per day
  - Child 12–17 years: Initially 20 mg/kg daily in 2–3 divided doses. Maintenance 0.75–1 g daily, to be taken 1 hour before food; maximum 2 g per day

**Cystinuria**
- **BY MOUTH**
  - Child: 20–30 mg/kg daily in 2–3 divided doses, lower doses may be used initially and increased gradually, doses to be adjusted to maintain 24-hour urinary cystine below 1 mmol/litre, maintain adequate fluid intake, to be taken 1 hour before food; maximum 3 g per day

**CONTRA-INDICATIONS** Lupus erythematosus

**CAUTIONS** Neurological involvement in Wilson’s disease

**INTERACTIONS** → Appendix 1 (penicillamine). Caution with concomitant nephrotoxic drugs (increased risk of toxicity).

**SIDE-EFFECTS**
- **Common or very common** Anorexia • fever • nausea • proteinuria • rash • thrombocytopenia
- **Rare** Alopecia • breast enlargement (male and female) • elastosis perforans • haematuria (withdraw immediately if cause unknown) • mouth ulceration • pseudoxanthoma elasticum • skin laxity • stomatitis
- **Frequency not known** Agranulocytosis • aplastic anaemia • blood disorders • bronchiolitis • cholestatic jaundice • dermatomyositis • glomerulonephritis • Goodpasture’s syndrome • haemolytic anaemia • haemolytic uraemia • late rashes (consider dose reduction) • lupus erythematosus • myasthenia gravis • nephrotic syndrome • neuropathy (especially if neurological involvement in Wilson’s disease—prophylactic pyridoxine recommended) • neutropenia • pancreatitis • pemphigus • pneumonitis • polymyositis • pulmonary haemorrhage • rheumatoid arthritis • Stevens-Johnson syndrome • taste loss (mineral supplements not recommended) • urticaria • vomiting

**ALLERGY AND CROSS-SENSITIVITY** Patients who are hypersensitive to penicillin may react rarely to penicillamine.

**PREGNANCY** Fetal abnormalities reported rarely; avoid if possible.

**ANTIDOTES AND CHELATORS** > COPPER CHELATORS

Trientine dihydrochloride

**INDICATIONS AND DOSE**

**Wilson’s disease in patients intolerant of penicillamine**
- **BY MOUTH**
  - Child 2–11 years: Initially 0.6–1.5 g daily in 2–4 divided doses, adjusted according to response, to be taken before food
  - Child 12–17 years: 1.2–2.4 g daily in 2–4 divided doses, adjusted according to response, to be taken before food

**INTERACTIONS** → Appendix 1 (trientine).

**SIDE-EFFECTS**
- **Common or very common** Nausea • rash
- **Very rare** Anaemia
- **Frequency not known** Colitis • duodenitis

**PREGNANCY** Teratogenic in animal studies—use only if benefit outweighs risk. Monitor maternal and neonatal serum-copper concentrations.

**PRESCRIBING AND DISPENSING INFORMATION** Trientine is not an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**CAUTIONARY AND ADVISORY LABELS** 6, 22
- **Trientine dihydrochloride (Non-proprietary)**
  - Trientine dihydrochloride 300 mg
    - 300 mg capsules £23.19
    - 100 capsule £20.97
  - Trientine dihydrochloride 600 mg
    - 600 mg capsules £46.38
    - 100 capsule £40.97

**RECOMMENDED MONITORING**

- Monitoring requirements
  - ▶ Monitor blood and platelet count regularly.
  - ▶ Monitor urine for proteinuria.
  - ▶ Monitor blood and platelet count regularly.
  - ▶ ▶ ▶ ▶

**PRESCRIBING AND DISPENSING INFORMATION**

Trientine is not an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.
4 Mineral and trace elements deficiencies

4.1 Zinc deficiency

Zinc deficiency

Zinc supplements should not be given unless there is good evidence of deficiency (hypoproteinaemia spuriously lowers plasma-zinc concentration) or in zinc-losing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disease, or in zinc-losing states.

Zinc is used in the treatment of Wilson’s disease and acrodermatitis enteropathica, a rare inherited abnormality of zinc absorption.

Parenteral nutrition regimens usually include trace amounts of zinc, see also Intravenous nutrition below. If necessary, further zinc can be added to intravenous feeding regimens.

ELECTROLYTES AND MINERALS > ZINC

Zinc sulfate

INDICATIONS AND DOSE

Zinc deficiency or supplementation in zinc-losing conditions

BY MOUTH USING EFFERVESCENT TABLETS

- Neonate: 1 mg/kg daily, dose expressed as elemental zinc, to be dissolved in water and taken after food.
- Child (body-weight up to 10 kg): 22.5 mg daily, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc.
- Child (body-weight 10-30 kg): 22.5 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc.
- Child (body-weight 30 kg and above): 45 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc.

ACRODERMATITIS ENTEROPATHICA

BY MOUTH USING EFFERVESCENT TABLETS

- Neonate: 0.5–1 mg/kg twice daily, dose to be adjusted as necessary, total daily dose may alternatively be given in 3 divided doses, dose expressed as elemental zinc.
- Child: 0.5–1 mg/kg twice daily, dose to be adjusted as necessary, total daily dose may alternatively be given in 3 divided doses, dose expressed as elemental zinc.

UNLICENSED USE Solvazinc® is not licensed for use in acrodermatitis enteropathica.

INTERACTIONS → Appendix 1 (zinc).

SIDE-EFFECTS Abdominal pain · diarrhoea · dyspepsia · gastric irritation · gastritis · headache · irritability · lethargy · nausea · vomiting

PREGNANCY Crosses placenta; risk theoretically minimal, but no information available.

BREAST FEEDING Present in milk; risk theoretically minimal, but no information available.

RENAL IMPAIRMENT Accumulation may occur in acute renal failure.

PRESCRIBING AND DISPENSING INFORMATION

Each Solvazinc® tablet contains zinc sulfate monohydrate 125 mg (45 mg zinc).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution, solution for injection, liquid effervescent tablet

**BNFC**

CAUTIONARY AND ADVISORY LABELS 13, 21

- Solvazinc (Galen Ltd)
  - Zinc sulfate monohydrate 125 mg Solvazinc 125 mg effervescent tablets sugar-free | 90 tablet £14.95 OT price = £14.95

5 Nutrition (intravenous)

Intravenous nutrition

Overview

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to oral or enteral tube feeding—supplemental parenteral nutrition, or may be the sole source of nutrition—total parenteral nutrition (TPN). Complete enteral starvation is undesirable and total parenteral nutrition is a last resort.

Indications for parenteral nutrition include prematurity; severe or prolonged disorders of the gastro-intestinal tract; preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; major surgery, trauma, or burns; prolonged coma or inability to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations used in children is given under Proprietary Infusion Fluids for Parenteral Feeding p. 576.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, lipids, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of an amino-acid, glucose, electrolyte bag, and a separate lipid infusion or, in older children a single ‘all-in-one’ bag. If the patient is able to take small amounts by mouth, vitamins may be given orally.

The nutrition solution is infused through a central venous catheter inserted under full surgical precautions. Alternatively, infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric cannulas and use of nutritional solutions of low osmolality and neutral pH. Nutritional fluids should be given by a dedicated intravenous line; if not possible, compatibility with any drugs or fluids should be checked as precipitation of components may occur. Extravasation of parenteral nutrition solution can cause severe tissue damage and injury; the infusion site should be regularly monitored.

Before starting intravenous nutrition the patient should be clinically stable and renal function and acid-base status should be assessed. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment. The nutritional components of parenteral nutrition regimens are usually increased gradually over a number of days to prevent metabolic complications and to allow metabolic adaptation to the infused nutrients. The solutions are usually infused over 24 hours but this may be gradually reduced if long-term nutrition is required. Home parenteral nutrition is usually infused over 12 hours overnight.
Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and management of parenteral nutrition complications, specialist literature should be consulted.

Protein (nitrogen) is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of non-essential ones to provide sufficient nitrogen together with electrolytes. Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose) and electrolytes. Solutions for use in neonates and children under 1 year of age are based on the amino acid profile of umbilical cord blood (Primene®) or breast milk (Vaminolact®) and contain amino acids that are essential in this age group; these amino acids may not be present in sufficient quantities in preparations designed for older children and adults.

Energy requirements must be met if amino acids are to be utilised for tissue maintenance. An appropriate energy to protein ratio is essential and requirements will vary depending on the child’s age and condition. A mixture of carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

Glucose p. 549 is the preferred source of carbohydrate, but frequent monitoring of blood glucose is required particularly during initiation and build-up of the regimen; insulin may be necessary. Glucose above a concentration of 12.5% must be infused through a central venous catheter to avoid thrombosis; the maximum concentration of glucose that should normally be infused in fluid restricted children is 20–25%.

In parenteral nutrition regimens, it is necessary to provide adequate phosphate in order to allow phosphorylation of glucose and to prevent hypophosphataemia. Neonates, particularly preterm neonates, and young children also require phosphorus and calcium to ensure adequate bone mineralisation. The compatibility and solubility of calcium and phosphorus salts is complex and unpredictable; precipitation is a risk and specialist pharmacy advice should be sought.

Fat (lipid) emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolarity with

1 1000 kcal = 4200kJ; 1000 kJ = 238.8 kcal. All entries are Prescription-only medicines.
2 Excludes protein- or amino acid-derived energy
plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Regular monitoring of plasma cholesterol and triglyceride is necessary to ensure clearance from the plasma, particularly in conditions where fat metabolism may be disturbed e.g. infection. Emulsions containing 20% or 30% fat should be used in neonates as they are cleared more efficiently. Additives should not be mixed with fat emulsions unless compatibility is known. Electrolytes are usually provided as the chloride salts of potassium and sodium. Acetate salts can be used to reduce metabolic acidosis. Sodium acetate requires reduced urinary excretion (careful biochemical monitoring required) - total parenteral nutrition exceeding one month may be disturbed e.g. infection. Emulsions containing amino acids. Hypermetabolic states may be disturbed e.g. infection. Emulsions containing amino acids. Hypermetabolic states may be disturbed e.g. infection.

**DIRECTIONS FOR ADMINISTRATION**

Because of the complex requirements relating to parenteral nutrition, full details relating to administration have been omitted. In all cases specialist pharmacy advice, product literature and other specialist literature should be consulted.

**NUTRIENTS**

Parenteral nutrition supplements

**INDICATIONS AND DOSE**

**Dipeptiven 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES**

Amino acid supplement for hypercatabolic or hypermetabolic states

- By intravenous infusion
- Child: 300–400 mg/kg daily, dose not to exceed 20% of total amino acid intake

**CAUTIONS**

Peditrace solution contains trace elements Fe++, Zn++, Cu++, Mn++, F-, Co++, I, Se++, Mo++, Cr++. Addiphos solution contains selenium 40 mmol, K+ 30 mmol, Na+ 30 mmol/20 mL. Dipeptiven 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES Dipeptiven solution contains N(2)-L-alanyl-L-glutamine 200 mg/mL (providing L-alanine 82 mg, L-glutamine 134.6 mg).

**ADDITRACE SOLUTION FOR INFUSION 10ML AMPOULES** For addition to Vamin® solutions and glucose intravenous infusions. Glycophos® Vials For addition to Vamin® and Vaminolact® solutions, and glucose intravenous infusions. SOLIVITON POWDER FOR SOLUTION FOR INFUSION VIALS Dissolve in water for injections or glucose intravenous infusion for adding to glucose intravenous infusion or Intralipid®; dissolve in Vitlipid N® or Intralipid® for adding to Intralipid® only. Vitlipid N Infant Emulsion for Injection 10ML Ampoules For addition to Intralipid®. Vitlipid N Adult Emulsion for Injection 10ML Ampoules For addition to Intralipid®.

**PRESCRIBING AND DISPENSING INFORMATION**

Cernevit solution contains traces of Zn++, Cu++, Mn++, Se++, F-, I.

**PEDITRACE SOLUTION FOR INFUSION VIALS AND DILUENT** Cernevit solution contains dl-alpha tocopherol 11.2 units, ascorbic acid 125 mg, biotin 69 micrograms, colecaciferol 220 units, cyanocobalamin 6 micrograms, folic acid 414 micrograms, glycine 250 mg, nicotinamide 46 mg, pantothenic acid (as dexpantenol) 17.25 mg, pyridoxine hydrochloride 5.5 mg, retinol (as palmitate) 3500 units, riboflavin (as dihydrated sodium phosphate) 4.14 mg, thiamine (as cocarboxylase tetrahydrate) 3.51 mg.

**ADDITRACE SOLUTION FOR INFUSION 10ML VIALS** For use in neonates (when kidney function established, usually second day of life), infants, and children. Peditrace solution contains traces of Zn++, Cu++, Mn++, Se++, F-, I. Decan concentrate for solution for infusion 40ML Bottles For patients over 40 kg. Decan solution contains L-alanine 82 mg, L-glutamine 134.6 mg. ADDIPHOS® VIALS Addiphos® sterile solution contains vitamin A 15 micrograms/mL. For children 11 years and over.

**ADDITRACE SOLUTION FOR INFUSION 10ML AMPOULES** For addition to Vamin® solutions and glucose intravenous infusions. Glycophos® Vials For addition to Vamin® and Vaminolact® solutions, and glucose intravenous infusions. SOLIVITON POWDER FOR SOLUTION FOR INFUSION VIALS Dissolve in water for injections or glucose intravenous infusion for adding to glucose intravenous infusion or Intralipid®; dissolve in Vitlipid N® or Intralipid® for adding to Intralipid® only. Vitlipid N Infant Emulsion for Injection 10ML Ampoules For addition to Intralipid®. Vitlipid N Adult Emulsion for Injection 10ML Ampoules For addition to Intralipid®.
Blood and nutrition

6 Nutrition (oral)

**Enteral nutrition**

**Overview**

Children have higher nutrient requirements per kg bodyweight, different metabolic rates, and physiological responses compared to adults. They have low nutritional stores and are particularly vulnerable to growth and nutritional problems during critical periods of development. Major illness, operations, or trauma impose increased metabolic demands and can rapidly exhaust nutritional reserves.

Every effort should be made to optimise oral food intake before beginning enteral tube feeding; this may include change of posture, special seating, feeding equipment, oral desensitisation, food texture changes, thickening of liquids, increasing energy density of food, treatment of reflux or oesophagitis, as well as using age-specific nutritional supplements.

Enteral tube feeding has a role in both short-term rehabilitation and long-term nutritional management in paediatrics. It can be used as supportive therapy, in which the enteral feed supplies a proportion of the required nutrients, or as primary therapy, in which the enteral feed delivers all the necessary nutrients. Most children receiving tube feeds should also be encouraged to take oral food and drink. Tube feeding should be considered in the following situations:

- unsafe swallowing and risk of aspiration
- inability to consume at least 60% of energy needs by mouth
- total feeding time of more than 4 hours per day
- weight loss or no weight gain for a period of 3 months (less for younger children and infants)
- weight for height (or length) less than 2nd percentile for age and sex

Most feeds for enteral use contain protein derived from cows’ milk or soya. Elemental feeds containing protein hydrolysates or free amino acids can be used for children who have diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored.

Haematological and biochemical parameters should also be monitored, particularly in the clinically unstable child. Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed.

Choosing the best formula for children depends on several factors including: nutritional requirements, gastro-intestinal function, underlying disease, nutrient restrictions, age, and feed characteristics (nutritional composition, viscosity, osmolality, availability and cost). Children have specific dietary requirements and in many situations liquid feeds prepared for adults are totally unsuitable and should not be given. Expert advice from a dietician should be sought before prescribing enteral feeds for a child.

**Infant formula feeds**

Child 0–12 months. Term infants with normal gastro-intestinal function are given either breast milk or normal infant formula during the first year of life. The average intake is between 150 mL and 200 mL/kg/day. Infant milk formulas are based on whey- or casein-dominant protein, lactose with or without maltodextrin, amyllose, vegetable oil and milk fat. The composition of all normal and soya infant formulas have to meet The Infant Formula and Follow-on Formula Regulations (England and Wales) 2007, which enact
the European Community Regulations 2006/141/EC; the composition of other enteral and specialist feeds has to meet the Commission Directive (1999/21/EC) on Dietary Foods for Special Medical Purposes.

A high-energy feed, which contains 9–11% of energy derived from protein can be used for infants who fail to grow adequately. Alternatively, energy supplements may be added to normal infant formula to achieve a higher energy content (but this will reduce the protein to energy ratio) or the normal infant formula concentration may be increased slightly. Care should be taken not to present an osmotic load of more than 500 mmoles/kg water to the normal functioning gut, otherwise osmotic diarrhoea will result. Concentrating or supplementing feeds should not be attempted without the advice of a paediatric dietician.

**Enteral feeds**

**Child 1–6 years (body-weight 8–20 kg).** Ready-to-use feeds based on caseinates, maltodextrin and vegetable oils (with or without added medium chain triglyceride (MCT) oil or fibre) are well tolerated and effective in improving nutritional status in this age group. Although originally designed for children 1–6 years (body-weight 8–20 kg), some products have ACBS approval for use in children weighing up to 30 kg (approx. 10 years of age). Enteral feeds formulated for children 1–6 years are low in sodium and potassium; electrolyte intake and biochemical status should be monitored. Older children in this age range taking small feed volumes may need to be given additional micronutrients. Fibre-enriched feeds may be helpful for children with chronic constipation or diarrhoea.

**Child 7–12 years (body-weight 21–45 kg).** Depending on age, weight, clinical condition and nutritional requirements, ready-to-use feeds formulated for 7–12 year olds may be given at appropriate rates.

**Child over 12 years (body-weight over 45 kg).** As there are no standard enteral feeds formulated for this age group, adult formulations are used. The intake of protein, electrolytes, vitamins, and trace minerals should be carefully assessed and monitored. Note: Adult feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be used with caution and expert advice.

**Specialised formula**

It is essential that any infant who is intolerant of breast milk or normal infant formula, or whose condition requires nutrient-specific adaptation, is prescribed an adequate volume of a nutritionally complete replacement formula. In the first 4 months of life, aolar feeds (see Specialised Formulas for Specific Clinical Conditions) are based on individual protein, fat, carbohydrate, vitamin and mineral components or modules which can be combined to meet the specific needs of a child. Modular feeds are used when nutritionally complete specialised formula are not tolerated, or if the fluid and nutrient requirements change e.g. in gastro-intestinal, renal or liver disease. The main advantage of modular feeds is their flexibility; disadvantages include their complexity and preparation difficulties. Modular feeds should not be used without the supervision of a paediatric dietician.

**Specialised formula.** Highly specialised formulas are designed to meet the specific requirements in various clinical conditions such as renal and liver diseases. When using these formulas, both the biochemical status of the child and their growth parameters need to be monitored.

**Feed thickeners**

**Carob based thickeners** may be used to thicken feeds for infants under 1 year with significant gastro-oesophageal reflux. Breast-fed infants can be given the thickener mixed to a paste with water or breast-milk prior to feeding.

**Pre-thickened formula** Milk-protein- or casein-dominant infant formula, which contains small quantities of pre-gelatinized starch, is recommended primarily for infants with mild gastro-oesophageal reflux. Pre-thickened formula is prepared in the same way as normal infant formula and flows through a standard teat. The feeds do not thicken on standing but thicken in the stomach when exposed to acid pH.

**Starched based thickeners** can be used to thicken liquids and feeds for children over 1 year of age with dysphagia.

**Dietary supplements for oral use**

Three types of prescription fortified dietary supplements are available: fortified milk and non-milk tasting (juice-style) drinks, and fortified milk-based semi-solid preparations. The recommended daily quantity is age-dependent. The following is a useful guide: 1–2 years, 200 kcal (840 kJ); 3–5 years, 400 kcal (1680 kJ); 6–11 years, 600 kcal (2520 kJ); and over 12 years, 800 kcal (3360 kJ). Supplements containing 1.5 kcal/mL are high in protein and should not be used for children under 3 years of age. Many supplements are high in sugar or maltodextrin; care should be taken to prevent prolonged contact with teeth. Ideally supplements should be administered after meals or at bedtime so as not to affect appetite.

**Low lactose infant formulations, based on whole cow’s milk protein, are unsuitable for children with cow’s milk protein intolerance. Liquid soya milks purchased from supermarkets and health food stores are not nutritionally complete and should never be used for infants under 1 year of age.**

**Protein hydrolysate formulas.** Non-milk, peptide-based feeds containing hydrolysates of casein, whey, meat and soya protein, are suitable for infants with disaccharide or whole protein intolerance. The total daily intake of electrolytes, vitamins and minerals should be carefully assessed and modified to meet the child’s nutritional requirements; these feeds have a high osmolality when given at recommended dilution and need gradual and careful introduction.

**Elemental (amino acid based formula).** Specially formulated elemental feeds containing essential and nonessential amino acids are available for use in infants and children under 6 years with proven whole protein intolerance. Adult elemental formula may be used for children over 6 years; the intake of electrolytes, vitamins and minerals should be carefully assessed and modified to meet nutritional requirements. These feeds have a high osmolality when given at the recommended concentration and therefore need gradual and careful introduction.

**Modular feeds.** Modular feeds (see Specialised Formulas for Specific Clinical Conditions) are based on individual protein, fat, carbohydrate, vitamin and mineral components or modules which can be combined to meet the specific needs of a child. Modular feeds are used when nutritionally complete specialised formula are not tolerated, or if the fluid and nutrient requirements change e.g. in gastro-intestinal, renal or liver disease. The main advantage of modular feeds is their flexibility; disadvantages include their complexity and preparation difficulties. Modular feeds should not be used without the supervision of a paediatric dietician.

**Specialised formula.** Highly specialised formulas are designed to meet the specific requirements in various clinical conditions such as renal and liver diseases. When using these formulas, both the biochemical status of the child and their growth parameters need to be monitored.

Many supplements are high in sugar or maltodextrin; care should be taken to prevent prolonged contact with teeth. Ideally supplements should be administered after meals or at bedtime so as not to affect appetite.
6.1 Special diets

Nutrition in special diets

Overview

These are preparations that have been modified to eliminate a particular constituent from a food or that are nutrient mixtures formulated as food substitutes for children who either cannot tolerate or cannot metabolise certain common constituents of food.

Coeliac disease

Intolerance to gluten in coeliac disease is managed by completely eliminating gluten from the diet. A range of gluten-free products is available for prescription.

Phenylketonuria

Phenylketonuria (hyperphenylalaninaemia, PKU), which results from the inability to metabolise phenylalanine, is managed by restricting dietary intake of phenylalanine to a small amount sufficient for tissue building and repair.

Aspartame

Aspartane (used as a sweetener in some foods and medicines) contributes to the phenylalanine intake and may affect control of phenylketonuria. If alternatives are unavailable, children with phenylketonuria should not be denied access to appropriate medication; the amount of aspartane consumed can be taken in to account in the management of the condition. Where the presence of aspartane in a preparation is specified in the product literature, aspartane is listed as an excipient in the relevant product entry in BNF for Children; the child or carer should be informed of this.

Some rare forms of phenylketonuria are caused by a deficiency of tetrahydrobiopterin. Treatment involves oral supplementation of tetrahydrobiopterin p. 581; in some severe cases, the addition of the neurotransmitter precursors, levodopa and 5-hydroxytryptophan, is also necessary.

Sapropterin dihydrochloride below, a synthetic form of tetrahydrobiopterin p. 581, is licensed as an adjunct to dietary restriction of phenylalanine in the management of patients with phenylketonuria and tetrahydrobiopterin deficiency.

Products for metabolic diseases

There is a large range of disease-specific infant formulas and amino acid-based supplements available for use in children with metabolic diseases (see under specific metabolic diseases). Some of these formulas are nutritionally incomplete and supplementation with vitamins and other nutrients may be necessary. Many of the product names are similar; to prevent metabolic complications in children who cannot tolerate specific amino acids it is important to ensure the correct supplement is supplied.

Enteral feeding tubes

Care is required in choosing an appropriate formulation of a drug for administration through a nasogastric narrow-bore feeding tube or through a percutaneous endoscopic gastrostomy (PEG) or jejunostomy tube. Liquid preparations (or soluble tablets) are preferred; injection solutions may also be suitable for administration through an enteral tube.

If a solid formulation of a medicine needs to be given, it should be given as a suspension of particles fine enough to pass through the tube. It is possible to crush many immediate-release tablets but enteric-coated or modified-release preparations should not be crushed.

Enteral feeds may affect the absorption of drugs and it is therefore important to consider the timing of drug administration in relation to feeds. If more than one drug needs to be given, they should be given separately and the tube should be flushed with water after each drug has been given.

Clearing blockages

Carbonated (sugar-free) drinks may be marginally more effective than water in unblocking feeding tubes, but mildly acidic liquids (such as pineapple juice or cola-based drinks) can coagulate protein in feeds, causing further blockage. If these measures fail to clear the enteral feeding tube, an alkaline solution containing pancreatic enzymes may be introduced into the tube (followed after at least 5 minutes by water). Specific products designed to break up blockages caused by formula feeds are also available.

6.1a Phenylketonuria

**DRUGS FOR METABOLIC DISORDERS**

**TETRAHYDROBIOPTERIN AND DERIVATIVES**

**Sapropterin dihydrochloride**

- **INDICATIONS AND DOSE**
  - Phenylketonuria (adjunct to dietary restriction of phenylalanine) (specialist use only)
    - **BY MOUTH**
      - Child 4-17 years: Initially 10 mg/kg once daily, adjusted according to response; usual dose 5–20 mg/kg once daily, dose to be taken preferably in the morning
      - Tetrahydrobiopterin deficiency (adjunct to dietary restriction of phenylalanine) (specialist use only)
        - **BY MOUTH**
          - Neonate: Initially 2–5 mg/kg once daily, adjusted according to response, dose to be taken preferably in the morning, the total daily dose may alternatively be given in 2–3 divided doses; maximum 20 mg/kg per day.
          - Child: Initially 2–5 mg/kg once daily, adjusted according to response, dose to be taken preferably in the morning, the total daily dose may alternatively be given in 2–3 divided doses; maximum 20 mg/kg per day.

- **CAUTIONS**
  - History of convulsions
- **SIDE-EFFECTS**
  - Common or very common Abdominal pain· cough· diarrhoea· headache· nasal congestion· pharyngolaryngeal pain· vomiting
  - Frequency not known Hypersensitivity reactions
  - **PREGNANCY**
  - Manufacturer advises caution—consider only if strict dietary management inadequate.
  - **BREAST FEEDING**
  - Manufacturer advises avoid—no information available.
  - **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution—no information available.
  - **RENAL IMPAIRMENT**
  - Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS**
  - Monitor blood-phenylalanine concentration before and after first week of treatment—if unsatisfactory response
increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month.

- Monitor blood-phenylalanine and tyrosine concentrations 1–2 weeks after dose adjustment and during treatment.

**DIRECTIONS FOR ADMINISTRATION**
Tablets should be dissolved in water and taken within 20 minutes.

**PRESCRIBING AND DISPENSING INFORMATION**
Sapropterin is a synthetic form of tetrahydrobiopterin.

**PATIENT AND CARER ADVICE**
Patient or carers should be given advice on how to administer sapropterin.

**SPECIAL CONSIDERATIONS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Sapropterin dihydrochloride (Non-proprietary)**
- **Sapropterin dihydrochloride 10 mg** Tetrahydrobiopterin 10mg tablets | 100 tablet | P | no price available

**Soluble tablet**
CAUTIONARY AND ADVISORY LABELS 13, 21

- **Kuvan (BioMarin Europe Ltd)**
- **Sapropterin dihydrochloride 100 mg** Kuvan 100mg soluble tablets sugar-free | 30 tablet | P | £597.22

## Tetrahydrobiopterin

### INDICATIONS AND DOSE

**Monotherpay in tetrahydrobiopterin-sensitive phenylketonuria (specialist use only)**

- **BY MOUTH**
  - Child: 10 mg/kg twice daily, adjusted according to response, total daily dose may alternatively be given in 3 divided doses

**In combination with neurotransmitter precursors for tetrahydrobiopterin-sensitive phenylketonuria (specialist use only)**

- **BY MOUTH**
  - Child 1 month–1 year: Initially 250–750 micrograms/kg 4 times a day, adjusted according to response, total daily dose may alternatively be given in 3 divided doses; maximum 7 mg/kg per day
  - Child 2–17 years: Initially 250–750 micrograms/kg 4 times a day, adjusted according to response, total daily dose may alternatively be given in 3 divided doses; maximum 10 mg/kg per day

**UNLICENSED USE**
Not licensed.

**SIDE-EFFECTS**
Diarrhoea - disturbed sleep - urinary frequency

**PREGNANCY**
Crosses the placenta; use only if benefit outweighs risk.

**BREAST FEEDING**
Present in milk, effects unknown.

**RENAI IMPAIRMENT**
Use with caution—accumulation of metabolites.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

---

**7 Vitamin deficiency**

### Vitamins

#### Overview

Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements. Except for iron—deficiency anaemia, a primary vitamin or mineral deficiency due to simple dietary inadequacy is rare in the developed world. Some children may be at risk of developing deficiencies because of an inadequate intake, impaired vitamin synthesis or malabsorption in disease states such as cystic fibrosis and Crohn’s disease.

The use of vitamins as general ‘pick-me-ups’ is of unproven value and, the ‘fad’ for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid and pyridoxine hydrochloride, is unscientific and can be harmful. Many vitamin supplements are described as ‘multivitamin’ but few contain the whole range of essential vitamins and many contain relatively high amounts of vitamins A and D. Care should be taken to ensure the correct dose is not exceeded.

Dietary reference values for vitamins are available in the Department of Health publication:

**Dental patients**
It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment.

Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if this is suspected the patient should be referred to a medical practitioner.

#### Vitamin A

Deficiency of vitamin A (retinol) p. 584 is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption).

Vitamin A supplementation may be required in children with liver disease, particularly cholestatic liver disease, due to the malabsorption of fat soluble vitamins. In those with complete biliary obstruction an intramuscular dose once a month may be appropriate.

Preterm neonates have low plasma concentrations of vitamin A and are usually given vitamin A supplements, often as part of an oral multivitamin preparation once enteral feeding has been established.

#### Vitamin B group

Deficiency of the B vitamins, other than vitamin B12, is rare in the UK and is usually treated by preparations containing thiamine (B1) p. 586, and riboflavin (B2). Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol nicotinate, and pantothenic acid or panthenol may be included in vitamin B preparations, but there is no evidence of their value as supplements; however, they can be used in the management of certain metabolic disorders. Anaphylaxis has been reported with parenteral B vitamins.

As with other vitamins of the B group, pyridoxine hydrochloride (B6) deficiency is rare, but it may occur during isoniazid p. 345 therapy or penicillamine p. 574 treatment in
Wilson's disease and is characterised by peripheral neuritis. High doses of pyridoxine hydrochloride are given in some metabolic disorders, such as hyperoxaluria, cystathioninuria and homocystinuria; folic acid p. 533 supplementation may also be beneficial in these disorders. Pyridoxine hydrochloride is also used in sideroblastic anaemia. Rarely, seizures in the neonatal period or during infancy respond to pyridoxine hydrochloride treatment; pyridoxine hydrochloride should be tried in all cases of early-onset intractable seizures and status epilepticus. Pyridoxine hydrochloride has been tried for a wide variety of other disorders, but there is little sound evidence to support the claims of efficacy.

A number of mitochondrial disorders may respond to treatment with certain B vitamins but these disorders require specialist management. Thiamine is used in the treatment of maple syrup urine disease, mitochondrial respiratory chain defects and, together with riboflavin, in the treatment of congenital lactic acidosis; riboflavin is also used in glutaric acidopathies and cytochrome oxidase deficiencies; biotin is used in carboxylase defects. Folic acid and vitamin B12 are used in the treatment of megaloblastic anaemia. Folinic acid p. 515 (available as calcium folinate) is used in association with cytotoxic therapy.

**Vitamin C**

Vitamin C (ascorbic acid) therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency have been reported. Vitamin C is used to enhance the excretion of iron one month after starting desferrioxamine mesilate p. 593 therapy; it is given separately from food as it also enhances iron absorption. Vitamin C is also used in the treatment of some inherited metabolic disorders, particularly mitochondrial disorders; specialist management of these conditions is required.

Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a child with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.

Claims that vitamin C ameliorates colds or promotes wound healing have not been proved.

**Vitamin D**

The term Vitamin D is used for a range of compounds including ergocalciferol (calciferol, vitamin D3) p. 591, colecalciferol (vitamin D3) p. 589, dihydrotachysterol, alfacalcidol (1α-hydroxycholecalciferol) p. 588, and calcitriol (1,25-dihydroxycholecalciferol) p. 588. Asymptomatic vitamin D deficiency is common in the United Kingdom; symptomatic deficiency may occur in certain ethnic groups, particularly as rickets or hypocalcaemia, and rarely in association with malabsorption. The amount of vitamin D required in infancy is related to the stores built up in-utero and subsequent exposure to sunlight. The amount of vitamin D in breast milk varies and some breast-fed babies, particularly if preterm or born to vitamin D deficient mothers, may become deficient. Most formula milk and supplement feeds contain adequate vitamin D to prevent deficiency.

Simple, nutritional vitamin D deficiency can be prevented by oral supplementation of ergocalciferol (calciferol, vitamin D2) or colecalciferol (vitamin D3) daily, using multi-vitamin drops, preparations of vitamins A and D, manufactured ‘special’ solutions, or as calcium and ergocalciferol tablets (although the calcium and other vitamins in supplements are unnecessary); excessive supplementation may cause hypercalcemia.

Inadequate bone mineralisation can be caused by a deficiency, or a lack of action of vitamin D or its active metabolite. In childhood this causes bowing and distortion of bones (rickets). In nutritional vitamin D deficiency rickets, initial high doses of ergocalciferol or colecalciferol should be reduced to supplemental doses after 8–12 weeks, as there is a significant risk of hypercalcemia. However, calcium supplements are recommended if there is hypocalcemia or evidence of a poor dietary calcium intake. A single large dose of ergocalciferol p. 591 or colecalciferol p. 589 can also be effective for the treatment of nutritional vitamin D deficiency rickets.

Poor bone mineralisation in neonates and young children may also be due to inadequate intake of phosphate or calcium particularly during long-term parenteral nutrition—supplementation with phosphate or calcium may be required.

**Hypophosphataemic rickets** occurs due to abnormal phosphate excretion; treatment with high doses of oral phosphate, and hydroxylated (activated) forms of vitamin D allow bone mineralisation and optimise growth.

Nutritional deficiency of vitamin D is best treated with colecalciferol or ergocalciferol. Preparations containing calcium and colecalciferol are also occasionally used in children where there is evidence of combined calcium and vitamin D deficiency. Vitamin D deficiency caused by intestinal malabsorption or chronic liver disease usually requires vitamin D in pharmacological doses; the hypocalcaemia of **hypoparathyroidism** often requires higher doses in order to achieve normocalcaemia and alfalcaldol p. 588 is generally preferred.

Vitamin D supplementation is often given in combination with calcium supplements for persistent hypocalcaemia in neonates, and in chronic renal disease.

Vitamin D requires hydroxylation, by the kidney and liver, to its active form therefore the hydroxylated derivatives alfalcaldol or calcitriol p. 588 should be prescribed if patients with severe liver or renal impairment require vitamin D therapy. Alfalcaldol is generally preferred in children as there is more experience of its use and appropriate formulations are available. Calcitriol is unlicensed for use in children and is generally reserved for those with severe liver disease.

**Vitamin E**

The daily requirement of vitamin E (tocopherol) has not been well defined. Vitamin E supplements are given to children with fat malabsorption such as in cystic fibrosis and cholestatic liver disease. In children with abetalipoproteinaemia abnormally low vitamin E concentrations may occur in association with neuromuscular problems; this usually responds to high doses of vitamin E. Some neonatal units still administer a single intramuscular dose of vitamin E at birth to preterm neonates to reduce the risk of complications; no trials of long-term outcome have been carried out. The intramuscular route should also be considered in children with severe liver disease when response to oral therapy is inadequate.

Vitamin E has been tried for various other conditions but there is little scientific evidence of its value.

**Vitamin K**

Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Because vitamin K is fat soluble, children with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. For oral administration to prevent vitamin K deficiency in malabsorption syndromes, a water-soluble synthetic vitamin K derivative, menadione sodium phosphate p. 593 can be used if supplementation with phytonadione p. 593 by mouth has been insufficient. Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects
Vitamin K deficiency bleeding in virtually all babies. Vitamin K (as phytomenadione) may be given by a single intramuscular injection at birth; this prevents vitamin K deficiency bleeding in virtually all babies. Alternatively, in healthy babies who are not at particular risk of bleeding disorders, vitamin K may be given by mouth, and arrangements must be in place to ensure the appropriate regimen is followed. Two doses of a colloidal (mixed micelle) preparation of phytomenadione should be given by mouth in the first week, the first dose being given at birth and the second dose at 4–7 days. For exclusively breast-fed babies, a third dose of colloidal phytomenadione is given by mouth at 1 month of age; the third dose is omitted in formula-fed babies because formula feeds contain adequate vitamin K. An alternative regimen is to give one dose of phytomenadione by mouth at birth (using the contents of a phytomenadione capsule) to protect from the risk of vitamin K deficiency bleeding in the first week; for exclusively breast-fed babies, further doses of phytomenadione capsule are given by mouth (using the contents of a phytomenadione capsule) at weekly intervals for 12 weeks.

**UNLICENSED USE** Not licensed in children under 6 months of age.

**INTERACTIONS** → Appendix 1 (vitamins).

**SIDE-EFFECTS**

**Overdose** Prolonged excessive ingestion of vitamins A and D can lead to hypervitaminosis.

**PRESCRIBING AND DISPENSING INFORMATION** This drug contains vitamin D; consult individual vitamin D monographs.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

- **Vitamins A and D (Non-proprietary)**
  - Vitamin D 400 unit, Vitamin A 4000 unit
  - Vitamins A and D capsules BPC 1973 | 28 capsule £2.81 | 28 capsule GSK £2.81 | 84 capsule £8.42 DT price = £8.42
**584 Vitamin deficiency**

- **Divalit (Boston Healthcare Ltd)**
  Ascorbic acid 83 mg per 1 ml, Ergocalciferol 667 iu per 1 ml, Riboflavin 667 microgram per 1 ml, Pyridoxine 833 microgram per 1 ml, Thiamine 667 microgram per 1 ml, Nicotinamide 8.3 mg per 1 ml, Vitamin A 8333 iu per 1 ml Dalvit oral drops | 25 ml | £3.32 | 50 ml | £6.33

**Vitamins A, C and D**

The properties listed below are those particular to the combination only. For the properties of the components please consider, vitamin A below, ascorbic acid p. 587.

- **INDICATIONS AND DOSE**
  - Prevention of vitamin deficiency
    - BY MOUTH
    - Child 1 month–4 years: 5 drops daily, 5 drops contain vitamin A approx. 700 units, vitamin D approx. 300 units (7.5 micrograms), ascorbic acid approx. 20 mg

- **PRESCRIBING AND DISPENSING INFORMATION**
  This drug contains vitamin D; consult individual vitamin D monographs.
  Available free of charge to children under 4 years in families on the Healthy Start Scheme, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

  Healthy Start Vitamins for women (containing ascorbic acid, vitamin D, and folic acid) are also available free of charge to women on the Healthy Start Scheme during pregnancy and until their baby is one year old, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

- **INTERACTIONS**
  - DEPENDENT USE
  - PRESCRIPTION
  - ADNICATIONS
  - INTERACTIONS
  - NONCOMPLIANCE
  - EXCESSIVE USE

- **SIDE-EFFECTS**
  - Overdose
  - Massive overdose can cause rough skin, dry hair, an enlarged liver, and a raised erythrocyte sedimentation rate and raised serum calcium and serum alkaline phosphatase concentrations.
  - Pregnancy
  - Excessive doses may be teratogenic. In view of evidence suggesting that high levels of vitamin A may cause birth defects, women who are (or may become) pregnant are advised not to take vitamin A supplements (including tablets and fish liver oil drops), except on the advice of a doctor or an antenatal clinic; nor should they eat liver or products such as liver paté or liver sausage.
  - Breastfeeding
  - Theoretical risk of toxicity in infants of mothers taking large doses.

- **MONITORING REQUIREMENTS**
  - Treatment is sometimes initiated with very high doses of vitamin A and the child should be monitored closely; very high doses are associated with acute toxicity.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: drops, solution for injection
  - Drops
    - Vitamin A (Non-proprietary)
    - Vitamin A 150000 unit per 1 ml Arovit 150,000 units/ml drops | 1.5 ml | no price available
  - Solution for injection
    - Vitamin A (Non-proprietary)
    - Retinol (as Vitamin A palmitate) 50000 unit per 1 ml Aquasol A Parenteral 100,000 units/2ml solution for injection vials | 1 vial | no price available | 10 vial | no price available
  - Combinations available: Vitamins A, C and D, above

**Biotin**

*(Vitamin H)*

- **INDICATIONS AND DOSE**
  - Isolated carboxylase defects
    - BY MOUTH, OR BY SLOW INTRAVENOUS INJECTION
    - Neonate: 5 mg once daily, adjusted according to response, maintenance 10–50 mg daily, higher doses may be required.
    - Child: 10 mg once daily, adjusted according to response, maintenance 50 mg daily, increased if necessary up to 100 mg daily
  - Defects of biotin metabolism
    - BY MOUTH, OR BY SLOW INTRAVENOUS INJECTION
    - Neonate: Initially 10 mg once daily, adjusted according to response; maintenance 5–20 mg daily, higher doses may be required.
    - Child: Initially 10 mg once daily, adjusted according to response; maintenance 5–20 mg daily, higher doses may be required.

- **PREGNANCY**
  - No information available.

- **BREAST FEEDING**
  - No information available.

- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use For administration by mouth, tablets may be crushed and mixed with food or drink.

**Pyridoxine hydrochloride**

(Vitamin B₆)

**INDICATIONS AND DOSE**

**Isoniazid-induced neuropathy (prophylaxis)**

- BY MOUTH
  - Neonate: 5 mg daily.
  - Child 1 month-11 years: 5–10 mg daily
  - Child 12-17 years: 10 mg daily

**Isoniazid-induced neuropathy (treatment)**

- BY MOUTH
  - Neonate: 5–10 mg daily.
  - Child 1 month-11 years: 10–20 mg 2–3 times a day
  - Child 12-17 years: 30–50 mg 2–3 times a day

**Prevention of penicillamine-induced neuropathy in Wilson’s disease**

- BY MOUTH
  - Child 1–11 years: 5–10 mg daily
  - Child 12-17 years: 10 mg daily

**Metabolic diseases** | **Cystathioninuria** | **Homocystinuria**

- BY MOUTH
  - Neonate: 50–100 mg 1–2 times a day.
  - Child: 50–250 mg 1–2 times a day

**Pyridoxine-dependent seizures**

- INITIALLY BY INTRAVENOUS INJECTION
  - Neonate: Test dose 50–100 mg, repeated if necessary, if responsive, followed by an oral maintenance dose; (by mouth) maintenance 50–100 mg once daily, dose to be adjusted as necessary.

- Child 1 month-11 years: Test dose 50–100 mg daily, if responsive, followed by an oral maintenance dose, (by mouth) maintenance 20–50 mg 1–2 times a day, dose to be adjusted as necessary, (by mouth) increased if necessary up to 30 mg/kg daily, alternatively (by mouth) increased if necessary up to 1 g daily

**CAUTIONS**

- With intravenous use Risk of cardiovascular collapse (with intravenous injection—resuscitation facilities must be available and monitor closely)

**INTERACTIONS** → Appendix 1 (vitamins).

**SIDE-EFFECTS** Sensory neuropathy (with high doses when given for extended periods)

Overdose

Overdosage induces toxic effects.

**RIBOFLAVIN**

(Riboflavin; Vitamin B₂)

**INDICATIONS AND DOSE**

**Metabolic diseases**

- BY MOUTH
  - Neonate: 50 mg 1–2 times a day, adjusted according to response.
  - Child: 50–100 mg 1–2 times a day, adjusted according to response to up to 400 mg daily

**UNLICENSED USE** Not licensed in children.

**SIDE-EFFECTS** Bright yellow urine

**PREGNANCY** Crosses the placenta but no adverse effects reported, information at high doses limited.

**BREAST FEEDING** Present in breast milk but no adverse effects reported, information at high doses limited.

**MEDICINAL FORMS**

**Vitamin B₁**

### INDICATIONS AND DOSE

#### Maple syrup urine disease
- **BY MOUTH**
  - Neonate: 5 mg/kg daily, dose to be adjusted as necessary.
  - Child: 5 mg/kg daily, dose to be adjusted as necessary.

#### Metabolic disorders / Congenital lactic acidosis
- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Neonate: 50–200 mg once daily, dose to be adjusted as necessary, the total dose may alternatively be given in 2–3 divided doses, administer intravenous infusion over 30 minutes.
  - Child: 100–300 mg once daily, dose to be adjusted as necessary, the total dose may alternatively be given in 2–3 divided doses, administer intravenous infusion over 30 minutes, increased if necessary up to 2 g daily.

### UNLICENSED USE
- Not licensed in children.

### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE (SEPTEMBER 2017)**

Although potentially serious allergic adverse reactions may rarely occur during, or shortly after, parenteral administration, the CHM has recommended that:
- This should not preclude the use of parenteral thiamine in patients where this route of administration is required, particularly in patients at risk of Wernicke-Korsakoff syndrome where treatment with thiamine is essential;
- Intravenous administration should be by infusion over 30 minutes;
- Facilities for treating anaphylaxis (including resuscitation facilities) should be available when parenteral thiamine is administered.

### CAUTIONS
- Anaphylaxis may occasionally follow injection.

### SIDE-EFFECTS
- With intravenous use: Hypersensitivity reactions.
- **BREAST FEEDING** Severely thiamine-deficient mothers should avoid breast-feeding as toxic methyl-glyoxal present in milk.

### PRESCRIBING AND DISPENSING INFORMATION
- With intramuscular use or intravenous infusion: Some preparations may contain phenol as a preservative.

### MEDICINAL FORMS

**Tablet**
- Thiamine (Non-proprietary)
  - Thiamine hydrochloride 50 mg: Thiamine 50mg tablets | 28 tablet £1.80-£2.00 | 100 tablet £0.713 DT price = £0.71 | 100 tablet no price available DT price = £0.713
  - Thiamine hydrochloride 100 mg: Thiamine 100mg tablets | 28 tablet £2.50-£2.82 | 100 tablet no price available DT price = £0.99 | 100 tablet £1.00 8 DT price = £0.99
  - Tyvera (Auden McKenzie (Pharma Division) Ltd, Almus Pharmaceuticals Ltd, Teva UK Ltd)
    - Thiamine hydrochloride 50 mg: Tyvera 50mg tablets | 100 tablet £4.99-£7.13 DT price = £7.13
    - Thiamine hydrochloride 100 mg: Tyvera 100mg tablets | 100 tablet £6.99-£10.13 DT price = £7.99

**Modified-release tablet**
- Thiamine (Non-proprietary)
  - Thiamine hydrochloride 100 mg: modified-release tablets | 90 tablet £4.18

### Solution for injection
- **Thiamine (Non-proprietary)**
  - Thiamine hydrochloride 50 mg per 1 ml: Betabion 100mg/2ml solution for injection ampoules | 5 ampoule £0 no price available
  - Thiamine hydrochloride 50 mg per 1 ml: Bevitine 100mg/2ml solution for injection ampoules | 5 ampoule £0 no price available
  - Thiamine hydrochloride 100 mg per 1 ml: Vitamin B1 Streuli 100mg/1ml solution for injection ampoules | 10 ampoule £0 no price available

### Vitamin B complex

#### INDICATIONS AND DOSE

**TREATMENT OF DEFICIENCY**
- **BY MOUTH USING SYRUP**
  - Child 1–11 months: 5 mL 3 times a day, this dose is for Vigranon B® syrup.
  - Child 1–11 years: 10 mL 3 times a day, this dose is for Vigranon B® syrup.
  - Child 12–17 years: 10–15 mL 3 times a day, this dose is for Vigranon B® syrup.

**PROPHYLAXIS OF DEFICIENCY**
- **BY MOUTH USING SYRUP**
  - Child 1–11 months: 5 mL once daily, this dose is for Vigranon B® syrup.
  - Child 1–11 years: 5 mL twice daily, this dose is for Vigranon B® syrup.
  - Child 12–17 years: 5 mL 3 times a day, this dose is for Vigranon B® syrup.

### NATIONAL FUNDING/ACCESS DECISIONS
- Vigranon® syrup is not prescribable under the National Health Service (NHS).
- LESS SUITABLE FOR PRESCRIBING Vigranon B® syrup are less suitable for prescribing.

### MEDICINAL FORMS

**Oral solution**
- There can be variation in the licensing of different medicines containing the same drug.
- **Vigranon®** syrup.

### Vitamins with minerals and trace elements

#### INDICATIONS AND DOSE

**FORCEVAL® CAPSULES**

**Vitamin and mineral deficiency and as adjunct in synthetic diets**
- **BY MOUTH**
  - Child 12–17 years: 1 capsule daily, one hour after a meal.

**KETOVITE® LIQUID**

**Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism | Adjunct in restricted, specialised, or synthetic diets**
- **BY MOUTH**
  - Child: 5 mL daily, dose adjusted according to condition, diet, or age, use with Ketovite® Tablets for complete vitamin supplementation.
**PATIENT AND CARER ADVICE**

BY MOUTH

**Prescribing and Dispensing Information**

To avoid potential toxicity, the content of all vitamin preparations, particularly vitamin A, should be considered when used together with other supplements.

**Contra-indications**

Iron overload: Ascorbic acid should not be given to patients with cardiac dysfunction.

In patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine.

**Interactions**

Appendix 1 (vitamins).

**Side-effects**

Diarrhoea, fatigue, headache, hyperoxaluria, nausea.

**Prescribing and Dispensing Information**

It is rarely necessary to prescribe more than 100 mg daily except early in the treatment of scurvy.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

VITAMINS AND TRACE ELEMENTS > VITAMIN D AND ANALOGUES

Vitamin D and analogues (systemic)

- **CONTRA-INDICATIONS** Hypercalcaemia · metastatic calcification
- **INTERACTIONS** → Appendix 1 (vitamins).
- **SIDE-EFFECTS**
  - Overdose: Symptoms of overdosage include anorexia, lassitude, nausea and vomiting, diarrhoea, constipation, weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine.
- **PREGNANCY** High doses teratogenic in animals but therapeutic doses unlikely to be harmful.
- **BREAST FEEDING** Caution with high doses; may cause hypercalcaemia in infant—monitor serum-calcium concentration.
- **MONITORING REQUIREMENTS Important** All patients receiving pharmacological doses of vitamin D should have their plasma-calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occur.

Alfacalcidol
(1α-Hydroxycholecalciferol)

- **INDICATIONS AND DOSE**
  - Hypophosphataemic rickets · Persistent hypocalcaemia due to hypoparathyroidism or pseudohypoparathyroidism
    - **BY MOUTH, OR BY INTRAVENOUS INJECTION**
      - Child 1 month–11 years: 25—50 nanograms/kg once daily, dose to be adjusted as necessary; maximum 1 microgram per day
      - Child 12–17 years: 1 microgram once daily, dose to be adjusted as necessary
  - Persistent neonatal hypocalcaemia
    - **BY MOUTH, OR BY INTRAVENOUS INJECTION**
      - Neonate: 50–100 nanograms/kg once daily, dose to be adjusted as necessary, in resistant cases higher doses may be needed; increased if necessary up to 2 micrograms/kg daily.

Prevention of vitamin D deficiency in renal or cholestatic liver disease

- **BY MOUTH, OR BY INTRAVENOUS INJECTION**
  - Neonate: 20 nanograms/kg once daily, dose to be adjusted as necessary.
  - Child 1 month–11 years (body-weight up to 20 kg): 15–30 nanograms/kg once daily (max. per dose 500 nanograms)
  - Child 1 month–11 years (body-weight 20 kg and above): 250–500 nanograms once daily, dose to be adjusted as necessary
  - Child 12–17 years: 250–500 nanograms once daily, dose to be adjusted as necessary

**DOSE EQUIVALENCE AND CONVERSION**
One drop of alfacalcidol 2 microgram/mL oral drops contains approximately 100 nanograms alfacalcidol.

- **CAUTIONS** Nephrolithiasis · take care to ensure correct dose in infants

Calcitriol
(1,25-Dihydroxycholecalciferol)

- **INDICATIONS AND DOSE**
  - Vitamin D dependent rickets · Hypophosphataemic rickets · Persistent hypocalcaemia due to hypoparathyroidism · Pseudo-hypoparathyroidism (limited experience)
    - **BY MOUTH**
      - Child 1 month–11 years: Initially 15 nanograms/kg once daily (max. per dose 250 nanograms), increased in steps of 5 nanograms/kg daily (max. per dose 250 nanograms) if required, dose to be increased every 2–4 weeks
      - Child 12–17 years: Initially 250 nanograms once daily, increased in steps of 5 nanograms/kg daily (max. per dose 250 nanograms) if required, dose to be increased every 2–4 weeks; usual dose 0.5–1 microgram daily

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Take care to ensure correct dose in infants
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises avoid—no information available. Monitor plasma-calcium concentration in renal impairment.

- **SIDE-EFFECTS**
  - Rare Nephrocalcinosis · pruritus · rash · urticaria
- **RENA L IMPAIRMENT**
  - **MONITORING** Monitor plasma-calcium concentration in renal impairment.
  - **MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.
  - **DIRECTIONS FOR ADMINISTRATION**
    - With intravenous use

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.
**INDICATIONS AND DOSE**

**Prevention of vitamin D deficiency**
- **BY MOUTH**
  - Child: 400 units daily

**UNLICENSED USE**
- Adcal-D³, Calcex®, and Fulltum-D³ 800 units and Fulltum-D³ 20000 units are not licensed for use in children under 12 years. Cacit³,D³, Calcichew-D³, Forte, Calcichew-D³ 500 mg/400 unit, and Kalcipos-D³ not licensed for use in children (age range not specified by manufacturers). Accrete D³, Calcit ³, and Natereal D³ not licensed for use in children under 18 years.

**CAUTIONS**
- Take care to ensure correct dose in infants

**RENAL IMPAIRMENT**
- Monitoring
  - Monitor plasma-calcium concentration in patients receiving high doses.

**DIRECTIONS FOR ADMINISTRATION**

**INVITA D³ 25,000UNITS/1ML ORAL SOLUTION (CONSILENT HEALTH LTD)**
- May be mixed with a small amount of milk or cold or lukewarm food immediately before administration.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

**Tablet**

Colecalficorol with calcium carbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, colecalficorol p. 589, calcium carbonate p. 552.

- **INDICATIONS AND DOSE**
  - Prevention and treatment of vitamin D and calcium deficiency
  - **BY MOUTH**
    - Child: Dosed according to the deficit or daily maintenance requirements (consult product literature)

- **UNLICENSED USE**

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Accrete D3® contains calcium carbonate 1.5 g (calcium 600 mg or Ca2+ 15 mmol), colecalficorol 10 micrograms (400 units); Adcal-D3® tablets contain calcium carbonate 1.5 g (calcium 600 mg or Ca2+ 15 mmol), colecalficorol 10 micrograms (400 units); Cacti-D3® contains calcium carbonate 1.25 g (calcium 500 mg or Ca2+ 12.5 mmol), colecalficorol 11 micrograms (440 units)/sachet; Calceos® contains calcium carbonate 1.25 g (calcium 500 mg or Ca2+ 12.5 mmol), colecalficorol 10 micrograms (400 units); Calcichew-D3® tablets contain calcium carbonate 1.25 g (calcium 500 mg or Ca2+ 12.5 mmol), colecalficorol 5 micrograms (200 units); Calcichew-D3® Forte tablets contain calcium carbonate 1.25 g (calcium 500 mg or Ca2+ 12.5 mmol), colecalficorol 10 micrograms (400 units); Calcichew-D3® 500 mg/400 unit caplets contain calcium carbonate (calcium 500 mg or Ca2+ 12.5 mmol), colecalficorol 10 micrograms (400 units); Kalcigos-D® contains calcium carbonate (calcium 500 mg or Ca2+ 12.5 mmol), colecalficorol 20 micrograms (800 units);

- **Natacal D3®** contains calcium carbonate 1.5 g (calcium 600 mg or Ca2+ 15 mmol), colecalficorol 10 micrograms (400 units); consult product literature for details of other available products.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **Tablet**
  - EXPICENTS: May contain Propylene glycol
  - Colecalficorol with calcium carbonate (Non-proprietary)

Colecalciferol with calcium phosphate

The properties listed below are those particular to the combination only. For the properties of the components please consider, colecalfciferol p. 589, calcium phosphate p. 554.

**INDICATIONS AND DOSE**

**Calcium and vitamin D deficiency**
- **BY MOUTH**
- Child: (consult product literature)

**INDICATIONS AND DOSE**

Nutritional vitamin-D deficiency rickets
- **BY MOUTH**
- Child: 0–600 units daily

Vitamin D deficiency in intestinal malabsorption or in chronic liver disease
- **BY MOUTH, OR BY INTRAMUSCULAR INJECTION**
- Child 1–11 years: 10 000–25 000 units daily, dose to be adjusted as necessary
- Child 12–17 years: 10 000–40 000 units daily, dose to be adjusted as necessary

**CAUTIONS**
- Take care to ensure correct dose in infants

**RENAL IMPAIRMENT**
- Monitoring
- Monitor plasma-calcium concentration in renal impairment.

**MONITORING REQUIREMENTS**
- Monitor plasma-calcium concentration in patients receiving high doses.

**PRESCRIBING AND DISPENSING INFORMATION**
- The BP directs that when calciferol is prescribed or demanded, colecalfciferol or ergocalciferol should be dispensed or supplied.
- When the strength of the tablets ordered or prescribed is not clear, the intention of the prescriber with respect to the strength (expressed in micrograms or milligrams per tablet) should be ascertained.

**PRESCRIBING AND DISPENSING INFORMATION**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, solution for injection.

**Tablet**
- **Ergocalciferol (Non-proprietary)**
  - Ergocalciferol 1.25 mg
  - Ergocalciferol 2.5 mg

**Capsule**
- **Ergocalciferol (Non-proprietary)**
  - Ergocalciferol 25 mcg

**Solution for injection**
- **Ergocalciferol (Non-proprietary)**
  - Ergocalciferol 300 000 unit per 1 ml

**Ergocalciferol with calcium lactate and calcium phosphate**

(Calcium and vitamin D)

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergocalciferol above, calcium lactate p. 554.

**INDICATIONS AND DOSE**

- Prevention of calcium and vitamin D deficiency
- Treatment of calcium and vitamin D deficiency
- **BY MOUTH**
- Child: (consult product literature)

**UNLICENSED USE**
- Calcium and Ergocalciferol tablets not licensed for use in children under 6 years.

**DIRECTIONS FOR ADMINISTRATION**
- Tablets may be crushed before administration, or may be chewed.

**PRESCRIBING AND DISPENSING INFORMATION**
- Each tablet contains calcium lactate 300 mg, calcium phosphate 150 mg (calcium 97 mg or Ca++ 2.4 mmol), ergocalciferol 10 micrograms (400 units).
VITAMINS AND TRACE ELEMENTS  VITAMIN E

Alpha tocopherol (Tocopherol)

- INDICATIONS AND DOSE

**Vitamin E deficiency because of malabsorption in congenital or hereditary chronic cholestasis**
- By mouth using oral solution
  - Neonate: 17 mg/kg daily, dose to be adjusted as necessary.
  - Child: 17 mg/kg daily, dose to be adjusted as necessary.

- CONTRA-INDICATIONS
  Preterm neonates

- CAUTIONS
  - Predisposition to thrombosis

- INTERACTIONS
  → Appendix 1 (Vitamin E).

- SIDE-EFFECTS
  - Common or very common: Diarrhoea
  - Uncommon: Alopecia, anaemia, disturbances in serum-potassium concentration, disturbances in serum-sodium concentration, headache, pruritus, rash

- PREGNANCY
  Manufacturer advises caution, no evidence of harm in animal studies.

- BREAST FEEDING
  Manufacturer advises use only if potential benefit outweighs risk—no information available.

- HEPATIC IMPAIRMENT
  Manufacturer advises caution—no information available. Manufacturer advises monitor closely in hepatic impairment.

- RENAL IMPAIRMENT
  Manufacturer advises caution. Risk of renal toxicity due to polyethylene glycol content. Manufacturer advises monitor closely in renal impairment.

- PRESCRIBING AND DISPENSING INFORMATION
  Tocfersolan is a water-soluble form of D-alpha tocopherol.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

  **Oral solution**
  - Vedrop (Orphan Europe (UK) Ltd)
  - D-alpha tocopherol (as Tocfersolan) 50 mg per 1 ml
  - Vedrop 50mg/ml oral solution sugar-free | 20 ml £65.89 | 60 ml £113.65

Alpha tocopheryl acetate (Tocopherol)

- INDICATIONS AND DOSE

**Vitamin E deficiency**
- By mouth
  - Neonate: 10 mg/kg once daily.
  - Child: 2–10 mg/kg daily, increased if necessary up to 20 mg/kg daily

**Malabsorption in cystic fibrosis**
- By mouth
  - Child 1–11 months: 50 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
  - Child 1–11 years: 100 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
  - Child 12–17 years: 100–200 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes

**Vitamin E deficiency in cholestasis and severe liver disease**
- By mouth
  - Neonate: 10 mg/kg once a month.
  - Child: 10 mg/kg once a month (max. per dose 100 mg)

**Malabsorption in abetalipoproteinaemia**
- By mouth
  - Neonate: 100 mg/kg once daily.
  - Child: 50–100 mg/kg once daily

- CAUTIONS
  - Increased risk of necrotising enterocolitis in neonate weighing less than 1.5 kg or in a preterm neonate • predisposition to thrombosis

- INTERACTIONS
  → Appendix 1 (Vitamins).

- SIDE-EFFECTS
  - Abdominal pain (particularly with high doses) • diarrhoea (particularly with high doses)

- PREGNANCY
  No evidence of safety of high doses.

- BREAST FEEDING
  Excreted in milk; minimal risk, although caution with large doses.

- MONITORING REQUIREMENTS
  Increased bleeding tendency in vitamin-K deficient patients or those taking anticoagulants (prothrombin time and INR should be monitored).

- DIRECTIONS FOR ADMINISTRATION
  - In neonates
    Consider dilution of oral suspension for use in neonates due to high osmolality.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: chewable tablet

  **Chewable tablet**
  - Alpha tocopheryl acetate (Non-proprietary)
  - Alpha tocopheryl acetate 100 mg
    Alpha tocopheryl acetate 100mg chewable tablets | 30 tablet no price available
  - E-Tabs (Ennogen Healthcare Ltd)
  - Alpha tocopheryl acetate 100 mg
    E-Tabs 100mg chewable tablets | 30 tablet £87.30
Menadione sodium phosphate

Alpha tocopherol acetate (Non-proprietary)
Alpha tocopherol 50 mg per 1 ml
Alpha tocopherol 100 mg per 1 ml
Alpha tocopherol 200 unit
Alpha tocopherol 400 unit
Alpha tocopherol 75 unit
Alpha tocopherol 1000 unit

Solution for injection
Alpha tocopherol acetate (Non-proprietary)
Alpha tocopherol acetate 50 mg per 1 ml

VITAMIN K

Phytomenadione

(Vitamin K)

INDICATIONS AND DOSE
Neonatal prophylaxis of vitamin-K deficiency bleeding
BY INTRAMUSCULAR INJECTION
- Preterm neonate: 400 micrograms/kg (max. per dose 1 mg) for 1 dose, to be given at birth, the intravenous route may be used in preterm neonates with very low birth-weight if intramuscular injection is not possible, however, it may not provide the prolonged protection of the intramuscular injection, any neonate receiving intravenous vitamin K should be given subsequent oral doses.

- Neonate: 1 mg for 1 dose, to be given at birth.

Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at particular risk of bleeding disorders
BY MOUTH USING CAPSULES
- Neonate: 1 mg for 1 dose at birth (to protect from the risk of vitamin K deficiency bleeding in the first week).

Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at particular risk of bleeding disorders (exclusively breast-fed babies)
BY MOUTH USING CAPSULES
- Neonate: Initially 1 mg for 1 dose at birth, then 1 mg every 1 week for 12 weeks.

Neonatal hypoprothrombinaemia
Vitamin-K deficiency bleeding
BY INTRAVENOUS INJECTION
- Neonate: 1 mg every 8 hours if required.

Neonatal biliary atresia and liver disease
BY MOUTH
- Neonate: 1 mg daily.

Reversal of coumarin anticoagulation when continued anticoagulation required or if no significant bleeding—seek specialist advice
BY INTRAVENOUS INJECTION
- Child: 15–30 micrograms/kg (max. per dose 1 mg) for 1 dose, dose may be repeated as necessary

Reversal of coumarin anticoagulation when anticoagulation not required or if significant bleeding—seek specialist advice/ Treatment of haemorrhage associated with vitamin-K deficiency—seek specialist advice
BY INTRAVENOUS INJECTION
- Child: 250–300 micrograms/kg (max. per dose 10 mg) for 1 dose

Konakion® MM Paediatric
Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at risk of bleeding disorders
BY MOUTH
- Neonate: Initially 2 mg for 1 dose at birth, then 2 mg after 4–7 days.

Neonatal prophylaxis of vitamin-K deficiency bleeding in healthy babies who are not at risk of bleeding disorders (exclusively breast fed babies)
BY MOUTH
- Neonate: Initially 2 mg for 1 dose at birth, then 2 mg after 4–7 days for a further 1 dose, then 2 mg for a further 1 dose 1 month after birth.

VITAMINS AND TRACE ELEMENTS
CAUTIONS

Intravenous injections should be given very slowly—risk of vascular collapse

KONAKION® MM PAEDIATRIC

- With intravenous use Parenteral administration in premature infant or neonate of less than 2.5 kg (increased risk of kernicterus)

INTERACTIONS → Appendix 1 (Vitamins).

SIDE-EFFECTS

KONAKION® MM Anaphylactoid reactions

PREGNANCY

Use if potential benefit outweighs risk.

BREAST FEEDING

Present in milk.

HEPATIC IMPAIRMENT

KONAKION® MM Caution—glycocholic acid may displace bilirubin.

DIRECTIONS FOR ADMINISTRATION

- With oral use in neonates The contents of one capsule should be administered by cutting the narrow tubular tip off and squeezing the liquid contents into the mouth; if the baby spits out the dose or is sick within three hours of administration a replacement dose should be given.

KONAKION® MM Paediatric Konakion® MM Paediatric may be administered by mouth or by intramuscular injection or by intravenous injection.

- For intravenous injection, may be diluted with Glucose 5%; not for intramuscular injection.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, drops

Capsule

- Neokay (Neoceuticals Ltd)
  Phytomenadione 1 mg Neokay 1mg capsules | 12 capsule £3.95 DT price = £3.95 | 100 capsule £34.00

Drops

- Neokay (Neoceuticals Ltd)
  Phytomenadione 200 microgram per 1 ml Neokay 200micrograms/ml oral drops sugar-free | 25 ml £3.95

Solution for injection

EXCIPIENTS: May contain Glycocholic acid, lecithin

- Konakion MM (Roche Products Ltd)
  Phytomenadione 10 mg per 1 ml Konakion MM Paediatric 2mg/0.2ml solution for injection ampoules | 5 ampoule £4.71
  Konakion MM 10mg/1ml solution for injection ampoules | 10 ampoule £3.78 DT price = £3.78

7.1 Neural tube defects (prevention in pregnancy)

Neural tube defects (prevention in pregnancy)

Prevention in pregnancy

Folic acid supplements p. 533 taken before and during pregnancy can reduce the occurrence of neural tube defects. The risk of a neural tube defect occurring in a child should be assessed and folic acid given as follows:

- Couples are at a high risk of conceiving a child with a neural tube defect if either partner has a neural tube defect (or either partner has a family history of neural tube defects), if they have had a previous pregnancy affected by a neural tube defect, or if the woman has coeliac disease (or other malabsorption state), diabetes mellitus, sickle-cell anaemia, or is taking antiepileptic medicines.

- Women in the high-risk group who wish to become pregnant (or who are at risk of becoming pregnant) should be advised to take folic acid daily (at high-risk group dose) and continue until week 12 of pregnancy (women with sickle-cell disease should continue taking their normal dose of folic acid (or to increase the dose to high-risk group daily dose) and continue this throughout pregnancy).

There is no justification for prescribing multiple-ingredient vitamin preparations containing vitamin B₁₂ or folic acid.
Chapter 10
Musculoskeletal system

1 Arthritis

Juvenile idiopathic arthritis

Management
Rheumatic diseases require symptomatic treatment to relieve pain, swelling, and stiffness, together with treatment to control and suppress disease activity. Treatment of juvenile idiopathic arthritis may involve Non-steroidal anti-inflammatory drugs (NSAIDs) p. 604, a disease modifying anti-rheumatic drug (DMARD) such as methotrexate, or a cytokine modulator, and intra-articular, intravenous, or oral corticosteroids.

Rheumatic disease, suppressing drugs

Overview
Certain drugs, such as methotrexate, cytokine modulators, and sulfasalazine, are used to suppress the disease process in juvenile idiopathic arthritis (juvenile chronic arthritis); these drugs are known as disease modifying antirheumatic drugs (DMARDs). In children, disease modifying antirheumatic drugs should be used under specialist supervision.

Some children with juvenile idiopathic arthritis do not require disease-modifying antirheumatic drugs. Methotrexate is effective in juvenile idiopathic arthritis; sulfasalazine is an alternative but should be avoided in systemic-onset juvenile idiopathic arthritis. Gold and penicillamine are no longer used. Cytokine modulators have a role in polyarticular juvenile idiopathic arthritis.

Unlike NSAIDs, disease-modifying antirheumatic drugs can affect the progression of disease but they may require 3–6 months of treatment for a full therapeutic response. Response to a disease-modifying antirheumatic drug may allow the dose of the NSAID to be reduced.

Disease-modifying antirheumatic drugs can improve not only the symptoms of inflammatory joint disease but also extra-articular manifestations. They reduce the erythrocyte sedimentation rate and C-reactive protein.

Antimalarials
The antimalarial hydroxychloroquine sulfate p. 596 is rarely used to treat juvenile idiopathic arthritis. Hydroxychloroquine sulfate can also be useful for systemic discoid lupus erythematosus, particularly involving the skin and joints, and in sarcoidosis.

Retinopathy rarely occurs provided that the recommended doses are not exceeded.

Mepacrine hydrochloride is used on rare occasions to treat discoid lupus erythematosus [unlicensed].

Drugs affecting the immune response
Methotrexate, given as a once weekly dose, is the disease-modifying antirheumatic drug of choice in the treatment of juvenile idiopathic arthritis and also has a role in juvenile dermatomyositis, vasculitis, uveitis, systemic lupus erythematosus, localised scleroderma, and sarcoidosis; for these indications it is given by the subcutaneous, oral, or rarely, the intramuscular route. Absorption from intramuscular or subcutaneous routes may be more predictable than from the oral route; if the oral route is ineffective subcutaneous administration is generally preferred. Folic acid may reduce mucosal or gastro-intestinal side-effects of methotrexate. The dosage regimen for folic acid p. 533 has not been established—in children over 2 years a weekly dose [unlicensed indication], may be given on a different day from the methotrexate.

Azathioprine p. 485 may be used in children for vasculitis which has failed to respond to other treatments, for the management of severe cases of systemic lupus erythematosus and other connective tissue disorders, in conjunction with corticosteroids for patients with severe or progressive renal disease, and in cases of polymyositis which are resistant to corticosteroids. Azathioprine has a corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive.

Ciclosporin p. 486 is rarely used in juvenile idiopathic arthritis, connective tissue diseases, vasculitis, and uveitis; it may be considered if the condition has failed to respond to other treatments.

Cytokine modulators
Cytokine modulators should be used under specialist supervision.

Adalimumab p. 598, etanercept p. 600, and infliximab p. 30 inhibit the activity of tumour necrosis factor alpha (TNF-α). Adalimumab can be used for the management of active polyarticular juvenile idiopathic arthritis and enthesitis-related arthritis. Etanercept is licensed for the treatment of the following subtypes of juvenile idiopathic arthritis: polyarticular juvenile idiopathic arthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it, oligoarthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it, psoriatic arthritis in children over 12 years who have had an inadequate response to methotrexate or cannot tolerate it, and enthesitis-related arthritis in children over 12 years who have had an inadequate response to conventional therapy or cannot tolerate it. Infliximab has been used in...
refractory polyarticular juvenile idiopathic arthritis [unlicensed indication] when other treatments, such as etanercept, have failed. Abatacept p. 598 prevents the full activation of T-lymphocytes; it can be used for the management of active polyarticular juvenile idiopathic arthritis. Abatacept is not recommended for use in combination with TNF inhibitors. Canakinumab p. 491 inhibits the activity of interleukin-1 beta (IL-1β) and is licensed for the treatment of active systemic juvenile idiopathic arthritis in children over 2 years, when there has been an inadequate response to NSAIDs and systemic corticosteroids. Tocilizumab p. 597 antagonises the actions of interleukin-6; it can be used for the management of active systemic juvenile idiopathic arthritis when there has been an inadequate response to methotrexate. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated. Tocilizumab is not recommended for use with other cytokine modulators.

Sulfasalazine
Sulfasalazine has a beneficial effect in suppressing the inflammatory activity associated with some forms of juvenile idiopathic arthritis; it is generally not used in systemic-onset disease.

DISEASE-MODIFYING ANTI-RHEUMATIC DRUGS

Hydroxychloroquine sulfate

**INDICATIONS AND DOSE**
Active rheumatoid arthritis (including juvenile idiopathic arthritis) (administered on expert advice) / Systemic and discoid lupus erythematosus (administered on expert advice) / Dermatological conditions caused or aggravated by sunlight (administered on expert advice)

- **BY MOUTH**
  - Child: 5–6.5 mg/kg once daily (max. per dose 400 mg), dose given based on ideal body-weight

**UNLICENSED USE** Plaquenil® not licensed for use in children for dermatological conditions caused or aggravated by sunlight.

**CAUTIONS** Acute porphyrias p. 562 · G6PD deficiency · may aggravate myasthenia gravis · may exacerbate psoriasis · neurological disorders (especially in those with a history of epilepsy) · severe gastro-intestinal disorders

**CAUTIONS, FURTHER INFORMATION**
- Screening for ocular toxicity Hydroxychloroquine is rarely associated with ocular toxicity. The British Society for Paediatric and Adolescent Rheumatology recommends that children should have their vision tested before long-term treatment with hydroxychloroquine and have an annual review of visual acuity. Children should be referred to an ophthalmologist if there is visual impairment, changes in visual acuity, or blurring vision. The Royal College of Ophthalmologists has recommended that a locally agreed protocol between the prescribing doctor and ophthalmologist be established to monitor the vision of these children. A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on long-term treatment with hydroxychloroquine (Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening 2009); this includes the recommendation that a child treated for juvenile idiopathic arthritis should receive slit-lamp examination routinely to check for uveitis.

**INTERACTIONS** → Appendix 1 (hydroxychloroquine).

- Concurrent use of hepatotoxic drugs should be avoided.

**SIDE-EFFECTS**
- Common or very common Gastro-intestinal disturbances · headache · pruritus · rashes · skin reactions
- Uncommon Convulsions · discolouration of skin, nails, and mucous membranes · ECG changes · hair depigmentation · hair loss · keratopathy · otoxicity · retinal damage · visual changes
- Rare Acute generalised exanthematous pustulosis · agranulocytosis · aplastic anaemia · blood disorders · cardiomyopathy · emotional disturbances · exfoliative dermatitis · hepatic damage · mental changes · myopathy · neuromyopathy · photosensitivity · psychosis · Stevens-Johnson syndrome · thrombocytopenia
- Frequency not known Angioedema · bronchospasm

**Overdose**
Hydroxychloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

**PREGNANCY** It is not necessary to withdraw an antimalarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.

**BREAST FEEDING** Avoid—risk of toxicity in infant.

**HEPATIC IMPAIRMENT** Caution in moderate to severe hepatic impairment.

**RENAL IMPAIRMENT** Manufacturer advises caution. Monitor plasma-hydroxychloroquine concentration in severe renal impairment.

**PRESCRIBING AND DISPENSING INFORMATION** To avoid excessive dosage in obese patients, the dose of hydroxychloroquine should be calculated on the basis of ideal body-weight.

**PATIENT AND CARER ADVICE** Do not take antacids for at least 4 hours before or after hydroxychloroquine to reduce possible interference with hydroxychloroquine absorption.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

### Tocilizumab

**31.5.2016**

#### INDICATIONS AND DOSE

Active systemic juvenile idiopathic arthritis (in combination with methotrexate or alone if methotrexate inappropriate) in children who have had an inadequate response to NSAIDs and systemic corticosteroids

- **BY INTRAVENOUS INFUSION**
  - Child 2-17 years (body-weight up to 30 kg): 12 mg/kg every 2 weeks, review treatment if no improvement within 6 weeks.
  - Child 2-17 years (body-weight 30 kg and above): 8 mg/kg every 2 weeks, review treatment if no improvement within 6 weeks.

Polyarticular juvenile idiopathic arthritis (in combination with methotrexate or alone if methotrexate inappropriate) in children who have had an inadequate response to methotrexate

- **BY INTRAVENOUS INFUSION**
  - Child 2-17 years (body-weight up to 30 kg): 10 mg/kg every 4 weeks, review treatment if no improvement within 12 weeks.
  - Child 2-17 years (body-weight 30 kg and above): 8 mg/kg every 4 weeks, review treatment if no improvement within 12 weeks.

#### CONTRA-INDICATIONS

Do not initiate if absolute neutrophil count less than 2 × 10⁹/litre · severe active infection

#### CAUTIONS

History of diverticulitis · history of intestinal ulceration · history of recurrent or chronic infection (interrupt treatment if serious infection occurs) · low absolute neutrophil count · low platelet count · predisposition to infection (interrupt treatment if serious infection occurs)

#### CAUTIONS, FURTHER INFORMATION

- Tuberculosis Patients with latent tuberculosis should be treated with standard therapy before starting tocilizumab.

#### INTERACTIONS

- **Appendix 1 (tocilizumab).**

#### SIDE-EFFECTS

- Common or very common: Headache · hypercholesterolaemia · infection · neutropenia · raised hepatic transaminases · upper respiratory tract infection

- **Frequency not known:** Antibody formation · diarrhoea · infusion related reactions · nausea · thrombocytopenia

#### SIDE-EFFECTS, FURTHER INFORMATION

- Neutrophil and platelet counts: Discontinue if absolute neutrophil count less than 0.5 × 10⁹/litre or platelet count less than 50 × 10⁹/microlitre.

#### CONCESSION AND CONTRACEPTION

Effective contraception required during and for 3 months after treatment.

#### PREGNANCY

Manufacturer advises avoid unless essential—toxicity in animal studies.

#### BREAST FEEDING

Manufacturer advises use only if potential benefit outweighs risk—no information available.

#### HEPATIC IMPAIRMENT

Manufacturer advises caution—consult product literature.

#### RENAL IMPAIRMENT

Manufacturer advises monitor renal function closely in moderate or severe impairment.

#### PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

#### MONITORING REQUIREMENTS

- **Monitor lipid profile 4–8 weeks after starting treatment and then as indicated.**
- **Monitor for demyelinating disorders.**
- **Monitor hepatic transaminases.**
- **Monitor neutrophil and platelet counts.**

#### DIRECTIONS FOR ADMINISTRATION

For intravenous infusion; body-weight less than 30 kg, dilute requisite dose to a volume of 50 mL with Sodium chloride 0.9% and give over 1 hour; body-weight over 30 kg, dilute requisite dose to a volume of 100 mL with Sodium chloride 0.9% and give over 1 hour.

#### PATIENT AND CARER ADVICE

An alert card should be provided.

Patients and their carers should be advised to seek immediate medical attention if symptoms of infection occur, or if symptoms of diverticular perforation such as abdominal pain, haemorrhage, or fever accompanying change in bowel habits occur.

#### NATIONAL FUNDING/ACCESS DECISIONS

**NICE technology appraisals (TAs)**

- **Tocilizumab for the treatment of systemic juvenile idiopathic arthritis (December 2011) NICE TA238**

  Tocilizumab is recommended for the treatment of systemic juvenile idiopathic arthritis in children aged over 2 years who have not responded adequately to NSAIDs, systemic corticosteroids and methotrexate, if the manufacturer makes tocilizumab available with the discount agreed in the patient access scheme.

  Tocilizumab is not recommended for the treatment of systemic juvenile idiopathic arthritis in children whose disease continues to respond to methotrexate or who have not been treated with methotrexate.

  Children currently receiving tocilizumab for systemic juvenile idiopathic arthritis who do not meet these criteria should have the option to continue treatment until it is considered appropriate to stop.

  [www.nice.org.uk/TA238](http://www.nice.org.uk/TA238)

- **Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015) NICE TA373**

  Tocilizumab is recommended as an option for treatment of polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA in children 2 years and older whose disease has responded inadequately to previous therapy with methotrexate and if the manufacturer provides tocilizumab with the discounts agreed in the patient access schemes.

  [www.nice.org.uk/TA373](http://www.nice.org.uk/TA373)

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **RoActemra (Roche Products Ltd)**
  - Tocilizumab 20 mg per 1 ml RoActemra 400mg/20ml concentrate for solution for infusion vials | 1 vial (£250.00) (Hospital only)
  - RoActemra 200mg/10ml concentrate for solution for infusion vials | 1 vial (£180.00) (Hospital only)
  - RoActemra 80mg/4ml concentrate for solution for infusion vials | 1 vial (£112.40) (Hospital only)

[www.nice.org.uk/](http://www.nice.org.uk/)
IMMUNOSUPPRESSANTS > T-CELL ACTIVATION INHIBITORS

Abatacept

- **INDICATIONS AND DOSE**
  Moderate to severe active polyarticular juvenile idiopathic arthritis (in combination with methotrexate) in children who have not responded adequately to other disease-modifying anti-rheumatic drugs (including at least one tumour necrosis factor (TNF) inhibitor)
  - **BY INTRAVENOUS INFUSION**
    - Child 6-17 years (body-weight up to 75 kg): 10 mg/kg every 2 weeks for 3 doses, then 10 mg/kg every 4 weeks, review treatment if no response within 6 months
    - Child 6-17 years (body-weight 75-100 kg): 750 mg every 2 weeks for 3 doses, then 750 mg every 4 weeks, review treatment if no response within 6 months
    - Child 6-17 years (body-weight 101 kg and above): 1 g every 2 weeks for 3 doses, then 1 g every 4 weeks, review if no response within 6 months

- **CONTRA-INDICATIONS** Severe infection
- **CAUTIONS** Children should be brought up to date with current immunisation schedule before initiating therapy - do not initiate until active infections are controlled
- **SIDE-EFFECTS**
  - Common or very common Abdominal pain - conjunctivitis - cough - diarrhoea - dizziness - dyspepsia - fatigue - flushing - headache - hypertension - infection - leucopenia - nausea - pain in extremities - paraesthesia - stomatitis - vomiting
  - Frequency not known Lung cancer - lymphoma
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for 14 weeks after last dose.
- **PREGNANCY**
  - Manufacturer advises avoid unless essential.
- **BREAST FEEDING**
  - Present in milk in animal studies — manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, given intermittently in Sodium chloride 0.9%; reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in Sodium Chloride 0.9% to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2-1.2 micron).
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - NICE technology appraisals (Tas)
    - Abatacept, adalimumab, etanercept and tocizumab for treating juvenile idiopathic arthritis (December 2015)
      - NICE TA373
  - Abatacept is recommended as options for treating polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA in patients 6 years and older whose disease has responded inadequately to other disease-modifying anti-rheumatic drugs (DMARDs) including at least 1 tumour necrosis factor (TNF) inhibitor, only if the manufacturer provides abatacept with the discounts agreed in the patient access schemes.
    - www.nice.org.uk/TA373

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Powder for solution for infusion
    - ELECTROLYTES: May contain Sodium
    - Orencia (Bristol-Myers Squib Pharmaceuticals Ltd)
      - Abatacept 250 mg Orencia 250mg powder for concentrate for solution for infusion vials 1 vial £302.40 (Hospital only)

Adalimumab

- **INDICATIONS AND DOSE**
  - Severe chronic plaque psoriasis in children who have had an inadequate response to, or are inappropriate for topical therapy and phototherapies
    - **BY SUBCUTANEOUS INJECTION**
      - Child 4-17 years: Initially 0.8 mg/kg every 1 week (max. per dose 40 mg) for 2 doses, then 0.8 mg/kg every 2 weeks (max. per dose 40 mg), review treatment if no response within 12 weeks; for further information on dose banding, consult product literature
      - Child 4-12 years: 24 mg/m² every 2 weeks (max. per dose 40 mg), review treatment if no response within 12 weeks; for further information on dose banding, consult product literature
      - Child 13-17 years: 40 mg every 2 weeks, review treatment if no response within 12 weeks; for further information on dose banding, consult product literature
  - Active polyarticular juvenile idiopathic arthritis (in combination with methotrexate or alone if methotrexate inappropriate) in children who have not responded adequately to one or more disease-modifying anti-rheumatic drug
    - **BY SUBCUTANEOUS INJECTION**
      - Child 2-3 years: 20 mg/m² every 2 weeks (max. per dose 20 mg), review treatment if no response within 12 weeks; for further information on dose banding, consult product literature
      - Child 4-12 years: 24 mg/m² every 2 weeks (max. per dose 40 mg), review treatment if no response within 12 weeks; for further information on dose banding, consult product literature
      - Child 13-17 years: 40 mg every 2 weeks, review treatment if no response within 12 weeks; for further information on dose banding, consult product literature
  - Active enthesitis-related arthritis in children who have had an inadequate response to, or who are intolerant of, conventional therapy
    - **BY SUBCUTANEOUS INJECTION**
      - Child 6-17 years: 24 mg/m² every 2 weeks (max. per dose 40 mg), for further information on dose banding, consult product literature
  - Severe active Crohn's disease
    - **BY SUBCUTANEOUS INJECTION**
      - Child 6-17 years (body-weight up to 40 kg): Initially 40 mg, then 20 mg after 2 weeks; maintenance 20 mg every 2 weeks, increased if necessary to 20 mg once weekly, review treatment if no response within 12 weeks of initial dose
      - Child 6-17 years (body-weight 40 kg and above): Initially 80 mg, then 40 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose
  - Severe active Crohn's disease (accelerated regimen)
    - **BY SUBCUTANEOUS INJECTION**
      - Child 6-17 years (body-weight up to 40 kg): Initially 80 mg, then 40 mg after 2 weeks; maintenance 20 mg every 2 weeks, increased if necessary to 20 mg once
**CONTRA-INDICATIONS** Moderate or severe heart failure - severe infection

**CAUTIONS** Children should be brought up to date with current immunisation schedule before initiating therapy - demyelinating disorders (risk of exacerbation) - development of malignancy - do not initiate until active infections are controlled (discontinue if new serious infection develops) - hepatitis B virus - monitor for active infection - history of malignancy - mild heart failure (discontinue if symptoms develop or worsen) - predisposition to infection

**CAUTIONS, FURTHER INFORMATION**

- **Tuberculosis** Active tuberculosis should be treated with standard treatment for at least 2 months before starting adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with adalimumab.

**INTERACTIONS** → Appendix 1 (adalimumab).

**SIDE-EFFECTS**

- **Common or very common** Anxiety - benign tumours - chest pain - cough - dehydration - dermatitis - dizziness - dyspepsia - dysphagia - electrolyte disturbances - eye disorders - flushing - gastrointestinal haemorrhage - haematuria - hyperlipidaemia - hypertension - hyperuricaemia - impaired healing - mood changes - musculoskeletal pain - oedema - onycholysis - paraesthesia - rash - renal impairment - skin cancer - sleep disturbances - tachycardia - vomiting

- **Rare** Autoimmune hepatitis - demyelinating disorders - myocardial infarction

**SIDE-EFFECTS, FURTHER INFORMATION**

Associated with infections, sometimes severe, including tuberculosis, sepsicaemia, and hepatitis B reactivation.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during treatment and for at least 5 months after last dose.

**PREGNANCY** Avoid.

**BREAST FEEDING** Avoid; manufacturer advises avoid for at least 5 months after last dose.

**PRE-TREATMENT SCREENING** Tuberculosis Patients should be evaluated for tuberculosis before treatment.

**MONITORING REQUIREMENTS**

- Monitor for infection before, during, and for 4 months after treatment.
- Monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy.

**PATIENT AND CARER ADVICE** An alert card should be provided. Tuberculosis Patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015) NICE TA373

Adalimumab is recommended as an option for treating polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA in patients 2 years and older whose disease has responded inadequately to 1 or more disease-modifying antirheumatic drugs (DMARDs) and for treating enthesis-related JIA in patients 6 years and older whose disease has responded inadequately to, or who are intolerant of, conventional therapy.

www.nice.org.uk/TA373

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (April 2015) that adalimumab (Humira®) is accepted for restricted use within NHS Scotland for the treatment of active enthesis-related arthritis in children under 6 years of age who have had an inadequate response to, or who are intolerant of, conventional therapy, and is used within specialist rheumatology services (including those working within the network for paediatric rheumatology).

The Scottish Medicines Consortium has advised (June 2015) that adalimumab (Humira®) is accepted for restricted use within NHS Scotland for the treatment of severe chronic plaque psoriasis in children under 4 years who have had an inadequate response to, or are inappropriate for, topical therapy and phototherapies, and have severe disease as defined by a total Psoriasis Area Severity Index (PASI) score of >10 and a Dermatology Life Quality Index (DLQI) score of >10.

**Etanercept**

**4.5.2016**

**INDICATIONS AND DOSE**

Polyarticular juvenile idiopathic arthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it. Oligoarthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it. Psoriatic arthritis in children who have had an inadequate response to methotrexate or cannot tolerate it. Enthesitis-related arthritis in children who have had an inadequate response to conventional therapy or cannot tolerate it.

- **BY SUBCUTANEOUS INJECTION**
  - Child 2-16 years: 400 micrograms/kg twice weekly (max. per dose 25 mg), to be given at an interval of 2-4 days. Between doses, alternatively 800 micrograms/kg once weekly (max. per dose 50 mg). Consider discontinuation if no response after 4 months.

Severe plaque psoriasis either refractory to at least 2 standard systemic treatments and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications.

- **BY SUBCUTANEOUS INJECTION**
  - Child 6-17 years: 800 micrograms/kg once weekly (max. per dose 50 mg) for up to 24 weeks. Discontinue if no response after 12 weeks.

**CONTRA-INDICATIONS**

Active infection.

**CAUTIONS**

Children should be brought up to date with current immunisation schedule before initiating therapy. Development of malignancy, diabetes mellitus, heart failure (risk of exacerbation), hepatitis B virus—monitor for active infection. Hepatitis C infection—monitor for worsening infection. History of blood disorders—history of malignancy—history or increased risk of demyelinating disorders—predisposition to infection—avoid if predisposition to septicemia—significant exposure to herpes zoster virus—interrupt treatment and consider varicella—zoster immunoglobulin.

**CAUTIONS, FURTHER INFORMATION**

- Tuberculosis: Active tuberculosis should be treated with standard treatment for at least 2 months before starting etanercept. Patients who have previously received adequate treatment for tuberculosis can start etanercept but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting etanercept. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with etanercept.

**INTERACTIONS**

- Appendix 1 (etanercept).

**SIDE-EFFECTS**

- **Uncommon**: Interstitial lung disease, new onset or worsening psoriasis, rash, skin cancer, uveitis.

- **Rare**: Demyelinating disorders, lymphoma, seizures, Stevens-Johnson syndrome, vasculitis.

- **Very rare**: Toxic epidermal necrolysis.

- **Frequency not known**
  - Abdominal pain.
  - Anaemia.
  - Antibody formation.
  - Aplastic anaemia.
  - Appendicitis.
  - Blood disorders.
  - Cutaneous ulcer.
  - Depression.
  - Diabetes mellitus.
  - Fever.
  - Gastritis.
  - Headache.
  - Hypersensitivity reactions.
  - Inflammatory bowel disease.
  - Injection-site reactions.
  - Leucopenia.
  - Leukaemia.
  - Lupus erythematosus-like syndrome.
  - Macrophage activation syndrome.
  - Malignancy.
  - Nausea.
  - Oesophagitis.
  - Pancreatitis.
  - Pruritus.
  - Solid tumours.
  - Thrombocytopenia.
  - Vomiting.
  - Worsening heart failure.

**SIDE-EFFECTS, FURTHER INFORMATION**

Associated with infections, sometimes severe, including tuberculosis, septicemia, and hepatitis B reactivation.

**CONCEPTION AND CONTRACEPTION**

Manufacturer advises effective contraception required during treatment and for 3 weeks after last dose.

**PREGNANCY**

Avoid—limited information available.

**BREAST FEEDING**

Manufacturer advises avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Use with caution in moderate to severe alcoholic hepatitis.

**PRE-TREATMENT SCREENING**

Tuberculosis: Patients should be evaluated for tuberculosis before treatment.

**MONITORING REQUIREMENTS**

Monitor for skin cancer before and during treatment, particularly in those at risk (including patients with psoriasis or a history of PUVA treatment).

**PRESCRIBING AND DISPENSING INFORMATION**

Products containing etanercept are not identical and although there should be no important differences in terms of safety and efficacy, when prescribing biological products it is good practice to use the brand name, see Biosimilar medicines, under Guidance on prescribing p. 1.

**PATIENT AND CARER ADVICE**

An alert card should be provided.

Blood disorders: Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Tuberculosis: Patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015)

**NICE TA373**

Etanercept is recommended as an option for treating:

- Polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, juvenile idiopathic arthritis (JIA) in patients 2 years and over whose disease has responded inadequately to, or who are intolerant of, methotrexate;
- Enthesitis-related JIA in patients 12 years and over whose disease has responded inadequately to, or who are intolerant of, conventional therapy;
- Psoriatic JIA in patients 12 years and over whose disease has responded inadequately to, or who are intolerant of, methotrexate.

[www.nice.org.uk/TA373](http://www.nice.org.uk/TA373)

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium issued similar advice to NICE TA103 on the use of etanercept for severe plaque psoriasis in adults (August 2009) and children over 6 years old (April 2012). The Scottish Medicines Consortium has advised (January 2013) that etanercept (Enbrel®) is accepted for restricted use within NHS Scotland for the treatment of polyarthritis (rheumatoid factor positive or negative) and extended oligoarticular psoriatic arthritis in children and adolescents from the age of 2 years who have an inadequate response to or are intolerant of methotrexate, psoriatic arthritis in adolescents from the age of 12 years who have had an inadequate response to or are intolerant of methotrexate, and enthesitis-related arthritis in adolescents from the age of 12 years who have had an inadequate response to or are intolerant of conventional therapy. It is further restricted to use within specialist rheumatology services (including...
those working within the network for paediatric rheumatology).

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**2 Neuromuscular disorders**

**Neuromuscular disorders**

**Drugs that enhance neuromuscular transmission**

Anticholinesterases are used as first-line treatment in oculomasticynia gravis and as an adjunct to immunosuppressant therapy for generalised myasthenia gravis.

Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line immunosuppressant such as azathioprine is preferred in resistant cases. The dose should be increased slowly.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine sulphate p. 624.

Neostigmine p. 602 produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine sulphate or propantheline bromide p. 58 may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. In infants, neostigmine by either subcutaneous or intramuscular injection is preferred for the short-term management of myasthenia.

Pyridostigmine bromide p. 602 is less powerful and slower in action than neostigmine but it has a longer duration of action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastrointestinal effect but an antimuscarinic drug may still be required. It is advisable to use excessive doses because acetylcholine receptor down regulation may occur. Immunosuppressant therapy may be considered if high doses of pyridostigmine bromide are needed.

Neostigmine and pyridostigmine bromide should be given to neonates 30 minutes before feeds to improve suckling.

Neostigmine is also used to reverse the actions of the non-depolarising neuromuscular blocking drugs.

**Immunosuppressant therapy**

A course of corticosteroids is an established treatment in severe cases of myasthenia gravis and may be particularly useful when antibodies to the acetylcholine receptor are present in high titre. Short courses of high-dose (‘pulsed’) methylprednisolone p. 412 followed by maintenance therapy with oral corticosteroids may also be useful.

Corticosteroid treatment is usually initiated under specialist supervision. Transient but very serious worsening of symptoms can occur in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. Once remission has occurred (usually after 2–6 months), the dose of prednisolone p. 413 should be reduced slowly to the minimum effective dose.

**Skeletal muscle relaxants**

The drugs described are used for the relief of chronic muscle spasm or spasticity associated with neurological damage; they are not indicated for spasm associated with minor injuries. They act principally on the central nervous system with the exception of dantrolene, which has a peripheral site of action. They differ in action from the muscle relaxants used in anaesthesia, which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

Dantrolene sodium p. 775 acts directly on skeletal muscle and produces fewer central adverse effects. It is generally used in resistant cases. The dose should be increased slowly.

Baclofen p. 603 inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscle hypotonia (other adverse events are uncommon).

Diazepam p. 207 has undoubted efficacy in some children. Sedation and occasionally extensor hypotonus are disadvantages. Other benzodiazepines also have muscle-relaxant properties.

**2.1 Myasthenia gravis**

**Anticholinesterases**

**Drug action** They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase.

**Contra-indications** Intestinal obstruction - urinary obstruction.
Musculoskeletal system

Breast Feeding

Pregnancy

Side-effects

Interactions → Appendix 1 (parasympathomimetics).

Caution

Caution

Indications and Dose

Treatment of myasthenia gravis

By Mouth

Neonate: Initially 1–2 mg, then 1–5 mg every 4 hours, given 30 minutes before feeds.

Child 1 month–5 years: Initially 7.5 mg, dose repeated at suitable intervals throughout the day, total daily dose 15–90 mg.

Child 6–11 years: Initially 15 mg, dose repeated at suitable intervals throughout the day, total daily dose 15–90 mg.

Child 12–17 years: Initially 15–30 mg, dose repeated at suitable intervals throughout the day, total daily dose 75–300 mg, the maximum that most patients can tolerate is 180 mg daily.

By Subcutaneous Injection, or By Intramuscular Injection

Neonate: 150 micrograms/kg every 6–8 hours, to be given 30 minutes before feeds, then increased if necessary up to 300 micrograms/kg every 4 hours.

Child 1 month–11 years: 200–500 micrograms, dose repeated at suitable intervals throughout the day.

Child 12–17 years: 1–2.5 mg, dose repeated at suitable intervals throughout the day.

Reversal of non-depolarising (competitive) neuromuscular blockade

By Intravenous Injection

Neonate: 50 micrograms/kg, to be given over 1 minute after or with glycopyrronium or atropine, followed by 25 micrograms/kg if required.

Child 1 month–11 years: 50 micrograms/kg (max. per dose 2.5 mg), to be given over 1 minute after or with glycopyrronium or atropine, then 25 micrograms/kg if required.

Child 12–17 years: 50 micrograms/kg (max. per dose 2.5 mg), to be given over 1 minute after or with glycopyrronium or atropine, then 25 micrograms/kg (max. per dose 2.5 mg) if required.

Labeled Use

In neonates Dose for treatment of myasthenia gravis by subcutaneous or intramuscular injection is unlicensed.

Caution

With intravenous use Glycopyrronium or atropine should also be given when reversing neuromuscular blockade.

Interactions → Appendix 1 (parasympathomimetics).

Renal Impairment May need dose reduction.

DIRECTIONS FOR ADMINISTRATION For intravenous injection, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9%.

Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution.

Tablet

Neostigmine (Non-proprietary)

Neostigmine bromide 15 mg, Prostigmin 15 mg tablets | 100 tablet (*not price available)

Neostigmine 15 mg tablets | 140 tablet (*not price available)

Solution for Injection

Neostigmine (Non-proprietary)

Neostigmine methylsulfate 2.5 mg per 1 ml, Neostigmine 2.5 mg/1 ml solution for injection ampoules | 10 ampoule (*not price available)

4.95–5.06

Pyridostigmine Bromide

Drug Action Pyridostigmine bromide has weaker muscarinic action than neostigmine.

Indications and Dose

Myasthenia gravis

Initially by Mouth

Neonate: Initially 1–1.5 mg/kg, dose repeated throughout the day, then (by mouth using immediate-release medicines) increased if necessary up to 10 mg, to be increased gradually and given 30–60 minutes before feeds.

Child 1 month–11 years: Initially 1–1.5 mg/kg daily, then (by mouth using immediate-release medicines) increased to 7 mg/kg daily in 6 divided doses, to be increased gradually; (by mouth using immediate-release medicines) usual dose 30–360 mg daily in divided doses.

Child 12–17 years: 30–120 mg, dose repeated throughout the day; (by mouth using immediate-release medicines) usual dose 300–600 mg daily in divided doses, consider immunosuppressant therapy if total daily dose exceeds 360 mg, down-regulation of acetylcholine receptors possible if total daily dose exceeds 450 mg.

Renal Impairment Reduce dose; excreted by kidney.

Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

Tablet

Pyridostigmine bromide (Non-proprietary)

Pyridostigmine bromide 60 mg

Pyridostigmine bromide 60 mg tablets | 200 tablet (*not price available)

Pyridostigmine bromide 60 mg, Mestinon 60 mg tablets | 200 tablet (*not price available)

Neostigmine

(Neostigmine methylsulfate)

INDICATIONS AND DOSE

Treatment of myasthenia gravis

By Mouth

Neonate: Initially 1–2 mg, then 1–5 mg every 4 hours, given 30 minutes before feeds.

Child 1 month–5 years: Initially 7.5 mg, dose repeated at suitable intervals throughout the day, total daily dose 15–90 mg.

Child 6–11 years: Initially 15 mg, dose repeated at suitable intervals throughout the day, total daily dose 15–90 mg.

Child 12–17 years: Initially 15–30 mg, dose repeated at suitable intervals throughout the day, total daily dose 75–300 mg, the maximum that most patients can tolerate is 180 mg daily.

By Subcutaneous Injection, or By Intramuscular Injection

Neonate: 150 micrograms/kg every 6–8 hours, to be given 30 minutes before feeds, then increased if necessary up to 300 micrograms/kg every 4 hours.

Child 1 month–11 years: 200–500 micrograms, dose repeated at suitable intervals throughout the day.

Child 12–17 years: 1–2.5 mg, dose repeated at suitable intervals throughout the day.

Reversal of non-depolarising (competitive) neuromuscular blockade

By Intravenous Injection

Neonate: 50 micrograms/kg, to be given over 1 minute after or with glycopyrronium or atropine, followed by 25 micrograms/kg if required.

Child 1 month–11 years: 50 micrograms/kg (max. per dose 2.5 mg), to be given over 1 minute after or with glycopyrronium or atropine, then 25 micrograms/kg if required.

Child 12–17 years: 50 micrograms/kg (max. per dose 2.5 mg), to be given over 1 minute after or with glycopyrronium or atropine, then 25 micrograms/kg (max. per dose 2.5 mg) if required.
2.2 Spasticity

MUSCLE RELAXANTS > CENTRALLY ACTING

**Baclofen**

- **INDICATIONS AND DOSE**
  - Chronic severe spasticity of voluntary muscle
    - **BY MOUTH**
      - Child 1 month–7 years: Initially 300 micrograms/kg daily in 4 divided doses, increased gradually at weekly intervals until satisfactory response; maintenance 0.75–2 mg/kg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 40 mg per day
      - Child 8–17 years: Initially 300 micrograms/kg daily in 4 divided doses, increased gradually at weekly intervals until satisfactory response; maintenance 0.75–2 mg/kg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 60 mg per day
  - Severe chronic spasticity of cerebral or spinal origin unresponsive to oral antispastic drugs (oral therapy not tolerated) (specialist use only)
    - **BY INTRATHECAL INJECTION**
      - Child 4–17 years: Test dose 25–50 micrograms, to be given over at least 1 minute via catheter or lumbar puncture, then increased in steps of 25 micrograms (max. per dose 100 micrograms), not more often than every 24 hours to determine initial maintenance dose; maintenance 25–200 micrograms daily, adjusted according to response, dose-titration phase, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose retaining some spasticity to avoid sensation of paralysis

**IMPORTANT SAFETY INFORMATION**

Consult product literature for details on test dose and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use. Treatment with continuous pump-administered intrathecal baclofen should be initiated within 3 months of a satisfactory response to intrathecal baclofen testing.

**CONTRA-INDICATIONS**

- With intrathecal use: Local infection - systemic infection
- With oral use: Avoid oral route in active peptic ulceration

**CAUTIONS**

**GENERAL CAUTIONS**

Diabetes - epilepsy - history of peptic ulcer - hypertonic bladder sphincter - psychiatric illness - respiratory impairment

**SPECIFIC CAUTIONS**

- With intrathecal use: Coagulation disorders - malnutrition (increased risk of post-surgical complications) - previous spinal fusion procedure

**INTERACTIONS**

- Appendix 1 (muscle relaxants)

**SIDE-EFFECTS**

- Rare: Abdominal pain - changes in hepatic function - dysarthria - erectile dysfunction - paraesthesia - taste disturbances
- Very rare: Hypothermia

- **PREGNANCY**
  - Manufacturer advises use only if potential benefit outweighs risk (toxicity in animal studies).

- **BREAST FEEDING**
  - Present in milk—amount probably too small to be harmful.

- **HEPATIC IMPAIRMENT**
  - With oral use: Manufacturer advises use with caution.

- **RENAL IMPAIRMENT**
  - With oral use: Risk of toxicity—use smaller oral doses and if necessary increase dosage interval; if estimated glomerular filtration rate less than 15 mL/minute/1.73 m² use by mouth only if potential benefit outweighs risk. Excreted by the kidney.

- **TREATMENT CESSATION**
  - Avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms occur).

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Flavours of oral liquid formulations may include raspberry.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks:
    - Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
  - Medicines for Children leaflet: Baclofen for muscle spasm
    - www.medicinesforchildren.org.uk/baclofen-muscle-spasm

**MEDICINAL FORMS**

**BNFC 2016–2017**

**Spasticity 603**
3 Pain and inflammation in musculoskeletal disorders

Non-steroidal anti-inflammatory drugs

Therapeutic effects
In single doses non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol p. 254 but paracetamol is preferred.

In regular full dosage NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation.

Choice
Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance of these drugs. A large proportion of children will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. However, in juvenile idiopathic arthritis NSAIDs may take 4–12 weeks to be effective. If appropriate responses are not obtained within these times, another NSAID should be tried. The availability of appropriate formulations needs to be considered when prescribing NSAIDs for children.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. However, in children gastro-intestinal symptoms are rare in those taking NSAIDs for short periods. The role of selective inhibitors of cyclo-oxygenase-2 is undetermined in children.

Ibuprofen p. 608 and naproxen p. 614 are propionic acid derivatives used in children. Ibuprofen combines anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other NSAIDs but its anti-inflammatory properties are weaker.

Naproxen combines good efficacy with a low incidence of side-effects.

Diclofenac sodium p. 605, diclofenac potassium p. 605, indomethacin p. 611, mefenamic acid p. 612, and piroxicam p. 615 have properties similar to those of propionic acid derivatives:

Diclofenac sodium and diclofenac potassium are similar in efficacy to naproxen.

Indomethacin has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances. It is rarely used in children and should be reserved for when other NSAIDs have been unsuccessful.

Mefenamic acid has minor anti-inflammatory properties.

It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

Piroxicam is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastro-intestinal side-effects than most other NSAIDs, and is associated with more frequent serious skin reactions.

Meloxicam p. 613 is a selective inhibitor of cyclo-oxygenase-2. Its use may be considered in adolescents intolerant to other NSAIDs.

Ketorolac trometamol p. 636 can be used for the short-term management of postoperative pain.

Etoricoxib p. 607, a selective inhibitor of cyclo-oxygenase-2, is licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, ankylosing spondylitis, and acute gout in children aged 16 years and over.

Dental and orofacial pain
Most mild to moderate dental pain and inflammation is effectively relieved by ibuprofen, diclofenac potassium or diclofenac sodium.

NSAIDs and cardiovascular events

The risk of cardiovascular events secondary to NSAID use is undetermined in children. In adults, all NSAID use (including cyclo-oxygenase-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those patients receiving high doses long term. A small increased thrombotic risk cannot be excluded in children.

In adults, cyclo-oxygenase-2 selective inhibitors, diclofenac (150 mg daily) and ibuprofen (2.4 g daily) are associated with an increased risk of thrombotic events. The increased risk for diclofenac is similar to that of etoricoxib.

Naproxen (in adults, 1 g daily) is associated with a lower thrombotic risk, and lower doses of ibuprofen (in adults, 1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms, and the need for long-term treatment should be reviewed periodically.

NSAIDs and gastro-intestinal events

All NSAIDs are associated with gastro-intestinal toxicity. In adults, evidence on the relative safety of NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects—piroxicam and ketorolac trometamol are associated with the highest risk; indomethacin, diclofenac, and naproxen are associated with intermediate risk, and ibuprofen with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). Selective inhibitors of cyclo-oxygenase-2 are associated with a lower risk of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Children appear to tolerate NSAIDs better than adults and gastro-intestinal side-effects are less common although they do still occur and can be significant; use of gastro-protective drugs may be necessary.

Asthma

All NSAIDs have the potential to worsen asthma, either acutely or as a gradual worsening of symptoms; consider both prescribed NSAIDs and those that are purchased over the counter.
Pain and inflammation in musculoskeletal disorders

Diclofenac potassium

**INDICATIONS AND DOSE**

**Pain and inflammation in rheumatic disease and other musculoskeletal disorders**
- **BY MOUTH**
  - Child 14-17 years: 75–100 mg daily in 2–3 divided doses

**Postoperative pain**
- **BY MOUTH**
  - Child 9-13 years (body-weight 35 kg and above): Up to 2 mg/kg daily in 3 divided doses; maximum 100 mg per day
  - Child 14-17 years: 75–100 mg daily in 2–3 divided doses

**Fever in ear, nose, or throat infection**
- **BY MOUTH**
  - Child 9-17 years (body-weight 35 kg and above): Up to 2 mg/kg daily in 3 divided doses; maximum 100 mg per day

**SIDE-EFFECTS**

- **Rare**
  - Alveolitis
  - Angioedema
  - Rash (especially in patients with pre-existing renal impairment)
  - Tinnitus
  - Vertigo

- **Allergic disorders**
  - Cardiac failure
  - Hypertension
  - Left ventricular dysfunction
  - Oedema

- **Coagulation defects**
  - Haemorrhage

- **Frequency not known**
  - Angioedema
  - Blood disorders
  - Bronchospasm
  - Colitis (induction of or exacerbation of)

- **Contra-indications**
  - Active gastrointestinal ulceration
  - History of gastrointestinal bleeding related to previous NSAID therapy
  - History of recurrent gastrointestinal haemorrhage
  - History of recurrent gastrointestinal ulceration

- **Cautions**
  - Allergic disorders
  - Cardiac failure
  - Hypertension
  - Left ventricular dysfunction
  - Oedema

- **INTERACTIONS**
  - **Appendix 1 (NSAIDs).**

- **Unlicensed use**
  - Voltarol® Rapid not licensed for use in children under 14 years or in fever.

- **Contra-indications**
  - Active gastrointestinal ulceration
  - History of gastrointestinal bleeding related to previous NSAID therapy

- **Side-effects**
  - Rare

- **Frequency not known**
  - Angioedema
  - Blood disorders

- **Contra-indicated**
  - Patients with a history of hypersensitivity to aspirin or any other NSAID—where this includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **Pregnancy**
  - Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **Breast feeding**
  - Use with caution during breast-feeding.

- **Hepatic impairment**
  - Use with caution; there is an increased risk of gastrointestinal bleeding and fluid retention.

- **Renal impairment**
  - The lowest effective dose should be used for the shortest possible duration.

- **Patient and carer advice**
  - Medicines for Children leaflet: Diclofenac for pain and inflammation www.medicinesforchildren.org.uk/diclofenac-for-pain-and-inflammation

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Cautionary and advisory labels 21**
  - Diclofenac potassium (Non-proprietary)
  - Diclofenac potassium 25 mg
    - 28 tablet (P) £3.87
  - Diclofenac potassium 50 mg
    - 28 tablet (P) £7.41
  - Voltarol Rapid (Novartis Pharmaceuticals UK Ltd)

      - Voltarol Rapid 25 mg tablets
        - 30 tablet (P) £4.15
      - DT price = £4.15
    - Diclofenac potassium 50 mg
      - Voltarol Rapid 50 mg tablets
        - 30 tablet (P) £7.04
        - DT price = £7.04

**Diclofenac sodium**

**INDICATIONS AND DOSE**

**Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis**
- **BY MOUTH**
  - Diclofenac sodium 25 mg
    - Tab 25 mg (P) £2.87
  - Diclofenac sodium 50 mg
    - Tab 50 mg (P) £5.69
  - Voltarol (Novartis Pharmaceuticals UK Ltd)
    - Diclofenac sodium 25 mg
      - Voltarol 25 mg tablets
        - 30 tablet (P) £2.87
      - DT price = £2.87
    - Diclofenac sodium 50 mg
      - Voltarol 50 mg tablets
        - 30 tablet (P) £5.69
        - DT price = £5.69

**Unlicensed use**

- Voltarol® Rapid not licensed for use in children under 14 years or in fever.

**Contra-indications**

- Active gastro-intestinal ulceration
- History of gastro-intestinal bleeding related to previous NSAID therapy

**Side-effects**

- Rare

**Frequency not known**

- Angioedema
- Blood disorders
- Bronchospasm
- Colitis (induction of or exacerbation of)

**Contra-indicated**

- Patients with a history of hypersensitivity to aspirin or any other NSAID—where this includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**Pregnancy**

- Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**Breast feeding**

- Use with caution during breast-feeding. Amount in milk too small to be harmful.

**Hepatic impairment**

- Use with caution; there is an increased risk of gastrointestinal bleeding and fluid retention.

**Renal impairment**

- The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Avoid in severe impairment. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**Patient and carer advice**

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: dispersible tablet, oral suspension, oral solution

Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 13, 21

Voltarol (Novartis Pharmaceuticals UK Ltd)

Diclofenac sodium 50 mg Voltarol 50mg dispersible tablets sugar-free | 21 tablet (Pkt) £7.43 per unit price £7.43

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

Voltarol Retard (Novartis Pharmaceuticals UK Ltd)

Diclofenac sodium 100 mg Voltarol Retard 100mg tablets | 28 tablet (Pkt) £11.36 per unit price £11.36

Voltarol SR (Novartis Pharmaceuticals UK Ltd)

Diclofenac sodium 75 mg Voltarol 75mg SR tablets | 28 tablet (Pkt) £7.75 | 56 tablet (Pkt) £15.50 per unit price £15.50
Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 5, 25

- **Diclofenac sodium (non-proprietary)**
  - Diclofenac sodium 25 mg Diclofenac sodium 25mg gastro-resistant tablets | 28 tablet | £2.25–£8.99 DT price = £2.45 | 84 tablet | £8.16
  - Diclofenac sodium 50 mg Diclofenac sodium 50mg gastro-resistant tablets | 28 tablet | £4.97 DT price = £3.29 | 84 tablet | £15.00
  - Diclofenac sodium 50 mg Diclofenac sodium 50mg gastro-resistant tablets | 100 tablet | no price available

- **Dicloflex** (Dexcel-Pharma Ltd, Almus Pharmaceuticals Ltd)
  - Diclofenac sodium 25 mg Dicloflex 25mg gastro-resistant tablets | 84 tablet | £4.42
  - Diclofenac sodium 50 mg Dicloflex 50mg gastro-resistant tablets | 28 tablet | £2.75 DT price = £3.29 (Hospital only) | 84 tablet | £8.05–£8.85

- **Fenactol (Discovery Pharmaceuticals)**
  - Diclofenac sodium 50mg gastro-resistant tablets | 100 tablet | £3.70

- **Voltarol (Novartis Pharmaceuticals UK Ltd)**
  - Diclofenac sodium 25 mg Voltarol 25mg gastro-resistant tablets | 84 tablet | £2.94
  - Diclofenac sodium 50 mg Voltarol 50mg gastro-resistant tablets | 10 tablet | £0.91 (Hospital only) | 14 tablet | no price available (Hospital only) | 90 tablet | £5.88

**Modified-release capsule**

CAUTIONARY AND ADVISORY LABELS 21 (does not apply to Motilene® 75 mg, 25

EXCIPIENTS: May contain Propylene glycol

- **Diclomax Retard** (Galen Ltd)
  - Diclofenac sodium 100 mg Diclamox Retard 100mg capsules | 28 capsule | £6.97 DT price = £6.97

- **Diclomax SR (Galen Ltd)**
  - Diclofenac sodium 75 mg Diclomax SR 75mg capsules | 56 capsule | £9.69 DT price = £9.69
  - Motilene (Daichii Sankyo UK Ltd)
  - Diclofenac sodium 75 mg Motifene 75mg modified-release capsules | 56 capsule | £8.00 DT price = £8.00

**Solution for injection**

EXCIPIENTS: May contain Benzyl alcohol, propylene glycol

- **Voltarol (Novartis Pharmaceuticals UK Ltd)**
  - Voltarol 75mg/3ml solution for injection ampoules | 10 ampoule | £9.91 DT price = £9.91

**Suppository**

- **Diclofenac sodium (non-proprietary)**
  - Diclofenac sodium 100 mg Diclofenac 100mg suppositories | 10 suppository | £7.75 DT price = £3.64
  - Econac (AMCo)
  - Diclofenac sodium 100 mg Econac 100mg suppositories | 10 suppository | £3.04 DT price = £3.04
  - Voltarol (Novartis Pharmaceuticals UK Ltd)
  - Diclofenac sodium 12.5 mg Voltarol 12.5mg suppositories | 10 suppository | £0.70 DT price = £0.70

**Etoricoxib**

- **INDICATIONS AND DOSE**

  **Pain and inflammation in osteoarthritis**
  - **BY MOUTH**
    - Child 16-17 years: 30 mg once daily, then increased if necessary to 60 mg once daily

  **Pain and inflammation in rheumatoid arthritis**
  - **BY MOUTH**
    - Child 16-17 years: 90 mg once daily

  **Acute gout**
  - **BY MOUTH**
    - Child 16-17 years: 120 mg once daily for maximum 8 days

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding - active gastro-intestinal ulceration - cerebrovascular disease - inflammatory bowel disease - ischaemic heart disease - mild to severe heart failure - peripheral arterial disease - uncontrolled hypertension (persistently above 140/90 mmHg)

- **CAUTIONS** Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - dehydration - history of cardiac failure - hypertension - left ventricular dysfunction - oedema - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated)

- **INTERACTIONS** → Appendix 1 (NSAIDs).

- **SIDE-EFFECTS**
  - **Common or very common** Eczymosis - fatigue - influenza-like symptoms - palpitation
  - **Uncommon** Anxiety - appetite change - arthralgia - atrial fibrillation - chest pain - cough - dry mouth - dyspnoea - electrolyte disturbance - epistaxis - flushing - mental acuity impaired - mouth ulcer - myalgia - paraesthesia - taste disturbance - transient ischaemic attack - weight change

- **Rare** Alveolitis - asptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances

- **Very rare** Confusion - hallucinations

- **Frequency not known** Angioedema - blood disorders - bronchospasm - colitis (induction of or exacerbation of). Crohn’s disease (induction of or exacerbation of) - depression - diarrhoea - dizziness - dryness - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal bleeding - gastro-intestinal discomfort - gastro-intestinal disturbances - gastro-intestinal ulceration - haematuria - headache - hearing disturbances - hypersensitivity reactions - insomnia - nausea - nervousness - photosensitivity - raised blood pressure - rashes - renal failure (especially in patients with pre-existing renal impairment) - tinnitus - vertigo

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 604.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRAINDICATION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Max. 60 mg daily in mild impairment. Max. 60 mg on alternate days or 30 mg once daily in moderate impairment. Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
**608 Pain and inflammation in musculoskeletal disorders**

**Musculoskeletal system**

- Frequency not known
  - Rare
  - Uncommon
  - Common or very common

**SIDE-EFFECTS**

- Coagulation defects
- Cramps
- Diarrhoea
- Dizziness
- Depression
- Fatigue
- Hallucinations
- Headache
- Hepatic failure
- Insomnia
- Nausea
- Photosensitivity
- Raised blood pressure
- Rash
- Retention
- Vertigo

**CONTRA-INDICATIONS**

- Allergic disorders
- Cardiac impairment (NSAIDs may impair renal function)
- Cerebrovascular disease
- Coagulation defects
- Connective-tissue disorders
- Crohn’s disease (may be exacerbated)
- Heart failure
- Ischaemic heart disease
- Peripheral arterial disease
- Risk factors for cardiovascular events
- Ulcerative colitis (may be exacerbated)

**INTERACTIONS**

- Appendix 1 (NSAIDs).

**SIDE-EFFECTS, FURTHER INFORMATION**

- Serious side-effects
- For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 604.
- PREGNANCY
- Avoid unless the potential benefit outweighs the risk.
- Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING**

- Use with caution during breast-feeding. Small amount present in milk—manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

- Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

**RENAL IMPAIRMENT**

- Avoid if possible or use with caution. Avoid in severe impairment. If used, the lowest effective dose should be given for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

### Flurbiprofen

**INDICATIONS AND DOSE**

- **Pain and inflammation in rheumatic disease and other musculoskeletal disorders:** Migraine | Postoperative analgesia | Mild to moderate pain
- **BY MOUTH**
  - Child 12–17 years: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions

### Dysmenorrhea

- **BY MOUTH**
  - Child 12–17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day

**CONTRA-INDICATIONS**

- Active gastro-intestinal bleeding
- Active gastro-intestinal ulceration
- History of gastro-intestinal bleeding related to previous NSAID therapy
- History of gastro-intestinal perforation related to previous NSAID therapy
- History of recurrent gastro-intestinal haemorrhage (two or more distinct episodes)
- History of recurrent gastro-intestinal ulceration (two or more distinct episodes)
- Severe heart failure

**CAUTIONS**

- Allergic disorders
- Cardiac impairment (NSAIDs may impair renal function)
- Cerebrovascular disease
- Coagulation defects
- Connective-tissue disorders
- Crohn’s disease (may be exacerbated)
- Heart failure
- Ischaemic heart disease
- Peripheral arterial disease
- Risk factors for cardiovascular events
- Ulcerative colitis (may be exacerbated)
- Uncontrolled hypertension

**INTERACTIONS**

- Appendix 1 (NSAIDs).

**SIDE-EFFECTS**

- Common or very common: Stomatitis
- Uncommon: Confusion, fatigue, hallucinations, paraesthesia
- Rare: Alveolitis, aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible), hepatic damage, interstitial fibrosis associated with NSAIDs can lead to renal failure, pancreatitis, papillary necrosis associated with NSAIDs can lead to renal failure, pulmonary eosinophilia, Stevens-Johnson syndrome, toxic epidermal necrolysis, visual disturbances
- Frequency not known: Angioedema, blood disorders, bronchospasm, colitis (induction of or exacerbation of), Crohn’s disease (induction of or exacerbation of), depression, diarrhoea, dizziness, drowsiness, fluid retention (rarely precipitating congestive heart failure), gastro-intestinal bleeding, gastro-intestinal discomfort, gastro-intestinal disturbances, gastro-intestinal ulceration, haematuria, headache, hearing disturbances, hypersensitivity reactions, insomnia, nausea, nervousness, photosensitivity, raised blood pressure, rashes, renal failure (especially in patients with pre-existing renal impairment), tinnitus, vertigo

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Arcoxia (Grunenthal Ltd)
  - Etoricoxib 30 mg: Arcoxia 30mg tablets | 28 tablet | price = £13.99
  - Etoricoxib 60 mg: Arcoxia 60mg tablets | 28 tablet | price = £20.11
  - Etoricoxib 90 mg: Arcoxia 90mg tablets | 5 tablet | price = £4.10
  - 28 tablet | price = £22.96
  - 120 mg: Arcoxia 120mg tablets | 7 tablet | price = £6.03
  - 28 tablet | price = £24.11

**SIDE-EFFECTS**

- Serious side-effects
  - For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 604.

**PREGNANCY**

- Avoid unless the potential benefit outweighs the risk.
- Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING**

- Use with caution during breast-feeding. Small amount present in milk—manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

- Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

**RENAL IMPAIRMENT**

- Avoid if possible or use with caution. Avoid in severe impairment. If used, the lowest effective dose should be given for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- CAUTIONARY AND ADVISORY LABELS 21
  - Flurbiprofen (Non-proprietary)
  - Flurbiprofen 50 mg Flurbiprofen 50mg tablets | 100 tablet | price = £2.29
  - Flurbiprofen 100 mg Flurbiprofen 100mg tablets | 100 tablet | price = £4.18

**Flurbiprofen**

**INDICATIONS AND DOSE**

- Pain and inflammation in rheumatic disease and other musculoskeletal disorders
- Migraine
- Postoperative analgesia
- Mild to moderate pain

- **BY MOUTH**
  - Child 12–17 years: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions

- **Drug**

  - Etoricoxib
  - Flurbiprofen

- **Price**

  - Flurbiprofen 50 mg Flurbiprofen 50mg tablets | 100 tablet
  - Flurbiprofen 100 mg Flurbiprofen 100mg tablets | 100 tablet

**Ibuprofen**

**INDICATIONS AND DOSE**

- Closure of ductus arteriosus
- Ibuprofen (lactose, starch, taurine, titanium dioxide, 2-hydroxypropylcellulose, silicon dioxide)

- **BY SLOW INTRAVENOUS INJECTION**

  - Neonate: Initially 10 mg/kg for 1 dose, followed by 5 mg/kg every 24 hours for 2 doses, the course may be repeated after 48 hours if necessary.
Pain and inflammation in musculoskeletal disorders

- **Child 4-6 years**: 150 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- **Child 7-9 years**: 200 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
- **Child 10-11 years**: 300 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
- **Child 12-17 years**: Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate

### Pain and inflammation

- **By mouth using modified-release medicines**
- **Child 12-17 years**: 1.6 g once daily, dose preferably taken in the early evening, increased to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

### Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

- **By mouth using immediate-release medicines**
- **Child 3 months-17 years**: 30–40 mg/kg daily in 3–4 divided doses; maximum 2.4 g per day

### Pain and inflammation in systemic juvenile idiopathic arthritis

- **By mouth using immediate-release medicines**
- **Child 3 months-17 years**: Up to 60 mg/kg daily in 4–6 divided doses; maximum 2.4 g per day

### Post-infection pyrexia in infants (on doctor’s advice only)

- **By mouth using immediate-release medicines**
- **Child 2-3 months**: 50 mg for 1 dose, followed by 50 mg after 6 hours if required

### **UNLICENSED USE**

- With intravenous use in neonates  Orphan licence for the injection for closure of ductus arteriosus in premature neonates less than 34 weeks corrected gestational age.
- With oral use  Not licensed for use in children under 3 months or body-weight under 5 kg. Maximum dose for systemic juvenile idiopathic arthritis is unlicensed.

### CONTRA-INDICATIONS

- With intravenous use in neonates  Active bleeding (especially intracranial or gastro-intestinal) - coagulation defects - known or suspected necrotising enterocolitis - life-threatening infection - marked unconjugated hyperbilirubinaemia - pulmonary hypertension - thrombocytopenia
- With oral use  Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

### CAUTIONS

- With intravenous use in neonates  May mask symptoms of infection
- With oral use  Cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

### CAUTIONS, FURTHER INFORMATION

- **High-dose ibuprofen** A small increase in cardiovascular risk, similar to the risk associated with cyclo-oxygenase-2 inhibitors and diclofenac, has been reported with high-dose ibuprofen (≥ 2.4 g daily); use should be avoided in patients with established ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, congestive heart failure (New York Heart Association classification II-III), and uncontrolled hypertension.

### INTERACTIONS

- Appendix 1 (NSAIDs).

### SIDE-EFFECTS

- Common or very common
- With intravenous use in neonates  Bronchopulmonary dysplasia - fluid retention - haematuria - hyponatraemia - intestinal perforation - intraventricular haemorrhage - ischaemic brain injury - neutropenia - oliguria - pulmonary haemorrhage - thrombocytopenia

- Uncommon
- With intravenous use in neonates  Gastrointestinal haemorrhage

- Rare
- With oral use  Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances

### Frequency not known

- With intravenous use in neonates  Hypoxaemia
- With oral use  Angioedema - blood disorders - bronchospasm - colitis (induction of or exacerbation of) - Crohn’s disease (induction of or exacerbation of) - depression - diarrhoea - dizziness - drowsiness - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal bleeding - gastro-intestinal discomfort - gastro-intestinal disturbances - gastro-intestinal ulceration - haematuria - headache - hearing disturbances - hypersensitivity reactions - insomnia - nausea - nervousness - photosensitivity - raised blood pressure - rashes - renal failure (especially in patients with pre-existing renal impairment) - tinnitus - vertigo

### SIDE-EFFECTS, FURTHER INFORMATION

- **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 604.

### Overdose

- Overdose with ibuprofen may cause nausea, vomiting, epigastric pain, and tinnitus, but more serious toxicity is very uncommon. Charcoal, activated p. 793 followed by symptomatic measures are indicated if more than 100 mg/kg has been ingested within the preceding hour.
- For details on the management of poisoning, see Emergency treatment of poisoning p. 788.

### ALLERGY AND CROSS-SENSITIVITY

- Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

### PREGNANCY

- Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

### BREAST FEEDING

- Use with caution during breast-feeding. Amount too small to be harmful but some manufacturers advise avoid.

### HEPATIC IMPAIRMENT

- With intravenous use in neonates  Increased risk of gastro-
intestinal bleeding and fluid retention. Avoid in severe liver disease.
• With oral use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

**RENAL IMPAIRMENT**
• With intravenous use in neonates Use lowest effective dose and monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure. Avoid if possible in severe impairment.
• With oral use Avoid if possible or use with caution. Avoid in severe impairment. If used, the lowest effective dose should be given for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**MONITORING REQUIREMENTS**
• With intravenous use in neonates Monitor for bleeding. Monitor gastro-intestinal function.
• With intravenous use in neonates For slow intravenous injection, give over 15 minutes, preferably undiluted. May be diluted with Glucose 5% or Sodium Chloride 0.9%.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of syrup may include orange.

- **INDICATIONS AND DOSE**
  - **Symptomatic ductus arteriosus**
    - **BY INTRAVENOUS INFUSION**
      - Neonate: Initially 100–200 micrograms/kg for 1 dose, followed by 100 micrograms/kg after 24 hours for 3 doses, at 24-hour intervals, doses to be given over 20–30 minutes, if residual patency present, 100 micrograms/kg to be given for a further 3 doses at 24-hour intervals.

- **Relief of pain and inflammation in rheumatic diseases including juvenile idiopathic arthritis**
  - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
    - Child: 0.5–1 mg/kg twice daily, higher doses may be used under specialist supervision

- **UNLICENSED USE**
  - With oral use Not licensed for use in children.

- **CONTRA-INDICATIONS**
  - With intravenous use in neonates Bleeding (especially with active intracranial haemorrhage or gastro-intestinal bleeding) - coagulation defects - necrotising enterocolitis - thrombocytopenia - untreated infection
  - With oral use Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

- **CAUTIONS**
  - **GENERAL CAUTIONS**
    - Heart failure
    - **SPECIFIC CAUTIONS**
      - With intravenous use in neonates Inhibition of platelet aggregation (monitor for bleeding) - may induce hyponatraemia - may mask symptoms of infection - may reduce urine output by 50% or more and precipitate renal impairment especially if extracellular volume depleted - sepsis
      - With oral use Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - epilepsy - ischaemic heart disease - peripheral arterial disease - psychiatric disturbances - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

- **INTERACTIONS**
  - With intravenous use in neonates Appendix 1 (NSAIDs).
  - With intravenous use in neonates Caution with concomitant use of nephrotoxic drugs.

- **SIDE-EFFECTS**
  - **Rare**
    - With oral use Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - blood disorders - confusion - convulsions - hepatic damage - hyperglycaemia - interstitial fibrosis associated with NSAIDs can lead to renal failure - intestinal strictures - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - peripheral neuropathy - psychiatric disturbances - pulmonary eosinophilia - Stevens-Johnson syndrome - syncope - thrombocytopenia - toxic epidermal necrolysis - visual disturbances

  - **FREQUENCY NOT KNOWN**
    - With intravenous use in neonates Coagulation disorders - exacerbation of infection - fluid retention - gastro-intestinal disorders - haemorrhagic disorders - intracranial bleeding - metabolic disorders - pulmonary hypertension - renal disorders
    - With oral use Angioedema - blood disorders - bronchospasm - colitis (induction of or exacerbation of) - Crohn’s disease (induction of or exacerbation of) - depression - diarrhoea - dizziness - drowsiness - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal bleeding - gastro-intestinal discomfort - gastro-intestinal disturbances - gastro-intestinal ulceration - haematuria - headache - hearing disturbances - hyperkalaemia - hypersensitivity reactions - insomnia - nausea - nervousness - photosensitivity - raised blood pressure - rashes - renal failure (especially in patients with pre-existing renal impairment) - tinnitus - vertigo

- **SIDE EFFECTS, FURTHER INFORMATION**
  - **SERIOUS SIDE-EFFECTS**
    - For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 604.

  - **ALLERGY AND CROSS-SENSITIVITY**
    - Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

  - **PREGNANCY**
    - Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

  - **BREAST FEEDING**
    - Amount probably too small to be harmful—manufacturers advise avoid. Use with caution during breast-feeding.

  - **HEPATIC IMPAIRMENT**
    - With intravenous use in neonates Increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe impairment.
    - With oral use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

  - **RENAL IMPAIRMENT**
    - With intravenous use in neonates Use lowest effective dose. Avoid if possible in severe impairment.
    - With oral use The lowest effective dose should be used for the shortest possible duration.

  - **ANURIA OR OLIGURIA**
    - With intravenous use in neonates If anuria or marked oliguria (urinary output less than 0.6 mL/kg/hour), delay further doses until renal function returns to normal.
    - With oral use Avoid if possible or use with caution. Avoid in severe impairment. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **MONITORING REQUIREMENTS**
  - With oral use During prolonged therapy ophthalmic and blood examinations particularly advisable.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use in neonates For intravenous infusion, dilute each vial with 1–2 mL Sodium Chloride 0.9% or Water for Injections.

- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks** Dizziness may affect performance of skilled tasks (e.g. driving).
**PREGNANCY**

- **Serious side-effects**
  - Frequency not known
  - Rare

- **INTERACTIONS**
  - Active gastro-intestinal bleeding
  - Active gastro-intestinal ulceration
  - History of gastro-intestinal bleeding
  - History of gastro-intestinal perforation
  - History of gastro-intestinal ulceration
  - Severe heart failure

- **CONTRA-INDICATIONS**
  - Active gastro-intestinal bleeding
  - Active gastro-intestinal ulceration
  - History of gastro-intestinal bleeding
  - History of gastro-intestinal perforation
  - History of gastro-intestinal ulceration
  - Severe heart failure

- **CAUTIONS**
  - Allergic disorders
  - Cardiac impairment (NSAIDs may impair renal function)
  - Cerebrovascular disease
  - Coagulation defects
  - Connective-tissue disorders
  - Crohn’s disease
  - Bleeding
  - Headache
  - Hearing disturbances
  - Haematuria
  - Headache
  - Renal failure (especially in patients with pre-existing renal impairment)

- **SIDE-EFFECTS**
  - Rare
  - Frequency not known
  - Angioedema
  - Blood disorders
  - Bronchospasm
  - Colitis (induction of or exacerbation of)
  - Crohn’s disease
  - Depression
  - Dizziness
  - Drowsiness
  - Fluid retention
  - Gastro-intestinal bleeding
  - Gastro-intestinal discomfort
  - Gastro-intestinal disturbances
  - Gastro-intestinal ulceration
  - Haematuria
  - Headache
  - Hearing disturbances
  - Hypersensitivity reactions
  - Insomnia
  - Nausea
  - Nervousness
  - Photosensitivity
  - Raised blood pressure
  - Rash
  - Renal failure
  - Severe heart failure

- **SERIOUS SIDE-EFFECTS**
  - Serious side-effects
  - For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 604.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **CONCEPTION AND CONTRACEPTION**
  - Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

- **PREGNANCY**
  - Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Flavours of oral liquid formulations may include strawberry.

**Ketoprofen**

- **INDICATIONS AND DOSE**
  - For use as a component of below
    - **BY MOUTH**
      - Child 15-17 years: (consult product literature)
  - **CONTRA-INDICATIONS**
  - **CAUTIONS**
  - **INTERACTIONS**
  - **SIDE-EFFECTS**
  - **SERIOUS SIDE-EFFECTS**
  - **ALLERGY AND CROSS-SENSITIVITY**
  - **CONCEPTION AND CONTRACEPTION**
  - **PREGNANCY**

**Ketoprofen with omeprazole**

- **INDICATIONS AND DOSE**
  - Patients requiring ketoprofen for osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis, who are at risk of NSAID-associated duodenal or gastric ulcer or gastroduodenal erosions
  - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 15-17 years: Initially 100-20 mg daily, increased if necessary to 200-200 mg daily, depending on severity of symptoms, dose expressed as x/y mg ketoprofen/omeprazole

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Capsules enclose microgranules containing modified-release ketoprofen and gastro-resistant omeprazole.

**Mefenamic acid**

- **INDICATIONS AND DOSE**
  - Acute pain including dysmenorrhoea | Menorrhagia
  - **BY MOUTH**
  - Child 12-17 years: 500 mg 3 times a day

- **CONTRA-INDICATIONS**
  - Active gastro-intestinal bleeding
  - Active gastro-intestinal ulceration
  - History of gastro-intestinal bleeding related to previous NSAID therapy
  - History of gastro-intestinal perforation related to previous NSAID therapy
  - History of recurrent gastro-intestinal haemorrhage (two or more distinct episodes)
  - History of recurrent gastro-intestinal ulceration (two or more distinct episodes)
  - Inflammatory bowel disease
  - Severe heart failure

- **CAUTIONS**
  - Acute porphyrias p. 562
  - Allergic disorders
  - Cardiac impairment (NSAIDs may impair renal function)
  - Cerebrovascular disease
  - Coagulation defects
  - Connective-tissue disorders
  - Crohn’s disease (may be exacerbated)
epilepsy · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

**INTERACTIONS** → Appendix 1 (NSAIDs).

**SIDE-EFFECTS**

- **Common or very common** Diarrhoea (withdraw treatment) · rash(es) (withdraw treatment) · stomatitis
- **Rare** Alveolitis · aplastic anaemia · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · glucose intolerance · haemolytic anaemia (positive Coombs' test) · hepatic damage · hypotension · interstitial fibrosis associated with NSAIDs can lead to renal failure · palmitation · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis · visual disturbances
- **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastrointestinal bleeding · gastrointestinal discomfort · gastrointestinal disturbances · gastro-intestinal ulceration · haemorrhage · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Serious side-effects** For information about cardiovascular and gastrointestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 604.

**Overdose**

Mefenamic acid has important consequences in overdose because it can cause convulsions, which if prolonged or recurrent, require treatment.

For details on the management of poisoning, see Emergency treatment of poisoning p. 786, in particular, Convulsions.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

**BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.

**HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastrointestinal bleeding and fluid retention. Avoid in severe liver disease.

**RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment. If used, the lowest effective dose should be given for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

**MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**SIDE-EFFECTS**

- **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis
Pain and inflammation in musculoskeletal disorders

614 Pain and inflammation in juvenile idiopathic arthritis

**BY MOUTH**
- Child 2-17 years: 5–7.5 mg/kg twice daily; maximum 1 g per day

- **UNLICENSED USE** Not licensed for use in children under 5 years for juvenile idiopathic arthritis. Not licensed for use in children under 16 years for musculoskeletal disorders or dysmenorrhea.

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding related to previous NSAID therapy - history of gastro-intestinal perforation related to previous NSAID therapy - history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) - history of recurrent gastro-intestinal ulceration (two or more distinct episodes) - severe heart failure

- **CAUTIONS** Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

- **INTERACTIONS** → Appendix 1 (NSAIDs).

- **SIDE-EFFECTS**
  - **Rare** Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances

Piroxicam

● INDICATIONS AND DOSE
Relief of pain and inflammation in juvenile idiopathic arthritis

BY MOUTH

Child 6–17 years (body-weight up to 15 kg): 5 mg daily
Child 6–17 years (body-weight 15–25 kg): 10 mg daily
Child 6–17 years (body-weight 26–45 kg): 15 mg daily
Child 6–17 years (body-weight 46 kg and above): 20 mg daily

● UNLICENSED USE Not licensed for use in children.

IMPORTANT SAFETY INFORMATION
CHMP ADVICE—PIROXICAM (JUNE 2007)
The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastrointestinal side effects and serious skin reactions. The CHMP has advised that:

● piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
● piroxicam should not be used as first-line treatment
● in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
● piroxicam dose should not exceed 20 mg daily
● piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
● treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter

● concomitant administration of a gastro–protective agent should be considered. Topical preparations containing piroxicam are not affected by these restrictions.

● CONTRA-INDICATIONS
Active gastro-intestinal bleeding - active gastro-intestinal ulceration - history of gastro-intestinal bleeding - history of gastro-intestinal perforation - history of gastro-intestinal ulceration - inflammatory bowel disease - severe heart failure

● CAUTIONS
Allergic disorders - cardiac impairment (NSAIDs may impair renal function) - cerebrovascular disease - coagulation defects - connective-tissue disorders - Crohn’s disease (may be exacerbated) - heart failure - ischaemic heart disease - peripheral arterial disease - risk factors for cardiovascular events - ulcerative colitis (may be exacerbated) - uncontrolled hypertension

● INTERACTIONS → Appendix 1 (NSAIDs).

● SIDE-EFFECTS
Rare Alveolitis - aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) - hepatic damage - interstitial fibrosis associated with NSAIDs can lead to renal failure - pancreatitis - papillary necrosis associated with NSAIDs can lead to renal failure - pulmonary eosinophilia - Stevens-Johnson syndrome - toxic epidermal necrolysis - visual disturbances

● Frequency not known Angioedema - blood disorders - bronchospasm - colitis (induction of or exacerbation of) - Crohn’s disease (induction of or exacerbation of) - depression - diarrhoea - dizziness - drowsiness - fluid retention (rarely precipitating congestive heart failure) - gastro-intestinal bleeding - gastro-intestinal discomfort - gastro-intestinal disturbances - gastro-intestinal ulceration - haematuria - headache - hearing disturbances - hypersensitivity reactions - insomnia - nausea - nervousness - photosensitivity - raised blood pressure - rashes - renal failure (especially in patients with pre-existing renal impairment) - tinnitus - vertigo

SIDE-EFFECTS, FURTHER INFORMATION

Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 604.

● ALLERGY AND CROSS-SENSITIVITY
Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

● PREGNANCY
Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

● BREAST FEEDING
Use with caution during breast-feeding. Amount too small to be harmful.

● HEPATIC IMPAIRMENT
Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

● RENAL IMPAIRMENT
Avoid if possible or use with caution. Avoid in severe impairment. If used, the lowest effective dose should be given for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

● DIRECTIONS FOR ADMINISTRATION
Piroxicam orodispersible tablets can be taken by placing on the tongue and allowing to dissolve or by swallowing. Piroxicam orodispersible tablets may be halved to give 10 mg dose.
LESS SUITABLE FOR PRESCRIBING
Piroxicam is less suitable for prescribing.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Orodispersible tablet

4 Soft tissue and joint disorders

4.1 Local inflammation of joints and soft tissues

CORTICOSTEROIDS

Corticosteroids, inflammatory disorders

Systemic corticosteroids
In children with rheumatic diseases corticosteroids should be reserved for specific indications (e.g. when other therapies are unsuccessful or while waiting for DMARDS to take effect) and should be used only under the supervision of a specialist.

Systemic corticosteroids may be considered for the management of juvenile idiopathic arthritis in systemic disease or when several joints are affected. Systemic corticosteroids may also be considered in severe, possibly life-threatening conditions such as systemic lupus erythematosus, systemic vasculitis, juvenile dermatomyositis, Behçet’s disease, and polyarticular joint disease.

In severe conditions, short courses (‘pulses’) of high dose intraarticular methylprednisolone p. 617 or a pulsed oral corticosteroid may be particularly effective for providing rapid relief, and has fewer long-term adverse effects than continuous treatment.

Corticosteroid doses should be reduced with care because of the possibility of relapse if the reduction is too rapid. If complete discontinuation of corticosteroids is not possible, prednisolone sodium succinate should be given to alternate-day (or alternate high-dose, low-dose) administration; on days when no corticosteroid is given, or a lower dose is given, an additional dose of a NSAID may be helpful. In some conditions, alternative treatment using an antimalarial or concomitant use of an immunosuppressant drug, such as azathioprine or methotrexate p. 306 or cyclophosphamide p. 498 may prove useful; in less severe conditions treatment with a NSAID alone may be adequate.

Administration of corticosteroids may result in suppression of growth and may affect the development of puberty. The risk of corticosteroid-induced osteoporosis should be considered for those on long-term corticosteroid treatment; corticosteroids may also increase the risk of osteopenia in those unable to exercise. See the disadvantages of corticosteroid treatment.

Local corticosteroid injections
Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, including juvenile idiopathic arthritis, they are given by intra-articular injection as monotherapy, or as an adjunct to long-term therapy to reduce swelling and deformity in one or a few joints. Aseptic precautions (e.g. a no-touch technique) are essential, as is a clinician skilled in the technique; infected areas should be avoided and general anaesthesia, or local anaesthesia, or conscious sedation should be used. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Triamcinolone hexacetonide p. 617 [unlicensed] is preferred for intra-articular injection because it is almost insoluble and has a long-acting (depot) effect. Triamcinolone acetonide p. 617 and methylprednisolone may also be considered for intra-articular injection into larger joints, whilst hydrocortisone below acetate should be reserved for smaller joints or for soft-tissue injections. Intra-articular corticosteroid injections can cause flushing and, in adults, may affect the hyaline cartilage. Each joint should usually be treated no more than 3–4 times in one year.

A smaller amount of corticosteroid may also be injected directly into soft tissues for the relief of inflammation in conditions such as tennis or golfer’s elbow or compression neuropathies, which occur rarely in children. In tendinitis, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions.

Hydrocortisone

INDICATIONS AND DOSE
HYDROCORTISTAB®

Local inflammation of joints and soft-tissues
  ▶ BY INTRA-ARTICULAR INJECTION
  Child 1 month–11 years: 5–30 mg, select dose according to size of child and joint; where appropriate dose may be repeated at intervals of 21 days. Not more than 3 joints should be treated on any one day, for details consult product literature
  Child 12–17 years: 5–50 mg, select dose according to size of patient and joint; where appropriate dose may be repeated at intervals of 21 days. Not more than 3 joints should be treated on any one day, for details consult product literature

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection
  ▶ Hydrocortisone (AMCO) Hydrocortisone acetate 25 mg per 1 ml Hydrocortistab 25mg/1ml suspension for injection ampoules | 10 ampoule (POM) £68.72 DT price + £68.72

  - Triamcinolone hexacetonide 20 mg per 1 ml Triamcinolone hexacetonide 20mg/1ml suspension for injection ampoules | 10 ampoule (PZN) £120.00

4.2 Soft tissue disorders

**Soft tissue disorders**

**Soft-tissue and musculoskeletal disorders**

The management of children with soft-tissue injuries and strains, and musculoskeletal disorders, may include temporary rest together with the local application of heat or cold, local massage and physiotherapy. For pain relief, paracetamol p. 254 is often adequate and should be used first. Alternatively, the lowest effective dose of a NSAID (e.g. ibuprofen p. 608) can be used. If pain relief with either drug is inadequate, both paracetamol (in a full dose appropriate for the child) and a low dose of a NSAID may be required.

**Extravasation**

Local guidelines for the management of extravasation should be followed where they exist or specialist advice sought.

Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with **promptly** to prevent tissue necrosis. Acids or alkaline preparations and those with an osmolarity greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. Very young children are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or...
analgesics may not notice the early signs or symptoms of extravasation.

**Prevention of extravasation**
Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and children receiving repeated doses of hazardous drugs peripherally should have the cannula resited at regular intervals. Attention should be paid to the manufacturers’ recommendations for administration. Placing a glyceryl trinitrate patch p. 127 or using glyceryl trinitrate ointment distal to the cannula may improve the patency of the vessel in children with small veins or in those whose veins are prone to collapse. Children or their carers should be asked to report any pain or burning at the site of injection immediately.

**Management of extravasation**
If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy.

**Corticosteroids** are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone p. 616 or dexamethasone p. 410 can be given either locally by subcutaneous injection or intravenously at a site distant from the injury. Antihistamines and analgesics may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it. The first method may be appropriate following extravasation of vesicant drugs and involves administration of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering hyaluronidase below. A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should not be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique).

**Enzymes**
Hyaluronidase is used for the management of extravasation.

**ENZYMES**

### Hyaluronidase

#### INDICATIONS AND DOSE

**Extravasation**
- By local infiltration
- Child: (consult product literature)

**UNLICENSED USE** Licensed for use in children, but age range not specified by the manufacturer.

**CONTRA-INDICATIONS** Avoid sites where infection is present · avoid sites where malignancy is present · do not apply direct to cornea · not for anaesthesia in unexplained premature labour · not for intravenous administration · not to be used to enhance the absorption and dispersion of dopamine and/or alpha-adrenoceptor agonists · not to be used to reduce swelling of bites · not to be used to reduce swelling of stings

**CAUTIONS** Infants (control speed and total volume and avoid overhydration especially in renal impairment)

**SIDE-EFFECTS**
- Common or very common Oedema
- Rare · Bleeding · bruising · infection · local irritation
- Frequency not known · Anaphylaxis · severe allergy

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
- Hyaluronidase (Non-proprietary)
  - Hyaluronidase 1500 unit
  - Hyaluronidase 1,500 unit powder for solution for injection ampoules | 10 ampoule £104.24

Eye
Administration of drugs to the eye
Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents). Product-specific devices may be supplied by manufacturers—contact individual manufacturers for further information. They are particularly useful for children in whom normal application is difficult, for the visually impaired, or otherwise physically limited patients.

Eye drops and eye ointments
Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; in neonates and infants it may be more appropriate to administer the drop in the inner angle of the open eye. One drop is all that is needed; instillation of more than one drop at a time should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow can occur when one immediately follows the other. The carer or child should therefore leave an interval of at least 5 minutes between the two; the interval should be extended when eye drops with a prolonged contact time, such as gels and suspensions, are used. Eye ointment should be applied after drops. Both drops and ointment can cause transient blurred vision; children should be warned, where appropriate, not to perform skilled tasks (e.g. cycling or driving) until vision is clear.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

Also see warnings relating to eye drops and contact lenses.

Eye lotions
These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies as a first-aid treatment. Sterile sodium chloride 0.9% p. 628 solution is usually used. Clean water will suffice in an emergency.

Other preparations administered to the eye
Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy; intracameral and intravitreal routes can also be used to administer certain drugs, for example antibacterials. These injections should only be used under specialist supervision.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat susceptible eye conditions.

Ophthalmic Specials
The Royal College of Ophthalmologists and the UK Ophthalmic Pharmacy Group have produced the Ophthalmic Specials Guidance to help prescribers and pharmacists manage and restrict the use of unlicensed eye preparations. ‘Specials’ should only be prescribed in situations where a licensed product will not be suitable for a child’s needs. The Ophthalmic Specials Guidance can be accessed on the Royal College of Ophthalmologists website (www.rcophth.ac.uk). The guidance will be reviewed every six months to ensure the most accurate and up-to-date information is available.

Preservatives and sensitisers
Information on preservatives and substances identified as skin sensitisers is provided under Excipients statements in preparation entries. Very rarely, cases of corneal calcification have been reported with the use of phosphate-containing eye drops in patients with significantly damaged corneas—consult product literature for further information.

Control of microbial contamination
Preparations for the eye should be sterile when issued. Care should be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for domiciliary use should not be used for more than 4 weeks after first opening (unless otherwise stated by the manufacturer).

Multiple application eye drops for use in hospital wards are normally discarded 1 week after first opening—local practice may vary. Individual containers should be provided for each patient. A separate container should be supplied for each eye only if there are special concerns about contamination.

Containers used before an eye operation should be discarded
at the time of the operation and fresh containers supplied postoperatively. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue containers that have been dispensed to the patient on the day of discharge.

In out-patient departments single-application containers should be used; if multiple-application containers are used, they should be discarded after single patient use within one clinical session.

In eye surgery single-application containers should be used if possible; if a multiple-application container is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; intravenous infusion preparations are not usually suitable for this purpose (Hartmann’s solution may be used in some ocular preparations). For all surgical procedures, a previously unopened container is used for each patient.

Contact lenses

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid (‘hard’ or gas permeable) lenses or soft (hydrogel or silicone hydrogel—in adults only) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious and non-infectious keratitis is increased by extended continuous contact lens wear, which is not recommended, except when medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.

Acanthamoeba keratitis, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

Contact lenses and drug treatment

Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic and adverse reactions. Therefore, unless medically indicated, the lenses should be removed before instillation of the eye preparation and not worn during the period of treatment. Alternatively, unsupervised drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anticholinergics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including ephephrine hydrochloride p. 114 and hyaluronic acid hydrochloride p. 108). Other drugs that may affect contact lens wear are isotretonin p. 712 (can cause conjunctival inflammation), aspirin p. 83 (salicylic acid appears in tears and can be absorbed by contact lenses—leading to irritation), and rifampicin p. 342 and sulfasalazine p. 29 (can discolor lenses).

1 Allergic and inflammatory eye conditions

Eye, allergy and inflammation

Corticosteroids

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation, including that which results from surgery. Topical corticosteroids should normally only be used under expert supervision; three main dangers are associated with their use:

- a ‘red eye’, when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye.
- Bacterial, fungal, and amoebic infections pose a similar hazard;
- ‘steroid glaucoma’ can follow the use of corticosteroid eye preparations in susceptible individuals;
- a ‘steroid cataract’ can follow prolonged use.

Products combining a corticosteroid with an antimicrobial are used after ocular surgery to reduce inflammation and prevent infection: use of combination products is otherwise rarely justified.

Systemic corticosteroids may be useful for ocular conditions. The risk of producing a ‘steroid cataract’ increases with the dose and duration of corticosteroid use.

Other anti-inflammatory preparations

Eye drops containing antihistamines, such as antazoline (with xylometazoline hydrochloride p. 650 as Otrivine®), azelastine hydrochloride p. 621, epinastine hydrochloride p. 621, ketotifen p. 621, and olopatadine p. 621, can be used for allergic conjunctivitis.

Sodium cromoglicate p. 622 and nedocromil sodium p. 622 eye drops may be useful for vernal keratoconjunctivitis and other allergic forms of conjunctivitis.

Lodoxamide eye drops p. 622 are used for allergic conjunctival conditions including seasonal allergic conjunctivitis.

Emedastine eye drops p. 621 are licensed for seasonal allergic conjunctivitis.

1.1 Allergic conjunctivitis

ANTIHISTAMINES

Antazoline with xylometazoline

- INDICATIONS AND DOSE
  - Allergic conjunctivitis
    - TO THE EYE
    - Child 12-17 years: Apply 2-3 times a day for maximum 7 days

- CAUTIONS Angle-closure glaucoma, cardiovascular disease, diabetes mellitus, hypertension, hyperthyroidism, phaeochromocytoma, urinary retention

- INTERACTIONS → Appendix 1 (antihistamines and sympathomimetics).
Absorption of antazoline and xylometazoline may result in the possibility of interaction with other drugs.

**SIDE-EFFECTS**
- **Common or very common** Transient stinging
- **Frequency not known** Blurred vision - eye irritation - mydriasis

**SIDE-EFFECTS, FURTHER INFORMATION**
Absorption of antazoline and xylometazoline may result in systemic side-effects.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
- Antazoline sulfate 5 mg per 1 ml
- Xylometazoline hydrochloride 500 microgram per 1 ml
- Xylometazoline hydrochloride 500 microgram per 1 ml Otrivine Antistin 0.9%/0.05% eye drops | 10 ml £2.35 DT price = £2.35

### Epinastine hydrochloride

**INDICATIONS AND DOSE**
**Seasonal allergic conjunctivitis**
- **TO THE EYE**
- Child 12-17 years: Apply twice daily for maximum 8 weeks

**SIDE-EFFECTS**
- **Common or very common** Burning
- **Uncommon** Conjunctival hyperaemia - dry eye - eye pain - eye pruritus - headache - increased lacrimation - nasal irritation - rhinitis - taste disturbance - visual disturbance

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
- Epinastine hydrochloride 500 microgram per 1 ml Relestat (Allergan Ltd) 500micrograms/ml eye drops | 5 ml £9.90 DT price = £9.90

### Ketotifen

**INDICATIONS AND DOSE**
**Seasonal allergic conjunctivitis**
- **TO THE EYE**
- Child 3-17 years: Apply twice daily

**INTERACTIONS**
Interactions do not generally apply to antihistamines used for topical action.

**SIDE-EFFECTS**
- **Common or very common** Punctate corneal epithelial erosion - transient burning - transient stinging
- **Uncommon** Dry eye - photophobia - subconjunctival haemorrhage
- **Frequency not known** Drowsiness - dry mouth - headache - skin reactions

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
- Ketotifen (as Ketotifen fumarate) 250 microgram per 1 ml Zaditen 250micrograms/ml eye drops | 80 £7.80 DT price = £7.80

### Olopatadine

**INDICATIONS AND DOSE**
**Seasonal allergic conjunctivitis**
- **TO THE EYE**
- Child 3-17 years: Apply twice daily for maximum 4 months

**SIDE-EFFECTS**
- **Common or very common** Local irritation
- **Uncommon** Asthenia - dizziness - dry eye - headache - keratitis - local oedema - photophobia
- **Frequency not known** Dry nose

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
- Olopatadine (as Olopatadine hydrochloride) 250 microgram per 1 ml Zaditen 250micrograms/ml eye drops | 5 ml £7.31 DT price = £7.31

### Azelastine hydrochloride

**INDICATIONS AND DOSE**
**Seasonal allergic conjunctivitis**
- **TO THE EYE**
- Child 4-17 years: Apply twice daily, increased if necessary to 4 times a day

**Perennial conjunctivitis**
- **TO THE EYE**
- Child 12-17 years: Apply twice daily; increased if necessary to 4 times a day, maximum duration of treatment 6 weeks

**SIDE-EFFECTS**
- **Frequency not known** Bitter taste - mild transient irritation

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
- Azelastine hydrochloride 500 microgram per 1 ml Optilast (Meta Pharmaceuticals Ltd) 80 £6.40 DT price = £6.40

### Emedastine

**INDICATIONS AND DOSE**
**Seasonal allergic conjunctivitis**
- **TO THE EYE**
- Child 3-17 years: Apply twice daily

**SIDE-EFFECTS**
- **Frequency not known** Blurred vision - corneal infiltrates (discontinue) - corneal staining - dry eye - headache - irritation - keratitis - lacrimation - local oedema - photophobia - rhinitis - transient burning - transient stinging

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
EXCIPIENTS: May contain Benzalkonium chloride
- Emedastine (as Emedastine difumarate) 500 microgram per 1 ml Emedastine 0.5mg/ml eye drops | 5 ml £7.31 DT price = £7.31

### Emadine

**EXCIPIENTS: May contain Benzalkonium chloride**

**Eye drops**
- Optilast (Meta Pharmaceuticals Ltd)
  - Emedastine (as Emedastine difumarate) 500 microgram per 1 ml Emedastine 0.5mg/ml eye drops | 5 ml £2.35 DT price = £2.35
MAST-CELL STABILISERS

Lodoxamide

**INDICATIONS AND DOSE**
- **Allergic conjunctivitis**
  - **TO THE EYE**
  - Child 4–17 years: Apply 4 times a day, improvement of symptoms may sometimes require treatment for up to 4 weeks

**SIDE-EFFECTS**
- **Common or very common**
  - Blurred vision
  - Burning
  - itching
  - ocular discomfort
  - stinging
  - transient burning
  - Distinctive taste
- **Uncommon**
  - Blepharitis
  - dizziness
  - drowsiness
  - flushing
  - headache
  - keratitis
  - nasal dryness
- **EXCEPTIONS TO LEGAL CATEGORY**
  - Lodoxamide 0.1% eye drops can be sold to the public for treatment of allergic conjunctivitis in adults and children over 4 years.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

  **Eye drops**
  - **EXCipients:** May contain Benzalkonium chloride, disodium edetate
  - **Alomide** (Alcon Laboratories (UK) Ltd)
    - **Lodoxamide (as Lodoxamide trometamol)** 1 mg per 1 ml
      - **Alomide Allergy** 0.1% eye drops 10 ml [P] £3.20 DT price = £2.36
      - **Alomide Allergy** 0.1% eye drops 5 ml [P] £1.56 DT price = £1.22
  - **Vividrin** (E M Pharma)
    - **Vividrin Allergy** 0.1% eye drops 10 ml [P] £3.88
    - **Vividrin Allergy** 0.1% eye drops 5 ml [P] £2.74

**Nedocromil sodium**

**INDICATIONS AND DOSE**
- **Seasonal and perennial conjunctivitis**
  - **TO THE EYE**
  - Child 6–17 years: Apply twice daily, increased if necessary to 4 times a day, max. 12 weeks duration of treatment for seasonal allergic conjunctivitis

**SIDE-EFFECTS**
- Distinctive taste
- Transient burning
- Transient stinging

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

  **Eye drops**
  - **EXCipients:** May contain Benzalkonium chloride, disodium edetate
  - **Rapitil** (Sanofi)
    - **Nedocromil sodium** 20 mg per 1 ml
      - **Rapitil 2% eye drops** 5 ml [P] £2.86 DT price = £2.06
  - **Betnesol** (Focus Pharmaceuticals Ltd)
    - **Betnesol sodium phosphate** 1 mg per 1 ml
      - **Betnesol sodium phosphate** 1.0% eye drops 5 ml [P] no price available
      - **Betnesol sodium phosphate** 1.0% eye drops 10 ml [P] £2.32 DT price = £2.32
  - **Vistamethasone** (Martindale Pharmaceuticals Ltd)
    - **Vistamethasone sodium phosphate** 1 mg per 1 ml
      - **Vistamethasone sodium phosphate** 0.1% eye drops 5 ml [P] £0.87
      - **Vistamethasone sodium phosphate** 0.1% eye drops 10 ml [P] £0.99 DT price = £2.32

**Sodium cromoglicate**

(Sodium cromoglycate)

**INDICATIONS AND DOSE**
- **Allergic conjunctivitis | Seasonal keratoconjunctivitis**
  - **TO THE EYE**
  - Child: Apply 4 times a day

**SIDE-EFFECTS**
- Transient burning
- Transient stinging

**EXCEPTIONS TO LEGAL CATEGORY**
- Sodium cromoglicate 2% eye drops can be sold to the public (in max. pack size of 10 ml) for treatment of acute seasonal and perennial allergic conjunctivitis.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

  **Eye drops**
  - **Sodium cromoglicate (Non-proprietary)**
    - **Sodium cromoglicate** 20 mg per 1 ml
      - **Sodium cromoglicate** 2% eye drops 13.5 ml [P] £3.85 DT price = £2.06
      - **Catacrum** (Moonfields Pharmaceuticals)
        - **Catacrum** 2% eye drops 0.3 ml unit dose | 30 unit dose [P] £8.99 DT price = £8.99
  - **Opticrom** (Sanofi)
    - **Sodium cromoglicate** 20 mg per 1 ml
      - **Opticrom Allergy** 2% eye drops 5 ml [P] £2.74
      - **Opticrom Allergy** 2% eye drops 10 ml [P] £3.35
  - **Optrex Allergy** (Reckitt Benckiser Healthcare (UK) Ltd)
    - **Sodium cromoglicate** 20 mg per 1 ml
      - **Optrex Allergy** 2% eye drops 10 ml [P] £2.08
  - **Pollenate (sodium cromoglicate)** (E M Pharma)
    - **Pollenate Allergy** 2% eye drops 10 ml [P] £2.08
    - **Pollenate Allergy** 2% eye drops 13.5 ml [P] £10.95 DT price = £2.06

**1.2 Inflammatory eye conditions**

**CORTICOSTEROIDS**

**Betamethasone**

**INDICATIONS AND DOSE**
- **Local treatment of inflammation (short term)**
  - **TO THE EYE USING EYE OINTMENT**
    - **Child:** Apply every 1–2 hours until controlled then reduce frequency
  - **TO THE EYE USING EYE DROP**
    - **Child:** Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops

**SIDE-EFFECTS**
- Adrenal suppression following prolonged use in neonates
- corneal thinning
- scleral thinning

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

  **Ear/eye/nose drops solution**
  - **EXCipients:** May contain Benzalkonium chloride, disodium edetate
  - **Betamethasone (Non-proprietary)**
    - **Betamethasone sodium phosphate** 1 mg per 1 ml
      - **Betamethasone sodium phosphate** 0.1% ear/eye/nose drops 5 ml [P] no price available
      - **Betnesol** (Focus Pharmaceuticals Ltd)
        - **Betnesol sodium phosphate** 1 mg per 1 ml
          - **Betnesol sodium phosphate** 0.1% eye drops 10 ml [P] £2.32 DT price = £2.32
      - **Vistamethasone** (Martindale Pharmaceuticals Ltd)
        - **Vistamethasone sodium phosphate** 1 mg per 1 ml
          - **Vistamethasone sodium phosphate** 0.1% ear/eye/nose drops 5 ml [P] £0.87
          - **Vistamethasone sodium phosphate** 0.1% ear/eye/nose drops 10 ml [P] £0.99 DT price = £2.32
  - **Eye ointment**
    - **Betnesol** (Focus Pharmaceuticals Ltd)
      - **Betnesol sodium phosphate** 1 mg per 1 gram
        - **Betnesol sodium phosphate** 0.1% eye ointment 3 gram [P] £1.41 DT price = £1.41

Combinations available: **Betamethasone with neomycin**, p. 623
Dexamethasone

**INDICATIONS AND DOSE**

- **Local treatment of inflammation (short-term)**
  - **TO THE EYE USING EYE DROP**
  - **Child:** Apply 4–6 times a day
- **Short term local treatment of inflammation (severe conditions)**
  - **TO THE EYE USING EYE DROP**
  - **Child:** Apply every 30–60 minutes until controlled, reduce frequency when control achieved

**UNLICENSED USE**

-May not be licensed in some countries due to regional differences in regulatory requirements.

**SIDE-EFFECTS**

- Adrenal suppression following prolonged use in neonates, corneal thinning, scleral thinning
- PREGNANCY
  - Dexamethasone readily crosses the placenta.
- PRESCRIBING AND DISPENSING INFORMATION
  - Although multi-dose Dexamethasone eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include:

- **Eye drops**
  - Excipients: May contain benzalkonium chloride, disodium edetate, polysorbates
  - Dexamethasone (Non-proprietary)
    - Dexamethasone sodium phosphate 1 mg per 1 ml Dexamethasone 0.1% eye drops 0.4 ml unit dose preservative free | 20 unit dose
  - Minims dexamethasone 0.1% eye drops 0.5 ml unit dose | 20 unit dose
  - Dexamethasone sodium phosphate 1 mg per 1 ml Dexamethasone 0.1% eye drops 0.4 ml unit dose | 30 unit dose
  - Dexamethasone sodium phosphate 0.5 mg per 1 ml Dexamethasone 0.1% eye drops 0.3 ml unit dose | 30 unit dose
  - Dexamethasone sodium phosphate 0.1 mg per 1 ml Dexamethasone 0.05% eye drops 0.5 ml unit dose | 30 unit dose
  - Dexamethasone sodium phosphate 0.05 mg per 1 ml Dexamethasone 0.05% eye drops 0.5 ml unit dose | 30 unit dose
  - Betamethasone with neomycin eye drops are less suitable for prescribing.
  - Prednisolone sodium phosphate 300 microgram per 1 ml
    - Prednisolone sodium phosphate 0.3% eye drops preservative free | 10 ml
  - Prednisolone sodium phosphate 1 mg per 1 ml Prednisolone sodium phosphate 0.1% eye drops preservative free | 10 ml
  - Prednisolone sodium phosphate 3 mg per 1 ml Prednisolone sodium phosphate 0.3% eye drops preservative free | 10 ml
  - Prednisolone sodium phosphate 5 mg per 1 ml Prednisolone sodium phosphate 0.5% eye drops preservative free | 10 ml
  - Prednisolone sodium phosphate 10 mg per 1 ml Pred Forte 1% eye drops | 5 ml

**EXCIPIENTS**

- May contain benzalkonium chloride, disodium edetate, polysorbates

**COMBINATIONS AVAILABLE**

- Dexamethasone with framycetin sulphate and gramicidin, p. 624 - Dexamethasone with hypromellose, neomycin and polymyxin B sulphate, p. 624

Prednisolone

**INDICATIONS AND DOSE**

- **Local treatment of inflammation (short-term)**
  - **TO THE EYE**
  - **Child:** Apply every 1–2 hours until controlled then reduce frequency

**UNLICENSED USE**

-Pred Forte® not licensed for use in children (age range not specified by manufacturer).

**SIDE-EFFECTS**

- Adrenal suppression following prolonged use in neonates, corneal thinning, scleral thinning
- PRESCRIBING AND DISPENSING INFORMATION
  - Although multi-dose prednisolone eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include:

- **Ear/eye drops solution**
  - Excipients: May contain benzalkonium chloride, disodium edetate
  - Predsol (Focus Pharmaceuticals Ltd)
    - Prednisolone sodium phosphate 5 mg per 1 ml Predsol 0.5% ear/eye drops | 10 ml
  - Predsol (Focus Pharmaceuticals Ltd)
    - Prednisolone sodium phosphate 5 mg per 1 ml Predsol 0.5% ear/eye drops | 20 ml
  - Predsol (Focus Pharmaceuticals Ltd)
    - Prednisolone sodium phosphate 5 mg per 1 ml Predsol 0.5% ear/eye drops | 30 ml
  - Pred Forte®
    - Prednisolone sodium phosphate 5 mg per 1 ml Pred Forte® ear/eye drops | 5 ml
  - Pred Forte®
    - Prednisolone sodium phosphate 5 mg per 1 ml Pred Forte® ear/eye drops | 10 ml

**Corticosteroids**

- WITH ANTI-INFECTIVES
  - Betamethasone with neomycin eye-drops are less suitable for prescribing.

**Medications**

- The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 622.

Flurometholone

**INDICATIONS AND DOSE**

- **Local treatment of inflammation (short-term)**
  - **TO THE EYE**
  - **Child:** 2-17 years: Apply every 1 hour for 24–48 hours, then reduced to 2–4 times a day

**UNLICENSED USE**

- Not licensed for use in children under 2 years.

**SIDE-EFFECTS**

- Adrenal suppression following prolonged use in neonates, corneal thinning, scleral thinning

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Eye drops**
  - Excipients: May contain benzalkonium chloride, disodium edetate, polysorbates
  - FML Liquifilm (Allergan Ltd)
    - Flurometholone 1 mg per 1 ml FML Liquifilm 0.1% ophthalmic suspension | 5 ml
    - 1.71 DT price = £1.71 | 10 ml
    - 2.95 DT price = £2.95

Betamethasone with neomycin

**INDICATIONS AND DOSE**

- **Local treatment of eye inflammation and bacterial infection (short-term)**
  - **TO THE EYE USING EYE DROP**
  - **Child:** (consult product literature)

**LESS SUITABLE FOR PRESCRIBING**

- Betamethasone with neomycin eye-drops are less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Ear/eye drops solution**
  - Excipients: May contain benzalkonium chloride, disodium edetate
  - Betnesol-N (Focus Pharmaceuticals Ltd)
    - Betnesol-N (as Betamethasone sodium phosphate) 1 mg per 1 ml Neomycin sulphate 5 mg per 1 ml Betnesol-N ear/eye/nose drops | 10 ml
    - 2.39 DT price = £2.39
Dexamethasone with framycetin sulfate and gramicidin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 623.

**INDICATIONS AND DOSE**

Local treatment of inflammation (short-term)
- **TO THE EYE**
- **Child:** Apply every 30–60 minutes in severe conditions until controlled, then reduce frequency

**LESS SUITABLE FOR PRESCRIBING** Dexamethasone with framycetin sulfate is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Eye ointment**
  - Maxitrol

- **Eye drops**
  - Dexamethasone 1 mg per 1 ml, Neomycin (as Neomycin sulfate) 3500 unit per 1 gram, Polymyxin B sulfate 6000 unit per 1 gram

**SIDE-EFFECTS, FURTHER INFORMATION**

- Contraindicated in the presence of open angle glaucoma or closure glaucoma (usually in those who are predisposed to the condition because of a shallow anterior chamber).
- Neonates at increased risk of systemic toxicity.
- When used with eye drops, there can be variation in the licensing of different medicines containing the same drug.
- There can be variation in the licensing of different medicines containing the same drug.

**PATIENT AND CARER ADVICE**

Patients may not be able to undertake skilled tasks until vision clears after mydriasis.

Dexamethasone with hypropomellose, neomycin and polymyxin B sulfate

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 623.

**INDICATIONS AND DOSE**

Local treatment of inflammation (short-term)
- **TO THE EYE**
- **Child:** Apply every 30–60 minutes until controlled, then reduced to 4–6 times a day

**LESS SUITABLE FOR PRESCRIBING** Dexamethasone with neomycin and polymyxin B sulfate is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Eye drops**
  - Atropine sulfate 10 mg per 1 ml
  - Maxitrol (Alcon Laboratories (UK) Ltd)
  - Minims atropine sulfate 1% eye drops 0.5ml unit dose | 20 unit dose £15.10 DT price = £15.10

- **Eye ointment**
  - Atropine sulfate 10 mg per 1 ml
  - Maxitrol (Alcon Laboratories (UK) Ltd)
  - Minims atropine sulfate 1% eye drops 0.5ml unit dose | 20 unit dose £15.10 DT price = £15.10

**SIDE-EFFECTS, FURTHER INFORMATION**

- Toxic systemic reactions can occur. Systemic side-effects can occur.
- Although multi-dose atropine sulfate eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**PRESCRIBING AND DISPENSING INFORMATION**

Although multi-dose atropine sulfate eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**Antimuscarinics (eye)**

**CAUTIONS**

Children under 3 months owing to the possible association between cycloplegia and the development of amblyopia - darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage. Mydriasis can precipitate acute angle-closure glaucoma (usually in those who are predisposed to the condition because of a shallow anterior chamber).

**SIDE-EFFECTS**

Conjunctivitis (on prolonged administration), contact dermatitis - eye oedema (on prolonged administration), hyperaemia (on prolonged administration), local irritation (on prolonged administration), raised intraocular pressure, transient stinging.

**PATIENT AND CARER ADVICE**

Patients may not be able to undertake skilled tasks until vision clears after mydriasis.

**Atropine sulfate**

**INDICATIONS AND DOSE**

- **Cycloplegia**
  - **TO THE EYE USING EYE DROP**
  - **Child 3 months-17 years:** Apply twice daily for 3 days, before procedure
  - **Anterior uveitis**
  - **TO THE EYE USING EYE DROP**
  - **Child 2-17 years:** Apply 1 drop up to 4 times a day

**UNLICENSED USE**

Not licensed for use in children for uveitis.

**SIDE-EFFECTS**

- Side-effects, further information
  - Toxic systemic reactions can occur. Systemic side-effects can occur.

**PRESCRIBING AND DISPENSING INFORMATION**

Although multi-dose atropine sulfate eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops
2 Dry eye conditions

Dry eye

Tear deficiency, ocular lubricants, and astringents

Chronic soreness of the eyes associated with reduced or abnormal tear secretion often responds to tear replacement therapy. The severity of the condition and child’s preference will often guide the choice of preparation.

Hypermellose p. 626 is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hypermellose with a mucolytic such as acetylcysteine below can be helpful.

The ability of carbomers to cling to the eye surface may help reduce frequency of application to 4 times daily. Polyvinyl alcohol p. 627 increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

Sodium hyaluronate eye drops p. 628 are also used in the management of tear deficiency. Sodium chloride 0.9% drops p. 628 are sometimes useful in tear deficiency, and can be used as ‘comfort drops’ by contact lens wearers, and to facilitate lens removal. Special presentations of sodium chloride 0.9% and other irrigation solutions are used routinely for intra-ocular surgery and in first aid for removal of harmful substances.

Eye ointments containing a paraffin can be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application before sleep. Ointments should not be used during contact lens wear.

Acetylcysteine

**INDICATIONS AND DOSE**

**Tear deficiency | Impaired or abnormal mucus production**

- **TO THE EYE**
- Child: Apply 3–4 times a day

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride

- **Cyclopentolate hydrochloride** (Bausch & Lomb UK Ltd)
  - Cyclopentolate hydrochloride 5 mg per 1 ml
    - Minims cyclopentolate hydrochloride 0.5% eye drops 0.5ml unit dose
    - 20 unit dose
    - £0.97 DT price = £0.97
  - Cyclopentolate hydrochloride 10 mg per 1 ml
    - Minims cyclopentolate hydrochloride 1% eye drops 0.5ml unit dose
    - 20 unit dose
    - £1.23 DT price = £1.23
- **Mydriolate** (Intrapharm Laboratories Ltd)
  - Cyclopentolate hydrochloride 5 mg per 1 ml
    - Mydriolate 0.5% solution
    - 5 ml
    - £6.73 DT price = £6.73
  - Cyclopentolate hydrochloride 10 mg per 1 ml
    - Mydriolate 1% solution
    - 5 ml
    - £6.73 DT price = £6.73

**Carbomers**

**(Polyacrylic acid)**

**INDICATIONS AND DOSE**

**Dry eyes including keratoconjunctivitis sicca, unstable tear film**

- **TO THE EYE**
- Child: Apply 3–4 times a day or when required

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- **Ilupe** (Moorfields Pharmaceuticals)
  - Acetylcysteine 50 mg per 1 ml
    - Ilupe 5% eye drops
    - 10 ml
    - £14.93 DT price = £14.93

**Hypromellose p. 626 is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hypermellose with a mucolytic such as acetylcysteine below can be helpful.**

- Systane (Alcon Laboratories (UK) Ltd)
  - Systane Gel eye drops | 10 ml £7.49

Hypermellose

**INDICATIONS AND DOSE**

**Tear deficiency**

- TO THE EYE
- Child: Apply as required

**PRESCRIBING AND DISPENSING INFORMATION** The Royal Pharmaceutical Society has stated that where it is not possible to ascertain the strength of hypermellose prescribed, the prescriber should be contacted to clarify the strength intended.

Although multi-dose hypermellose eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
Liquid paraffin with white soft paraffin and wool alcohols

- **INDICATIONS AND DOSE**
- **Dry eye conditions**
  - TO THE EYE
  - Child: Apply as required, best suited for application before sleep

- **PATIENT AND CARER ADVICE**
  - May cause temporary visual disturbance. Should not be used during contact lens wear.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye ointment**
    - Lacrilube (Allergan Ltd)
    - Wool alcohols 2 mg per 1 gram, Liquid paraffin 425 mg per 1 gram
      - Lacre-lube eye ointment | 3.5 gram | £2.94 | 5 gram | £3.88

- **Paraffin, yellow, soft**

- **INDICATIONS AND DOSE**
- **Eye surface lubrication**
  - TO THE EYE
  - Child: Apply every 2 hours as required

- **PATIENT AND CARER ADVICE**
  - Ophthalmic preparations may cause temporary visual disturbance. Should not be used during contact lens wear.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye ointment**
    - Paraffin, yellow, soft (Non-proprietary)
      - Liquid paraffin 100 mg per 1 gram, Wool fat 100 mg per 1 gram
      - Liquid soft paraffin 800 mg per 1 gram
      - Simple eye ointment | 4 gram | £6.98 DT price | £5.82

- **Polyvinyl alcohol**

- **INDICATIONS AND DOSE**
- **Tear deficiency**
  - TO THE EYE
  - Child: Apply as required

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Although multi-dose polyvinyl alcohol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - Polyvinyl alcohol (Non-proprietary)
      - Polyvinyl alcohol 14 mg per 1 ml
      - Polyvinyl alcohol 1.4% eye drops 0.4 ml unit dose preservative free | 10 ml | £1.89
      - Polyvinyl alcohol 1.4% eye drops | 30 unit dose | no price available
      - Polyvinyl alcohol 1.4% eye drops | 15 ml | no price available
    - Liqfilin Tears (Allergan Ltd)
      - Polyvinyl alcohol 14 mg per 1 ml
      - Liqfilin Tears 1.4% eye drops | 15 ml | £1.93
      - Liqfilin Tears 1.4% eye drops 0.4ml unit dose preservative free | 30 unit dose | £5.35
      - PVA (Tubilux Pharma Ltd)
        - Polyvinyl alcohol 14 mg per 1 ml
        - PVA 1.4% eye drops | 15 ml | £1.63

**Hypermellose with dextran 70**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hypermellose p. 626.

- **INDICATIONS AND DOSE**
- **Tear deficiency**
  - TO THE EYE
  - Child: Apply as required

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - Hypermellose (Non-proprietary)
      - Hypermellose 2.5 mg per 1 ml
        - Hypermellose 0.25% eye drops preservative free | 10 ml | £14.24 DT price | £14.24
      - Hypermellose 3 mg per 1 ml
        - Hypermellose 0.3% eye drops preservative free | 10 ml | £3.75
    - Artecal (Bausch & Lomb Ltd)
      - Hypermellose 3.2 mg per 1 ml
        - Artecal Single Dose Unit 0.32% eye drops 0.5ml unit dose | 30 unit dose | £16.95 | 60 unit dose | £32.85
        - Artecal 0.32% eye drops | 10 ml | £4.99
    - Brolene Cool (Sanofi)
      - Hypermellose 3 mg per 1 ml

      - Hypromol (Ennogen Healthcare Ltd)
        - Hypermellose 3 mg per 1 ml
          - Hypromol 0.3% eye drops preservative free | 10 ml | £4.55
      - Isopha Alkaline (Alcon Laboratories (UK) Ltd)
        - Hypermellose 10 mg per 1 ml
          - Isopha Alkaline 1% eye drops | 10 ml | £10.94 DT price | £0.94
      - Isopha Plain (Alcon Laboratories (UK) Ltd)
        - Hypermellose 5 mg per 1 ml
          - Isopha Plain 0.5% eye drops | 10 ml | £10.81 DT price | £0.81
    - Lumecare (Hypermellose) (Medicom Healthcare Ltd)
      - Hypermellose 3 mg per 1 ml
        - Lumecare Hypermellose 0.3% eye drops | 10 ml | £1.67 DT price | £0.99
    - Lumecare Tear Drops (Medicom Healthcare Ltd)
      - Hypermellose 3 mg per 1 ml
        - Lumecare Tear Drops 0.3% eye drops | 10 ml | £0.95 DT price | £0.99
    - Mandanol (Hydroxypropyl methylcellulose) (M & A Pharmachem Ltd)
      - Hypermellose 3 mg per 1 ml
        - Mandanol eye drops | 10 ml | £1.13 DT price | £0.99
    - Ocu-Lube (Si-A-Meds Ltd)
      - Hypermellose 3 mg per 1 ml
        - Ocu-Lube 0.3% eye drops preservative free | 10 ml | £5.75
    - SoftDrops (Farmigee S.p.A.)
      - Hypermellose 3 mg per 1 ml
        - SoftDrops 0.3% eye drops | 10 ml | £1.67 DT price | £0.99
    - Tear-Lac (Scope Ophthalmics Ltd)
      - Hypermellose 3 mg per 1 ml
        - Tear-Lac Hypermellose 0.3% eye drops preservative free | 10 ml | £5.75
    - Xaillin Hydrate (Nicos Pharma)
      - Hypermellose 3 mg per 1 ml
        - Xaillin Hydrate 0.3% eye drops preservative free | 10 ml | £4.60

**Hypermellose with dextran 70**

- **INDICATIONS AND DOSE**
- **Tear deficiency**
  - TO THE EYE
  - Child: Apply as required

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Eye drops**
    - EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
      - Tears Naturale (Alcon Laboratories (UK) Ltd)
        - Dextan 70 1 mg per 1 ml
          - Hypermellose 3 mg per 1 ml
            - Tears Naturale eye drops | 15 ml | £1.89
          - Tears Naturale eye drops 0.4ml unit dose | 28 unit dose | £13.26

**Medicinal forms**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops
Retinol palmitate with white soft paraffin and light liquid paraffin and liquid paraffin and wool fat
(Formulated as an ocular lubricant)

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye ointment**
- **VITA-POS** (Scope Ophthalmics Ltd)
  - VITA-POS eye ointment preservative free | 5 gram £2.75

**Sodium chloride**

**INDICATIONS AND DOSE**

Dry eye conditions
- **TO THE EYE**
- Child: Apply as required

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **Sodium chloride (Non-proprietary)**
  - Sodium chloride 50 mg per 1 ml | 10 ml £2.25
  - ODM5 (Kestrel Ophthalmics Ltd)
    - Sodium chloride 50 mg per 1 ml ODM5 5% eye drops preservative free | 10 ml £24.00 DT price = £0.00
  - Saline (Bausch & Lomb UK Ltd)
    - Sodium chloride 9 mg per 1 ml Minims saline 0.9% eye drops 0.5ml unit dose | 20 unit dose £0.14 DT price = £0.14
  - Sodium chloride (Essential Pharmaceuticals Ltd, Moorfields Pharmaceuticals)
    - Sodium chloride 50 mg per 1 ml NaCl 5% eye drops 0.45ml unit dose preservative free | 20 unit dose £19.70
    - PF Drops Sodium Chloride 5% eye drops preservative free | 10 ml £25.20 DT price = £0.00

**Eye ointment**
- **Sodium chloride (Non-proprietary)**
  - Sodium chloride 50 mg per 1 ml | 5 gram £22.50
  - Sodium chloride 50 mg per 1 gram Muro 128 5% eye ointment | 3.5 gram (PZN) no price available

**INDICATIONS AND DOSE**

Dry eye conditions
- **TO THE EYE**
- Child: Apply as required

**PRESCRIBING AND DISPENSING INFORMATION**
Although multi-dose sodium chloride eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **Sodium hyaluronate (Non-proprietary)**
  - Vislube 0.18% eye drops 0.3ml unit dose preservative free | 20 unit dose no price available
  - Artelac Rebalance (Bausch & Lomb UK Ltd)
    - Artelac Rebalance 0.15% eye drops | 10 ml £4.00
  - Artelac Splash (Bausch & Lomb UK Ltd)

- **Evolve HA** (Medicom Healthcare Ltd)
  - Evolve HA 0.2% eye drops preservative free | 10 ml £5.99
- **Hy-Opti** (Alissa Healthcare Research Ltd)
  - Hy-Opti 0.1% eye drops preservative free | 10 ml £8.50
  - Hy-Opti 0.2% eye drops preservative free | 10 ml £9.50
- **Hyabak** (Thea Pharmaceuticals Ltd)
  - Hyabak UD 0.15% eye drops 0.4ml unit dose preservative free | 30 unit dose £4.99
  - Hyabak 0.15% eye drops | 10 ml £7.99
- **Nycosan** (Scope Ophthalmics Ltd)
  - Nycosan Extra 0.2% eye drops | 7.5 ml no price available
  - Nycosan 0.3% eye drops | 7.5 ml no price available
- **HydraMed** (Farmigia S.p.A.)
  - HydraMed 0.2% eye drops preservative free | 10 ml £5.60
  - HydraMed 0.2% eye drops 0.5ml unit dose preservative free | 30 unit dose £5.60
- **Hylo-Comod** (Scope Ophthalmics Ltd)
  - Hylo-Tear 0.1% eye drops preservative free | 10 ml £4.50
  - Hylo-Forte 0.2% eye drops preservative free | 10 ml £9.90
- **Hylo-fresh** (Scope Ophthalmics Ltd)
  - Hylo-Fresh 0.3% eye drops preservative free | 10 ml £4.95
- **Lubristil** (Moorfields Pharmaceuticals)
  - Lubristil 0.15% eye drops 0.3ml unit dose preservative free | 20 unit dose £4.99
- **Ocusan** (Agepha Pharma s.r.o.)
  - Ocusan 0.2% eye drops 0.5ml unit dose | 20 unit dose £5.31
- **Optive Fusion** (Alltacor Ltd)
  - Optive Fusion 0.1% eye drops | 10 ml £7.49
- **Oxyl** (Bausch & Lomb UK Ltd)
  - Oxyl 0.15% eye drops | 10 ml £4.15
- **Vismed** (TRB Chemica UK Ltd)
  - Vismed Gel Multi 0.3% eye drops preservative free | 10 ml £7.95
  - Vismed Multi 0.3% eye drops preservative free | 10 ml £6.81
  - Vismed Multi 0.1% eye drops 0.3ml unit dose preservative free | 20 unit dose £5.30
- **Xaillin HA** (Nicco Pharma)
  - Xaillin HA 0.2% eye drops preservative free | 10 ml £7.13

**Eye gel**
- **Lubristil** (Moorfields Pharmaceuticals)
  - Lubristil 0.15% eye gel 0.45ml unit dose preservative free | 20 unit dose £6.49
- **Vismed** (TRB Chemica UK Ltd)
  - Vismed 0.3% eye gel 0.45ml unit dose preservative free | 20 unit dose £5.98
3 Eye infections

Eye infections

Most acute superficial eye infections can be treated topically. Blepharitis and conjunctivitis are often caused by staphylococci; keratitis and endophthalmitis may be bacterial, viral, or fungal.

**Bacterial blepharitis** is treated by lid hygiene and application of antibacterial eye drops to the conjunctival sac or to the lid margins. Systemic treatment may be required and may be necessary for 3 months or longer.

Most cases of acute bacterial conjunctivitis are self-limiting; where treatment is appropriate, antibacterial eye drops or an eye ointment are used. A poor response might indicate viral or allergic conjunctivitis or antibiotic resistance.

**Corneal ulcer** and **keratitis** require specialist treatment, usually under inpatient care, and may call for intensive topical, subconjunctival, or systemic administration of antimicrobials.

**Endophthalmitis** is a medical emergency which also calls for specialist management and requires intravitreal administration of antimicrobials; concomitant systemic treatment is required in some cases. Surgical intervention, such as vitrectomy, is sometimes indicated.

See reference to the treatment of crab lice of the eyelashes.

**Antibacterials**

Bacterial eye infections are generally treated topically with eye drops and eye ointments. Systemic administration is sometimes appropriate in blepharitis.

**Chloramphenicol** p. 631 has a broad spectrum of activity and is the drug of choice for superficial eye infections.

Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, ciprofloxacin p. 630, levofloxacin p. 631, moxifloxacin p. 631, and ofloxacin p. 631; the aminoglycosides, gentamicin p. 630 and tobramycin p. 630 are also active against a wide variety of bacteria. Gentamicin, tobramycin, quinolones (except moxifloxacin), and polymyxin B are effective for infections caused by *Pseudomonas aeruginosa*.

Ciprofloxacin eye drops are licensed for corneal ulcers; intensive application (especially in the first 2 days) is required throughout the day and night.

Azithromycin eye drops p. 630 are licensed for trachomatous conjunctivitis caused by *Chlamydia trachomatis* and for purulent bacterial conjunctivitis. *Trachoma* which results from chronic infection with *Chlamydia trachomatis* can be treated with azithromycin by mouth [unlicensed indication].

**Fusidic acid** is useful for staphyloccocal infections.

Propamidine isethionate p. 632 is of little value in bacterial infections but is used by specialists to treat the rare, but potentially sight-threatening, condition of *acanthamoeba keratitis* [unlicensed indication].

Other antibacterial eye drops may be prepared aseptically in a specialist manufacturing unit from material supplied for injection.

**With corticosteroids**

Many antibacterial preparations also incorporate a corticosteroid but such mixtures should not be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed ‘red eye’ which is sometimes caused by the herpes simplex virus and may be difficult to diagnose.

**Antifungals**

Fungal infections of the cornea are rare. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Debility or immunosuppression can encourage fungal proliferation. The spread of infection through blood occasionally produces metastatic endophthalmitis. Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

**Antifungal preparations for the eye** are not generally available. Treatment will normally be carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent in Scotland or Northern Ireland), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, 162 City Road, London E1CL 2PD (Tel. (020) 7253 3411) or www.moorfields.nhs.uk.

**Antivirals**

Herpes simplex infections producing, for example, dendritic corneal ulcers can be treated with aciclovir p. 632. Aciclovir eye ointment is used in combination with systemic treatment for ophthalmic zoster.

Also see systemic treatment of CMV retinitis.

**Antibacterials in neonates**

Antibacterial eye drops are used to treat acute bacterial conjunctivitis in neonates (ophthalmia neonatorum); where possible the causative microorganism should be identified. Chloramphenicol eye drops are used to treat mild conjunctivitis; more serious infections also require a systemic antibacterial. Failure to respond to initial treatment requires further investigation; chlamydial infection is one of the most frequent causes of neonatal conjunctivitis and should be considered. Azithromycin eye drops are licensed to treat chlamatous conjunctivitis caused by *Chlamydia trachomatis* and purulent bacterial conjunctivitis in neonates. However, as there is a risk of simultaneous infection at other sites in neonates and children under 3 months presenting with conjunctivitis caused by *Chlamydia trachomatis*, systemic treatment with oral erythromycin p. 310 is required. *Gonococcal eye infections* are treated with a single-dose of parenteral cefotaxime p. 301 or
Eye infections

ceftixime p. 302. Gentamicin eye drops together with appropriate systemic antibacterials are used in the treatment of pseudomonal eye infections; high-strength gentamicin eye drops (1.5%) [unlicensed] are available for severe infections.

### 3.1 Bacterial eye infection

#### ANTIBACTERIALS > AMINOGLYCOSIDES

**Gentamicin**

- **INDICATIONS AND DOSE**
  - **Bacterial eye infections**
    - **TO THE EYE**
      - Child: Apply 1 drop at least every 2 hours in severe infection, reduce frequency as infection is controlled and continue for 48 hours after healing, frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient

- **PRESCRIBING AND DISPENSING INFORMATION** Eye drops may be sourced as a manufactured special or from specialist importing companies.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

  **Ear/eye drops solution**

  **EXCIPIENTS** May contain Benzalkonium chloride
  - Gentamicin (Non-proprietary)
    - Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml Gentamicin 0.3% eye/ear drops | 10 ml $2.55 DT price = $2.13
    - Gentamicin 0.3% eye/ear drops | 10 ml $2.13 DT price = $2.13

**Tobramycin**

- **INDICATIONS AND DOSE**
  - **Local treatment of infections**
    - **TO THE EYE**
      - Child: Apply twice daily for 6–8 days
    - **Local treatment of infections (severe infection)**
      - **TO THE EYE**
        - Child: Apply 4 times a day for first day, then apply twice daily for 5–7 days

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Eye drops**

  - May contain Benzododecinium bromide
  - Tobradisc (Alcon Laboratories (UK) Ltd)
  - Tobramycin 3 mg per 1 ml Tobradisc 3mg/ml eye drops | 5 ml $4.74

#### ANTIBACTERIALS > MACROLIDES

**Azithromycin**

- **INDICATIONS AND DOSE**
  - **Trachomatous conjunctivitis caused by Chlamydia trachomatis** Purulent bacterial conjunctivitis
    - **TO THE EYE**
      - Child: Apply twice daily for 3 days, review if no improvement after 3 days of treatment

- **INTERACTIONS** → Appendix 3 (macrolides).
  Caution with concomitant use of drugs that prolong the QT interval.

- **SIDE-EFFECTS**
  - **Common or very common** Blurred vision • ocular burning • ocular discomfort • ocular pruritus
  - **Uncommon** Conjunctival hyperaemia • eyelid eczema • eyelid erythema • eyelid oedema • keratitis

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Eye drops**

  - Azyter (Thea Pharmaceuticals Ltd)
    - Azithromycin dihydrate 15 mg per 1 gram Azyter 15mg/g eye drops 0.25g unit dose | 6 unit dose $6.99 DT price = $6.99

#### ANTIBACTERIALS > QUINOLONES

**Ciprofloxacin**

- **INDICATIONS AND DOSE**
  - **Superficial bacterial eye infection**
    - **TO THE EYE USING EYE DROP**
      - Child: Apply 4 times a day for maximum duration of treatment 21 days
    - **TO THE EYE USING EYE OINTMENT**
      - Child 1–17 years: Apply 1.25 centimetres 3 times a day for 2 days, then apply 1.25 centimetres twice daily for 5 days
  - **Superficial bacterial eye infection (severe infection)**
    - **TO THE EYE USING EYE DROP**
      - Child: Apply every hour during waking hours for 2 days, then apply 4 times a day for maximum duration of treatment 21 days
    - **TO THE EYE USING EYE OINTMENT**
      - Child 1–17 years: Apply 1.25 centimetres every 1–2 hours for 2 days, then apply 1.25 centimetres every 4 hours for the next 12 days, to be administered throughout the day and night

- **UNLICENSED USE** Eye ointment not licensed for use in children under 1 year.

- **SIDE-EFFECTS**
  - **Common or very common** Corneal deposits (reversible after completion of treatment) • ocular discomfort • ocular hyperaemia • taste disturbance
  - **Uncommon** Increased lacrimation • blurred vision • conjunctival hyperaemia • corneal infiltrates • corneal staining • eye dryness • eye irritation • eye pain • eye pruritus • eye swelling • eyelid disorders • eyelid erythema • eyelid exfoliation • eyelid oedema • headache • keratopathy • nausea • photophobia
  - **Rare** Abdominal pain • asthenopia • corneal disorders • corneal epithelium defect • dermatitis • diarrhoea • diplopia • dizziness • ear pain • eye hypoesthesia • keratitis • paranasal sinus hypersecretion • rhinitis

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises caution.
### Levofoxacin

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **EXCIPIENTS**: May contain Benzalkonium chloride
- **Ciprofloxacín (as Ciprofloxacín hydrochloride)** 3 mg per 1 ml
  - **Ciprofloxacín (Alcon Laboratories (UK) Ltd)**
- **Levofoxacin (as Levofloxacin hemihydrate)** 5 mg per 1 ml
  - **Oftaquix (Santen UK Ltd)**

**SIDE-EFFECTS**
- **Common or very common**: Ocular burning, visual disturbances
- **Uncommon**: Conjunctival follicles, headache, lid erythema, lid oedema, ocular discomfort, ocular dryness, ocular itching, ocular pain, photophobia, rhinitis
- **PREGNANCY**: Manufacturer advises use only if potential benefit outweighs risks.
- **BREAST FEEDING**: Manufacturer advises use only if potential benefit outweighs risks.
- **PRESCRIBING AND DISPENSING INFORMATION**: Although multi-dose levofloxacin eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **EXCIPIENTS**: May contain Benzalkonium chloride
- **Oftaquix (Santen UK Ltd)**
- **Levofoxacin (as Levofloxacin hemihydrate)** 5 mg per 1 ml
  - **Oftaquix 5mg/ml eye drops**: 0.5ml unit dose | 30 unit dose [GBP] £11.95
  - **Oftaquix 5mg/ml eye drops**: 5 ml [GBP] £6.95

### Moxifloxacin

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**
- **Moxifloxacin (as Moxifloxacin hydrochloride)** 5 mg per 1 ml
  - **Moxivig (Alcon Laboratories (UK) Ltd)**

**SIDE-EFFECTS**
- **Common or very common**: Hyperaemia, ocular discomfort, ocular dryness, ocular irritation, ocular pain, taste disturbances
- **Uncommon**: Conjunctival haemorrhage, corneal disorders, corneal erosion, corneal keratitis, corneal staining, eyelid erythema, headache, nasal discomfort, paraesthesia, pharyngolaryngeal pain, visual disturbances, vomiting
- **Frequency not known**: Dizziness, dyspnoea, nausea, palpititation, photophobia, pruritus, raised intra-ocular pressure, rash

**SIDE-EFFECTS**
- Transient stinging
- **PREGNANCY**: Avoid unless essential—no information on topical use but risk of ‘neonatal grey-baby syndrome’ with oral use in third trimester.
- **BREAST FEEDING**: Avoid unless essential—theoretical risk of bone-marrow toxicity.
- **PRESCRIBING AND DISPENSING INFORMATION**: Although multi-dose moxifloxacin eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
632 Eye infections

**PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Chloramphenicol for eye infections
www.medicinesforchildren.org.uk/
chloramphenicol-eye-infections-0

**EXCEPTIONS TO LEGAL CATEGORY**
Chloramphenicol 0.5% eye drops (in max. pack size 10 mL) and 1% eye ointment (in max. pack size 4 g) can be sold to the public for treatment of acute bacterial conjunctivitis in adults and children over 2 years; max. duration of treatment 5 days.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops
EXCEPT: May contain Phenylmercuric acetate
- **Chloramphenicol** (Non-proprietary)

- **Optrex Infected Eyes** (Reckitt Benckiser Healthcare (UK) Ltd)
  - Chloramphenicol 5 mg per 1 mL Optrex Infected Eyes 0.5% eye drops | 10 mL £3.88 DT price = £1.12

**Eye ointment**
- **Chloramphenicol** (Non-proprietary)
  - Chloramphenicol 10 mg per 1 gram Chloramphenicol 1% eye ointment | 4 gram (£pm) £4.25 DT price = £1.63
  - Chloramphenicol 10 mg per 1 gram Brolene Chloramphenicol 1% eye ointment | 4 gram (£mp) £1.81 DT price = £1.63
- **Chloromycetin** (AMCo)
  - Chloramphenicol 10 mg per 1 gram Chloromycetin 1% eye ointment | 4 gram (£pm) £1.08 DT price = £1.63
  - Klorafect (Blumont Pharma Ltd)
  - Chloramphenicol 10 mg per 1 gram Klorafect 1% eye ointment | 4 gram (£pm) £1.08 DT price = £1.63
- **Optrex Infected Eyes** (Reckitt Benckiser Healthcare (UK) Ltd)
  - Chloramphenicol 10 mg per 1 gram Optrex Infected Eyes 1% eye ointment | 4 gram (£pm) £3.88 DT price = £1.63

**Fusidic acid**
**DRUG ACTION**
Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

**INDICATIONS AND DOSE**
Staphylococcal eye infections
- **TO THE EYE**
  - Child: Apply twice daily

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Modified-release drops
EXCEPT: May contain Benzalkonium chloride, disodium edetate
- Fusidic acid (Non-proprietary)
  - Fusidic acid 10 mg per 1 gram Fusidic acid 1% modified-release eye drops | 5 gram (£pm) £29.06 DT price = £23.06

**ANTIPROTOZOALS**

**Propamidine isetionate**

**INDICATIONS AND DOSE**
Acanthamoeba keratitis infections (specialist use only)
- **LOCAL TREATMENT OF EYE INFECTIONS**
  - **Child:** Apply up to 4 times a day

**UNLICENSED USE**
Not licensed for acanthamoeba keratitis infections.

**SIDE-EFFECTS**
Eye irritation - eye pain

**PREGNANCY**
Manufacturer advises avoid unless essential—no information available.

**BREAST FEEDING**
Manufacturer advises avoid unless essential—no information available.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Eye drops
EXCEPT: May contain Benzalkonium chloride
- **Brolene** (Propamidine) (Sanofi)
  - Propamidine isetionate 1 mg per 1 mL Brolene 0.1% eye drops | 10 mL (£P) £2.80
  - **Golden eye** (Cambridge Healthcare Supplies Ltd)
  - Propamidine isetionate 1 mg per 1 mL Golden Eye 0.1% drops | 10 mL £3.26

Eye ointment
- **Brolene** (Dibrompropamidine) (Sanofi)
  - Dibrompropamidine isetionate 1.5 mg per 1 gram Brolene 0.15% eye ointment | 5 gram (£p) £2.92 DT price = £1.49
  - **Golden eye** (Cambridge Healthcare Supplies Ltd)
  - Dibrompropamidine isetionate 1.5 mg per 1 gram Golden Eye 0.15% ointment | 5 gram (£p) £3.49 DT price = £3.49

3.2 Viral eye infection

3.2a Ophthalmic herpes simplex

**ANTIVIRALS**

**NUCLEOSIDE ANALOGUES**

**Aciclovir**
(Acyclovir)

**INDICATIONS AND DOSE**
Herpes simplex infection (local treatment)
- **TO THE EYE USING EYE OINTMENT**
  - Child: Apply 1 centimetre 5 times a day continue for at least 3 days after complete healing

**SIDE-EFFECTS**
- Common or very common
  - Local inflammation - local irritation - superficial punctate keratopathy
- Rare
  - Blepharitis
- Very rare
  - Angioedema - hypersensitivity reactions

**PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Aciclovir eye ointment for herpes simplex infections www.medicinesforchildren.org.uk/aciclovir-eye-ointment-for-herpes-simplex-infection

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

Eye ointment
- Zovirax (GlaxoSmithKline UK Ltd)
  - Aciclovir 30 mg per 1 gram Zovirax 3% ophthalmic ointment | 4.5 mg (£p) £9.34 DT price = £9.34
4 Eye procedures

Mydriatics and cycloplegics

Overview
Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action. Short-acting, relatively weak mydriatics, such as tropicamide 0.5% below (action lasts for 4–6 hours), facilitate the examination of the fundus of the eye. Cyclopentolate hydrochloride 1% p. 625 (action up to 24 hours) or atropine sulphate p. 624 (action up to 7 days) are preferable for producing cycloplegia for refraction in young children; tropicamide may be preferred in neonates.

Phenylephrine hydrochloride p. 634 is used for mydriasis in diagnostic or therapeutic procedures; mydriasis occurs within 60–90 minutes and lasts up to 5–7 hours.

Mydriatics and cycloplegics are used in the treatment of anterior uveitis, usually as an adjunct to corticosteroids. Atropine sulphate is used in anterior uveitis mainly to prevent posterior synechiae and to relieve ciliary spasm; cyclopentolate hydrochloride or homatropine hydrobromide p. 625 (action up to 3 days) can also be used and may be preferred because they have a shorter duration of action.

ANTIMUSCARINICS

Tropicamide

● INDICATIONS AND DOSE

Fundoscopy

▶ TO THE EYE

▶ Neonate: 0.5% eye drops to be applied 20 minutes before examination.

▶ Child: 0.5% eye drops to be applied 20 minutes before examination.

● PRESCRIBING AND DISPENSING INFORMATION Although multi-dose tropicamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, edetic acid (edta)

▷ Mydriacyl (Alcon Laboratories (UK) Ltd)

Tropicamide 5 mg per 1 ml Mydriacyl 0.5% eye drops | 5 ml £1.29

Tropicamide 10 mg per 1 ml Mydriacyl 1% eye drops | 5 ml £1.69

▷ Tropicamide (Bausch & Lomb UK Ltd)

Tropicamide 5 mg per 1 ml Minims tropicamide 0.5% eye drops 0.5ml unit dose | 20 unit dose £0.75

Tropicamide 10 mg per 1 ml Minims tropicamide 1% eye drops 0.5ml unit dose | 20 unit dose £1.77

Povidone-iodine

● INDICATIONS AND DOSE

Cutaneous peri-ocular and conjunctival antisepsis before ocular surgery

▶ TO THE EYE

▶ Neonate: Apply, leave for 2 minutes, then irrigate thoroughly with sodium chloride 0.9%.

▶ Child: Apply, leave for 2 minutes, then irrigate thoroughly with sodium chloride 0.9%

● CONTRA-INDICATIONS Concomitant use of ocular antimicrobial drugs - concomitant use of ocular formulations containing mercury-based preservatives - preterm neonates

● SIDE-EFFECTS

▶ Rare Conjunctival hyperaemia - superficial punctate keratitis

▶ Frequency not known Cytotoxicity on deep tissue - cytotoxicity on mucous membranes - hypothyroidism in neonates - residual yellow coloration of the conjunctiva

● PRESCRIBING AND DISPENSING INFORMATION Although multi-dose povidone iodine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

▷ Povidone iodine (Bausch & Lomb UK Ltd)

Povidone-iodine 50 mg per 1 ml Minims povidone iodine 5% eye drops 0.4ml unit dose | 20 unit dose £16.00

DIAGNOSTIC AGENTS ▶ DYES

Fluorescein sodium

● INDICATIONS AND DOSE

Detection of lesions and foreign bodies

▶ TO THE EYE USING EYE DROP

▶ Child: Use sufficient amount to stain damaged areas

● PRESCRIBING AND DISPENSING INFORMATION Although multi-dose fluorescein eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Eye drops

▷ Fluorescein sodium (Bausch & Lomb UK Ltd)

Fluorescein sodium 10 mg per 1 ml Minims fluorescein sodium 1% eye drops 0.5ml unit dose | 20 unit dose £8.89

Fluorescein sodium 20 mg per 1 ml Minims fluorescein sodium 2% eye drops 0.5ml unit dose | 20 unit dose £8.89
MIOTICS > PARASYMPATHOMIMETICS

Acetylcholine chloride

● INDICATIONS AND DOSE
Cataract surgery | Penetrating keratoplasty | Iridectomy | Anterior segment surgery requiring rapid complete miosis

TO THE EYE
Child: (consult product literature)

● UNLICENSED USE Not licensed for use in children.
● CAUTIONS Asthma | gastro-intestinal spasm | heart failure | hyperthyroidism | peptic ulcer | urinary-tract obstruction

● PREGNANCY Avoid unless potential benefit outweighs risk—no information available.

● BREAST FEEDING Avoid unless potential benefit outweighs risk—no information available.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.
Irrigation
- Miochol-E (Bausch & Lomb UK Ltd)
  Acetylcholine chloride 20 mg Miochol-E 20mg powder and solvent for solution for intraocular irrigation vials | 4 vial pack £7.28
- Miphtel (Alan Pharmaceuticals)
  Acetylcholine chloride 20 mg Miphtel 20mg powder and solvent for solution for intraocular irrigation ampoules | 6 ampule pack £43.68 (Hospital only)

SYMPATHOMIMETICS > VASOCONSTRICTOR

Phenylephrine hydrochloride

● INDICATIONS AND DOSE
Mydriasis

TO THE EYE
Child: Apply 1 drop, to be administered before procedure, a drop of proxymetacaine topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging

● CONTRA-INDICATIONS 10% strength eye drops - aneurysms | cardiovascular disease | hypertension | thyrotoxicosis

● CAUTIONS Asthma | corneal epithelial damage | darkly pigmented iris is more resistant to papillary dilatation and caution should be exercised to avoid overdosage. | diabetes (avoid eye drops in long-standing diabetes) | mydriasis can precipitate acute angle-closure glaucoma in the very few children who are predisposed to the condition because of a shallow anterior chamber | neonates are at an increased risk of systemic toxicity | ocular hyperaemia | susceptibility to angle-closure glaucoma

● INTERACTIONS → Appendix 1 (sympathomimetics). Phenylephrine may interact with systemically administered monoamine-oxidase inhibitors.

● SIDE-EFFECTS Arrhythmias | blurred vision | conjunctivitis on prolonged administration | coronary artery spasm | extrasystoles | hyperaemia on prolonged administration | local irritation on prolonged administration | hypertension | myocardial infarction (usually after use of 10% strength in patients with pre-existing cardiovascular disease) | oedema on prolonged administration | palpitation | photophobia | raised intraocular pressure | tachycardia | transient stinging

● PREGNANCY Use only if potential benefit outweighs risk.

● BREAST FEEDING Use only if potential benefit outweighs risk—no information available.

● PRESCRIBING AND DISPENSING INFORMATION Although multi-dose phenylephrine eye drops commonly contain preservatives, preserved-free unit dose vials may be available.

● PATIENT AND CARER ADVICE
Driving and skilled tasks
Patients should be warned not to undertake skilled tasks (e.g. driving) until vision clears after mydriasis.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops
EXCIPIENTS: May contain Diodium edetate, sodium metabolisulfite
- Phenylephrine hydrochloride (Bausch & Lomb UK Ltd)
  Phenylephrine hydrochloride 25 mg per 1 ml Minimum phenylephrine hydrochloride 2.5% eye drops 0.5ml unit dose | 20 unit dose £1.41

4.1 Post-operative pain and inflammation

Eye, surgical and peri-operative drug use

Ocular peri-operative drugs
Drugs used to prepare the eye for surgery and drugs that are injected into the anterior chamber at the time of surgery are included here.
Sodium hyaluronate p. 628 is used during surgical procedures on the eye.
Apraclonidine p. 641, an alpha₂-adrenoceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used for short-term treatment only.
Balanced Salt Solution is used routinely in intra-ocular surgery.
Povidone-iodine p. 633 is used for peri-ocular and conjunctival antisepsis before ocular surgery to support postoperative infection control.

Local anaesthetics
Oxybuprocaine hydrochloride p. 635 and tetracaine p. 635 are widely used topical local anaesthetics. Proxymetacaine hydrochloride p. 635 causes less initial stinging and is useful for children. Oxybuprocaine hydrochloride or a combined preparation of lidocaine hydrochloride p. 780 and fluorescein sodium p. 633 is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine hydrochloride, with or without adrenaline/epinephrine p. 128, is injected into the eyelids for minor surgery. Local anaesthetics should never be used for the management of ocular symptoms.

Local anaesthetic eye drops should be avoided in preterm neonates because of the immaturity of the metabolising enzyme system.

ANAESTHETICS, LOCAL

Fluorescein with lidocaine

● INDICATIONS AND DOSE
Local anaesthesia

TO THE EYE
Child: As required

● CONTRA-INDICATIONS Avoid in pre-term neonate (immature metabolising enzyme system)
Post-operative pain and inflammation 635

**SIDE-EFFECTS, FURTHER INFORMATION**

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems; systemic side effects unlikely as minimal absorption following topical application.

**ALLERGY AND CROSS-SENSITIVITY**

- Hypersensitivity and cross-sensitivity: Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, meptivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

**PRESCRIBING AND DISPENSING INFORMATION**

- Although multi-dose tetracaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

---

**Oxybuprocaine hydrochloride**

(Benoxinate hydrochloride)

**INDICATIONS AND DOSE**

**Local anaesthetic**

- **TO THE EYE**
  - Child: As required

**CONTRA-INDICATIONS**

Avoid in preterm neonates

**PRESCRIBING AND DISPENSING INFORMATION**

Although multi-dose oxybuprocaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- Oxybuprocaine hydrochloride (Bausch & Lomb Ltd)
  - Oxybuprocaine hydrochloride 4 mg per 1 ml: Minims oxybuprocaine hydrochloride 0.4% eye drops 0.5ml unit dose | 20 unit dose £10.15

---

**Proxymetacaine hydrochloride**

**INDICATIONS AND DOSE**

**Local anaesthetic**

- **TO THE EYE**
  - Child: As required

**CONTRA-INDICATIONS**

Avoid in preterm neonates

**PRESCRIBING AND DISPENSING INFORMATION**

Although multi-dose proxymetacaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- Proxymetacaine (Bausch & Lomb Ltd)
  - Proxymetacaine hydrochloride 5 mg per 1 ml: Minims proxymetacaine hydrochloride 0.5% eye drops 0.5ml unit dose | 20 unit dose £11.54

---

**Tetracaine**

(Amethocaine)

**INDICATIONS AND DOSE**

**Local anaesthetic**

- **TO THE EYE**
  - Child: As required

**UNLICENSED USE**

Not licensed for use in neonates.

**CONTRA-INDICATIONS**

Avoid in preterm neonates

**SIDE-EFFECTS**

Local skin reactions

---

**Diclofenac sodium**

**INDICATIONS AND DOSE**

Inhibition of intra-operative miosis during cataract surgery (but does not possess intrinsic mydriatic properties) Postoperative inflammation in cataract surgery, strabismus surgery, argon laser trabeculoplasty

- **TO THE EYE**
  - Child: (consult product literature)

**UNLICENSED USE**

Not licensed for use in children.

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**PRESCRIBING AND DISPENSING INFORMATION**

Although multi-dose diclofenac sodium eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- Voltarol Ophtha MultiDose (Thea Pharmaceuticals Ltd)
  - Voltarol Ophtha MultiDose (Thea Pharmaceuticals Ltd)
    - Voltarol Ophtha MultiDose (Thea Pharmaceuticals Ltd)
**Glaucoma**

**Overview**
Glaucoma describes a group of disorders characterised by a loss of visual field associated with cupping of the optic disc and optic nerve damage and is generally associated with raised intra-ocular pressure.

Glaucoma is rare in children and should always be managed by a specialist. **Primary congenital glaucoma** is the most common form of glaucoma in children, followed by **secondary glaucomas**, such as following hereditary anterior segment malformations; **juvenile open-angle glaucoma** is less common and usually occurs in older children.

Treatment of glaucoma is determined by the pathophysiology and usually involves controlling raised intra-ocular pressure with surgery. Drug therapy is generally supportive, and can be used temporarily, pre- or post-operatively, or both, to reduce intra-ocular pressure. In secondary glaucomas, drug therapy is often used first-line, and long-term treatment may be required. Drugs that reduce intra-ocular pressure by different mechanisms are available for managing glaucoma. A topical beta-blocker or a prostaglandin analogue can be used. It may be necessary to combine these drugs or add others, such as carbonic anhydrase inhibitors, or miotics to control intra-ocular pressure.

Children with an acute form of glaucoma (usually presenting with pain in older children, a cloudy cornea, and may be associated with a previous history of controlled glaucoma or recent intra-ocular surgery) need immediate referral for specialist ophthalmology assessment and treatment.

**Beta-blockers**
Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in primary and secondary glaucomas, probably by reducing the rate of production of aqueous humour.

**Prostaglandin analogues**
The prostaglandin analogues latanoprost p. 641, and travoprost, and the synthetic prostamide, bimatoprost, increase uveoscleral outflow and subsequently reduce intra-ocular pressure. They are used to reduce intra-ocular pressure. Only latanoprost (Xalatan® and certain non-proprietary preparations of latanoprost) is licensed for use in children. Children receiving prostaglandin analogues should be managed by a specialist.

**Sympathomimetics**
Apraclonidine p. 641 is an alpha-2-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. Eye drops containing apraclonidine 0.5% are used for a short period to delay laser treatment or surgery for glaucoma in patients not adequately controlled by another drug; eye drops containing 1% are used for control of intra-ocular pressure after anterior segment laser surgery. Brimonidine tartrate, an alpha-2-adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow.

**Carbonic anhydrase inhibitors and systemic drugs**
The **carbonic anhydrase inhibitors**, acetazolamide p. 638, brinzolamide p. 639, and dorzolamide p. 639, reduce intra-ocular pressure by reducing aqueous humour production. Systemic use of acetazolamide also produces weak diuresis. Acetazolamide is given by mouth or, rarely in children, by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is used as an adjunct to other treatment for reducing intra-ocular pressure. Acetazolamide is not generally recommended for long-term use.

Dorzolamide and brinzolamide are topical carbonic anhydrase inhibitors. They are unlicensed in children but are used in those resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Brinzolamide can also be used as an adjunct to a prostaglandin analogue. Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

Metabolic acidosis can occur in children using topical carbonic anhydrase inhibitors; symptoms may include poor feeding and lack of weight gain.

**Miotics**
Miotics act by opening up the inefficient drainage channels in the trabecular meshwork. Pilocarpine p. 640 is a miotic used pre- and post-operatively in goniotomy and trabeculotomy; it is used occasionally for aphakic glaucoma.
**BETA-ADRENOCEPTOR BLOCKERS**

**Betaxolol**

- **INDICATIONS AND DOSE**
  - **Primary and secondary glaucomas**
    - **TO THE EYE**
    - Child: Apply twice daily
  - **UNLICENSED USE** Not licensed for use in children.
  - **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers - bradycardia - heart block
  - **CAUTIONS** Patients with corneal disease

**SIDE-EFFECTS** Anaphylaxis - blepharoconjunctivitis - burning - corneal disorders - cough, rather than wheeze, may occur - dry eyes - erythema - itching - ocular stinging - pain

**INTERACTIONS** → Appendix 1 (beta-blockers).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

**Betaxolol (as Betaxolol hydrochloride) 2.5 mg per 1 ml**

- **Betaxolol (Non-proprietary)**
  - **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers - bradycardia - heart block
  - **CAUTIONS** Patients with corneal disease

**SIDE-EFFECTS** Anaphylaxis - blepharoconjunctivitis - burning - corneal disorders - cough, rather than wheeze, may occur - dry eyes - erythema - itching - ocular stinging - pain

**INTERACTIONS** → Appendix 1 (beta-blockers).

Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind.

**SIDE-EFFECTS, FURTHER INFORMATION**

Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

**Betaxolol (as Betaxolol hydrochloride) 5 mg per 1 ml Betaxolol 0.5% eye drops**

- **Betoptic (Thea Pharmaceuticals Ltd)**
  - **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers - bradycardia - heart block
  - **CAUTIONS** Patients with corneal disease

**SIDE-EFFECTS** Anaphylaxis - blepharoconjunctivitis - burning - corneal disorders - cough, rather than wheeze, may occur - dry eyes - erythema - itching - ocular stinging - pain

**INTERACTIONS** → Appendix 1 (beta-blockers).

Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind.

**SIDE-EFFECTS, FURTHER INFORMATION**

Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

**Betaxolol (as Betaxolol hydrochloride) 5 mg per 1 ml Betaxolol 0.5% eye drops**

- **Betoptic (Thea Pharmaceuticals Ltd)**

**Carteolol hydrochloride**

- **INDICATIONS AND DOSE**
  - **Primary and secondary glaucomas**
    - **TO THE EYE**
    - Child: Apply twice daily
  - **UNLICENSED USE** Not licensed for use in children.
  - **CONTRA-INDICATIONS** Also consider contra-indications listed for systemically administered beta blockers - bradycardia - heart block
  - **CAUTIONS** Patients with corneal disease

**SIDE-EFFECTS** Anaphylaxis - blepharoconjunctivitis - burning - corneal disorders - cough, rather than wheeze, may occur - dry eyes - erythema - itching - ocular stinging - pain

**INTERACTIONS** → Appendix 1 (beta-blockers).

Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind.

**SIDE-EFFECTS, FURTHER INFORMATION**

Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

Timolol maleate

INDICATIONS AND DOSE
Primary congenital and primary juvenile glaucoma, for a transitional period, before surgery or following failed surgery

TO THE EYE

Child: (consult product literature)

TIMOPTOL-LA®
Reduction of intra-ocular pressure in primary and secondary glaucoma

TO THE EYE

Child: Apply once daily

TIOPEX®
Reduction of intra-ocular pressure primary and secondary glaucomas

TO THE EYE

Child: Apply once daily, to be applied in the morning

UNLICENSED USE
Not licensed for use in children.

CONTRA-INDICATIONS
Also consider contra-indications listed for systemically administered beta blockers - bradycardia - heart block

CAUTIONS
Consider also cautions listed for systemically administered beta blockers - patients with corneal disease

INTERACTIONS
Since systemic absorption may follow topical application the possibility of interactions, in particular, with drugs such as verapamil should be borne in mind.

SIDE-EFFECTS
Anaphylaxis - blepharoconjunctivitis - burning - corneal disorders - cough, rather than wheeze, may occur - dry eyes - erythema - itching - ocular stinging - pain

SIDE-EFFECTS, FURTHER INFORMATION
Systemic absorption can follow topical application to the eyes; consider side effects listed for systemically administered beta blockers.

NATIONAL FUNDING/ACCESS DECISIONS
TIOPEX®
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (February 2014) that timolol gel eye drops (TIOPEX®) are accepted for restricted use within NHS Scotland for the reduction of elevated intraocular pressure in patients with ocular hypertension or chronic open angle glaucoma who have proven sensitivity to preservatives.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops
EXCIPIENTS: May contain Benzalkonium chloride

Timolol maleate (Non-proprietary)
Timolol (as Timolol maleate) 2.5 mg per 1 ml Timolol 0.25% eye drops | 5 ml £1.80 DT price = £1.02
Timolol (as Timolol maleate) 5 mg per 1 ml Timolol 0.5% eye drops | 5 ml £2.95 DT price = £1.94

Timoptol (Santen UK Ltd)
Timolol (as Timolol maleate) 2.5 mg per 1 ml Timolol 0.25% eye drops | 5 ml £3.12 DT price = £1.02
Timotol Unit Dose 0.25% ophthalmic solution 0.2ml unit dose | 30 unit dose £0.45

Timolol (as Timolol maleate) 5 mg per 1 ml Timotol 0.5% eye drops | 5 ml £3.12 DT price = £1.04
Timotol Unit Dose 0.5% ophthalmic solution 0.2ml unit dose | 30 unit dose £0.65 DT price = £0.65

Tiopex (Thea Pharmaceuticals Ltd)
Timolol (as Timolol maleate) 1 mg per 1 gram Tiopex 1mg/g eye gel 0.4g unit dose | 30 unit dose £7.40 DT price = £7.40

Eye gel
EXCIPIENTS: May contain Benzalkonlicium bromide

Timoptol-LA (Santen UK Ltd)
Timolol (as Timolol maleate) 2.5 mg per 1 ml Timoptol-LA 0.25% ophthalmic gel-forming solution | 2.5 ml £3.12 DT price = £3.12
Timolol (as Timolol maleate) 5 mg per 1 ml Timoptol-LA 0.5% ophthalmic gel-forming solution | 2.5 ml £3.12 DT price = £3.12

Combinations available: Dorzolamide with timolol, p. 640

CARBONIC ANHYDRASE INHIBITORS

Acetazolamide

INDICATIONS AND DOSE
Glaucoma

BY MOUTH USING MODIFIED-RELEASE MEDICINES

Child 12-17 years: 250–500 mg daily

Epilepsy

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY SLOW INTRAVENOUS INJECTION

Child 1 month–11 years: Initially 2.5 mg/kg 2–3 times a day, followed by maintenance 5–7 mg/kg 2–3 times a day; maximum 750 mg per day

Child 12–17 years: 250 mg 2–4 times a day

Reduction of intra-ocular pressure in primary and secondary glaucoma (specialist use only)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY SLOW INTRAVENOUS INJECTION

Child 1 month–11 years: 5 mg/kg 2–4 times a day, adjusted according to response; maximum 750 mg per day

Child 12–17 years: 250 mg 2–4 times a day

Raised intracranial pressure

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY SLOW INTRAVENOUS INJECTION

Child 1 month–11 years: Initially 8 mg/kg 3 times a day, then increased if necessary up to 100 mg/kg daily

UNLICENSED USE
Not licensed for the treatment of glaucoma.

CONTRA-INDICATIONS
Adrenocortical insufficiency - hyperchloraemic acidosis - hypokalaemia - hyponatraemia - long-term administration in chronic angle-closure glaucoma

CAUTIONS
Avoid extravasation at injection site (risk of necrosis) - diabetes mellitus - impaired alveolar ventilation (risk of acidosis) - not generally recommended for long-term use - pulmonary obstruction (risk of acidosis) - renal calculi

INTERACTIONS
Appendix 1 (diuretics).

SIDE-EFFECTS

Common or very common
Ataxia - depression - diarrhoea - dizziness - excitement - fatigue - flushing - headache - irritability - loss of appetite - nausea - paraesthesia - polyuria - taste disturbance - thirst - vomiting

Uncommon

Rare
Cholestatic jaundice - convulsions - flaccid paralysis - fulminating hepatic necrosis - hepatitis - photosensitivity

Frequency not known
Transient myopia

SIDE-EFFECTS, FURTHER INFORMATION

Acetazolamide is a sulfonamide derivative; blood disorders, rashes, and other sulfonamide-related side-
effects occur occasionally—patients should be told to report any unusual skin rash.
If electrolyte disturbances and metabolic acidosis occur, these can be corrected by administering potassium bicarbonate (as effervescent potassium tablets).

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
**PREGNANCY** Manufacturer advises avoid, especially in first trimester (toxicity in animal studies).
**BREAST FEEDING** Amount too small to be harmful.
**HEPATIC IMPAIRMENT** Manufacturer advises avoid.
**RENAL IMPAIRMENT** Avoid—risk of metabolic acidosis.
**MONITORING REQUIREMENTS** Monitor blood count and plasma electrolyte concentrations with prolonged use.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**
CAUTIONARY AND ADVISORY LABELS 3
- Acetazolamide (Non-proprietary)
  - Acetazolamide 250 mg
    - 1 tablet (Hes) no price available | 112 tablet (Hes) £75.36 DT price = £64.00

**Modified-release capsule**
CAUTIONARY AND ADVISORY LABELS 3, 25
- Diamox SR (AMCo)
  - Acetazolamide 250 mg
    - Diamox SR 250mg capsules | 100 tablet (Pp) £16.66 DT price = £16.66

- Eytaox (Auden Mckenzie (Pharma Division) Ltd)
  - Acetazolamide 250 mg
    - Eyezax 250mg modified-release capsules | 30 capsule (Pp) £16.66 DT price = £16.66

**Powder for solution for injection**
- Diamox (AMCo)
  - Acetazolamide 500 mg
    - Diamox Sodium Parenteral 500mg powder for solution for injection vials | 1 vial (Pp) £14.76

**Brinzolamide**

**INDICATIONS AND DOSE**
Reduction of intra-ocular pressure in primary and secondary glaucoma either as adjunct to beta-blockers or prostaglandin analogues or used alone if unresponsive to beta-blockers or if beta-blockers contra-indicated

- TO THE EYE
  - Child: Apply twice daily, then increased if necessary up to 3 times a day

**SIDE-EFFECTS**
- Common or very common
  - Headache• oculomotor disturbances• photophobia• reduced visual acuity• taste disturbances

- Uncommon
  - Alopecia• amnesia• bradycardia• chest pain• cough• decreased libido• depression• diarrhoea• dizziness• drowsiness• dyspepsia• dysphonia• epistaxis• erectile dysfunction• flattened• malaise• malaise• nasal dryness• nausea• nervousness• oesophagitis• oral hypoaesthesia and paraesthesia• palpitation• paraesthesia• pharyngitis• renal pain• sinusitis• sleep disturbances• throat irritation• tinnitus• upper respiratory tract congestion• vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**
Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
**PREGNANCY** Avoid—toxicity in animal studies.
**BREAST FEEDING** Manufacturer advises avoid—risk of metabolic acidosis.
**RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

**Dorzolamide**

**INDICATIONS AND DOSE**
Raised intra-ocular pressure in primary and secondary glaucoma used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated

- TO THE EYE
  - Child: Apply 3 times a day

**UNLICENSED USE** Not licensed for use in children.
**CONTRA-INDICATIONS** Hyperchloraeic acidosis
**CAUTIONS** Chronic corneal defects• history of intra-ocular surgery• history of renal calculi• immature renal tubules (neonates and infants)—risk of metabolic acidosis• low endothelial cell count—systemic absorption follows topical application

**INTERACTIONS**→ Appendix 1 (brinzolamide).
- When used by eye
  - Since systemic absorption may follow topical application of dorzolamide to the eye, the possibility of interactions should be borne in mind.

**SIDE-EFFECTS**
- Common or very common
  - Asthenia• bitter taste• blurred vision• conjunctivitis• eyelid inflammation• headache• lacrimation• nausea• oculir irritation• superficial punctate keratitis

- Uncommon
  - Iridocyclitis

- Rare
  - Contact dermatitis• corneal oedema• dizziness• dry mouth• epistaxis• eyelid crusting• paraesthesia• Stevens-Johnson syndrome• throat irritation• toxic epidermal necrolysis• transient myopia• urolithiasis

**Frequency not known** Metabolic acidosis

**SIDE-EFFECTS, FURTHER INFORMATION**
Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
**PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
**BREAST FEEDING** Manufacturer advises avoid—no information available.
**Dorzolamide with timolol**

The properties listed below are those particular to the combination only. For the properties of the components please consider, dorzolamide p. 639, timolol maleate p. 638.

### INDICATIONS AND DOSE

- **Raised intra-ocular pressure in open-angle glaucoma when beta-blockers alone not adequate**
- **Raised intra-ocular pressure in pseudo-exfoliative glaucoma when beta-blockers alone not adequate**
  - TO THE EYE
  - Child: Apply twice daily

### PRESCRIBING AND DISPENSING INFORMATION

Although multi-dose dorzolamide with timolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **EXCIPIENTS**: May contain Benzalkonium chloride
- **Dorzolamide (Non-proprietary)**
  - Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml
  - Timolol 0.5% eye drops | 5 ml (Pd) £27.16 DT price = £28.59
  - 20 mg per 1 ml
  - Timolol 0.5% eye drops | 5 ml (Pd) £27.16 DT price = £28.59
  - Cosopt (Santen UK Ltd)
  - Timolol (as Timolol maleate) 5 mg per 1 ml
  - Dorzolamide hydrochloride 20 mg per 1 ml
  - Cosopt eye drops 0.2ml unit dose preservative free | 60 unit dose (Pd) £11.05 DT price = £12.00
  - Cosopt eye drops | 5 ml (Pd) £10.05 DT price = £12.00

**PRESCRIBING AND DISPENSING INFORMATION**

- **Although multi-dose dorzolamide with timolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.**

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Eye drops**

- **EXCIPIENTS**: May contain Benzalkonium chloride
  - Dorzolamide with timolol (Non-proprietary)
  - Timolol (as Timolol maleate) 5 mg per 1 ml
  - Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 ml
  - Timolol 0.5% eye drops | 5 ml (Pd) £27.16 DT price = £28.59
  - Cosopt (Santen UK Ltd)
  - Timolol (as Timolol maleate) 5 mg per 1 ml
  - Dorzolamide hydrochloride 20 mg per 1 ml
  - Cosopt eye drops 0.2ml unit dose preservative free | 60 unit dose (Pd) £28.59 DT price = £28.59
  - Cosopt eye drops | 5 ml (Pd) £10.05 DT price = £12.00

### MIOTICS > PARASYMPATHOMIMETICS

**Pilocarpine**

**DRUG ACTION** Pilocarpine acts by opening the inefficient drainage channels in the trabecular meshwork.

**INDICATIONS AND DOSE**

- **Raised intra-ocular pressure**
  - TO THE EYE
  - Child 1 month-1 year: Apply 1 drop 3 times a day, doses are for 0.5% or 1% solution
  - Child 2-17 years: Apply 1 drop 4 times a day

**PRE- and postoperatively in goniotomy and trabeculotomy**

- **TO THE EYE**
  - Child: Apply once daily, 1% or 2% solution to be applied

**UNLICENSED USE** Not licensed for use in children.

**CONTRA-INDICATIONS** Acute inflammatory disease of the anterior segment - acute iritis - anterior uveitis - conditions where pupillary constriction is undesirable - some forms of secondary glaucoma (where pupillary constriction is undesirable)

**CAUTIONS** A darkly pigmented iris may require a higher concentration of the miotic or more frequent administration and care should be taken to avoid overdose - asthma - cardiac disease - care in conjunctival damage - care in corneal damage - epilepsy - gastrointestinal spasm - hypotension - hyperthyroidism - hypotension - peptic ulceration - retinal detachment has occurred in susceptible individuals and those with retinal disease - urinary-tract obstruction

**INTERACTIONS** Appendix 1 (parasympathomimetics).

Systemic effects rare following application to the eye.

**SIDE-EFFECTS**

- **Rare** Parasympathomimetics systemic side effects

- **Frequency not known** Blurred vision - ciliary spasm (leads to headache and browache which may be more severe in the initial 2–4 weeks of treatment—a particular disadvantage in patients under 40 years of age) - conjunctival vascular congestion - lens changes (with chronic use) - myopia - ocular burning - ocular itching - pupillary block - smarting - vitreous haemorrhage

**PREGNANCY** Avoid unless the potential benefit outweighs risk—limited information available.

**BREAST FEEDING** Avoid unless the potential benefit outweighs risk—no information available.

**PRE-TREATMENT SCREENING** Fundus examination is advised before starting treatment with a miotic (retinal detachment has occurred).

**MONITORING REQUIREMENTS** Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic.

**PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose pilocarpine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**PATIENT AND CARER ADVICE**

- **Driving and skilled tasks**
  - Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

**Eye drops**

- **EXCIPIENTS**: May contain Benzalkonium chloride
  - Pilocarpine (Non-proprietary)
  - Pilocarpine hydrochloride 10 mg per 1 ml
  - Pilocarpine hydrochloride 1% eye drops | 10 ml (Pd) £6.30 DT price = £6.33
  - Pilocarpine hydrochloride 2% eye drops | 10 ml (Pd) £7.74 DT price = £6.51
  - Pilocarpine hydrochloride 40 mg per 1 ml
  - Pilocarpine hydrochloride 4% eye drops | 10 ml (Pd) £8.70 DT price = £7.32
  - Pilocarpine nitrate (Bausch & Lomb UK Ltd)
  - Pilocarpine nitrate 20 mg per 1 ml
  - Minims pilocarpine nitrate 2% eye drops 0.5ml unit dose | 20 unit dose (Pd) £11.99
PROSTAGLANDIN ANALOGUES AND PROSTAMIDES

Latanoprost

**INDICATIONS AND DOSE**
Reduction of intra-ocular pressure in raised intra-ocular pressure and glaucoma
- **TO THE EYE**
  - Child: Apply once daily, to be administered preferably in the evening

**IMPORTANT SAFETY INFORMATION**
MHRA/CHM ADVICE: LATANOPROST (XALATAN®): INCREASED REPORTING OF EYE IRRITATION SINCE REFORMULATION (JULY 2015)
Following reformulation of Xalatan®, to allow for long-term storage at room temperature, there has been an increase in the number of reports of eye irritation from across the EU. Patients should be advised to tell their health professional promptly (within a week) if they experience eye irritation (e.g. excessive watering) severe enough to make them consider stopping treatment. Review treatment and prescribe a different formulation if necessary.

**CONTRA-INDICATIONS**
Active herpes simplex keratitis - history of recurrent herpetic keratitis associated with prostaglandin analogues

**CAUTIONS**
Aphakia - asthmas - children less than 1 year - limited information available - history of herpetic keratitis - history of significant ocular viral infections - perioperative period of cataract surgery - preterm neonates less than 36 weeks gestational age — no information available - pseudophakia with torn posterior lens capsule or anterior chamber lenses - risk factors for cystoid macular oedema - risk factors for iritis - risk factors for uveitis

**SIDE-EFFECTS**
- **Common or very common** - Blepharitis - conjunctival hyperaemia - eye irritation - eye pain - eyelash and vellus hair changes - increased iris pigmentation - transient punctate epithelial erosion
- **Uncommon** - Blurred vision - conjunctivitis - dry eye - eyelid oedema - keratitis - skin rash
- **Rare** - Corneal erosion - corneal oedema - distichiasis - iritis - macular oedema - misdirected eyelashes - periorbital oedema - photophobia - uveitis
- **Very rare** - Chest pain - darkening of palpebral skin of the eyelids - localised skin reaction on the eyelids - periocular changes resulting in deepening of the eyelid sulcus
- **Frequency not known** - Arthralgia - asthma - dizziness - dyspnoea - exacerbation of asthma - headache - herpetic keratitis - iritis - myalgia - nasopharyngitis - palpitation - pyrexia

**PREGNANCY**
Manufacturer advises avoid.

**BREAST FEEDING**
May be present in milk — manufacturer advises avoid.

**MONITORING REQUIREMENTS**
Monitor for changes to eye coloration.

**PRESCRIBING AND DISPENSING INFORMATION**
Although multi-dose latanoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

**PATIENT AND CARER ADVICE**
Changes in eye colour: Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

**MEDICINAL FORMS**
There can be variation in the linking of different medicines containing the same drug.

**Eye drops**
EXCIPIENTS: May contain Benzalkonium chloride
- **Latanoprost (Non-proprietary)**
  - **Latanoprost 50 microgram per 1 ml**
    - Latanoprost 50 micrograms/ml eye drops: 2.5 ml (POM) £12.48 DT price = £1.56
    - Monopost (Thea Pharmaceuticals Ltd)
      - Latanoprost 50 microgram per 1 ml
        - eye drops 0.2ml unit dose: £8.49 DT price = £1.89
        - 90 unit dose (POM) £25.47 DT price = £25.47
      - Xalatan (Pfizer Ltd)
        - Latanoprost 50 microgram per 1 ml
          - Xalatan 50micrograms/ml eye drops: 2.5 ml (POM) £12.48 DT price = £1.56

**SYMPATHOMIMETICS**

**APRACLONIDINE**

**DRUG ACTION**
Apraclonidine is an alpha-2-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. It is a derivative of clonidine.

**INDICATIONS AND DOSE**
Control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery
- **TO THE EYE**
  - Child: Apply 1 drop, 1 hour before laser procedure, then 1 drop, immediately after completion of procedure, 1% eye drops to be administered
  - Short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug
    - **TO THE EYE**
      - Child 12-17 years: Apply 1 drop 3 times a day usually for maximum 1 month, 0.5% eye drops to be administered may not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

**UNLICENSED USE**
0.5% drops are not licensed for use in children under 12 years. 1% drops are not licensed for use in children.

**CONTRA-INDICATIONS**
History of severe or unstable and uncontrolled cardiovascular disease

**CAUTIONS**
Cerebrovascular disease - depression - heart failure - history of angina - hypertension - loss of effect may occur over time - Raynaud’s syndrome - recent myocardial infarction - reduction in vision in end-stage glaucoma (suspend treatment) - severe coronary insufficiency - thromboangitis obliterans - vasovagal attack

**INTERACTIONS**
Appendix 1 (apraclonidine).

**SIDE-EFFECTS**
- **Common or very common**
  - Conjunctivitis - dry eye - ocular intolerance - rhinitis - taste disturbance
- **Uncommon**
  - Asthma - blepharitis - blepharospasm - chest pain - conjunctival vascular disorders - corneal erosion and infiltrates - dyspnoea - eyelid ptosis or retraction - impaired co-ordination - irritability - keratitis - keratopathy - myalgia - mydriasis - nervousness - parosmia - photophobia - rhinorhoea - throat irritation - visual impairment

**SIDE-EFFECTS, FURTHER INFORMATION**
- Ocular intolerance Withdraw if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur.
- Systemic effects: Since absorption may follow topical application, see clonidine hydrochloride p. 93.

**PREGNANCY**
Manufacturer advises avoid — no information available.
BREAST FEEDING  Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT  Manufacturer advises caution.

RENAL IMPAIRMENT  Use with caution in chronic renal failure.

MONITORING REQUIREMENTS
- Monitor intra-ocular pressure and visual fields.
- Monitor for excessive reduction in intra-ocular pressure following peri-operative use.

PATIENT AND CARER ADVICE
Driving and skilled tasks
Drowsiness may affect performance of skilled tasks (e.g. driving).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Eye drops
EXCIPIENTS: May contain Benzalkonium chloride
Iopidine (Alcon Laboratories (UK) Ltd)
  Apraclonidine (as Apraclonidine hydrochloride) 5 mg per 1 ml
  Iopidine 5mg/ml eye drops | 5 ml | £2.52
  £10.88 DT price = £10.88

  Apraclonidine (as Apraclonidine hydrochloride) 10 mg per 1 ml
  Iopidine 1% eye drops 0.25ml unit dose | 24 unit dose | £3.58
  £77.85 DT price = £77.85

Ear

Otitis externa

Otitis externa is an inflammatory reaction of the lining of the ear canal usually associated with an underlying seborrhoeic dermatitis or eczema; it is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping.

A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge soaked with an astringent such as aluminium acetate solution p. 647. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

Secondary infection in otitis externa may be of bacterial, fungal, or viral origin. If infection is present, a topical anti-infective which is not used systemically (such as neomycin sulphate p. 645 or ciprofloxacin p. 325 or a systemic antibiotic) may be used, but for only about a week because excessive use may result in fungal infections that are difficult to treat. Sensitivity to the anti-infective or solvent may occur and resistance to antibacterials is a possibility with prolonged use. Aluminium acetate ear drops are also effective against bacterial infection and inflammation of the ear. Chloramphenicol p. 645 may be used, but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients. Solutions containing an anti-infective and a corticosteroi

 failed for otitis externa; treatment should be considered only by specialists in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- the carer and child should be counselled on the risk of otoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances.

A solution of acetic acid 2% acts as an antifungal and antibacterial in the external ear canal. It may be used to treat mild otitis externa but in severe cases an anti-inflammatory preparation with or without an anti-infective drug is required. A proprietary preparation containing acetic acid 2% (EarCalm® spray) is on sale to the public for children over 12 years.

For severe pain associated with otitis externa, a simple analgesic, such as paracetamol p. 254 or ibuprofen p. 608, can be used. A systemic antibacterial can be used if there is spreading cellulitis or if the patient is systemically unwell. When a resistant staphylococcal infection (a boil) is present in the external auditory meatus, flucloxacillin p. 325 is the drug of choice; oral ciprofloxacin p. 328 or a systemic aminoglycoside may be needed for pseudomonal infections, particularly in children with diabetes or compromised immunity.

The skin of the pinna adjacent to the ear canal is often affected by eczema. Topical corticosteroid creams and ointments are then required, but prolonged use should be avoided.

Otitis media

Acute otitis media

Acute otitis media is the commonest cause of severe aural pain in young children and may occur with even minor upper respiratory tract infections. Children diagnosed with acute otitis media should not be prescribed antibacterials routinely as many infections, especially those accompanying coryza, are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment and a simple analgesic, such as paracetamol, may be sufficient. In children without systemic features, a systemic antibacterial may be started after 72 hours if there is no improvement, or earlier if there is deterioration, if the child is systemically unwell, if the
child is at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis is present, or in children under 2 years of age with bilateral otitis media. Perforation of the tympanic membrane in children with acute otitis media usually heals spontaneously without treatment; if there is no improvement, e.g. pain or discharge persists, a systemic antibiotic can be given. Topical antibacterial treatment of acute otitis media is ineffective and there is no place for ear drops containing a local anaesthetic.

Otitis media with effusion

Otitis media with effusion (glue ear) occurs in about 10% of children and in 90% of children with cleft palates. Antimicrobials, corticosteroids, decongestants, and antihistamines have little place in the routine management of otitis media with effusion. If glue ear persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of chronic otitis media.

Chronic otitis media

Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in children with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction, which may completely resolve long-standing infection. Cleansing may be followed by topical treatment as for otitis externa; this is particularly beneficial for discharging ears or infections of the mastoid cavity. Acute exacerbations of chronic infection may require treatment with an oral antibacterial; a swab should be taken to identify infecting organisms and antibacterial sensitivity.

In view of reports of ototoxicity, manufacturers contraindicate topical treatment with ototoxic antibacterials in the presence of a tympanic perforation or patent grommet. Ciprofloxacin or ofloxacin eye drops used in the ear [unlicensed use] or ear drops [both unlicensed; available from ‘special-order’ manufacturers or specialist importing companies] are an effective alternative to such ototoxic ear drops for chronic otitis media in patients with perforation of the tympanic membrane. However, some specialists do use ear drops containing aminoglycosides or polymyxins [unlicensed indications] cautiously in children with chronic suppurative otitis media and perforation of the tympanic membrane, if the otitis media has failed to settle with systemic antibacterials; treatment should be considered only by specialists in the following circumstances:
- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- the carer and child should be counselled on the risk of ototoxicity and given justification for the use of these topical antibacterials;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances. It is considered that the pus in the middle ear associated with otitis media also carries a risk of ototoxicity.

Removal of ear wax

Ear wax (cerumen) is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum. Ear wax causing discomfort or impaired hearing may be softened using simple remedies such as olive oil ear drops or almond oil ear drops; sodium bicarbonate ear drops p. 647 are also effective, but may cause dryness of the ear canal. If the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The child should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium p. 647 or urea hydrogen peroxide p. 648 are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in children unable to cooperate with the procedure, in children who have had otitis media in the last six weeks, in otitis externa, in children with cleft palate, a history of ear drum perforation, or previous ear surgery. A child who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

Administration

To administer ear drops, lay the child down with the head turned to one side; for an infant pull the earlobe back and down, for an older child pull the earlobe back and up.

Otitis externa

1. Otitis externa

2. ANTIBACTERIALS > AMINGLYCOSIDES

1. Framycetin sulfate

- INDICATIONS AND DOSE
  - Bacterial infection in otitis externa
    - TO THE EAR
    - Child: (consult product literature)

- CONTRA-INDICATIONS
  - Perforated tympanic membrane
- CAUTIONS
  - Avoid prolonged use
- SIDE-EFFECTS
  - Local sensitivity

2. Gentamicin

- INDICATIONS AND DOSE
  - Bacterial infection in otitis externa
    - TO THE EAR
    - Child: Apply 2–3 drops 4–5 times a day, (including a dose at bedtime)

- CONTRA-INDICATIONS
  - Patent grommet (although may be used by specialists (see Ear p. 643) - perforated tympanic membrane (although may be used by specialists (see Ear p. 643)
- CAUTIONS
  - Avoid prolonged use
- SIDE-EFFECTS
  - Local sensitivity
### Gentamicin with hydrocortisone

**INDICATIONS AND DOSE**
- Eczematous inflammation in otitis externa
  - **TO THE EAR**
  - **Child:** Apply 2–4 drops 4–5 times a day, (including a dose at bedtime)

**CONTRA-INDICATIONS**
- Patent grommet (although may be used by specialists, see Ear p. 643) - perforated tympanic membrane (although may be used by specialists, see Ear p. 645)

**CAUTIONS**
- Avoid prolonged use

**SIDE-EFFECTS**
- Local sensitivity reactions

**PATIENT AND CARER ADVICE**
- Medicines for Children leaflet: Gentamicin and hydrocortisone ear drops for inflammatory ear infections

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- **Ear drops**
  - EXCIPIENTS: May contain Propylene glycol
  - Gentamicin 50 mg per 1 ml
  - Chloramphenicol 50 mg per 1 ml
  - Chloramphenicol 100 mg per 1 ml

**EXCIPIENTS:**
- May contain Benzalkonium chloride, disodium edetate

**CAUTIONS**
- Avoid prolonged use

**SIDE-EFFECTS**
- Common or very common: High incidence of sensitivity reactions to vehicle

**ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS**

#### Clotrimazole

**INDICATIONS AND DOSE**
- **Fungal infection in otitis externa**
  - **TO THE EAR**
  - **Child:** Apply 2–3 times a day continue for at least 14 days after disappearance of infection

**SIDE-EFFECTS**
- Local irritation · local sensitivity

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- **Liquid**
  - Canesten (clotrimazole)
  - Clotrimazole 10 mg per 1 ml

**EXCIPIENTS:**
- May contain Benzalkonium chloride

**CORTICOSTEROIDS**

#### Betamethasone

**INDICATIONS AND DOSE**
- **Bacterial infection in otitis externa**
  - **TO THE EAR**
  - **Child:** Apply 2–3 drops every 2–3 hours, reduce frequency when relief obtained

**SIDE-EFFECTS**
- Avoid alone in the presence of untreated infection (combine with suitable anti-infective)

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- **Ear drops**
  - EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
  - Betnesol (Focus Pharmaceuticals Ltd)

**EXCIPIENTS:**
- May contain Benzalkonium chloride, disodium edetate

**SIDE-EFFECTS**
- Local sensitivity reactions

**CAUTIONS**
- Avoid prolonged use

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- **Ear/eye/nose drops solution**
  - EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate
  - Betnesol (Focus Pharmaceuticals Ltd)
Vistamethasone (Marindale Pharmaceuticals Ltd)
Betamethasone sodium phosphate 1 mg per 1 ml
Vistamethasone 0.1% ear/eye/nose drops | 5 ml £0.87 | 10 ml £0.99 DT
price = £2.32

Combinations available: Betamethasone with neomycin, below

Clioquinol with flumetasone pivalate

**INDICATIONS AND DOSE**

**Eczematous inflammation in otitis externa**

**Mild bacterial or fungal infections in otitis externa**

**TO THE EAR**

**Child 2-17 years:** 2–3 drops twice daily for 7–10 days, to be instilled into the ear

**CONTRA-INDICATIONS**

Iodine sensitivity

**CAUTIONS**

Avoid prolonged use; manufacturer advises avoid in perforated tympanic membrane (but used by specialists for short periods)

**SIDE-EFFECTS**

Local sensitivity

**PATIENT AND CARER ADVICE**

Clioquinol stains skin and clothing

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ear drops**

Clioquinol with flumetasone pivalate (Non-proprietary)

Flumetasone pivalate 200 microgram per 1 ml, Clioquinol 10 mg per 1 ml

Flumetasone 0.02% / Clioquinol 1% ear drops | 7.5 ml £0.37 DT price = £1.37 | 10 ml £1.82 DT price = £1.82

Prednisolone

**INDICATIONS AND DOSE**

**Eczematous inflammation in otitis externa**

**TO THE EAR**

**Child:** Apply 2–3 drops every 2–3 hours, frequency to be reduced when relief obtained

**CONTRA-INDICATIONS**

Avoid alone in the presence of untreated infection (combine with suitable anti-infective)

**CAUTIONS**

Avoid prolonged use

**SIDE-EFFECTS**

Local sensitivity reactions

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ear drops

**Ear/eye drops solution**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

Prednisolone sodium phosphate 5 mg per 1 ml

Prednisol 0.5% ear/e眼 drops | 10 ml £2.00 DT price = £2.00

**CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIONES**

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 645, neomycin sulfate p. 644.

**CONTRA-INDICATIONS**

Patent grommet (although may be used by specialists, see Ear p. 643) • perforated tympanic membrane (although may be used by specialists, see Ear p. 643)

**CAUTIONS**

When used by ear Avoid prolonged use

**SIDE-EFFECTS**

When used by ear Local sensitivity

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ear/eye/nose drops solution**

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml

Betnesol-N (Focus Pharmaceuticals Ltd)

Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml

Betnesol-N ear/eye/nose drops | 10 ml £2.39 DT price = £2.39

**LESS SUITABLE FOR PRESCRIBING**

Sofradex® is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ear/eye drops solution**

EXCIPIENTS: May contain Polysorbates

Sofradex (Sanofi)

Gramicidin 50 microgram per 1 ml, Dexamethasone (as Dexamethasone sodium metasulfobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml

Sofradex ear/eye drops | 10 ml £7.50

**Dexamethasone with framycetin sulfate and gramicidin**

The properties listed below are those particular to the combination only. For the properties of the components please consider, framycetin sulfate p. 644.

**INDICATIONS AND DOSE**

**Eczematous inflammation in otitis externa**

**TO THE EAR**

**Child:** 2–3 drops 3–4 times a day

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ear/eye drops solution**

EXCIPIENTS: May contain Polysorbates

Sofradex (Sanofi)

Gramicidin 50 microgram per 1 ml, Dexamethasone (as Dexamethasone sodium metasulfobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml

Sofradex ear/eye drops | 10 ml £7.50

**Dexamethasone with glacial acetic acid and neomycin sulfate**

**INDICATIONS AND DOSE**

**Eczematous inflammation in otitis externa**

**TO THE EAR**

**Child 17 years:** Apply 1 spray 3 times a day

**CONTRA-INDICATIONS**

Patent grommet (although may be used by specialists, see Ear p. 643) • perforated tympanic membrane (although may be used by specialists, see Ear p. 643)

**CAUTIONS**

Avoid prolonged use

**SIDE-EFFECTS**

Local sensitivity

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Spray**

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

Otomize (Forest Laboratories UK Ltd)

Dexamethasone 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram

Acetic acid glacial 20 mg per 1 gram

Otomize ear spray | 5 ml £1.27
DERMATOLOGICAL DRUGS  ASTRINGENTS

Aluminium acetate

● INDICATIONS AND DOSE

Inflammation in otitis externa

► TO THE EAR
► Child: To be inserted into meatus or apply on a ribbon gauze dressing or sponge wick which should be kept saturated with the ear drops

● UNLICENSED USE

Not licensed for use in children.

● DIRECTIONS FOR ADMINISTRATION

For ear drops 8%—dilute 8 parts aluminium acetate ear drops (13%) with 5 parts purified water. Must be freshly prepared.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ear drops

2 Removal of ear wax

BICARBONATE

Sodium bicarbonate

● INDICATIONS AND DOSE

Removal of ear wax (with 5% ear drop solution)

► TO THE EAR
► Child: (consult product literature)

● SIDE-EFFECTS

Dryness of the ear canal

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear drops

► Sodium bicarbonate (Non-proprietary)
  Sodium bicarbonate 50 mg per 1 ml  Sodium bicarbonate 5% ear drops  10 ml  £1.23–£1.25

SOFTENING DRUGS

Almond oil

● INDICATIONS AND DOSE

Removal of ear wax

► TO THE EAR
► Child: Allow drops to warm to room temperature before use (consult product literature)

● DIRECTIONS FOR ADMINISTRATION

The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Liquid

► Almond oil (Non-proprietary)
  Almond oil 1 ml per 1 ml  Almond oil liquid  50 ml  £0.85  70 ml  £0.73  200 ml  £2.01–£2.37  500 ml  £11.67

2001

Arachis oil with chlorobutanol

● INDICATIONS AND DOSE

Removal of ear wax

► TO THE EAR
► Child 1–17 years: (consult product literature)

● LESS SUITABLE FOR PRESCRIBING

Arachis (peanut) oil with chlorobutanol ear drops are less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear drops

► Cerumenol (Thornton & Ross Ltd)
  Chlorobutanol 50 mg per 1 ml  Arachis oil 573 mg per 1 ml  Cerumenol ear drops  11 ml  £2.05

Docusate sodium

(Dioctyl sodium sulphonate)

● INDICATIONS AND DOSE

Removal of ear wax

► TO THE EAR
► Child 1–17 years: (consult product literature)

● LESS SUITABLE FOR PRESCRIBING

Ear drops less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear drops

► EXCIPIENTS: May contain Propylene glycol
  Molcer (Wallace Manufacturing Chemists Ltd)
  Docusate sodium 50 mg per 1 ml  Molcer ear drops  15 ml  £8.08
  Waxsol (Meda Pharmaceuticals Ltd)
  Docusate sodium 5 mg per 1 ml  Waxsol ear drops  10 ml  £1.95 DT price = £1.95

Olive oil

● INDICATIONS AND DOSE

Removal of ear wax

► TO THE EAR
► Child: Apply twice daily for several days (if wax is hard and impacted)

● DIRECTIONS FOR ADMINISTRATION

The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Allow ear drops to warm to room temperature before use.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear drops

► Olive oil (Non-proprietary)
  Olive oil ear drops  10 ml  £1.42  20 ml  £2.70

  Earol olive oil ear spray  10 ml  no price available
Urea hydrogen peroxide

- INDICATIONS AND DOSE
  - Softening and removal of earwax
    - TO THE EAR
      - Child: (consult product literature)
  - LESS SUITABLE FOR PRESCRIBING
    - Urea-hydrogen peroxide ear drops are less suitable for prescribing.

- PATIENT AND CARER ADVICE
  - The patient should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

  - Ear drops
    - Exterol (Dermal Laboratories Ltd)
      - Urea hydrogen peroxide 50 mg per 1 gram
        - 8 ml: £1.75 DT price = £2.89
    - Otex (Bendron Ltd)
      - Urea hydrogen peroxide 50 mg per 1 gram
        - 8 ml: £2.89 DT price = £2.89

Nose

Rhinitis and bacterial sinusitis
Rhinitis is often self-limiting but bacterial sinusitis may require treatment with antibacterials. Many nasal preparations contain sympathomimetic drugs which can give rise to rebound congestion (rhinitis medicamentosa) and may damage the nasal cilia. Sodium chloride 0.9% solution p. 547 may be used as a douche or ‘sniff’ following endonasal surgery.

Administration
To administer nasal drops, lay the child face-upward with the neck extended, instil the drops, then sit the child up and tilt the head forward.

Drugs used in nasal allergy
Mild allergic rhinitis is controlled by antihistamines (see Under Antihistamines, allergen immunotherapy and allergic emergencies p. 162) or topical nasal corticosteroids; systemic nasal decongestants are not recommended for use in children. Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms can be relieved by topical nasal corticosteroids; sodium cromoglicate p. 654 is an alternative, but may be less effective. The topical antihistamine, azelastine hydrochloride, is useful for controlling breakthrough symptoms in allergic rhinitis. Azelastine hydrochloride is less effective than nasal corticosteroids, but probably more effective than sodium cromoglicate. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous long-term treatment may be required in perennial rhinitis.

Montelukast p. 155 is less effective than topical nasal corticosteroids; it can be used in children with seasonal allergic rhinitis (unresponsive to other treatments) and concomitant asthma.

Children with disabling symptoms of seasonal rhinitis (e.g. students taking important examinations), may be treated with oral corticosteroids for short periods. Oral corticosteroids may also be used at the beginning of a course of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal mucosa.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal ipratropium bromide p. 651 can reduce watery rhinorrhoea.

Corticosteroids

Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, after nasal surgery (until healing has occurred), and in pulmonary tuberculosis. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

Nasal polyps
Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the child in the ‘head down’ position. A short course of a systemic corticosteroid may be required initially to shrink large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

Pregnancy
If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclometasone dipropionate p. 652, budesonide p. 652, fluticasone p. 652, or sodium cromoglicate may be considered.

Topical nasal decongestants
Sodium chloride 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions in children with rhinitis. In infants, 1–2 drops of sodium chloride 0.9% solution in each nostril before feeds will help relieve congestion and allow more effective suckling.

Inhalation of warm moist air is useful in the treatment of symptoms of acute nasal congestion in infants and children, but the use of boiling water for steam inhalation is dangerous for children and should not be recommended. Volatile substances such as menthol and eucalyptus may encourage inhalation of warm moist air (see also Aromatic inhalations, cough preparations and systemic nasal decongestants p. 176).

Topical nasal decongestants containing sympathomimetics can cause rebound congestion (rhinitis medicamentosa) following prolonged use (more than 7 days), and are therefore of limited value in the treatment of nasal congestion.

Epinephrine hydrochloride nasal drops p. 649 is the least likely of the sympathomimetic nasal decongestants to cause rebound congestion and can provide relief for several hours. The more potent sympathomimetic drugs oxymetazoline and xylometazoline hydrochloride p. 650 are more likely to cause a rebound effect.

Non-allergic watery rhinorrhoea often responds well to treatment with the antimuscarinic ipratropium bromide.

Recurrent, persistent bleeding may respond to the use of a sympathomimetic nasal spray; if infection is present, chlorhexidine and neomycin (Naseptin®) cream may be effective.

Sinusitis and oral pain

Sinusitis affecting the maxillary antrum can cause pain in the upper jaw. Where this is associated with blockage of the opening from the sinus into the nasal cavity, it may be helpful to relieve the congestion with inhalation of warm moist air or with ephedrine hydrochloride nasal drops.
Systemic antibacterials may sometimes be required for sinusitis (see under Nose infections, bacterial p. 289).

**Nasal preparations for infection**

There is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis; see elimination of nasal staphylococci. In children, acute complications such as periorbital cellulitis require hospital treatment.

**Nasal staphylococci**

Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing chlorhexidine and neomycin (Naseptin®), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population.

A nasal ointment containing mupirocin p. 650 is also available; it should probably be held in reserve for resistant infections. In hospitals or in care establishments, mupirocin nasal ointment should be reserved for the eradication (in both patients and staff) of nasal carriage of meticillin-resistant *Staphylococcus aureus* (MRSA). A sample should be taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more than one occasion. If the MRSA strain is mupirocin-resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream.

For eradication of MRSA also consult local infection control policy. See also MRSA p. 339.

---

### 1 Nasal congestion

**SYMPATHOMIMETICS → VASOCONSTRICTOR**

#### Ephedrine hydrochloride

**INDICATIONS AND DOSE**

**Nasal congestion** | Sinusitis affecting the maxillary antrum
---|---
**BY INTRanasal ADMINISTRATION** | **BY INTRanasal ADMINISTRATION**
| Child 6–11 years: | Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril, administer ephedrine 0.5% nasal drops

**IMPORTANT SAFETY INFORMATION**

**CHM/MHRA ADVICE**

The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine can be considered for use for up to 5 days’ treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

**CAUTIONS**

Avoid excessive or prolonged use - cardiovascular disease - diabetes mellitus - hypertension - hyperthyroidism

**INTERACTIONS** → Appendix 1 (sympathomimetics).

**SIDE-EFFECTS**

- **Common or very common** Headache - nausea
- **Frequency not known** After excessive use tolerance with diminished effect - cardiovascular effect - local irritation - rebound congestion
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.

**PRESCRIBING AND DISPENSING INFORMATION**

For nasal drops, the BP directs that if no strength is specified 0.5% drops should be supplied.

**PROFESSION SPECIFIC INFORMATION**

**Dental practitioners’ formulary**

Ephedrine nasal drops may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY**

Ephedrine nasal drops can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: nasal drops

**Nasal drops**

- Ephedrine hydrochloride (Non-proprietary)
  - Ephedrine hydrochloride 5 mg per 1 ml Ephedrine 0.5% nasal drops | 10 ml | £1.73–£1.75 DT price + £1.74
  - Ephedrine hydrochloride 10 mg per 1 ml Ephedrine 1% nasal drops | 10 ml | £1.79–£1.81 DT price + £1.80

---

### Pseudoephedrine hydrochloride

#### INDICATIONS AND DOSE

Congestion of mucus membranes of upper respiratory tract

- **BY MOUTH**
  - Child 6–11 years: 30 mg 3–4 times a day
  - Child 12–17 years: 50 mg 3–4 times a day

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009): OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN**

Children under 6 years should not be given over-the-counter cough and cold medicines containing pseudoephedrine.

**CAUTIONS**

Diabetes - heart disease - hypertension - hyperthyroidism - raised intra-ocular pressure

**INTERACTIONS** → Appendix 1 (sympathomimetics).

Contra-indicated in patients taking monoamine oxidase inhibitors within the previous 2 weeks.

**SIDE-EFFECTS**

- **Common or very common** Anxiety - headache - hypertension - insomnia - nausea - restlessness - tachycardia - vomiting
- **Rare** Hallucinations - rash
- **Very rare** Angle-closure glaucoma
- **Frequency not known** Urinary retention

**PREGNANCY**

Defective closure of the abdominal wall (gastroschisis) reported very rarely in newborns after first trimester exposure.

**BREAST FEEDING**

May suppress lactation; avoid if lactation not well established or if milk production insufficient.

**HEPATIC IMPAIRMENT**

Manufacturer advises use with caution in severe impairment.

**RENAL IMPAIRMENT**

Use with caution in mild to moderate renal impairment. Manufacturer advises avoid in severe renal impairment.

**LESS SUITABLE FOR PRESCRIBING**

Pseudoephedrine hydrochloride is less suitable for prescribing.

**EXCEPTIONS TO LEGAL CATEGORY**

Galpseud® and Sudafed® can be sold to the public provided no more than 720 mg of pseudoephedrine salts are supplied, and ephedrine base (or salts) are not supplied at the same time; for details see...

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Pseudoephedrine hydrochloride (Non-proprietary)**
  - Pseudoephedrine hydrochloride 60 mg tablets | 12 tablet | no price available
  - Galpseud (Thorton & Ross Ltd)

- **Pseudoephedrine hydrochloride 60 mg** Galpseud 60mg tablets | 24 tablet | £2.25 | 100 tablet | £5.42 | 1st price = £5.42

- **Sudafed Non-Drowsy Decongestant (pseudoephedrine)** (McNeil Products Ltd)
  - Pseudoephedrine hydrochloride 60 mg Sudafed Decongestant 60mg tablets | 12 tablet | £2.04

**Oral solution**

EXCIPIENTS: May contain Alcohol

- **Pseudoephedrine hydrochloride (Non-proprietary)**
  - Pseudoephedrine hydrochloride 6 mg per 1 ml Decongestant 30mg/5ml oral liquid sugar-free | 100 ml | £1.57 | 1st price = £1.57

- **Galpseud** (Thorton & Ross Ltd)
  - Pseudoephedrine hydrochloride 6 mg per 1 ml Galpseud 30mg/5ml linctus sugar-free | 2000 ml | £14.00

- **Sudafed Non-Drowsy Decongestant (pseudoephedrine)** (McNeil Products Ltd)
  - Pseudoephedrine hydrochloride 6 mg per 1 ml Sudafed Decongestant 30mg/5ml liquid | 100 ml | £1.92

**Xylometazoline hydrochloride**

**DRUG ACTION**

Xylometazoline is a sympathomimetic.

**INDICATIONS AND DOSE**

**Nasal congestion**

- **BY INTRanasal ADMINISTRATION USING NASAL DROPS**
  - Child 6–11 years: 1–2 drops 1–2 times a day as required for maximum duration of 5 days, 0.00% solution to be administered into each nostril
  - Child 12–17 years: 2–3 drops 2–3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each nostril

- **BY INTRanasal ADMINISTRATION USING NASAL SPRAY**
  - Child 12–17 years: 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril

**IMPORTANT SAFETY INFORMATION**

The CHM/MHRA has stated that non-prescription cough and cold medicines containing oxymetazoline or xylometazoline can be considered for up to 5 days’ treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

**CAUTIONS**

- Angle-closure glaucoma
- Excessive or prolonged use
- Cardiovascular disease
- Diabetes mellitus
- Hypertension
- Hyperthyroidism
- Rebound congestion

**SIDE-EFFECTS**

Carotid vascular effects - hallucinations in small children - headache - local irritation - nausea - rebound congestion - restlessness in small children - sleep disturbances in small children - tolerance with diminished effect (after excessive use) - transient visual disturbances

**REBOUND CONGESTION**

Can, following prolonged use (more than 7 days), give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events.

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hallucinations (in small children) - Discontinue treatment if the hallucinations occur.
- **PREGNANCY**
  - Manufacturer advises avoid.
- **BREAST FEEDING**
  - Manufacturer advises caution—no information available.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- Otrivine (Novartis Consumer Health UK Ltd)

There can be variation in the licensing of different medicines containing the same drug.

**Spray**

- **EXCIPIENTS**: May contain Benzalkonium chloride, disodium edetate
- Betamethasone with neomycin nasal-drops are less suitable for prescribing; there can be variation in the licensing of different medicines containing the same drug.

**SIDE-EFFECTS, FURTHER INFORMATION**

- Systemic absorption: Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; therefore also consider the cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

**SIDE-EFFECTS**

- Rare: Glaucma · raised intra-ocular pressure
- Very rare: Nasal septal perforation (usually following nasal surgery)

- Frequency not known: Aggression (particularly in children) · anxiety (particularly in children) · bronchospasm · depression (particularly in children) · dryness · epistaxis · headache · hyperactivity (particularly in children) · hypersensitivity reactions · nasal irritation · nasal ulceration · sleep disturbances (particularly in children) · smell disturbances · taste disturbances · throat irritation

- **Systemic absorption** Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged. Therefore also consider the side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

**CAUTIONS**

- Avoid after nasal surgery (until healing has occurred) · avoid in pulmonary tuberculosis · avoid in the presence of untreated nasal infections · patients transferred from systemic corticosteroids may experience exacerbation of some symptoms

**MONITORING REQUIREMENTS**

The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

**SIDE-EFFECTS**

- Common or very common: Epistaxis · nasal dryness · nasal irritation
- Uncommon: Headache · nausea
- Very rare: Gastro-intestinal motility disturbances · palpitations · urinary retention
Beclometasone dipropionate
(Beclometasone dipropionate)

**INDICATIONS AND DOSE**

Prophylaxis and treatment of allergic and vasomotor rhinitis
- **By intranasal administration**
  - Child 6-17 years: 100 micrograms twice daily, dose to be administered into each nostril, reduced to 50 micrograms twice daily, dose to be administered into each nostril, to be reduced when symptoms controlled; maximum 400 micrograms per day

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Spray
- **Excipients:** May contain Benzalkonium chloride, polysorbates
  - **Beclometasone dipropionate (Non-proprietary)**
    - Beclometasone dipropionate 50 microgram per 1 dose
      - **Dose:** Beclometasone 50 micrograms/dose nasal spray
      - **Price:** £2.02
  - **Nasobec (Teva UK Ltd)**
    - Beclometasone dipropionate 50 microgram per 1 dose
      - **Dose:** Nasobec Aquous 50 micrograms/dose nasal spray
      - **Price:** £2.02
  - **Polienase (beclometasone) (E M Pharma)**
    - Beclometasone dipropionate 50 microgram per 1 dose
      - **Dose:** Pollenase Hayfever 50 micrograms/dose nasal spray
      - **Price:** £2.02

Betamethasone

**INDICATIONS AND DOSE**

**BETNESOL**

Non-infected inflammatory conditions of nose
- **By intranasal administration**
  - Child: Apply 2–3 drops 2–3 times a day, dose to be applied into each nostril

**VISTAMETHASONE**

Non-infected inflammatory conditions of nose
- **By intranasal administration**
  - Child: Apply 2–3 drops twice daily, dose to be applied into each nostril

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ear/eye/nose drops solution**
- **Excipients:** May contain Benzalkonium chloride, disodium edetate
  - **Betnesol (Focus Pharmaceuticals Ltd)**
    - Betamethasone sodium phosphate 1 mg per 1 ml
      - **Dose:** Betnesol Solution 1.0 mg/ml
      - **Price:** £3.22
  - **Vistamethasone (Martindale Pharmaceuticals Ltd)**
    - Betamethasone sodium phosphate 1 mg per 1 ml
      - **Dose:** Vistamethasone 0.1% ear/eye/nose drops
      - **Price:** £2.22

Fluticasone

**INDICATIONS AND DOSE**

Prophylaxis and treatment of allergic rhinitis and perennial rhinitis
- **By intranasal administration using nasal spray**
  - Child 4–11 years: 50 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 50 micrograms twice daily
  - Child 12-17 years: 100 micrograms once daily, to be administered into each nostril preferably in the morning, increased if necessary to 100 micrograms twice daily; reduced to 50 micrograms once daily, dose to be administered into each nostril, dose to be reduced when control achieved

**Nasal polyps**
- **By intranasal administration using nasal spray**
  - Child 16-17 years: 200 micrograms 1–2 times a day, to be administered into each nostril, alternative
Fluticasone with azelastine

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluticasone p. 652.

**INDICATIONS AND DOSE**
Moderate to severe seasonal and perennial allergic rhinitis, if monotherapy with antihistamine or corticosteroid is inadequate

- Child 12-17 years: 1 spray twice daily, dose to be administered into each nostril
Oropharynx

1 Dry mouth

Treatment of dry mouth

Overview
Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. antispasmodics and sedating antihistamines), by irradiation of the head and neck region or by damage to or disease of the salivary glands. Children with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene; they may develop dental caries, periodontal disease, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates saliva and may be prescribed as Artifical Saliva Gel. Artificial saliva products can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate.

Artificial saliva products

**ARTIFICIAL SALIVA PRODUCTS**

**AS SALIVA ORTHANA**

*Lozenges*

- **AS Saliva Orthana**
  - lozenges do not contain fluoride.
  - *AS Saliva Orthana lozenges (A S Pharma Ltd)*
  - 30 lozenges: NHS indicative price = £3.50

**Spray**

- *AS SALIVA ORTHANA**
  - **Spray**
    - Gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral.

**INDICATIONS AND DOSE**

- **AS SALIVA ORTHANA**
  - **Spray**
    - Dry mouth as a result of having (or having undergone) radiotherapy | Sicca syndrome
      - **BY MOUTH**
        - Child: 1 lozenge as required, allow to dissolve slowly in the mouth
      - **PREScribing AND DISPensing INFORMATION**
        - AS Saliva Orthana **lozenges do not contain fluoride.**
        - *AS Saliva Orthana lozenges (A S Pharma Ltd)*
        - 30 lozenges: NHS indicative price = £3.50

**INDICATIONS AND DOSE**

- **Symptomatic treatment of dry mouth**
  - **BY MOUTH**
    - Child: Apply 2–3 sprays as required, spray onto oral and pharyngeal mucosa

**PREScribing AND DISPensing INFORMATION**

- Dental practitioners’ formulary
  - *AS Saliva Orthana** Oral Spray may be prescribed.

**Mucedo**

- **Gel**
  - Lactoperoxidase, lactoferrin, lysozyme, whey colostrum, xylitol and other ingredients.

**INDICATIONS AND DOSE**

- **Dry mouth as a result of having (or having undergone) radiotherapy (ACBS)**: Dry mouth as a result of sicca syndrome (ACBS)
  - **BY MOUTH**
    - Child: Apply as required, apply to oral mucosa

**PREScribing AND DISPensing INFORMATION**

- Dental practitioners’ formulary
  - BioXtra** Gel may be prescribed.
  - *BioXtra moisturising gel for dry mouths (R.I.S. Products Ltd)*
    - 40 ml: NHS indicative price = £3.94

**Biotene Oralbalance**

- **Gel**
  - Lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis

**INDICATIONS AND DOSE**

- **Symptomatic treatment of dry mouth**
  - **BY MOUTH**
    - Child: Apply as required, apply to gums and tongue

**PREScribing AND DISPensing INFORMATION**

- Dental practitioners’ formulary
  - Biotene Oralbalance** Saliva Replacement Gel may be prescribed as Artificial Saliva Gel.
  - *Biotene Oralbalance dry mouth saliva replacement gel (GlaxoSmithKline Consumer Healthcare)*
    - Glucose oxidase 12000 unit, Lactoferrin 12 mg, Lactoperoxidase 12000 unit, Muramidase 12 mg
    - 50 gram: NHS indicative price = £4.46 - Drug Tariff (Part IXa)
2 Oral hygiene

Mouthwashes and other preparations for oropharyngeal use

Lozenges and sprays

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

Mouthwashes and gargles

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. Mouthwashes may not be suitable for children under 7 years (risk of the solution being swallowed); the mouthwash or dental gel may be applied using a cotton bud.

A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting compound sodium chloride mouthwash p. 657 with an equal volume of warm water. Mouthwashes containing an oxidising agent, such as hydrogen peroxide p. 657, may be useful in the treatment of acute ulcerative gingivitis (Vincent’s infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris. Concentrations greater than 1.5% in children may cause ulceration and tissue damage.

Chlorhexidine p. 656 is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover,
chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed. Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis. With prolonged use, chlorhexidine causes reversible brown staining of teeth and tongue. Chlorhexidine may be incompatible with some ingredients in toothpaste, causing an unpleasant taste in the mouth; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing products.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the patient has a haemorrhagic disorder, or is disabled. Chlorhexidine mouthwash is used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in children undergoing dental procedures.

### Antiseptics and Disinfectants

#### Chlorhexidine

- **Indications and Dose**
  - Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of apthous ulcers
    - By mouth using mouthwash
      - Child: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)
  - Oral hygiene and plaque inhibition and gingivitis
    - By mouth using dental gel
      - Child: Apply 1–2 times a day, to be brushed on the teeth
  - Oral candidiasis | Management of apthous ulcers
    - By mouth using dental gel
      - Child: Apply 1–2 times a day, to affected areas
  - Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of apthous ulcers
    - By mouth using oromucosal spray
      - Child: Apply up to 12 sprays twice daily as required, to be applied tooth, gingival, or ulcer surfaces
  - Bladder irrigation and catheter patency solutions
    - By intravesical instillation
      - Child: (consult product literature)

- **Unlicensed Use**
  - Corsodyl® not licensed for use in children under 12 years (unless on the advice of a healthcare professional).

- **Side-Effects**
  - Anaphylaxis | hypersensitivity | mucosal irritation | parotid gland swelling | reversible brown staining of composite restorations | reversible brown staining of silicate compositions | reversible brown staining of teeth | taste disturbance | tongue discoloration

- **Side-Effects, Further Information**
  - If desquamation occurs with mucosal irritation, discontinue treatment or dilute mouthwash with an equal volume of water.

- **Patient and Carer Advice**
  - Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing product.

#### Chlorhexidine with Chlorobutanol

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine above.

- **Indications and Dose**
  - Oral hygiene and plaque inhibition
    - By mouth using mouthwash
      - Child 6–17 years: Rinse or gargle 10–15 mL 2–3 times a day, to be diluted with lukewarm water in measuring cup provided

- **Prescribing and Dispensing Information**
  - Flavours of mouthwash may include mint.

#### Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

- **Dental Gel**
  - Corsodyl (GlaxoSmithKline Consumer Healthcare)
    - Chlorhexidine gluconate 10 mg per 1 gram Corsodyl 1% dental gel sugar-free | 50 gram | £1.26 DT price = £1.26

- **Mouthwash**
  - Chlorhexidine (Non-proprietary)
    - Chlorhexidine gluconate 2 mg per 1 mL Chlorhexidine gluconate 0.2% mouthwash natural | 300 mL | £3.65 DT price = £3.48
    - Chlorhexidine gluconate 0.2% mouthwash | 300 mL | £1.99–£2.09
    - Chlorhexidine gluconate 0.2% mouthwash plain | 300 mL | £3.48
    - Chlorhexidine gluconate 0.2% mouthwash peppermint | 300 mL | £3.65 DT price = £3.48
    - Chlorhexidine gluconate 0.2% mouthwash alcohol free | 300 mL | £3.48
      - no price available DT price = £3.48 | 500 mL | £3.48
  - Corsodyl (GlaxoSmithKline Consumer Healthcare)
    - Chlorhexidine gluconate 2 mg per 1 mL Corsodyl 0.2% mouthwash aniseed | 300 mL | £2.44 DT price = £3.48
    - Corsodyl Mint 0.2% mouthwash | 300 mL | £2.44 DT price = £3.48 | 600 mL | £4.76
    - Corsodyl 0.2% mouthwash alcohol free | 300 mL | £3.06 DT price = £3.48
  - Curasept (Curaprox (UK) Ltd)
    - Chlorhexidine gluconate 2 mg per 1 mL Curasept 0.2% oral rinse | 200 mL | no price available

- **Irrigation**
  - Chlorhexidine (Non-proprietary)
    - Chlorhexidine acetate 200 microgram per 1 mL Chlorhexidine acetate 0.02% catheter maintenance solution | 100 mL | £0.68
  - Uro-Tainer (chlorhexidine) (B.Braun Medical Ltd)
    - Chlorhexidine acetate 200 microgram per 1 mL Uro-Tainer chlorhexidine 1:5000 catheter maintenance solution | 100 mL | £2.70
Hexetidine

- **INDICATIONS AND DOSE**
  - **Oral hygiene**
    - *By mouth using mouthwash*
    - Child 6–17 years: Rinse or gargle 15 mL 2–3 times a day, to be used undiluted

- **SIDE-EFFECTS**
  - Very rare: Taste disturbance, transient anaesthesia
  - Frequency not known: Local irritation

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - **Mouthwash**
      - Oralene (McNeil Products Ltd)
        - Hexetidine 1 mg per 1 mL Oralene Icemint 0.1% mouthwash sugar-free | 200 mL [G2] £2.21
        - Oralene 0.1% mouthwash peppermint sugar-free | 100 mL [G5] £1.43
        - [G5] 200 mL £2.21

- **DRUG ACTION**
  - Hydrogen peroxide is an oxidising agent.

- **INDICATIONS AND DOSE**
  - **Oral hygiene (with hydrogen peroxide 6%)**
    - **By mouth using mouthwash**
      - Child: Rinse or gargle 15 mL 2–3 times a day for 2–3 minutes, to be diluted in half a tumblerful of warm water
      - **PEROXYL®**
        - **Oral hygiene**
          - **By mouth using mouthwash**
            - Child 6–17 years: Rinse or gargle 10 mL 3 times a day for about 1 minute, for maximum 7 days, to be used after meals and at bedtime

- **SIDE-EFFECTS**
  - Hypertrophy of papillae of tongue on prolonged use

- **PRESCRIBING AND DISPENSING INFORMATION**
  - When prepared extemporaneously, the BP states Hydrogen Peroxide Mouthwash, BP consists of hydrogen peroxide 6% solution (= approx. 20 volume) BP.

- **HANDLING AND STORAGE**
  - Hydrogen peroxide bleaches fabric.

- **PROFESSION SPECIFIC INFORMATION**
  - **Dental practitioners’ formulary**
    - Hydrogen Peroxide Mouthwash may be prescribed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
    - **Mouthwash**
      - Peroxyl (Colgate-Palmolive (UK) Ltd)
        - Hydrogen peroxide 15 mg per 1 mL Peroxyl 1.5% mouthwash sugar-free | 300 mL [G5] £2.94

- **DIRECTIONS FOR ADMINISTRATION**
  - For mouthwash, extemporaneous preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL. To be diluted with an equal volume of warm water prior to administration.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Flavours of mouthwash may include peppermint.

- **PROFESSION SPECIFIC INFORMATION**
  - **Dental practitioners’ formulary**
    - Compound sodium chloride mouthwash may be prescribed.

Sodium chloride

- **INDICATIONS AND DOSE**
  - **Oral hygiene**
    - *By mouth using mouthwash*
    - Child: Rinse or gargle as required

- **DIRECTIONS FOR ADMINISTRATION**
  - Extemporaneous mouthwash preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL. To be diluted with an equal volume of warm water.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - No mouthwash preparations available—when prepared extemporaneously, the BP states Sodium Chloride Mouthwash, Compound, BP consists of sodium bicarbonate 1%, sodium chloride 1.5% in a suitable vehicle with peppermint flavour.

- **PROFESSION SPECIFIC INFORMATION**
  - **Dental practitioners’ formulary**
    - Compound Sodium Chloride Mouthwash may be prescribed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. No licensed preparations listed.

2.1 Dental caries

Fluoride

Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

When the fluoride content of drinking water is less than 700 micrograms per litre (0.7 parts per million), daily administration of fluoride tablets or drops provides suitable supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months. Dentifrices which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional protection by use of fluoride rinses or by application of fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than weekly use of a more concentrated one. High-strength gels must be applied regularly under professional supervision; extreme caution is necessary to prevent children from swallowing any excess.
Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.

**VITAMINS AND TRACE ELEMENTS**

### Sodium fluoride

#### INDICATIONS AND DOSE

**Prophylaxis of dental caries for water content less than 300 micrograms/litre (0.3 parts per million) of fluoride ion**
- **BY MOUTH USING TABLETS**
  - Child 6 months-2 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)
  - Child 3-5 years: 500 micrograms daily, doses expressed as fluoride ion (F⁻)
  - Child 6-17 years: 1 mg daily, doses expressed as fluoride ion (F⁻)

**Prophylaxis of dental caries for water content between 300 and 700 micrograms/litre (0.3-0.7 parts per million) of fluoride ion**
- **BY MOUTH USING TABLETS**
  - Child 6 months-17 years: Supplements not advised

**Prophylaxis of dental caries for water content above 700 micrograms/litre (0.7 parts per million) of fluoride ion**
- **BY MOUTH USING TABLETS**
  - Child 6 months-17 years: Supplements not advised

**Prophylaxis of dental caries for individuals who are caries prone or medically compromised**
- **BY MOUTH USING PASTE**
  - Child 6-17 years: Rinse or gargle 10 mL daily

**COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE**

**Prophylaxis of dental caries**
- **BY MOUTH USING PASTE**
  - Child 10-17 years: Apply 1 centimetre twice daily, to be applied using a toothbrush

**COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE**

**Prophylaxis of dental caries**
- **BY MOUTH USING PASTE**
  - Child 16-17 years: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush

**ENDEKAY® FLUORINSE**

**Prophylaxis of dental caries for individuals who are caries prone or medically compromised**
- **BY MOUTH USING MOUTHWASH**
  - Child 8-17 years: 5 drops daily, dilute 5 drops to 10 mL of water, alternatively 20 drops once weekly, dilute 20 drops to 10 mL

**DOSE EQUIVALENCE AND CONVERSION**

Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion.

These doses reflect the recommendations of the British Dental Association, the British Society of Paediatric Dentistry and the British Association for the Study of Community Dentistry (Br Dent J 1997; 182: 6–7).

#### CONTRA-INDICATIONS

Not for areas where drinking water is fluoridated

#### SIDE-EFFECTS

- **Uncommon** Occasional white flecks on teeth with recommended doses
- **Rare** Yellowish-brown discoloration if recommended doses are exceeded

#### DIRECTIONS FOR ADMINISTRATION

Tablets should be sucked or dissolved in the mouth and taken preferably in the evening. For mouthwash, rinse mouth for 1 minute and then spit out.

**COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE** Brush teeth for 1 minute before spitting out.

**COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE** Brush teeth for 3 minutes before spitting out.

#### PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral tablet formulations may include orange.

#### PATIENT AND CARER ADVICE

**Mouthwash** Avoid eating, drinking, or rinsing mouth for 15 minutes after use.

**COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE** Patients or carers should be given advice on how to administer sodium fluoride toothpaste. Avoid drinking or rinsing mouth for 30 minutes after use.

**COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE** Patients or carers should be given advice on how to administer Sodium fluoride toothpaste.

#### PROFESSION SPECIFIC INFORMATION

**Dental practitioners’ formulary**

Tablets may be prescribed as Sodium Fluoride Tablets. Oral drops may be prescribed as Sodium Fluoride Oral Drops.

Mouthwashes may be prescribed as Sodium Fluoride Mouthwash 0.05% or Sodium Fluoride Mouthwash 2%.

**COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE**

May be prescribed as Sodium Fluoride Toothpaste 0.619%.

**COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE**

May be prescribed as Sodium Fluoride Toothpaste 1.1%.

#### Dental information

Fluoride mouthwash, oral drops, tablets and toothpaste are prescriptionable on form FP10D (GP14 in Scotland, WP10D in Wales).

There are also arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes.

Fluoride gels are not prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **Endekay (Manx Healthcare Ltd)**
  - Sodium fluoride 1.1 mg: Endekay Fluotabs 3-6 Years 1.1mg tablets | 200 tablet | £2.38 DT price = £2.38
  - Sodium fluoride 2.2 mg: Endekay Fluotabs 6+ Years 2.2mg tablets | 200 tablet | £2.38 DT price = £2.38

**Chewable tablet**

- **Fluor-a-day (Dental Health Products Ltd)**
  - Sodium fluoride 1.1 mg: Fluor-a-day 1.1mg chewable tablets sugar-free | 200 tablet | £2.79 DT price = £2.79
  - Sodium fluoride 2.2 mg: Fluor-a-day 2.2mg chewable tablets sugar-free | 200 tablet | £2.79 DT price = £2.79

**Oral drops**

- **Endekay (Manx Healthcare Ltd)**
  - Sodium fluoride 3.7 mg per 1 ml: Endekay Fluodrops 0.37% drops paediatric sugar-free | 60 ml | £2.38 DT price = £2.38

**Paste**

- **Colgate Duraphat (Colgate-Palmolive (UK) Ltd)**
  - Fluoride (as Sodium Fluoride) 2.8 mg per 1 gram: Colgate Duraphat 2800ppm fluoride toothpaste sugar-free | 75 ml | £3.26 DT price = £3.26
  - Fluoride (as Sodium Fluoride) 5 mg per 1 gram: Colgate Duraphat 5000ppm fluoride toothpaste sugar-free | 51 gram | £6.50 DT price = £6.50
3 Oral ulceration and inflammation

Oral ulceration and inflammation

Ulceration and inflammation

Ulceration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthae, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy. It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Children with an unexplained mouth ulcer of more than 3 weeks’ duration require urgent referral to hospital to exclude oral cancer in adults or secondary causes such as leukaemia.

Simple mouthwashes

A saline mouthwash may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.

Antiseptic mouthwashes

Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of chlorhexidine mouthwash p. 656 is often beneficial and may accelerate healing of recurrent aphthae.

Corticosteroids

Topical corticosteroid therapy may be used for some forms of oral ulceration. In the case of aphthous ulcers it is most effective if applied in the ‘prodromal’ phase. Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

Hydrocortisone oromucosal tablets p. 661 are allowed to dissolve next to an ulcer and are useful in recurrent aphthae and erosive lichenoid lesions.

Beclometasone dipropionate inhaler p. 150 sprayed on the oral mucosa is used to manage oral ulceration [unlicensed indication]. Alternatively, betamethasone soluble tablets p. 660 dissolved in water can be used as a mouthwash to treat oral ulceration [unlicensed indication].

Systemic corticosteroid therapy (see under Corticosteroids, inflammatory disorders p. 616) is reserved for severe conditions such as pemphigus vulgaris.

Local analgesics

Local analgesics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration so that analgesia cannot be maintained continuously throughout the day. When local anaesthetics are used in the mouth, care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

Benzydamine hydrochloride p. 660 and flurbiprofen p. 660 are non-steroidal anti-inflammatory drugs (NSAIDs). Benzydamine hydrochloride mouthwash or spray may be useful in reducing the discomfort associated with a variety of ulcerative conditions. It has also been found to be effective in reducing the discomfort of tonsilllectomy and post-irradiation mucositis. Some patients find the full-strength mouthwash causes some stinging and, for them, it should be diluted with an equal volume of water. Flurbiprofen lozenges are licensed for the relief of sore throat in adolescents.

Choline salicylate p. 661 is a derivative of salicylic acid and has some analgesic action. The dental gel may provide relief for recurrent aphthae, but excessive application or confinement under a denture irritates the mucosa and can itself cause ulceration in adults and children over 16 years of age.

Other preparations

Doxycycline p. 662 rinsed in the mouth may be of value for recurrent aphthous ulceration.

Periodontitis

Low-dose doxycycline (Periostar®) is licensed as an adjunct to scaling and root planing for the treatment of periodontitis; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis.

For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see under Oropharyngeal bacterial infections p. 661. See also Mouthwashes and other preparations for oropharyngeal use p. 655 for mouthwashes used for oral hygiene and plaque inhibition.
**PROFESSION SPECIFIC INFORMATION**

**Dental practitioners’ formulary**

Benzydamine Oromucosal Spray 0.15% may be prescribed. Benzydamine mouthwash may be prescribed as Benzydamine Mouthwash 0.15%.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Ointment**
  - Lidocaine hydrochloride (Non-proprietary)
    - Lidocaine hydrochloride 50 mg per 1 gram
    - Lidocaine 5% ointment
      - 15 gram [P] £6.50 DT price = £6.18
  - Spray
    - Xylocaine
      - Xylocaine 10 mg per 1 actuation
        - Xylocaine 10mg/dose spray sugar-free
          - 50 ml [P] £6.29
  - Liquid
    - Laryngojet
      - Laryngojet (UCB Pharma Ltd)
        - Lidocaine hydrochloride 40 mg per 1 mL
          - Lidocaine 4% oromucosal solution
            - 1 pre-filled disposable injection [P30] £5.10

- **Analgesics > Non-steroidal anti-inflammatory drugs**

**Benzydamine hydrochloride**

- **INDICATIONS AND DOSE**
  - **Painful inflammatory conditions of oropharynx**
    - To the lesion using mouthwash
      - Child 13-17 years: Rinse or gargle 15 mL every 1.5–3 hours as required usually for not more than 7 days, dilute with an equal volume of water if stinging occurs
    - To the lesion using oromucosal spray
      - Child 1 month–5 years (body-weight 4–7 kg): 1 spray every 1.5–3 hours, to be administered onto the affected area
      - Child 1 month–5 years (body-weight 8–11 kg): 2 sprays every 1.5–3 hours, to be administered onto the affected area
      - Child 1 month–5 years (body-weight 12–15 kg): 3 sprays every 1.5–3 hours, to be administered onto the affected area
      - Child 1 month–5 years (body-weight 16 kg and above): 4 sprays every 1.5–3 hours, to be administered onto the affected area
      - Child 6–11 years: 4 sprays every 1.5–3 hours, to be administered onto affected area
      - Child 12–17 years: 4–8 sprays every 1.5–3 hours, to be administered onto affected area

- **SIDE-EFFECTS**
  - Rare
    - Hypersensitivity reactions
  - Frequency not known
    - Occasional numbness or stinging

**Flurbiprofen**

- **INDICATIONS AND DOSE**
  - **Relief of sore throat**
    - By mouth using lozenges
      - Child 12-17 years: 1 lozenge every 3–6 hours for maximum 3 days, allow lozenge to dissolve slowly in the mouth; maximum 5 lozenges per day
  - **INTERACTIONS** → Appendix 1 (NSAIDs).
  - **SIDE-EFFECTS**
    - Mouth ulcers (move lozenge around mouth)
    - Taste disturbance
  - **ALLERGY AND CROSS-SENSITIVITY**
    - Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

**Corticosteroids**

**Betamethasone**

- **INDICATIONS AND DOSE**
  - **Oral ulceration**
    - By mouth using soluble tablets
      - Child 12-17 years: 500 micrograms 4 times a day, to be dissolved in 20 mL water and rinsed around the mouth; not to be swallowed
  - **UNLICENSED USE**
    - Betamethasone soluble tablets not licensed for use as mouthwash or in oral ulceration.
  - **CONTRA-INDICATIONS**
    - Untreated local infection
  - **SIDE-EFFECTS**
    - Candidal infection - exacerbation of local infection
  - **PATIENT AND CARER ADVICE**
    - Patient counselling is advised for betamethasone soluble tablets (administration).
Oropharyngeal bacterial infections

Salicylic acid with rhubarb extract

**INDICATIONS AND DOSE**

**Mild oral and perioral lesions**
- To the lesion
- Child 16-17 years: Apply 3–4 times a day maximum duration 7 days

**CONTRA-INDICATIONS**
- Children under 16 years

**CONTRA-INDICATIONS, FURTHER INFORMATION**
- Reye's syndrome The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye’s syndrome.
- **CAUTIONS** Frequent application, especially in children, may give rise to salicylate poisoning
- **SIDE-EFFECTS** Transient local burning sensation
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Choline Salicylate Dental Gel, BP consists of choline salicylate 8.7% in a flavoured gel basis.
- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
  - Choline Salicylate Dental Gel may be prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Oromucosal gel**
  - Bonjela (Reckitt Benckiser Healthcare (UK) Ltd)
  - Choline salicylate 87 mg per 1 gram Bonjela Cool Mint gel sugar-free | 15 gram | £3.07 DT price = £2.58
  - Bonjela Original gel sugar-free | 15 gram | £2.58 DT price = £2.58

**SALICYLIC ACID AND DERIVATIVES**

**Choline salicylate**

**INDICATIONS AND DOSE**

**Mild oral and perioral lesions**
- To the lesion
- Child 16-17 years: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours

**CONTRA-INDICATIONS**
- Children under 16 years

**CONTRA-INDICATIONS, FURTHER INFORMATION**
- Reye’s syndrome The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye’s syndrome.
- **CAUTIONS** Frequent application, especially in children, may give rise to salicylate poisoning
- **SIDE-EFFECTS** Transient local burning sensation
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Choline Salicylate Dental Gel, BP consists of choline salicylate 8.7% in a flavoured gel basis.
- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
  - Choline Salicylate Dental Gel may be prescribed.
Antibacterial therapy for periodontitis
Antibacterial used as an adjunct to debridement in severe disease or disease unresponsive to local treatment alone.

- Metronidazole, or alternatively in children over 12 years, doxycycline below

Antibacterial therapy for throat infections
Most throat infections are caused by viruses and many do not require antibacterial therapy. Consider antibacterial, if history of valvular heart disease, if marked systemic upset, if peritonsillar cellulitis or abscess, or if at increased risk from acute infection (e.g. in immunosuppression, cystic fibrosis); prescribe antibacterial for beta-haemolytic streptococcal pharyngitis.

- Phenoxymethylpenicillin p. 319
- In severe infection, initial parenteral therapy with benzylpenicillin sodium p. 318, then oral therapy with phenoxymethylpenicillin or amoxicillin (or ampicillin p. 321). Avoid amoxicillin if possibility of glandular fever.
- Suggested duration of treatment 10 days.

- If penicillin-allergic, clarithromycin p. 309 (or azithromycin p. 308 or erythromycin p. 310)
- Suggested duration of treatment 10 days

### ANTIBACTERIALS > TETRACYCLINES AND RELATED DRUGS

### Doxycycline

- **INDICATIONS AND DOSE**
  - Treatment of recurrent aphthous ulceration
    - **BY MOUTH USING SOLUBLE TABLETS**
      - Child 12-17 years: 100 mg 4 times a day usually for 3 days, dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2–3 minutes, it should preferably not be swallowed

- **UNLICENSED USE**
  - Not licensed for use in children under 12 years. Not licensed for severe aphthous ulceration.

- **CAUTIONS**
  - Alcohol dependence

- **INTERACTIONS**
  - The metabolism of doxycycline may be influenced by antiepileptics.

- **SIDE-EFFECTS**
  - Anorexia, anxiety, dry mouth, flushing, tinnitus

- **RENAI IMPAIRMENT**
  - Use with caution (avoid excessive doses).

- **PATIENT AND CARER ADVICE**
  - Counselling on administration advised.
  - Patients should be advised to avoid exposure to sunlight or sun lamps.

- **PROFESSION SPECIFIC INFORMATION**
  - Dental practitioners’ formulary
  - Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Dispersible tablet**
  - **CAUTIONARY AND ADVISORY LABELS** 6, 9, 11, 13
  - Vibramycin-D (Pfizer Ltd)
  - Doxycycline (as Doxycycline monohydrate) 100 mg
    - 100mg dispersible tablets sugar-free | 8 tablet (Pack) £4.91 OOP price = £4.91

### 5 Oropharyngeal fungal infections

#### Oropharyngeal fungal infections

**Overview**
Fungal infections of the mouth are usually caused by *Candida* spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

**Thrush**
Acute pseudomembranous candidiasis (thrush), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxics, or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child’s teeth) immediately after using the inhaler may avoid the problem. Treatment with nystatin p. 663 or miconazole p. 663 may be needed. Fluconazole p. 352 is effective for unresponsive infections or if a topical antifungal drug cannot be used. Topical therapy may not be adequate in immunocompromised children and an oral triazole antifungal is preferred.

**Acute erythematous candidiasis**
Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with fluconazole.

**Angular cheilitis**
Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It may represent a nutritional deficiency or it may be related to orofacial granulomatosis or HIV infection. Both yeasts (*Candida* spp.) and bacteria (*Staphylococcus aureus* and beta-haemolytic streptococci) are commonly involved as interacting, infective factors. While the underlying cause is being identified and treated, it is often helpful to apply miconazole cream or fusidic acid ointment p. 336; if the angular cheilitis is unresponsive to treatment, hydrocortisone with miconazole cream or ointment p. 698 can be used.

**Immunocompromised patients**
See advice on prevention of fungal infections under *Immunocompromised children* in Antifungals, systemic use p. 349.

Antiseptic mouthwashes can have a role in the prevention of oral candidiasis in immunocompromised children.

**Drugs used in oropharyngeal candidiasis**
Nystatin is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. Miconazole is used by local application (as an oral gel) in the mouth but it is also absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci. In neonates, nystatin oral suspension or miconazole oral gel is used for the treatment of oropharyngeal candidiasis; to prevent re-infection it is important to ensure that the mother’s breast nipples and the teats of feeding bottles are cleaned adequately.

Fluconazole given by mouth is reliably absorbed; it is used for infections that do not respond to topical therapy or when topical therapy cannot be used. Itracanazole p. 353 can be used for fluconazole-resistant infections.
If candidal infection fails to respond after 1 to 2 weeks of treatment with antifungal drugs the child should be sent for investigation to eliminate the possibility of underlying disease. Persistent infection may also be caused by re-infection from the genito-urinary or gastro-intestinal tract.

**ANTIFUNGALS**

### Miconazole

**INDICATIONS AND DOSE**

**Prevention and treatment of oral candidasis**
- **BY MOUTH USING ORAL GEL**
  - Neonate: 1 mL 2–4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be smeared around the inside of the mouth after feeds.
  - Child 1 month–1 year: 1.25 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be smeared around the inside of the mouth after feeds.
  - Child 2–17 years: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)

**Prevention and treatment of intestinal candidasis**
- **BY MOUTH USING ORAL GEL**
  - Child 2 months–17 years: 5 mg/kg 4 times a day (max. per dose 250 mg 4 times a day) treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared

**SIDE-EFFECTS**
- Nausea
- Local irritation
- Local sensitisation

**PATIENT AND CARER ADVICE**
- Counsel patients and carers on the use of the medication

**PROFESSION SPECIFIC INFORMATION**

**Dental practitioners’ formulary**

Miconazole Oromucosal Gel may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY**

15-g tube of oral gel can be sold to the public.

---

**6 Oropharyngeal viral infections**

**Management**

Viral infections are the most common cause of a sore throat. It is usually a self-limiting condition which does not benefit from anti-infective treatment. Adequate analgesia may be all that is required.

Children with varicella–zoster infection often develop painful lesions in the mouth and throat. Benzylidine hydrochloride p. 660 may be used to provide local analgesia. Chlorhexidine mouthwash or gel p. 656 will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.
In severe herpetic stomatitis systemic aciclovir p. 381 or valaciclovir p. 383 may be used for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used to prevent frequently recurring herpes simplex lesions of the mouth particularly when associated with the initiation of erythema multiforme. See the treatment of labial herpes simplex infections.

Skin conditions, management

Topical preparations
When prescribing topical preparations for the treatment of skin conditions in children, the site of application, the condition being treated, and the child’s (and carer’s) preference for a particular vehicle all need to be taken into consideration.

Vehicles
The British Association of Dermatologists list of preferred unlicensed dermatological preparations (specials) is available at www.bad.org.uk.

The vehicle in topical preparations for the skin affects the degree of hydration, has a mild anti-inflammatory effect, and aids the penetration of the active drug. Therefore, the vehicle, as well as the active drug, should be chosen on the basis of their suitability for the child’s skin condition.

Applications are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails.

Collodions are painted on the skin and allowed to dry to leave a flexible film over the site of application.

Creams are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.

Gels consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

Lotions have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. Shake lotions (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

Ointments are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid, and hard paraffin. Some ointment bases have both hydrophilic and lipophilic properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water; they often have a mild anti-inflammatory effect. Water-soluble ointments contain macrogols which are freely soluble in water and are therefore readily washed off; they have a limited but useful role where ready removal is desirable.

Pastes are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

Dusting powders are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

Dilution
The BP directs that creams and ointments should not normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

Suitable quantities for prescribing

<table>
<thead>
<tr>
<th>Suitable quantities of dermatological preparations to be prescribed for specific areas of the body</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Area of body</strong></td>
</tr>
<tr>
<td><strong>Face</strong></td>
</tr>
<tr>
<td><strong>Both hands</strong></td>
</tr>
<tr>
<td><strong>Scalp</strong></td>
</tr>
<tr>
<td><strong>Both arms or both legs</strong></td>
</tr>
<tr>
<td><strong>Trunk</strong></td>
</tr>
<tr>
<td><strong>Groins and genitalia</strong></td>
</tr>
</tbody>
</table>

These amounts are usually suitable for children 12-17 years for twice daily application for 1 week; smaller quantities will be required for children under 12 years. These recommendations do not apply to corticosteroid preparations.
Excipients and sensitisation
Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided (see also Anaphylaxis). The following excipients in topical preparations are associated, rarely, with sensitisation; the presence of these excipients is indicated in the entries for topical products. See also Excipients, under General Guidance.

- Beeswax
- Benzyl alcohol
- Butylated hydroxyanisole
- Butylated hydroxytoluene
- Cetostearyl alcohol (including cetyl and stearyl alcohol)
- Chlororessol
- Edetic acid (EDTA)
- Ethylendiamine
- Fragrances
- Hydroxybenzoates (parabens)
- Imidurea
- Isopropyl palmitate
- N-(3-Chlorallyl)hexaminium chloride (quaternium 15)
- Polysorbates
- Propylene glycol
- Sodium metabisulphite
- Sorbic acid
- Wool fat and related substances including lanolin (purified versions of wool fat have reduced the problem)

Neonates
Caution is required when prescribing topical preparations for neonates—their large body surface area in relation to body mass increases susceptibility to toxicity from systemic absorption of substances applied to the skin. Topical preparations containing potentially sensitising substances such as corticosteroids, aminoglycosides, iodine, and parasiticidal drugs should be avoided. Preparations containing alcohol should be avoided because they can dehydrate the skin, cause pain if applied to raw areas, and the alcohol can cause necrosis. In preterm neonates, the skin is more fragile and offers a poor barrier, especially in the first fortnight after birth. Preterm infants, especially if below 32 weeks corrected gestational age, may also require special measures to maintain skin hydration.

1 Dry and scaling skin disorders

Emollient and barrier preparations

Borderline substances
The preparations marked ‘ACBS’ are regarded as drugs when prescribed in accordance with the advice of the Advisory Committee on Borderline Substances for the clinical conditions listed. Prescriptions issued in accordance with this advice and endorsed ‘ACBS’ will normally not be investigated.

Emollients
Emollients hydrate the skin, soften the skin, act as barrier to water and external irritants, and are indicated for all dry or scaling disorders. Their effects are short-lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis; they should be applied immediately after washing or bathing to maximise the effect of skin hydration. The choice of an appropriate emollient will depend on the severity of the condition, the child’s (or carer’s) preference, and the site of application. Ointments may exacerbate acne and folliculitis. Some ingredients rarely cause sensitisation and this should be suspected if an eczematous reaction occurs. The use of aqueous cream as a leave-on emollient may increase the risk of skin reactions, particularly in eczema.

Preparations such as aqueous cream and emulsifying ointment can be used as soap substitutes for handwashing and in the bath; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil may also be helpful.

Urea is occasionally used with other topical agents such as corticosteroids to enhance penetration of the skin.

Emollient bath and shower preparations
In dry skin conditions soap should be avoided.

The quantities of bath additives recommended for older children are suitable for an adult-size bath. Proportionately less should be used for a child-size bath or a washbasin; recommended bath additive quantities for younger children reflect this.

Barrier preparations
Barrier preparations often contain water-repellent substances such as dimeticone p. 682, natural oils, and paraffins, to help protect the skin from abrasion and irritation; they are used to protect intact skin around stomas and pressure sores, and as a barrier against nappy rash. In neonates, barrier preparations which do not contain potentially sensitising excipients are preferred. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. Barrier preparations with zinc oxide or titanium salts are used to aid healing of uninfected, excoriated skin.

Nappy rash (Dermatitis)
The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation, applied with each nappy change, can be helpful. A mild corticosteroid such as hydrocortisone 0.5% or 1% p. 692 can be used if inflammation is causing discomfort, but it should be avoided in neonates. The barrier preparation should be applied after the corticosteroid preparation to prevent further damage. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and waterproof pants may increase absorption of corticosteroids (see cautions). If the rash is associated with candidial infection, a topical antifungal such as clotrimazole cream p. 678 can be used. Topical antibacterial preparations can be used if bacterial infection is present; treatment with an oral antibacterial may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is considerable inflammation, erosion, and infection.

Emollients
In the neonate, a preservative-free paraffin-based emollient hydrates the skin without affecting the normal skin flora; substances such as olive oil are also used. The development of blisters (epidermolysis bullosa) or ichthyosis may be alleviated by applying liquid and white soft paraffin ointment while awaiting dermatological investigation.
DERMATOLOGICAL DRUGS > BARRIER PREPARATIONS

Barrier creams and ointments

● MEDICATION FORMS
  There can be variation in the licensing of different medicines containing the same drug.
  
  **Cream**
  EXCIPIENTS: May contain Beeswax, butylated hydroxyanisole, butylated hydroxytoluene, cetostearyl alcohol (including cetyl and stearyl alcohol), chlororesol, fragrances, hydroxybenzoates (parabens), propylene glycol, wool fat and related substances including lanolin.
  
  benzalkonium chloride 1 mg per 1 gram, dimeticone 220 mg per 1 gram
  conotran cream | 100 gram GSK | £0.88 DT price = £0.88 | 500 gram GSK | £3.51
  
  drapolene (Omega Pharma Ltd)
  benzalkonium chloride 100 microgram per 1 gram, cetrimide 2 mg per 1 gram
  drapolene cream | 100 gram GSK | £1.76 | 200 gram GSK | £2.86 | 350 gram GSK | £4.28
  
  siopel (Derma UK Ltd)
  dimeticone 3 mg per 1 gram, dimeticone 1000 100 mg per 1 gram
  siopel cream | 50 gram GSK | £2.15
  
  sudocrem (Forest Laboratories UK Ltd)
  benzyl cinnamate 1.5 mg per 1 gram, benzyl alcohol 3.9 mg per 1 gram, benzyl benzate 10.1 mg per 1 gram, Wool fat hydrux 40 mg per 1 gram, Zinc oxide 152.5 mg per 1 gram
  sudocrem antiseptic healing cream | 60 gram GSK | £1.45 | 125 gram GSK | £2.15 | 250 gram GSK | £3.67 | 400 gram GSK | £5.25
  
  **Ointment**
  EXCIPIENTS: May contain wool fat and related substances including lanolin.
  
  barrier creams and ointments (non-proprietary)
  cetostearyl alcohol 20 mg per 1 gram, Zinc oxide 75 mg per 1 gram, Beeswax white 100 mg per 1 gram, arachis oil 305 mg per 1 gram, Castor oil 500 mg per 1 gram
  Zinc and Castor oil ointment | 15 gram GSK | £1.08 | 50 gram GSK | £2.01 | 100 gram GSK | £3.49 | 500 gram GSK | £5.34
  
  Brand may include Meteum.
  
  **Spray**
  CAUTIONARY AND ADVISORY LABELS: 15
  EXCIPIENTS: May contain cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), wool fat and related substances including lanolin.
  
  sprilon (J M Loveridge Ltd)
  dimeticone 10.4 mg per 1 gram, Zinc oxide 125 mg per 1 gram
  sprilon aerosol spray | 115 gram GSK | £8.90 DT price = £8.90

DERMATOLOGICAL DRUGS > EMOLLIENTS

Emollient bath and shower products, antimicrobial-containing

● INDICATIONS AND DOSE

**DERMOL® 600™ BATH EMOLLIENT**
Dry and pruritic skin conditions including eczema and dermatitis
  
  TO THE SKIN
  
  Child 1-23 months: 5–15 mL/bath, not to be used undiluted
  
  Child 2-17 years: 15–30 mL/bath, not to be used undiluted
  
  **DERMOL® WASH EMOLLUSION**
Dry and pruritic skin conditions including eczema and dermatitis
  
  TO THE SKIN
  
  Child: To be applied to the skin or used as a soap substitute
  
  **EMULSIDERM®**
Topical treatment of eczema, including eczema at risk from infection
  
  TO THE SKIN
  
  Child 6–11 months: 1 mL/bath, not to be used undiluted
  
  Child 1-7 years: 1–2 capfuls/bath, not to be used undiluted

**important safety information**

**Fire hazard with paraffin-based emollients**
Emulsifying ointment or 50% liquid paraffin and 50% white soft paraffin ointment in contact with dressings and clothing is easily ignited by a naked flame. The risk is greater when these preparations are applied to large areas of the body, and clothing or dressings become soaked with the ointment. Patients should be told to keep away from fire or flames, and not to smoke when using these preparations. The risk of fire should be considered when using large quantities of any paraffin-based emollient. These preparations make skin and surfaces slippery—particular care is needed when bathing.

● DIRECTIONS FOR ADMINISTRATION
  Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

● PRESCRIBING AND DISPENSING INFORMATION
  Preparations containing an antibacterial should be avoided unless infection is present or is a frequent complication.

● MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

**Liquid**
EXCIPIENTS: May contain cetostearyl alcohol (including cetyl and stearyl alcohol)
  
  **DERMOL 200** (Dermal Laboratories Ltd)
  benzalkonium chloride 1 mg per 1 gram, chlorhexidine hydrochloride 1 mg per 1 gram, isopropyl myristate 25 mg per 1 gram, liquid paraffin 25 mg per 1 gram
  
  **DERMOL 200** shower emollient | 200 ml (Ω) | £3.55
Emollient bath and shower products, colloidal oatmeal-containing

- **INDICATIONS AND DOSE**
  - Endogenous and exogenous eczema | Xeroderma | Ichthyosis
    - **TO THE SKIN**
    - Child 2–17 years: 20–30 mL/bath, alternatively apply to wet skin and rinse

**IMPORTANT SAFETY INFORMATION**
These preparations make skin and surfaces slippery—particular care is needed when bathing.

**DIRECTIONS FOR ADMINISTRATION**
Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Emollient bath additive**
- **EXCIPIENTS:** May contain Beeswax, fragrances
  - Aveeno (Johnson & Johnson Ltd)
    - Aveeno bath oil | 250 mL (ACBS) £4.49

**Emollient bath and shower products, paraffin-containing**

- **INDICATIONS AND DOSE**
  - **AQUAMAX® WASH**
    - Dry skin conditions
      - **TO THE SKIN**
      - Child: To be applied to wet or dry skin and rinse
  - **CETRABEN® BATH**
    - Dry skin conditions, including eczema
      - **TO THE SKIN**
      - Neonate: 0.5 capful/bath, alternatively, to be applied to wet skin and rinse.
      - Child 1 month–11 years: 0.5–1 capful/bath, alternatively, to be applied to wet skin and rinse
      - Child 12–17 years: 1–2 capfuls/bath, alternatively, to be applied to wet skin and rinse

**DERMAL®**
- Dermatitis | Dry skin conditions, including ichthyosis
  - **TO THE SKIN**
  - Neonate: 5 mL/bath, alternatively, to be applied to wet skin and rinse.
  - Child 1 month–11 years: 5–10 mL/bath, alternatively, to be applied to wet skin and rinse
  - Child 12–17 years: 15–20 mL/bath, alternatively, to be applied to wet skin and rinse

**DOUBLEBASE® EMOLLIENT BATH ADDITIVE**
- Dry skin conditions including dermatitis and ichthyosis
  - **TO THE SKIN**
  - Neonate: 5–10 mL/bath.
  - Child 1 month–11 years: 5–10 mL/bath
  - Child 12–17 years: 15–20 mL/bath

**DOUBLEBASE® EMOLLIENT SHOWER GEL**
- Dry, chapped, or itchy skin conditions
  - **TO THE SKIN**
  - Child: To be applied to wet or dry skin and rinse, or apply to dry skin after showering

**E45® BATH OIL**
- Endogenous and exogenous eczema, xeroderma, and ichthyosis
  - **TO THE SKIN**
  - Neonate: 5 mL/bath, alternatively, to be applied to wet skin and rinse.
  - Child 1 month–11 years: 5–10 mL/bath, alternatively, to be applied to wet skin and rinse
  - Child 12–17 years: 15 mL/bath, alternatively, to be applied to wet skin and rinse

**E45® WASH CREAM**
- Endogenous and exogenous eczema, xeroderma, and ichthyosis
  - **TO THE SKIN**
  - Child: To be used as a soap substitute

**HYDROMOL® BATH AND SHOWER EMOLLIENT**
- Dry skin conditions | Eczema | Ichthyosis
  - **TO THE SKIN**
  - Neonate: 0.5 capful/bath, alternatively apply to wet skin and rinse.
  - Child 1 month–11 years: 0.5–2 capfuls/bath, alternatively apply to wet skin and rinse
  - Child 12–17 years: 1–3 capfuls/bath, alternatively apply to wet skin and rinse

**LPL 63.4®**
- Dry skin conditions
  - **TO THE SKIN**
  - Neonate: 0.5 capful/bath, alternatively, to be applied to wet skin and rinse.
  - Child 1 month–11 years: 0.5–2 capfuls/bath, alternatively, to be applied to wet skin and rinse
  - Child 12–17 years: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse

**OILATUM® EMOLLIENT BATH ADDITIVE**
- Dry skin conditions including dermatitis and ichthyosis
  - **TO THE SKIN**
  - Neonate: 0.5 capful/bath, alternatively, to be applied to wet skin and rinse.
  - Child 1 month–11 years: Apply 0.5–2 capfuls/bath, alternatively, to be applied to wet skin and rinse
  - Child 12–17 years: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse
**OILATUM® JUNIOR BATH ADDITIVE**

**Dry skin conditions including dermatitis and ichthyosis**

- **TO THE SKIN**
  - Neonate: 0.5 capful/bath, alternatively, apply to wet skin and rinse.
  - Child 1 month-11 years: 0.5–2 capfuls/bath, alternatively, apply to wet skin and rinse
  - Child 12-17 years: 1–3 capfuls/bath, alternatively, apply to wet skin and rinse

**QV® BATH OIL**

**Dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus**

- **TO THE SKIN**
  - Neonate: 5 mL/bath, alternatively, to be applied to wet skin and rinse.
  - Child 1-11 months: 5 mL/bath, alternatively, to be applied to wet skin and rinse.
  - Child 1-17 years: 10 mL/bath, alternatively, to be applied to wet skin and rinse

**QV® GENTLE WASH**

**Dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus**

- **TO THE SKIN**
  - Child: To be used as a soap substitute

**ZEROLATUM®**

**Dry skin conditions | Dermatitis | Ichthyosis**

- **TO THE SKIN**
  - Child 1 month-11 years: 5–10 mL/bath
  - Child 12-17 years: 15–20 mL/bath

**IMPORTANT SAFETY INFORMATION**

**FIRE HAZARD WITH PARAFFIN-BASED EMOLLIENTS**

Emulsifying ointment or 50% Liquid Paraffin and 50% White Soft Paraffin Ointment in contact with dressings and clothing is easily ignited by a naked flame. The risk is greater when these preparations are applied to large areas of the body, and clothing or dressings become soaked with the ointment. Patients should be told to keep away from fire or flames, and not to smoke when using these preparations. The risk of fire should be considered when using large quantities of any paraffin-based emollient.

These preparations make the skin and surfaces slippery—particular care is needed when bathing.

**DIRECTIONS FOR ADMINISTRATION**

Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

  - **TO THE SKIN**
  - Child: Apply twice daily, to be applied thinly and rubbed into area
Infections of the skin 673

Skin infections

Antibacterial preparations

Topical antibacterial preparations are used to treat localised bacterial skin infections caused by Gram-positive organisms (particularly by staphylococci or streptococci). Systemic antibacterial treatment is more appropriate for deep-seated skin infections.

Problems associated with the use of topical antibacterials include bacterial resistance, contact sensitisation, and superinfection. In order to minimise the development of resistance, antibacterials used systemically (e.g. fusidic acid p. 336) should not generally be chosen for topical use. Resistant organisms are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

Neomycin sulfate p. 675 applied topically may cause sensitisation and cross-sensitivity with other aminoglycoside antibacterials such as gentamicin p. 293 may occur. Topical antibacterials applied over large areas can cause systemic toxicity; ototoxicity with neomycin sulfate and with polymyxins p. 676 is a particular risk for neonates and children with renal impairment.

Superficial bacterial infection of the skin may be treated with a topical antiseptic such as povidone-iodine p. 633 which also softens crusts, or hydrogen peroxide p. 657% cream.

Bacterial infections such as impetigo and folliculitis can be treated with a short course of topical fusidic acid; mupirocin p. 677 should be used only to treat meticillin-resistant Staphylococcus aureus.

For extensive or long-standing impetigo, an oral antibacterial such as flucloxacillin p. 325 (or clarithromycin p. 309 in children with penicillin-allergy), should be used. A mild antiseptic may help to soften crusts. Mild antiseptics may be useful in reducing the spread of infection, but there is little evidence to support the use of topical antiseptics alone in the treatment of impetigo.

Cellulitis, a rapidly spreading, deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment. Lower leg infections or infections spreading around wounds are almost always cellulitis. Erysipelas, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial.

Staphylococcal scaled-skin syndrome requires urgent treatment with a systemic antibacterial, such as flucloxacillin.

Mupirocin is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although Staphylococcus aureus strains with low-level resistance to mupirocin are emerging,
it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antiseptic, such as povidone-iodine, chlorhexidine p. 656, or alcohol, can be used; their use should be discussed with the local microbiologist.

Mupirocin ointment contains macrogols; extensive absorption of macrogols through the mucous membranes or through application to thin or damaged skin may result in renal toxicity, especially in neonates. Mupirocin nasal ointment is formulated in a paraffin base and may be more suitable for the treatment of MRSA-infected open wound in neonates.

Metronidazole p. 676 gel is used topically in children to reduce the odour associated with anaerobic infections and for the treatment of periorificial rosacea; oral metronidazole is used to treat wounds infected with anaerobic bacteria.

Retapamulin p. 678 can be used for impetigo and other superficial bacterial skin infections caused by Staphylococcus aureus and Streptococcus pyogenes that are resistant to first-line topical antibacterials. However, it is not effective against MRSA.

Silver sulfadiazine p. 677 is licensed for the prevention and treatment of infection in burns but the use of appropriate dressings may be more effective. Systemic effects may occur following extensive application of silver sulfadiazine; its use is not recommended in neonates.

**Antibacterial preparations also used systemically**

Fusidic acid is a narrow-spectrum antibacterial used for staphylococcal infections. Fusidic acid has a role in the treatment of impetigo.

An ointment containing fusidic acid is used in the fissures of angular cheilitis when associated with staphylococcal infection. See Oropharyngeal fungal infections p. 662 for further information on angular cheilitis.

Metronidazole is used topically to treat rosacea and to reduce the odour associated with anaerobic infections; oral metronidazole is used to treat wounds infected with anaerobic bacteria.

**Antifungal preparations**

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy is necessary for scalp infection or if the skin infection is widespread, disseminated or intractable; although topical therapy may be used to treat some nail infections, systemic therapy is more effective. Specimens of scale, nail or hair should be sent for mycological examination before starting treatment, unless the diagnosis is certain.

**Dermatophytes**

Ringworm infection can affect the scalp (tinea capitis), body (tinea corporis), groin (tinea cruris), hand (tinea manuum), foot (tinea pedis, athlete’s foot), or nail (tinea unguium, onychomycosis). Tinea capitis is a common childhood infection that requires systemic treatment with an oral antifungal; additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm.

Tinea corporis and tinea pedis infections in children respond to treatment with a topical **imidazole** ( clotrimazole p. 678, econazole nitrate p. 678, or miconazole p. 679) or terbinafine cream p. 680. Nystatin p. 663 is less effective against tinea.

**Compound benzoic acid ointment** ( Whitfield’s ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations.

Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic children with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. However, topical application of tioconazole p. 679 may be useful for treating early onychomycosis when involvement is limited to mild distal disease, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy. Chronic paronychia on the fingernails (usually due to a candidal infection) should be treated with topical clotrimazole or miconazole but these preparations should be used with caution in children who suck their fingers. Chronic paronychia of the toes (usually due to dermatophyte infection) can be treated with topical terbinafine.

**Pityriasis versicolor**

Pityriasis (tinea) versicolor can be treated with ketoconazole shampoo p. 678 or selenium sulfide shampoo. Topical imidazole antifungals such as clotrimazole, econazole nitrate and miconazole or topical terbinafine are alternatives, but large quantities may be required.

If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with an azole antifungal. Relapse is common, especially in the immunocompromised.

**Candidiasis**

Candidal skin infections can be treated with topical imidazole antifungals clotrimazole p. 678, econazole nitrate p. 678, or miconazole p. 679; topical terbinafine p. 680 is an alternative. Topical application of nystatin p. 663 is also effective for candidiasis but it is ineffective against dermatophyosis. Refractory candidiasis requires systemic treatment generally with a triazole such as fluconazole p. 352; systemic treatment with griseofulvin p. 357 or terbinafine is not appropriate for refractory candidiasis. See the treatment of oral candidiasis and for the management of nappy rash.

**Angular cheilitis**

Miconazole cream is used in the fissures of angular cheilitis when associated with Candida.

**Compound topical preparations**

Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1% p. 411) may be of value in the treatment of eczematous intertrigo and, in the first few days only, of a severely inflamed patch of ringworm. Combination of a mild corticosteroid with either an imidazole or nystatin may be of use in the treatment of intertriginous eczema associated with candida.

**Antiviral preparations**

Aciclovir p. 683 cream is used for the treatment of initial and recurrent labial, cutaneous, and genital herpes simplex infections in children; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections or if cold sores recur frequently.

**Herpes labialis**

Aciclovir cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear.

Penciclovir cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream.
Parasiticidal preparations

These amounts are usually suitable for a child 12–17 years for single application.

Scabies
Permethrin p. 683 is used for the treatment of scabies (Sarcoptes scabiei); malathion p. 682 can be used if permethrin is inappropriate. Benzyl benzoate is an irritant and should be avoided in children; it is less effective than malathion and permethrin. Ivermectin p. 361 (available from ‘special-order’ manufacturers or specialist importing companies) by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or ‘Norwegian’) scabies that does not respond to topical treatment alone.

Application
Although acaricides have traditionally been applied after a hot bath, this is not necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.

All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate in adults, up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

Itching
The itch and eczema of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema may be required. Application of crotamiton p. 707 can be used to control itching after treatment with more effective acaricides. A topical corticosteroid may help to reduce itch and inflammation after scabies has been treated successfully; however, persistent symptoms suggest that scabies eradication was not successful. Oral administration of a sedating antihistamine at night may also be useful.

Head lice
Dimeticone p. 682 is effective against head lice (Pediculus humanus capitis) and acts on the surface of the organism. Malathion, an organophosphorus insecticide, is an alternative, but resistance has been reported. Benzyl benzoate is licensed for the treatment of head lice but it is not recommended for use in children.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present. Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected household members should be treated at the same time.

Wet combing methods
Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks, and continued until no lice are found on 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process.

Several devices for the removal of head lice such as combs and topical solutions, are available and some are prescribable on the NHS.

The Drug Tariffs can be accessed online at:
- National Health Service Drug Tariff for England and Wales: www.dhsspsni.gov.uk/pas-tariff
- Scottish Drug Tariff: www.isdscotland.org/Health-topics/Prescribing-and-Medicines/Scottish-Drug-Tariff

Crab lice
Permethrin and malathion are used to eliminate crab lice (Pthirus pubis); permethrin is not licensed for treatment of crab lice in children under 18 years. An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.

Parasiticidal preparations
Dimeticone coats head lice and interferes with water balance in lice by preventing the excretion of water; it is less active against eggs and treatment should be repeated after 7 days.

Malathion is recommended for scabies, head lice and crab lice. The risk of systemic effects associated with 1–2 applications of malathion p. 682 is considered to be very low; however, except in the treatment of hyperkeratotic scabies in children, applications of malathion liquid repeated at intervals of less than 1 week or application for more than 3 consecutive weeks should be avoided since the likelihood of eradication of lice is not increased.

Permethrin p. 683 is effective for scabies. It is also active against head lice but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice. Permethrin is also effective against crab lice but it is not licensed for this purpose in children under 18 years.

2.1 Bacterial skin infections

ANTIBACTERIALS > AMINOLYCOGLOSIDES

Neomycin sulfate

- **INDICATIONS AND DOSE**
  - **Bacterial skin infections**
    - **TO THE SKIN**
      - Child: Apply up to 3 times a day, for short-term use only
  - **UNLICENSED USE** Neomycin Cream BPC—no information available.
  - **CONTRA-INDICATIONS** Neonates
  - **CAUTIONS** If large areas of skin are being treated ototoxicity may be a hazard in children, particularly in those with renal impairment.
  - **INTERACTIONS** → Appendix 1 (aminoglycosides).
  - **SIDE-EFFECTS** Sensitisation (cross sensitivity with other aminoglycosides may occur)

Bacterial skin infections

- **Antibacterials**
  - **Aminoglycosides**
METRONIDAZOLE DERIVATIVES

Metronidazole

- **Drug Action**: Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

### Indications and Dose

#### ACEA®
- **Acute inflammatory exacerbation of rosacea**
  - **To the Skin**
  - **Child 1-17 years**: Apply twice daily, to be applied thinly

#### ANABACT®
- **Malodorous fungating tumours and malodorous gravitational and decubitus ulcers**
  - **To the Skin**
  - **Child**: Apply 1–2 times a day, to be applied to clean wound and covered with non-adherent dressing

#### METROGEL®
- **Acute inflammatory exacerbation of rosacea**
  - **To the Skin**
  - **Child 1-17 years**: Apply twice daily, to be applied thinly

#### ROSICED®
- **Inflammatory papules and pustules of rosacea**
  - **To the Skin**
  - **Child 1-17 years**: Apply twice daily

#### ROZEX® Cream
- **Not licensed for use in children.**

#### ROZEX® Gel
- **Not licensed for use in children.**

#### UNLICENSED USE

- **METROSA®**: Not licensed for use in children.
- **ANABACT®**: Not licensed for use in children under 12 years.
- **ROZEX® Gel**: Not licensed for use in children.
- **METROGEL®**: Not licensed for use in children.
- **ZYOMET®**: Not licensed for use in children.
- **ACEA®**: Not licensed for use in children under 12 years.
Silver sulfadiazine

**INDICATIONS AND DOSE**

Prophylaxis and treatment of infection in burn wounds

- TO THE SKIN
- Child: Apply daily, may be applied more frequently if very exudative

For conservative management of finger-tip injuries

- TO THE SKIN
- Child: Apply every 2–3 days, consult product literature for details

Adjunct to prophylaxis of infection in skin graft donor sites and extensive abrasions

- TO THE SKIN
- Child: (consult product literature)

Adjunct to short-term treatment of infection in pressure sores

- TO THE SKIN
- Child: (consult product literature)

**UNLICENSED USE**

No age range specified by manufacturer.

**CONTRA-INDICATIONS**

Not recommended for neonates

**CAUTIONS**

G6PD deficiency

**CAUTIONS, FURTHER INFORMATION**

- Large areas Plasma-sulfadiazine concentrations may approach therapeutic levels with side-effects and interactions as for sulfonamides if large areas of skin are treated.

**INTERACTIONS**

Appendix 1 (sulfonamides)—if large amounts given.

May inactivate enzymatic debriding agents—concomitant use may be inappropriate.

**SIDE-EFFECTS**

- Allergic reactions • argyria (following treatment of large areas of skin or prolonged use) • burning • itching • leucopenia • rashes

**SIDE-EFFECTS, FURTHER INFORMATION**

- Severe blood and skin disorders

  Owing to the association of sulfonamides with severe blood and skin disorders, treatment should be stopped immediately if blood disorders or rashes develop.

  Leucopenia developing 2–3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to normality within a few days.

- ALLERGY AND CROSS-SENSITIVITY

  Contra-indicated in patients with sensitivity to sulfonamides.

- PREGNANCY

  Risk of neonatal haemolysis and methaemoglobinaemia in third trimester.

- BREAST FEEDING

  Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.

- HEPATIC IMPAIRMENT

  Manufacturer advises caution if significant impairment.

- RENAL IMPAIRMENT

  Manufacturer advises caution if significant impairment.

- MONITORING REQUIREMENTS

  Monitor for leucopenia.

- DIRECTIONS FOR ADMINISTRATION

  Apply with sterile applicator.

***MEDICINAL FORMS***

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

EXCIPIENTS: May contain cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

- Flamazine (Smith & Nephew Healthcare Ltd)

  Sulfadiazine silver 10 mg per 1 gram Flamazine 1% cream |
  20 gram [P] £2.91 | 50 gram [P] £3.85 DT price = £3.85 |
  250 gram [P] £10.32 DT price = £10.32 | 500 gram [P] £18.27 DT price = £18.27

---

**Bacitracin with polymyxin B**

**INDICATIONS AND DOSE**

Bacterial skin infections

- TO THE SKIN
- Child: Apply twice daily, can be applied more frequently if required

**UNLICENSED USE**

Licensed for use in children (age range not specified by manufacturer).

**CAUTIONS**

Nephrotoxicity • neurotoxicity

**CAUTIONS, FURTHER INFORMATION**

If large areas of skin are being treated nephrotoxicity and neurotoxicity may be a hazard, particularly in children with renal impairment.

**SIDE-EFFECTS**

Contact sensitisation

**RENAI IMPAIRMENT**

Renal impairment increases the risk of nephrotoxicity and neurotoxicity.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

- Polyfax (Teva UK Ltd)

  Bacitracin zinc 500 unit per 1 gram, Polymyxin B sulfate |
  10000 unit per 1 gram Polyfax ointment | 4 gram [P] £3.26 |
  20 gram [P] £6.62 DT price = £6.62

---

**Mupirocin**

**INDICATIONS AND DOSE**

Bacterial skin infections, particularly those caused by Gram-positive organisms (except pseudomonal infection)

- TO THE SKIN
- Child: Apply up to 3 times a day for up to 10 days

**UNLICENSED USE**

Mupirocin ointment is licensed for use in children (age range not specified by manufacturer).

**Bactroban®** cream not recommended for use in children under 1 year.

**SIDE-EFFECTS**

- Burning sensation • local reactions • pruritus • rash • urticaria

**PREGNANCY**

Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

**BREAST FEEDING**

No information available.

**RENAI IMPAIRMENT**

Manufacturer advises caution when mupirocin ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycol).
2.2 Fungal skin infections

ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

Clotrimazole

- **INDICATIONS AND DOSE**
  - **Fungal skin infections**
    - **TO THE SKIN**
    - Child: Apply 2–3 times a day
  - **CAUTIONS**
    - Contact with eyes and mucous membranes should be avoided
  - **SIDE-EFFECTS**
    - Local irritation - erythema - hypersensitivity reactions - itching - mild burning sensation
  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Treatment should be discontinued if side-effects are severe.
  - **PREGNANCY**
    - Minimal absorption from skin; not known to be harmful.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Spray may be useful for application of clotrimazole to large or hairy areas of the skin.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - **EXCIPIENTS:** May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol)
    - ▶ Bactroban (GlaxoSmithKline UK Ltd)
    - Mupirocin (as Mupirocin calcium) 20 mg per 1 gram Bactroban 2% cream 15 gram [P] £5.26 DT price = £5.26
    - ▶ Bactroban (GlaxoSmithKline UK Ltd)
    - Mupirocin (Non-proprietary) 20 mg per 1 gram Bactroban 2% ointment 15 gram [P] £4.38 DT price = £4.38
  - **Ointment**
    - ▶ Mupirocin (Non-proprietary) 20 mg per 1 gram Mupirocin 2% ointment 15 gram [P] £4.38 DT price = £4.38
    - ▶ Mupirocin (as Mupirocin calcium) 20 mg per 1 gram Mupirocin (Non-proprietary) 20 mg per 1 gram 15 gram [P] £4.38 DT price = £4.38

- **SIDE-EFFECTS**
  - Contact with eyes and mucous membranes
  - Local irritation
  - Occasional local irritation
  - Occasional local irritation
  - Occasional local irritation
  - Occasional local irritation
  - Occasional local irritation

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **LIQUID**
    - ▶ Canesten (Clotrimazole) (Bayer Plc)
      - Clotrimazole 10 mg per 1 gram Canesten 1% solution 20 ml [F] £2.30 DT price = £2.30
    - ▶ Canesten (Clotrimazole) (Bayer Plc)
      - Clotrimazole 10 mg per 1 gram Canesten 1% cream 20 gram [F] £2.79 DT price = £1.04 50 gram [F] £5.45 DT price = £2.60
  - ▶ Canesten (Clotrimazole) (Bayer Plc)
    - Clotrimazole 10 mg per 1 gram Canesten 1% cream 20 gram [F] £2.14 DT price = £1.04 50 gram [F] £3.50 DT price = £2.60
  - ▶ Canesten Antifungal 1% cream 20 gram [F] £1.85 DT price = £1.04
  - **COMBINATIONS AVAILABLE:** Hydrocortisone with clotrimazole, p. 697

Retapamulin

- **INDICATIONS AND DOSE**
  - **SUPERFICIAL BACTERIAL SKIN INFECTION CAUSED BY STAPHYLOCOCCUS AUREUS AND STREPTOCOCCUS PYOGENES (IF RESISTANT TO FIRST LINE TOPICAL ANTIBACTERIALS)**
    - ▶ TO THE SKIN
      - Child 9 months–17 years: Apply twice daily for 5 days, to be applied thinly, maximum area of skin treated 2% of body surface area, review treatment if no response within 2–3 days

- **CONTRA-INDICATIONS**
  - Contact with eyes - contact with mucous membranes

- **SIDE-EFFECTS**
  - Contact dermatitis - localised erythema - localised irritation - localised pain - pruritus

- **NATIONAL FUNDING / ACCESS DECISIONS**
  - **Scottish Medicines Consortium (SMC) Decisions**
    - The Scottish Medicines Consortium has advised (March 2008) that retapamulin (Altargo®) is not recommended for use within NHS Scotland for the treatment of superficial skin infections.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Ointment**
    - **CAUTIONARY AND ADVISORY LABELS:** 28
    - **EXCIPIENTS:** May contain Butylated hydroxyanisole, fragrances
    - ▶ Altargo (GlaxoSmithKline UK Ltd)
      - Retapamulin 10 mg per 1 gram Altargo 10 mg/g ointment 5 gram [P] £7.89

- **PREGNANCY**
  - Minimal absorption from skin; not known to be harmful.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - ▶ Canesten (Clotrimazole) (Bayer Plc)
    - Clotrimazole 10 mg per 1 gram Canesten 1% solution 20 ml [F] £2.30 DT price = £2.30

      - 30 gram DT price = £2.58

Tioconazole

- INDICATIONS AND DOSE
  - Fungal nail infection
  - BY TRANSGINGULAR APPLICATION
    - Child: Apply twice daily usually for up to 6 months (may be extended to 12 months), apply to nails and surrounding skin

- UNLICENSED USE Licensed for use in children (age range not specified by manufacturer).
- CAUTIONS
  - GENERAL CAUTIONS
    - Contact with eyes and mucous membranes should be avoided
  - SPECIFIC CAUTIONS
    - Use with caution if child likely to suck affected digits

- SIDE-EFFECTS
  - Burning sensation - dry skin - erythema - exfoliation - hypersensitivity reactions - itching - local oedema - nail discoloration - nail pain - occasional local irritation - periungual inflammation - rash

- PREGNANCY
  - Manufacturer advises avoid.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Paint Tioconazole (Non-proprietary)
    - Tioconazole 283 mg per 1 ml Tioconazole 283mg/ml medicated nail lacquer
      - 12 ml DT price = £27.38
    - Trosyl (Pfizer Ltd)
      - Tioconazole 283 mg per 1 ml Trosyl 283mg/ml nail solution
        - 12 ml DT price = £28.06
ANTIFUNGALS  OTHER

Amorolfine

● INDICATIONS AND DOSE

Fungal nail infections

► BY TRANSGINGIVAL APPLICATION

Child 1-month–11 years: Apply 1–2 times a week for 6 months to treat fingernails and for toenails 9–12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes

Child 12–17 years: Apply 1–2 times a week for 6 months to treat fingernails and for toenails 9–12 months (review at intervals of 3 months), apply to infected nails after filing and cleansing, allow to dry for approximately 3 minutes

● UNLICENSED USE Not licensed for use in children under 12 years.

● CAUTIONS Avoid contact with ears - avoid contact with eyes and mucous membranes - use with caution in child likely to suck affected digits

● SIDE-EFFECTS Burning sensation - erythema - hypersensitivity reactions - itching - occasional local irritation

SIDE-EFFECTS, FURTHER INFORMATION

Treatment should be discontinued if side-effects are severe.

● PATIENT AND CARER ADVICE Avoid nail varnish or artificial nails during treatment.

● MEDICINAL FORMS

Medicated nail lacquer

CAUTIONARY AND ADVISORY LABELS 10

Amorolfine (Non-proprietary)

Amorolfine (as Amorolfine hydrochloride) 50 mg per 1 ml Amorolfine 5% medicated nail lacquer | 3 ml [P] no price available | 5 ml [P] £16.21 DT price = £7.45 Boots Once Weekly Fungal Nail Treatment 5% medicated nail lacquer | 3 ml [P] no price available

Loceryl (Galderma (UK) Ltd)

Amorolfine (as Amorolfine hydrochloride) 50 mg per 1 ml Loceryl Curanail 5% medicated nail lacquer | 3 ml [P] £12.32 Loceryl 5% medicated nail lacquer | 2.5 ml [P] £7.76 | 5 ml [P] £9.08 DT price = £7.45

Omicur (Morningside Healthcare Ltd)

Amorolfine (as Amorolfine hydrochloride) 50 mg per 1 ml Omicur 5% medicated nail lacquer | 2.5 ml [P] £9.09 | 5 ml [P] £9.09 DT price = £7.45

Terbinafine

● INDICATIONS AND DOSE

Tinea pedis

► TO THE SKIN USING CREAM

Child: Apply 1–2 times a day for up to 1 week, to be applied thinly

► BY MOUTH USING TABLETS

Child 1–17 years (body-weight 10–19 kg): 62.5 mg once daily for 4 weeks

Child 1–17 years (body-weight 20–39 kg): 125 mg once daily for 4 weeks

Child 1–17 years (body-weight 40 kg and above): 250 mg once daily for 4 weeks

Tinea cruris

► TO THE SKIN USING CREAM

Child: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks

► BY MOUTH USING TABLETS

Child 1–17 years (body-weight 10–19 kg): 62.5 mg once daily for 2–4 weeks

Child 1–17 years (body-weight 20–39 kg): 125 mg once daily for 2–4 weeks

Child 1–17 years (body-weight 40 kg and above): 250 mg once daily for 2–4 weeks

Tinea capitis

► BY MOUTH USING TABLETS

Child 1–17 years (body-weight 10–19 kg): 62.5 mg once daily for 6 weeks-3 months (occasionally longer in toenail infections)

Child 1–17 years (body-weight 20–39 kg): 125 mg once daily for 6 weeks-3 months (occasionally longer in toenail infections)

Child 1–17 years (body-weight 40 kg and above): 250 mg once daily for 6 weeks-3 months (occasionally longer in toenail infections)

Dermatophyte infections of the nails

► BY MOUTH USING TABLETS

Child 1–17 years (body-weight 10–19 kg): 62.5 mg once daily for 6 weeks-3 months (occasionally longer in toenail infections)

Child 1–17 years (body-weight 20–39 kg): 125 mg once daily for 6 weeks-3 months (occasionally longer in toenail infections)

Cutaneous candidiasis; Pityriasis versicolor

► TO THE SKIN USING CREAM

Child: Apply 1–2 times a day for 2 weeks, to be applied thinly, review treatment after 2 weeks

● UNLICENSED USE Not licensed for use in children.

● CAUTIONS

With oral use Autoimmune disease (risk of lupus-erythematosus-like effect) - psoriasis (risk of exacerbation)

With topical use Contact with eyes and mucous membranes should be avoided

● INTERACTIONS

With oral use Appendix 1 (terbinafine).

● SIDE-EFFECTS

► Common or very common

With oral use Abdominal discomfort - anorexia - arthralgia - diarrhoea - dyspepsia - headache - myalgia - nausea - rash - urticaria.

► Uncommon

With oral use Taste disturbance

► Rare

With oral use Cholestasis - dizziness - hepatitis - hypoaesthesia - jaundice - liver toxicity - malaise - paraesthesia

► Very rare

With oral use Alopecia - blood disorders - lupus erythematosus-like effect - neutropenia - photosensitivity - serious skin reactions - Stevens-Johnson syndrome - thrombocytopenia - toxic epidermal necrolysis

Frequency not known

With oral use Disturbances in smell - exacerbation of psoriasis - hearing disturbances - influenza-like symptoms - pancreatitis - rhabdomyolysis - vasculitis
With topical use 

- Erythema • hypersensitivity reactions • itching • mild burning sensation • occasional local irritation

**SIDE-EFFECTS, FURTHER INFORMATION**

- Liver toxicity
- With oral use Discontinue treatment if liver toxicity develops (including jaundice, cholestasis and hepatitis).
- Serious skin reactions
- With oral use Discontinue treatment in progressive skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis).
- Topical application
- With topical use Treatment should be discontinued if side effects are severe.
- Pregnancy
- With topical use Manufacturer advises use only if potential benefit outweighs risk—animal studies suggest no adverse effects.
- With oral use Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING**
- With topical use Manufacturer advises avoid—present in milk. Less than 5% of the dose is absorbed after topical application of terbinafine; avoid application to mother’s chest.
- With oral use Avoid—present in milk.
- **HEPATIC IMPAIRMENT**
- With oral use Manufacturer advises avoid—elimination reduced.
- **RENAL IMPAIRMENT**
- With oral use Use half normal dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m² and no suitable alternative available.
- **MONITORING REQUIREMENTS**
- With oral use Monitor hepatic function before treatment and then every 4–6 weeks during treatment—discontinue if abnormalities in liver function tests.
- **EXCEPTIONS TO LEGAL CATEGORY**
- With topical use Preparations of terbinafine hydrochloride (maximum 1%) can be sold to the public for use in those over 16 years for external use for the treatment of tinea pedis as a cream in a pack containing maximum 15 g, or for the treatment of tinea pedis and cruris as a cream in a pack containing maximum 15 g, or for the treatment of tinea pedis, cruris, and corporis as a spray in a pack containing maximum 30 mL spray or as a gel in a pack containing maximum 30 g gel.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

- Terbinafine (Non-proprietary)
- **Terbinafine (as Terbinafine hydrochloride) 250 mg** Terbinafine 250mg tablets | 14 tablet (£18.11 DT price = £1.22 | 28 tablet (£34.93)
- Lamisil (Novartis Pharmaceuticals UK Ltd)

- **Terbinafine (as Terbinafine hydrochloride) 250 mg** Lamisil 250mg tablets | 14 tablet (£21.30 DT price = £1.22 | 28 tablet (£41.09)

**Cream**

**EXCIPIENTS:** May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

- **Terbinafine (Non-proprietary)**
- **Terbinafine hydrochloride 10 mg per 1 gram** Terbinafine 1% cream | 7.5 gram (£5.50) | 7.5 gram (£1.06) | 15 gram (£4.59) DT price = £1.31 | 15 gram (£4.86 DT price = £1.31 | 30 gram (£6.76 DT price = £2.62
- Lamisil (Novartis Consumer Health UK Ltd)

- **Terbinafine hydrochloride 10 mg per 1 gram** Lamisil 1% cream | 30 gram (£7.45 DT price = £2.62
- Lamisil AT 2% cream | 7.5 gram (£2.39) | 15 gram (£3.60) DT price = £1.31

**ANTISEPTICS AND DISINFECTANTS › OTHER**

**Chlorhexidine with nystatin**

**INDICATIONS AND DOSE**

**Skin infections due to Candida spp.**

**TO THE SKIN**

- Child: Apply 2–3 times a day, continuing for 7 days after lesions have healed

**SIDE-EFFECTS, FURTHER INFORMATION**

Treatment should be discontinued if side effects are severe.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**EXCIPIENTS:** May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

- **Chlorhexidine hydrochloride 10 mg per 1 gram**, Nystatin 100000 unit per 1 gram Nystaform cream | 30 gram (£18.00 DT price = £2.62

**UNLICENSED USE** Mycota® licensed for use in children (age range not specified by manufacturer).

**CAUTIONS** Avoid broken skin - contact with eyes should be avoided - contact with mucous membranes should be avoided

**SIDE-EFFECTS** Erythema • hypersensitivity reactions • itching • local irritation • mild burning sensation

**SIDE-EFFECTS, FURTHER INFORMATION**

Treatment should be discontinued if side effects are severe.
2.3 Parasitic skin infections

PARASITICIDES

Dimeticone

- **INDICATIONS AND DOSE**
  - Head lice
    - **TO THE SKIN**
    - Child: Apply once weekly for 2 doses, rub into dry hair and scalp, allow to dry naturally, shampoo after minimum 8 hours (or overnight)

- **UNLICENSED USE** Not licensed for use in children under 6 months except under medical supervision.

- **CAUTIONS** Avoid contact with eyes - children under 6 months, medical supervision required

- **SIDE-EFFECTS** Skin irritation

- **PATIENT AND CARER ADVICE** Patients should be told to keep hair away from fire and flames during treatment.

- **MEDICINAL FORMS**
  - **Liquid**
    - Hedrin (Thornton & Ross Ltd)
      - Dimeticone 40 mg per 1 gram
      - Hedrin 4% lotion: 50 ml £2.98 
      - 150 ml £6.92 DT price = £6.92
  - **Cutaneous spray solution**
    - Hedrin (Thornton & Ross Ltd)
      - Dimeticone 40 mg per 1 gram
      - Hedrin 4% spray: 120 ml £7.13
  - **Gel**
    - Hedrin Once (Thornton & Ross Ltd)
      - Hedrin Once spray gel: 60 ml £4.16
      - 100 ml £6.83
      - Hedrin Once liquid gel: 100 ml £3.95
      - 250 ml £10.40

Malathion

- **INDICATIONS AND DOSE**
  - Head lice
    - **TO THE SKIN**
    - Child: Apply once weekly for 2 doses, rub preparation into dry hair and scalp, allow to dry naturally, remove by washing after 12 hours
  - Crab lice
    - **TO THE SKIN**
    - Child: Apply once weekly for 2 doses, apply preparation over whole body, allow to dry naturally, wash off after 12 hours or overnight
  - Scabies
    - **TO THE SKIN**
    - Child: Apply once weekly for 2 doses, apply preparation over whole body, and wash off after 24 hours, if hands are washed with soap within 24 hours, they should be retreated

- **UNLICENSED USE** Not licensed for use in children under 6 months except under medical supervision.

- **CAUTIONS** Alcoholic lotions not recommended for head lice in children with severe eczema or asthma, or for scabies or crab lice - avoid contact with eyes - children under 6 months, medical supervision required - do not use lotion more than once a week for 5 consecutive weeks - do not use on broken or secondarily infected skin

- **SIDE-EFFECTS** Chemical burns - hypersensitivity reactions - skin irritation

- **PRESCRIBING AND DISPENSING INFORMATION** For scabies, manufacturer recommends application to the body but not
necessarily to the head and neck. However, application should be extended to the scalp, neck, face, and ears.

2.4 Viral skin infections

**ANTIVIRALS > NUCLEOSIDE ANALOGUES**

Aciclovir  (Acyclovir)

**INDICATIONS AND DOSE**

**Herpes simplex infection (local treatment)**

- **TO THE SKIN**
  - Child: Apply 5 times a day for 5–10 days, to be applied to lesions approximately every 4 hours, starting at first sign of attack

**UNLICENSED USE**

Cream licensed for use in children (age range not specified by manufacturer).

**CAUTIONS**

Avoid cream coming in to contact with eyes and mucous membranes

**SIDE-EFFECTS**

Drying of the skin - erythema - itching of the skin - transient burning - transient stinging

**PREGNANCY**

Limited absorption from topical aciclovir preparations.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Aciclovir cream for herpes

www.medicinesforchildren.org.uk/aciclovir-cream-for-herpes

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary

Aciclovir Cream may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY**

A 2-g tube and a pump pack are on sale to the public for the treatment of cold sores.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), propylene glycol

- Aciclovir (Non-proprietary)
  - Aciclovir 50 mg per 1 gram
    - Aciclovir 5% cream | 2 gram [GSS] £0.83 DT price = £1.05 | 2 gram [GSS] £4.17 DT price = £1.05
    - 10 gram [GSS] £12.56 DT price = £5.25
  - Zovirax (GlaxoSmithKline Consumer Healthcare, GlaxoSmithKline UK Ltd)
    - Aciclovir 50 mg per 1 gram
      - Zovirax Cold Sore 5% cream | 2 gram [GSS] £3.96–£4.28 DT price = £1.05
      - Zovirax 5% cream | 2 gram [GSS] £4.63 DT price = £1.05 | 10 gram [GSS] £13.96 DT price = £5.25

3 Inflammatory skin conditions

3.1 Eczema and psoriasis

**Eczema**

**Types and management**

The main types of eczema (dermatitis) in children are atopic, irritant and allergic contact; different types may co-exist.

Atopic eczema is the most common type and it usually involves dry skin as well as infection and lichenification caused by scratching and rubbing. Seborrhoeic dermatitis is also common in infants.

Management of eczema involves the removal or treatment of contributory factors; known or suspected irritants and contact allergens should be avoided. Rarely, ingredients in topical medicinal products may sensitise the skin; BNF for...
Children lists active ingredients together with excipients that have been associated with skin sensitisation. Skin dryness and the consequent irritant eczema requires emollients applied regularly (at least twice daily) and liberally to the affected area; this can be supplemented with bath or shower emollients. The use of emollients should continue even if the eczema improves or if other treatment is being used.

Topical corticosteroids are also required in the management of eczema; the potency of the corticosteroid should be appropriate to the severity and site of the condition, and the age of the child. Mild corticosteroids are generally used on the face and on flexures; the more potent corticosteroids are generally required for use on lichenified areas of eczema or for severe eczema on the scalp, limbs, and trunk. Treatment should be reviewed regularly, especially if a potent corticosteroid is required. In children with frequent flares (2–3 per month), a topical corticosteroid can be applied on 2 consecutive days each week to prevent further flares.

Bandages (including those containing ichthammol with zinc oxide p. 699) are sometimes applied over topical corticosteroids or emollients to treat eczema of the limbs. Dry-wrap dressings can be used to provide a physical barrier to help prevent scratching and improve retention of emollients. Wet elasticated viscose stockinette is used for ‘wet-wrap’ bandaging over topical corticosteroids or emollients to cool the skin and relieve itching, but there is an increased risk of infection and excessive absorption of the corticosteroid; ‘wet-wrap’ bandaging should be used under specialist supervision.

See Wound management products and elasticated garments for details of elasticated viscose stockinette tubular bandages and garments, and silk clothing.

See Eczema and psoriasis, drugs affecting the immune response below for the role of topical pimecrolimus p. 701 and tacrolimus p. 702 in atopic eczema.

Infection

Bacterial infection (commonly with Staphylococcus aureus and occasionally with Streptococcus pyogenes) can exacerbate eczema. A topical antibacterial may be used for small areas of mild infection; treatment should be limited to a short course (typically 1 week) to reduce the risk of drug resistance or skin sensitisation. Associated eczema is treated simultaneously with a topical corticosteroid which can be combined with a topical antimicrobial.

Eczema involving moderate to severe, widespread, or recurrent infection requires the use of a systemic antibacterial that is active against the infecting organism. Preparations that combine an antiseptic with an emollient application and with a bath emollient can also be used; antiseptic shampoos can be used on the scalp.

Intertiginous eczema commonly involves candida and bacteria; it is best treated with a mild or moderately potent topical corticosteroid combined with a suitable antimicrobial drug.

Widespread herpes simplex infection may complicate atopic eczema (eczema herpeticum) and treatment under specialist supervision with a systemic antiviral drug is indicated. Secondary bacterial infection often exacerbates eczema herpeticum.

Management of other features of eczema

Lichenification, which results from repeated scratching, is treated initially with a potent corticosteroid. Bandages containing ichthammol p. 699 (to reduce pruritus) and other substances such as zinc oxide can be applied over the corticosteroid or emollient. Coal tar and ichthammol can be useful in some cases of chronic eczema. Desoid eczema, with thickened plaques in chronic atopic eczema, is usually treated with a topical antiseptic preparation, a potent topical corticosteroid, and paste bandages containing ichthammol with zinc oxide.

A non-sedating antihistamine may be of some value in relieving severe itching or urticaria associated with eczema. A sedating antihistamine can be used at night if itching causes sleep disturbance, but a large dose may be needed and drowsiness may persist on the following day.

Exudative (‘weeping’) eczema requires a potent corticosteroid initially; infection may also be present and require specific treatment. Potassium permanganate solution (1 in 10,000) p. 716 can be used as a soak in exudating eczema for its antiseptic and astringent effects; treatment should be stopped when exudation stops.

Severe refractory eczema is best managed under specialist supervision; it may require phototherapy or drugs that act on the immune system.

Seborrhoeic dermatitis

Seborrhoeic dermatitis (seborrhoeic eczema) is associated with species of the yeast Malassezia. Infantile seborrhoeic dermatitis affects particularly the body folds, nappy area and scalp; it is treated with emollients and mild topical corticosteroids with suitable antimicrobials. Infantile seborrhoeic dermatitis affecting the scalp (cradle cap) is treated by hydrating the scalp using natural oils and the use of mild shampoo.

In older children, seborrhoeic dermatitis affects the scalp, paranasal areas, and eyebrows. Shampoos active against the yeast (including those containing ketoconazole p. 678 and coal tar) and combinations of mild topical corticosteroids with suitable antimicrobials are used to treat older children.

Medicated bandages

Zinc paste bandages (see Wound management products and elasticated garments) are used with coal tar or ichthammol in chronic lichenified skin conditions such as chronic eczema (ichthammol often being preferred since its action is considered to be milder). They are also used with calamine in milder eczematous skin conditions.

Eczema and psoriasis, drugs affecting the immune response

Overview

Drugs affecting the immune response are used for eczema or psoriasis. Pimecrolimus p. 701 by topical application is licensed for mild to moderate atopic eczema. Tacrolimus p. 702 is licensed for topical use in moderate to severe atopic eczema. Both are drugs whose long-term safety is still being evaluated and they should not usually be considered first-line treatment unless there is a specific reason to avoid or reduce the use of topical corticosteroids. Treatment with topical pimecrolimus or topical tacrolimus should be initiated only by prescribers experienced in treating atopic eczema.

Topical corticosteroids have a role in eczema and a limited role in psoriasis. A systemic corticosteroid such as prednisolone p. 413 may be used in severe refractory eczema. Systemic drugs acting on the immune system are generally used by specialists in a hospital setting.

Ciclosporin p. 486 by mouth can be used for severe psoriasis and for severe eczema. Azathioprine p. 485 or mycophenolate mofetil p. 492 are also used for severe refractory eczema in children.

Methotrexate p. 506 can be used for severe resistant psoriasis; the dose is given once weekly and adjusted according to severity of the condition and haematological and biochemical measurements. Folic acid p. 533 should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid can be given once weekly on a different day to the methotrexate; alternative regimens may be used in some settings.
Etcetopin p. 600 (a cytokine modulator) is licensed in children over 6 years of age for the treatment of severe plaque psoriasis that is inadequately controlled by other systemic treatments and phototherapy, or when these other treatments cannot be used because of intolerance or contra-indications.

Adalimumab p. 598 (a cytokine modulator) is licensed in children over 4 years for the treatment of severe plaque psoriasis that is inadequately controlled by other topical treatments and phototherapies, or when these treatments are inappropriate.

### Psoriasis

#### Management

Psoriasis is characterised by epidermal thickening and scaling. It commonly affects extensor surfaces and the scalp. For mild psoriasis, reassurance and treatment with an emollient may be all that is necessary. *Guttate* psoriasis is a distinctive form of psoriasis that characteristically occurs in children and young adults, often following a streptococcal throat infection or tonsillitis.

Occasionally psoriasis is provoked or exacerbated by drugs such as lithium, chloroquine and hydroxychloroquine, beta-blockers, non-steroidal anti-inflammatory drugs, and ACE inhibitors. Psoriasis may not occur until the drug has been taken for weeks or months.

**Emollients**, in addition to their effects on dryness, scaling and cracking, may have an antiproliferative effect in psoriasis. They are particularly useful in inflammatory psoriasis and in chronic plaque psoriasis.

For chronic plaque psoriasis on extensor surfaces of trunk and limbs preparations containing coal tar are moderately effective, but the smell is unacceptable to some children. **Vitamin D** and its analogues are effective and cosmetically acceptable alternatives to preparations containing coal tar or dithranol p. 699. Dithranol is an effective topical antipsoriatic agent but it irritates and stains the skin and it should be used only under specialist supervision. Adverse effects of dithranol are minimised by using a short-contact technique and by starting with low concentration preparations. Tazarotene, a topical retinoid inhibitor, is more likely to cause irritation in children over 6 years of age for the treatment of severe plaque psoriasis; it is less likely to irisrate. Coal tar is more likely to cause irritation in children over 1 month to 2 years; leave-on preparations containing coal tar 10% may be used on children over 2 years with more severe psoriasis. Tar baths and tar shampoos may also be helpful.

Dithranol is effective for chronic plaque psoriasis. Its major disadvantages are irritation (for which individual susceptibility varies) and staining of skin and of clothing. Dithranol is not generally suitable for widespread small lesions nor should it be used in the flexures or on the face. Proprietary preparations are more suitable for home use; they are usually washed off after 20–30 minutes (short contact technique). Specialist nurses may apply intensive treatment with dithranol paste; it is covered by stockinette dressings and usually retained overnight. Dithranol should be discontinued if even a low concentration causes acute inflammation; continued use can result in the psoriasis becoming unstable.

A topical **corticosteroid** is not generally suitable for long-term use or as the sole treatment of extensive chronic plaque psoriasis; any early improvement is not usually maintained and there is a risk of the condition deteriorating or of precipitating an unstable form of psoriasis e.g. erythrodermic psoriasis or generalised pustular psoriasis on withdrawal. Topical use of potent corticosteroids on widespread psoriasis can also lead to systemic as well as local side-effects. However, topical corticosteroids used short-term may be appropriate to treat psoriasis in specific sites such as the face or flexures with a mild corticosteroid, and psoriasis of the scalp, palms, and soles with a potent corticosteroid. Very potent topical corticosteroids should only be used under specialist supervision.

Combining the use of a corticosteroid with another specific topical treatment may be beneficial in chronic plaque psoriasis; the drugs may be used separately at different times of the day or used together in a single formulation. **Eczema** co-existing with psoriasis may be treated with a corticosteroid, or coal tar, or both.

#### Phototherapy

**Phototherapy** is available in specialist centres under the supervision of a dermatologist. Narrow band ultraviolet B (UVB) radiation is usually effective for chronic plaque psoriasis and for guttate psoriasis. It can be considered for children with moderately severe psoriasis in whom topical treatment has failed, but it may irritate inflammatory psoriasis. The use of phototherapy and photochemotherapy in children is limited by concerns over carcinogenicity and premature ageing.
Inflammatory skin conditions

Photochemotherapy combining long-wave ultraviolet A radiation with a psoralen (PUVA) is available in specialist centres under the supervision of a dermatologist. The psoralen, which enhances the effect of irradiation, is administered either by mouth or topically. PUVA is effective in most forms of psoriasis, including the localised palmoplantar pustulosis. Early adverse effects include phototoxicity and pruritus. Higher cumulative doses exaggerate skin ageing, increase the risk of dysplastic and neoplastic skin lesions especially squamous cancer, and pose a theoretical risk of cataracts.

Phototherapy combined with coal tar, dithranol, topical vitamin D or vitamin D analogues, or oral acitretin, allows reduction of the cumulative dose of phototherapy required to treat psoriasis.

Systemic treatment

Systemic treatment is required for severe, resistant, unstable or complicated forms of psoriasis, and it should be initiated only under specialist supervision. Systemic drugs for psoriasis include acitretin and drugs that affect the immune response (see Eczema and psoriasis, drugs affecting the immune system). Acitretin p. 684.

Acitretin p. 703, a metabolite of etretinate, is a retinoid (vitamin A derivative); it is prescribed by specialists. The main indication of acitretin is severe psoriasis resistant to other forms of therapy. It is also used in disorders of keratinisation such as severe Darier’s disease (keratosis follicularis), and some forms of ichthyosis. Although a minority of cases of psoriasis respond well to acitretin alone, it is only moderately effective in many cases; adverse effects are a limiting factor. A therapeutic effect occurs after 2 to 4 weeks and the maximum benefit after 4 months. Consideration should be given to stopping acitretin if the response is inadequate after 4 months at the optimum dose. Continuous treatment for longer than 6 months is not usually necessary in psoriasis. However, some patients, particularly those with severe ichthyosis, may benefit from longer treatment, provided that the lowest effective dose is used. Patients are monitored carefully for adverse effects, and the need for treatment is reviewed regularly. Topical preparations containing keratolytics should normally be stopped before administration of acitretin. Liberal use of emollients should be encouraged and topical corticosteroids can be continued if necessary.

Acitretin is teratogenic; in females of child-bearing age, the possibility of pregnancy must be excluded before treatment and effective contraception must be used during treatment and for at least 3 years afterwards (oral progesterogen-only contraceptives not considered effective).

Topical treatment

The vitamin D and analogues, calcipotriol p. 704, calcitriol p. 704, and tacalcitol p. 705 are used for the management of plaque psoriasis. They should be avoided by those with calcium metabolism disorders, and used with caution in generalised pustular or erythrodermic exfoliative psoriasis (enhanced risk of hypercalcaemia).

Corticosteroids

Overview

Topical corticosteroids are used for the treatment of inflammatory conditions of the skin (other than those arising from an infection), particularly eczema, contact dermatitis, insect stings, and eczema of scabies. Corticosteroids suppress the inflammatory reaction during use; they are not curative and on discontinuation a rebound exacerbation of the condition may occur. They are generally used to relieve symptoms and suppress signs of the disorder when other measures such as emollients are ineffective.

Children, especially infants, are particularly susceptible to side-effects. However, concern about the safety of topical corticosteroids in children should not result in the child being undertreated. The aim is to control the condition as well as possible; inadequate treatment will perpetuate the condition. Carers of young children should be advised that treatment should not necessarily be reserved to ‘treat only the worst areas’ and they may need to be advised that patient information leaflets may contain inappropriate advice for the child’s condition.

In an acute flare-up of atopic eczema, it may be appropriate to use more potent formulations of topical corticosteroids for a short period to regain control of the condition.

Topical corticosteroids are not recommended in the routine treatment of urticaria; treatment should only be initiated and supervised by a specialist. Topical corticosteroids may worsen infections or secondarily infected lesions. They should not be used indiscriminately in psoriasis (where they will only benefit if inflammation is causing the itch) and are not recommended for acne vulgaris.

Systemic or very potent topical corticosteroids should be avoided or given only under specialist supervision in psoriasis because, although they may suppress the psoriasis in the short term, relapse or vigorous rebound occurs on withdrawal (sometimes precipitating severe pustular psoriasis). Topical use of potent corticosteroids on widespread psoriasis can lead to systemic as well as to local side-effects. It is reasonable, however, to prescribe a mild topical corticosteroid for a short period (2–4 weeks) for flexural and facial psoriasis, and to use a more potent corticosteroid such as betamethasone p. 688 or fluocinonide p. 692 for psoriasis of the scalp, palms, or soles.

In general, the most potent topical corticosteroids should be reserved for recalcitrant dermatoses such as chronic discoid lupus erythematosus, lichen simplex chronicus, hypertrophic lichen planus, and palmoplantar pustulosis. Potent corticosteroids should generally be avoided on the face and skin flexures, but specialists occasionally prescribe them for use on these areas in certain circumstances. When topical treatment has failed, intralasional corticosteroid injections may be used. These are more effective than the very potent topical corticosteroid preparations and should be reserved for severe cases where there are localised lesions such as keloid scars, hypertrophic lichen planus, or localised alopecia areata.

Perioral lesions

Hydrocortisone cream 1% p. 692 can be used for up to 7 days to treat uninfected inflammatory lesions on the lips. Hydrocortisone with miconazole cream or ointment p. 698 is useful where infection by susceptible organisms and inflammation co-exist, particularly for initial treatment (up to 7 days) e.g. in angular cheilitis. Organisms susceptible to miconazole include Candida spp. and many Gram-positive bacteria including streptococci and staphylococci.

Choice

Water-miscible corticosteroid creams are suitable for moist or weeping lesions whereas ointments are generally chosen for dry, lichenified or scaly lesions or where a more occlusive effect is required. Lotions may be useful when minimal application to a large or hair-bearing area is required or for the treatment of exudative lesions. Occlusive polythene or hydrocolloid dressings increase absorption, but also increase the risk of side-effects; they are therefore used only under supervision on a short-term basis for areas of very thick skin (such as the palms and soles). Disposable nappies and tight fitting pants also increase the risk of side-effects by increasing absorption of the corticosteroid. The inclusion of urea or salicylic acid also increases the penetration of the corticosteroid.
In the *BNF for Children*, topical corticosteroids for the skin are categorised as 'mild', 'moderately potent', 'potent' or 'very potent'; the least potent preparation which is effective should be chosen but dilution should be avoided whenever possible.

Topical hydrocortisone is usually used in children under 1 year of age. Moderately potent and potent topical corticosteroids should be used with great care in children and for short periods (1–2 weeks) only. A very potent corticosteroid should be initiated under the supervision of a specialist.

Appropriate topical corticosteroids for specific conditions are:

- **Mild to moderate eczema, flexural and facial eczema or psoriasis**—mild corticosteroid such as hydrocortisone 1%;
- **Severe eczema of the face and neck**—moderately potent corticosteroid for 3–5 days only, if not controlled by a mild corticosteroid;
- **Severe eczema on the trunk and limbs**—moderately potent or potent corticosteroid for 1–2 weeks only, switching to a less potent preparation as the condition improves;
- **Eczema affecting area with thickened skin (e.g. soles of feet)**—potent topical corticosteroid in combination with urea or salicylic acid (to increase penetration of corticosteroid).

**Absorption through the skin**

*Mild and moderately potent* topical corticosteroids are associated with few side-effects but particular care is required when treating neonates and infants, and in the use of *potent* and *very potent* corticosteroids. Absorption through the skin can rarely cause adrenal suppression and even Cushing’s syndrome, depending on the area of the body being treated and the duration of treatment. Absorption of corticosteroid is greatest from severely inflamed skin, thin skin (especially on the face or genital area), from flexural sites (e.g. axillae, groin), and in infants where skin surface area is higher in relation to body-weight; absorption is increased by occlusion.

**Compound preparations**

The advantages of including other substances (such as antibacterials or antifungals) with corticosteroids in topical preparations are uncertain, but such combinations may have a place where inflammatory skin conditions are associated with bacterial or fungal infection, such as infected eczema. In these cases the antimicrobial drug should be chosen according to the sensitivity of the infecting organism and used regularly for a short period (typically twice daily for 1 week). Longer use increases the likelihood of resistance and of sensitisation.

The keratolytic effect of salicylic acid facilitates the absorption of topical corticosteroids; however, excessive and prolonged use of topical preparations containing salicylic acid may cause salicylism.

**Topical corticosteroid preparation potencies**

Potency of a topical corticosteroid preparation is a result of the formulation as well as the corticosteroid. Therefore, proprietary names are shown.

**Mild**

- Hydrocortisone 0.1–2.5%
- Dioderm
- Mildison
- Synalar 1 in 10 dilution

**Mild with antimicrobials**

- Canesten HC

**Potent**

- Beclometasone dipropionate 0.025%
- Betamethasone valerate 0.1%
- Betacap
- Betesil
- Beclometasone dipropionate 0.005%
- Trimovate

**Very potent**

- Betnovate-RD
- Eumovate
- Haelan
- Modrasone
- Synalar 1 in 4 Dilution
- Ultralanum Plain

**Corticosteroids (topical)**

- **CONTRA-INDICATIONS** Acne - perioral dermatitis - potent corticosteroids in widespread plaque psoriasis - untreated bacterial, fungal or viral skin lesions
- **CAUTIONS** Avoid prolonged use (particularly on the face) - cautions applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use - dermatoses of infancy, including nappy rash (extreme caution required—treatment should be limited to 5–7 days) - infection - keep away from eyes - use potent or very potent topical corticosteroids under specialist supervision
- **SIDE-EFFECTS**
  - Rare: Adrenal suppression - Cushing’s syndrome
  - Frequency not known: Acne - contact dermatitis - hypertrichosis - irreversible striate atrophicae - irreversible telangiectasia - mild depigmentation (may be reversible)
perioral dermatitis • side-effects applicable to systemic corticosteroids may also apply if absorption occurs following topical and local use • spread and worsening of untreated infection • thinning of the skin (may be restored over a period after stopping treatment but the original structure may never return) • worsening of acne • worsening of rosacea

**SIDE-EFFECTS, FURTHER INFORMATION**

In order to minimise the side-effects of a topical corticosteroid, it is important to apply it thinly to affected areas only, no more frequently than twice daily, and to use the least potent formulation which is fully effective.

**DIRECTIONS FOR ADMINISTRATION**

Topical corticosteroid preparations should be applied no more frequently than twice daily; once daily is often sufficient. Topical corticosteroids should be spread thinly on the skin but in sufficient quantity to cover the affected areas. The length of cream or ointment expelled from a tube may be used to specify the quantity to be applied to a given area of skin. This length can be measured in terms of a fingertip unit (the distance from the tip of the adult index finger to the first crease). One fingertip unit (approximately 500 mg from a tube with a standard 5 mm diameter nozzle) is sufficient to cover an area that is twice that of the flat adult handprint (palm and fingers). Mixing topical preparations on the skin should be avoided where possible; several minutes should elapse between application of different preparations.

‘Wet-wrap bandaging’ increases absorption into the skin, but should be initiated only by a dermatologist and application supervised by a healthcare professional trained in the technique.

**PRESCRIBING AND DISPENSING INFORMATION**

The potency of each topical corticosteroid should be included on the label with the directions for use. The label should be attached to the container (for example, the tube) rather than the outer packaging.

**PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer corticosteroid creams and ointments. If a patient is using topical corticosteroids of different potencies, the patient should be told when to use each corticosteroid. Patients and their carers should be reassured that side effects such as skin thinning and systemic effects rarely occur when topical corticosteroids are used appropriately.

### Alclometasone dipropionate

**INDICATIONS AND DOSE**

**Inflammatory skin disorders such as eczemas**

- **TO THE SKIN**
  - Child: Apply 1–2 times a day, to be applied thinly

**POTENCY**

Alclometasone dipropionate cream 0.05%: moderate

**UNLICENSED USE**

Licensed for use in children (age range not specified by manufacturer).

**PATIENT AND CARER ADVICE**

Patients or carers should be counselled on the application of alclometasone dipropionate cream.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**CAUTIONARY AND ADVISORY LABELS 2B**

**EXCIPIENTS:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, propylene glycol

**Alclometasone dipropionate (Non-proprietary)**

- **Alclometasone dipropionate 500 microgram per 1 gram**
  - Boots Derma Care Eczema & Dermatitis Flare-Up 0.05% cream
  - 15 gram [P] no price available

---

### Beclometasone dipropionate

(Beclometasone dipropionate)

**INDICATIONS AND DOSE**

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids: Psoriasis**

- **TO THE SKIN**
  - Child: Apply 1–2 times a day, thin layer to be applied

**POTENCY**

Beclometasone dipropionate cream and ointment 0.025%: potent.

**UNLICENSED USE**

Not licensed for use in children under 1 year.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

**Cream**

**CAUTIONARY AND ADVISORY LABELS 2B**

- **Beclometasone dipropionate (Non-proprietary)**
  - Beclometasone dipropionate 250 microgram per 1 gram Beclometasone 0.025% cream | 30 gram [P] £68.00 DT price = £68.00

**Ointment**

**CAUTIONARY AND ADVISORY LABELS 2B**

- **Beclometasone dipropionate (Non-proprietary)**
  - Beclometasone dipropionate 250 microgram per 1 gram Beclometasone 0.025% ointment | 30 gram [P] £68.00 DT price = £68.00

---

### Betamethasone

**INDICATIONS AND DOSE**

**Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids: Psoriasis**

- **TO THE SKIN**
  - Child: Apply 1–2 times a day, to be applied thinly

**POTENCY**

Betamethasone valerate 0.025% cream and ointment: moderate.

Betamethasone valerate 0.1% cream, lotion, ointment, and scalp application: potent.

Betamethasone valerate 0.12% foam: potent.

Betamethasone dipropionate 0.05% cream, lotion, and ointment: potent.

**UNLICENSED USE**

Betacap®, Betnovate® and Betnovate-RD® are not licensed for use in children under 1 year. Bettamousse® is not licensed for use in children under 6 years.

**CAUTIONS**

Use of more than 100 g per week of 0.1% preparation likely to cause adrenal suppression

**PATIENT AND CARER ADVICE**

Patient counselling is advised for betamethasone cream, ointment, scalp application and foam (application).
**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment, Foam

**CAUTIONARY AND ADVISORY LABELS** 28, 15

**EXCIPIENTS:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

- **Betamethasone (as Betamethasone valerate) 1 mg per gram**
- **Betacap** (Auden McKenzie (Pharma Division) Ltd)
  - Betamethasone (as Betamethasone valerate) 250 microgram per 1 gram

  - Diprosone 1% ointment | 30 gram (POM) £19.84 DT price = £19.84 | 60 gram (POM) £39.68 | 120 gram (POM) £73.86

**Calcinoptriol with betamethasone**

The properties listed below are those particular to the combination only. For the properties of the components please consider, calcinoptriol p. 704, betamethasone p. 688.

**INDICATIONS AND DOSE**

**DOVOBET® GEL**

**Scalp psoriasis**

- **TO THE SKIN**
  - Child 12-17 years (specialist use only): Apply 1–4 g once daily usual duration of therapy 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist, shampoo off after leaving on scalp overnight or during day, when different preparations containing calcinoptriol used together, maximum total calcinoptriol 3.75 mg in any one week

**Mild to moderate plaque psoriasis**

- **TO THE SKIN**
  - Child 12-17 years (specialist use only): Apply once daily usual duration for up to 4 weeks; if necessary, treatment should be continued beyond 4 weeks, or repeated, only on the advice of a specialist, apply to maximum 30% of body surface, when different preparations containing calcinoptriol used together, max. total calcinoptriol 3.75 mg in any one week; maximum 75 g per week

**DOVOBET® OINTMENT**

**Stable plaque psoriasis**

- **TO THE SKIN**
  - Child 12-17 years (specialist use only): Apply once daily for up to 4 weeks; if necessary, treatment may be continued beyond 4 weeks or repeated, on the advice of a specialist, apply to maximum 30% of body surface, when different preparations containing calcinoptriol used together, max. total calcinoptriol 3.75 mg in any one week; maximum 75 g per week

**UNLICENSED USE**

Dovobet® not licensed for use in children.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

**CAUTIONARY AND ADVISORY LABELS** 28

**Eczema and psoriasis 689**
Clobetasol propionate

- **INDICATIONS AND DOSE**
  
  Short-term treatment only of severe resistant inflammatory skin disorders such as calcinartan eczemas unresponsive to less potent corticosteroids.

  - **Psoriasis**
  
  - **Patient and Carer Advice**
    
    - **To the skin**
    
    - Child: Apply 1–2 times a day for up to 4 weeks, to be applied thinly

  - **Potency**
    
    Clobetasol propionate 0.05% cream, foam, ointment, scalp application, and shampoo: very potent.

- **LICENSED USE**
  
  - **Dermovate®** not licensed for use in children under 1 year.
  
  - **Patient and Carer Advice**
    
    Patients or carers should be given advice on how to administer clobetasol propionate foam, liquid (scalp application), cream, ointment and shampoo.

  - **Scalp application**
    
    Patients or carers should be advised to apply foam directly to scalp lesions (foam begins to subside immediately on contact with skin).

- **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment, paste, dermatitis.

- **EXCIPIENTS**
  
  May contain: Propylene glycol, Cetostearyl alcohol (including cetyl and stearyl alcohol), polyisorbates, propylene glycol.

  - **Clarelux (Pierre Fabre Dermo-Cosmetique)**

**Impregnated dressing**

- **Haelan (Typharm Ltd)**
  - **Fludroxycortide 4 microgram per 1 square cm**: Haelan 4micrograms/square cm tape 7.5cm | 20 cm [P] £8.39 | 50 cm [P] £9.27 DT price = £9.27

**Fluocinolone acetonide**

**INDICATIONS AND DOSE**

Severe inflammatory skin disorders such as eczemas

- TO THE SKIN
  - Child 1-17 years: Apply 1–2 times a day, to be applied thinly, reduce strength as condition responds

**POTENCY**

Fluocinolone acetonide 0.025% cream, gel, and ointment: potent.

Fluocinolone acetonide 0.00625% cream and ointment: moderate.

Fluocinolone acetonide 0.0025% cream: mild.

**UNLICENSED USE**

Not licensed for use in children under 1 year.

**PRESCRIBING AND DISPENSING INFORMATION**

Gel is useful for application to the scalp and other hairy areas.

**PATIENT AND CARER ADVICE**

Patient counselling is advised for fluocinolone acetonide cream, gel and ointment (application).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**CAUTIONARY AND ADVISORY LABELS** 28

**EXCIPIENTS**: May contain Benzy alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), propyline glycol

- **Synalar (Derma UK Ltd)**
  - Fluocinolone acetonide 25 microgram per 1 gram
    - Synalar 1 in 10 Dilution 0.0025% cream | 50 gram [P] £4.58 DT price = £4.58

**Fludroxycortide (Flurandrenolone)**

**INDICATIONS AND DOSE**

Inflammatory skin disorders such as eczemas

- TO THE SKIN
  - Child: Apply 1–2 times a day, to be applied thinly

**HAELAN® TAPE**

Chronic localised recalcitrant dermatoses (but not acute or weeping)

- TO THE SKIN
  - Child: Cut tape to fit lesion, apply to clean, dry skin shorn of hair, usually for 12 hours daily

**POTENCY**

Fludroxycortide 0.0125% cream and ointment: moderate

**UNLICENSED USE**

Licensed for use in children (age range not specified by manufacturer).

**PATIENT AND CARER ADVICE**

Patients or carers should be counselled on application of fludroxycortide cream and ointment.

Severe inflammatory skin disorders such as eczemas

- TO THE SKIN
  - Child: Apply 1–2 times a day for up to 4 weeks, reducing strength as condition responds, to be applied thinly; maximum 60 g per week

**POTENCY**

Diflucortolone valerate 0.1% cream and ointment: potent.

Diflucortolone valerate 0.3% cream and ointment: very potent.

- **UNLICENSED USE**
  - Nerisone ® licensed for use in children (age range not specified by manufacturer); Nerisone Forte ® not licensed for use in children under 4 years.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Patients or carers should be counselled on application of diflucortolone valerate containing preparations.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**CAUTIONARY AND ADVISORY LABELS** 28

**EXCIPIENTS**: May contain Beeswax, cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, hydroxybenzoxazoles (parabens)

- **Nerisone (Meadow Laboratories Ltd)**
  - **Diflucortolone valerate 1 mg per 1 gram**: Nerisone 0.1% cream | 30 gram [P] £3.98
  - **Nerisone 0.1% oily cream**: 30 gram [P] £4.95 DT price = £4.95
  - **Diflucortolone valerate 3 mg per 1 gram**: Nerisone Forte 0.3% oily cream | 15 gram [P] £6.70 DT price = £6.70

**Ointment**

**CAUTIONARY AND ADVISORY LABELS** 28

- **Nerisone (Meadow Laboratories Ltd)**
  - **Diflucortolone valerate 1 mg per 1 gram**: Nerisone 0.1% ointment | 30 gram [P] £3.98
  - **Diflucortolone valerate 3 mg per 1 gram**: Nerisone Forte 0.3% ointment | 15 gram [P] £6.70
Hydrocortisone

**OINTMENT**

**CAUTIONARY AND ADVISORY LABELS** 28
EXCIPIENTS: May contain Propylene glycol, wool fat and related substances including lanolin.

- **Fluocortolone** (Derma UK Ltd)
  - Fluocortolone 2.5 mg per 1 gram
    - Synalar 1 in 4
      - Dilution 0.00625% ointment | 50 gram (£0.75) £4.84 DT price = £4.84
    - Fluocortolone 250 microgram per 1 gram
      - Synalar 0.025% ointment | 30 gram (£0.85) £4.14 DT price = £4.14 | 100 gram (£5.60) £11.75 DT price = £11.75
- **Ointment**
  - Metosyn FAPG (Derma UK Ltd)
    - Fluocortolone 500 microgram per 1 gram
      - Metosyn FAPG 0.05% cream | 25 gram (£0.29) £3.96 DT price = £3.96 | 100 gram (£5.85) £13.34 DT price = £13.34

**GEL**

**CAUTIONARY AND ADVISORY LABELS** 28
EXCIPIENTS: May contain Propylene glycol.

- **Fluocortolone** (Derma UK Ltd)
  - Fluocortolone 250 microgram per 1 gram
    - Synalar 0.025% gel | 30 gram (£0.85) £5.56 DT price = £5.56 | 60 gram (£1.53) £10.02 DT price = £10.02

**COMBINATIONS AVAILABLE:** Fluocortolone with cloquelin, p. 696. Fluocortolone with neomycin, p. 697

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**CAUTIONARY AND ADVISORY LABELS** 28
EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, fragrances, hydroxybenzoates (parabens).

- **Ultralanum Plain** (Fluocortolone hexanoate / Fluocortolone pivalate) (Meadow Laboratories Ltd)
  - Fluocortolone hexanoate 2.5 mg per 1 gram, Fluocortolone pivalate 2.5 mg per 1 gram
    - Ultralanum Plain cream | 50 gram (£3.85) £14.95

**OINTMENT**

**CAUTIONARY AND ADVISORY LABELS** 28
EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, fragrances, hydroxybenzoates (parabens).

- **Ultralanum Plain** (Fluocortolone hexanoate / Fluocortolone pivalate) (Meadow Laboratories Ltd)
  - Fluocortolone hexanoate 2.5 mg per 1 gram, Fluocortolone pivalate 2.5 mg per 1 gram
    - Ultralanum Plain ointment | 50 gram (£3.85) £14.95

---

**Fluticasone**

**INDICATIONS AND DOSE**

Severe inflammatory skin disorders such as dermatitis and eczemas unresponsive to less potent corticosteroids / Psoriasis

- TO THE SKIN
  - Child: Apply 1–2 times a day, to be applied thinly

**POTENCY**

Fluticasone 0.05% cream and ointment: potent.

**UNLICENSED USE**

Not licensed for use in children under 1 year.

**POTENCY**

Not licensed for use in children under 3 months.

**POTENCY**

Patients or carers should be advised on the application of fluticasone preparations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**CAUTIONARY AND ADVISORY LABELS** 28
EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, fragrances, hydroxybenzoates (parabens).

- **Cultivate** (GlaxoSmithKline UK Ltd)
  - Fluticasone propionate 50 microgram per 1 gram
    - Cultivate 0.056% cream | 15 gram (£0.22) £2.27 DT price = £2.27 | 30 gram (£0.45) £4.24 DT price = £4.24

**OINTMENT**

**CAUTIONARY AND ADVISORY LABELS** 28
EXCIPIENTS: May contain Propylene glycol.

- **Cultivate** (GlaxoSmithKline UK Ltd)
  - Fluticasone propionate 50 microgram per 1 gram
    - Cultivate 0.005% ointment | 15 gram (£0.52) £2.27 DT price = £2.27 | 30 gram (£1.05) £4.24 DT price = £4.24

---

**Flucinonide**

**INDICATIONS AND DOSE**

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids / Psoriasis

- TO THE SKIN
  - Child: Apply 1–2 times a day, to be applied thinly

**POTENCY**

Flucinonide 0.5% cream and ointment: potent.

**UNLICENSED USE**

Not licensed for use in children under 1 year.

**PATIENT AND CARER ADVICE**

Patients or carers should be advised on the application of flucinonide preparations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**CAUTIONARY AND ADVISORY LABELS** 28
EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, fragrances, hydroxybenzoates (parabens).

- **Synalar** (Derma UK Ltd)
  - Fluocinonide 500 microgram per 1 gram
    - Synalar 0.25% cream | 25 gram (£0.29) £3.50 DT price = £3.50 | 100 gram (£8.85) £13.15 DT price = £13.15

---

**Flucortolone**

**INDICATIONS AND DOSE**

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids / Psoriasis

- TO THE SKIN
  - Child: Apply 1–2 times a day, to be applied thinly

**POTENCY**

Flucortolone hexanoate 0.25% cream and ointment; flucortolone pivalate 0.25% cream and flucortolone 0.25% ointment: moderate.

**UNLICENSED USE**

Licensed for use in children (age range not specified by manufacturer).

**PREScribing AND Dispensing INFORMATION**

Patients or carers should be counselled on the application of flucortolone preparations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**CAUTIONARY AND ADVISORY LABELS** 28
EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, fragrances, hydroxybenzoates (parabens).

- **Ultralanum Plain** (Fluocortolone hexanoate / Fluocortolone pivalate) (Meadow Laboratories Ltd)
  - Fluocortolone hexanoate 2.5 mg per 1 gram, Fluocortolone pivalate 2.5 mg per 1 gram
    - Ultralanum Plain cream | 50 gram (£3.85) £14.95

---

**Hydrocortisone**

**INDICATIONS AND DOSE**

Mild inflammatory skin disorders such as eczemas

- TO THE SKIN
  - Child: Apply 1–2 times a day, to be applied thinly

**Nappy rash**

- TO THE SKIN
  - Child: Apply as required for no more than 1 week, discontinue as soon as the inflammation subsides

**POTENCY**

Hydrocortisone cream and ointment 0.5 to 2.5%: mild
Hydrocortisone butyrate

- **INDICATIONS AND DOSE**
  - Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
  - **TO THE SKIN**
  - Child 1–7 years: Apply 1–2 times a day, to be applied thinly
  - **POTENCY**
  - Hydrocortisone butyrate 0.1% cream, liquid, and ointment: potent

- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Hydrocortisone (topical) for eczema www.medicinesforchildren.org.uk/hydrocortisone-topical-for-eczema
  - Patients or carers should be given advice on how to administer hydrocortisone butyrate lotion, cream, ointment and scalp lotion.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment
  - **Liquid**
    - CAUTIONARY AND ADVISORY LABELS 15 (excluding Locoid Crelo topical emulsion), 28
    - EXCIPIENTS: May contain Butylated hydroxytoluene, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), propylene glycol
    - Locoid (Astellas Pharma Ltd)
      - Hydrocortisone butyrate 1 mg per 1 ml Locoid 0.1% scalp lotion | 100 ml (PST) £6.83 DT price = £6.83
    - Locoid Crelo (Astellas Pharma Ltd)
      - Hydrocortisone butyrate 1 mg per 1 gram Locoid Crelo 0.1% topical emulsion | 100 gram (PST) £5.91
  - **Cream**
    - CAUTIONARY AND ADVISORY LABELS 28
    - EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens)
    - Locoid (Astellas Pharma Ltd)
      - Hydrocortisone butyrate 1 mg per 1 gram Locoid 0.1% cream | 30 gram (PST) £1.60 DT price = £1.60 | 100 gram (PST) £4.93 DT price = £4.93
    - Locoid Lipocream (Astellas Pharma Ltd)
      - Hydrocortisone butyrate 1 mg per 1 gram Locoid 0.1% Lipocream | 30 gram (PST) £1.69 DT price = £1.60 | 100 gram (PST) £5.17 DT price = £4.93
  - **Ointment**
    - CAUTIONARY AND ADVISORY LABELS 28
    - Locoid (Astellas Pharma Ltd)
      - Hydrocortisone butyrate 1 mg per 1 gram Locoid 0.1% ointment | 30 gram (PST) £1.60 DT price = £1.60 | 100 gram (PST) £4.93 DT price = £4.93

Hydrocortisone with urea

- **INDICATIONS AND DOSE**
  - Mild inflammatory skin disorders such as eczemas
  - **TO THE SKIN**
  - Child: To be applied thinly (consult product literature)
  - **POTENCY**
  - Hydrocortisone 1% with urea cream: moderate

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be advised on application of hydrocortisone with urea cream.
CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES

Betamethasone with clioquinol

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 688.

- **INDICATIONS AND DOSE**
  - Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
    - TO THE SKIN
    - Child: (consult product literature)
  - **POTENCY**
    - Betamethasone (as valerate) 0.1% with clioquinol cream and ointment: potent.

- **UNLICENSED USE**
  - Betamethasone and clioquinol preparations are not licensed for use in children under 1 year.

- **PATIENT AND CARER ADVICE**
  - Stains clothing. Patients or carers should be counselled on application of betamethasone with clioquinol preparations.

Betamethasone with clotrimazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 688, clotrimazole p. 481.

- **INDICATIONS AND DOSE**
  - Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
    - TO THE SKIN
    - Child: (consult product literature)
  - **POTENCY**
    - Betamethasone dipropionate 0.064% (=betamethasone 0.5%) with clotrimazole cream: potent.

- **UNLICENSED USE**
  - Lotriderm® not licensed for use in children under 12 years.

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be given advice on how to administer betamethasone with clotrimazole cream.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Cream**

- Lotriderm® (Merck Sharp & Dohme Ltd)
  - Betamethasone dipropionate 0.064% with clotrimazole cream: potent.

**Ointment**

- Lotriderm® (Merck Sharp & Dohme Ltd)
  - Betamethasone dipropionate 0.064% with clotrimazole cream: potent.

Betamethasone with clioquinol

- **INDICATIONS AND DOSE**
  - Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
    - TO THE SKIN
    - Child: (consult product literature)
  - **POTENCY**
    - Betamethasone (as valerate) 0.1% with clioquinol cream and ointment: potent.

Betamethasone with clotrimazole

- **INDICATIONS AND DOSE**
  - Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
    - TO THE SKIN
    - Child: (consult product literature)
  - **POTENCY**
    - Betamethasone dipropionate 0.064% (=betamethasone 0.5%) with clotrimazole cream: potent.

Betamethasone with clotrimazole

- **INDICATIONS AND DOSE**
  - Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
    - TO THE SKIN
    - Child: (consult product literature)
  - **POTENCY**
    - Betamethasone dipropionate 0.064% (=betamethasone 0.5%) with clotrimazole cream: potent.

Betamethasone with clotrimazole

- **INDICATIONS AND DOSE**
  - Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
    - TO THE SKIN
    - Child: (consult product literature)
  - **POTENCY**
    - Betamethasone dipropionate 0.064% (=betamethasone 0.5%) with clotrimazole cream: potent.

Betamethasone with clotrimazole

- **INDICATIONS AND DOSE**
  - Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
    - TO THE SKIN
    - Child: (consult product literature)
  - **POTENCY**
    - Betamethasone dipropionate 0.064% (=betamethasone 0.5%) with clotrimazole cream: potent.

Betamethasone with clotrimazole

- **INDICATIONS AND DOSE**
  - Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
    - TO THE SKIN
    - Child: (consult product literature)
  - **POTENCY**
    - Betamethasone dipropionate 0.064% (=betamethasone 0.5%) with clotrimazole cream: potent.

Betamethasone with clotrimazole

- **INDICATIONS AND DOSE**
  - Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
    - TO THE SKIN
    - Child: (consult product literature)
  - **POTENCY**
    - Betamethasone dipropionate 0.064% (=betamethasone 0.5%) with clotrimazole cream: potent.

Betamethasone with clotrimazole

- **INDICATIONS AND DOSE**
  - Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
    - TO THE SKIN
    - Child: (consult product literature)
  - **POTENCY**
    - Betamethasone dipropionate 0.064% (=betamethasone 0.5%) with clotrimazole cream: potent.

Betamethasone with clotrimazole

- **INDICATIONS AND DOSE**
  - Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
    - TO THE SKIN
    - Child: (consult product literature)
  - **POTENCY**
    - Betamethasone dipropionate 0.064% (=betamethasone 0.5%) with clotrimazole cream: potent.

Betamethasone with clotrimazole

- **INDICATIONS AND DOSE**
  - Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
    - TO THE SKIN
    - Child: (consult product literature)
  - **POTENCY**
    - Betamethasone dipropionate 0.064% (=betamethasone 0.5%) with clotrimazole cream: potent.
Betamethasone with fusidic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 688, fusidic acid p. 336.

- **INDICATIONS AND DOSE**
  - Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
  - To the skin
  - Child: (consult product literature)

- **POTENCY**
  - Betamethasone (as valerate) 0.1% with fusidic acid cream: potent.

- **UNLICENSED USE**
  - Fucibet® Lipid Cream is not licensed for use in children under 6 years.

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be counselled on application of betamethasone with fusidic acid preparations.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Cream**
  - CAUTIONARY AND ADVISORY LABELS 28
  - EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol, hydroxybenzoates (parabens)
  - Fucibet (LEO Pharma)
    - Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Fusidic acid 20 mg per 1 gram Fucibet cream | 30 gram (POT) £6.38 DT price = £6.38 | 60 gram (POT) £12.76 DT price = £12.76
  - Xemacort (Mylan Ltd)
    - Betamethasone (as Betamethasone valerate) 1 mg per 1 gram, Fusidic acid 20 mg per 1 gram Xemacort cream | 30 gram (POT) £6.05 DT price = £6.38 | 60 gram (POT) £12.45 DT price = £12.76

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 688, neomycin sulfate p. 645.

- **INDICATIONS AND DOSE**
  - Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
  - Child: 1-23 months: Apply 1–2 times a day, to be applied thinly
  - Child: 2-17 years: Apply 1–2 times a day, to be applied thinly

- **POTENCY**
  - Betamethasone (as valerate) 0.1% with neomycin cream and ointment: potent.

- **UNLICENSED USE**
  - Betamethasone and neomycin preparations not licensed for use in children under 2 years.

- **PATIENT AND CARER ADVICE**
  - Patient counselling is advised for betamethasone with neomycin cream and ointment (application).

Betamethasone with salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 688.

- **INDICATIONS AND DOSE**
  - Diprosalic® Ointment
    - Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
    - To the skin
    - Child: Apply 1–2 times a day, max. 60 g per week

- **POTENCY**
  - For Diprosalic® ointment: Betamethasone (as dipropionate) 0.05% with salicylic acid 3%: potent.

- **DIPROSALIC® SCALP APPLICATION**
  - Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids | Psoriasis
  - To the skin
  - Child: 1–2 times a day, apply a few drops

- **POTENCY**
  - For Diprosalic® scalp application: Betamethasone (as dipropionate) 0.05% with salicylic acid 2%: potent.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Cream**
  - CAUTIONARY AND ADVISORY LABELS 28
  - EXCIPIENTS: May contain Disodium edetate
  - Diprosalic (Merck Sharp & Dohme Ltd)
    - Betamethasone (as Betamethasone dipropionate)
      - 500 microgram per 1 ml, Salicylic acid 20 mg per 1 ml Diprosalic 0.05%/2% scalp application | 100 ml (POT) £10.10 DT price = £10.10

  **Ointment**
  - CAUTIONARY AND ADVISORY LABELS 28
  - Diprosalic (Merck Sharp & Dohme Ltd)
    - Betamethasone (as Betamethasone dipropionate)
      - 500 microgram per 1 gram, Salicylic acid 30 mg per 1 gram Diprosalic 0.05%/3% ointment | 30 gram (POT) £3.18 DT price = £3.18 | 100 gram (POT) £9.14 DT price = £9.14
Chlorotetracycline with triamcinolone

**INDICATIONS AND DOSE**

Severe inflammatory skin disorders such as eczemas unresponsive to less potent corticosteroids (associated with infection) | Psoriasis (associated with infection)
- **TO THE SKIN**
- Child 8-17 years: To be applied thinly (consult product literature)
- Child 1 month-7 years: To be applied thinly (consult product literature)

**POTENCY**

- Triamcinolone acetonide 0.1%, chlorotetracycline hydrochloride 3% ointment: potent.

**UNLICENSED USE**

Not licensed for use in children under 8 years.

**PATIENT AND CARER ADVICE**

Patients or carers should be counselled on the application of chlorotetracycline with triamcinolone products.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

- **CAUTIONARY AND ADVISORY LABELS** 28
- **EXCIPIENTS**: May contain Wool fat and related substances including lanolin
- Aureocort (AMCo)
  - Triamcinolone acetonide 1 mg per 1 gram, Chlorotetracycline hydrochloride 30.9 mg per 1 gram  Aureocort ointment | 15 gram [PBN] £3.51

Clobetasol propionate with neomycin sulfate and nystatin

The properties listed below are those particular to the combination only. For the properties of the components please consider, clobetasol propionate p. 690, neomycin sulfate p. 645.

**INDICATIONS AND DOSE**

Short-term treatment only of severe resistant inflammatory skin disorders such as calciniferous eczemas associated with infection and unresponsive to less potent corticosteroids | Psoriasis associated with infection
- **TO THE SKIN**
- Child: (consult product literature)

**POTENCY**

Clobetasol propionate 0.05% with neomycin sulfate and nystatin cream and ointment: very potent.

**UNLICENSED USE**

Clobetasol with neomycin and nystatin preparations not licensed for use in children under 2 years.

**PATIENT AND CARER ADVICE**

Patients or carers should be advised on application of clobetasol propionate, neomycin sulfate and nystatin containing preparations.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

- **CAUTIONARY AND ADVISORY LABELS** 28
- **EXCIPIENTS**: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, sodium metabisulfite, hydroxybenzoates (parabens), polysorbates, propylene glycol
- **Clobetasol propionate with neomycin sulfate and nystatin (Non proprietary)**
  - Clobetasol propionate 500 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram, Nystatin 100000 unit per 1 gram  Clobetasol 500 microgram / Neomycin 5 mg / Nystatin 100000 units/g ointment | 30 gram [PBN] £6.00 DT price = £64.00

Fluocinolone acetonide with clioquinol

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluocinolone acetonide p. 691.

**INDICATIONS AND DOSE**

Inflammatory skin disorders such as eczemas associated with infection | Psoriasis associated with infection
- **TO THE SKIN**
- Child: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds

**POTENCY**

Clioquinol 3% with fluocinolone acetonide 0.025% cream and ointment: potent

**PATIENT AND CARER ADVICE**

Patient counselling is advised for clioquinol with fluocinolone acetonide cream and ointment (application). Ointment stains clothing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

- **CAUTIONARY AND ADVISORY LABELS** 28
- **EXCIPIENTS**: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, hydroxybenzoates (parabens), polysorbates, propylene glycol
- **Synalar C** (Derma UK Ltd)
  - Fluocinolone acetonide 250 microgram per 1 gram, Clioquinol 30 mg per 1 gram  Synalar C cream | 15 gram [PBN] £2.66
Fluocinolone acetonide with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, fluocinolone acetonide p. 691, neomycin sulfate p. 645.

- **INDICATIONS AND DOSE**
  - Inflammatory skin disorders such as eczemas associated with infection | Psoriasis associated with infection
  - **TO THE SKIN**
    - Child 1-11 months: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds
    - Child 1-17 years: Apply 1–2 times a day, to be applied thinly, reducing strength as condition responds
  - **POTENCY**
    - Fluocinolone acetonide 0.025% with neomycin 0.5% cream and ointment: potent.

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be counselled on the application of fluocinolone acetonide with neomycin preparations.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Cream**
  - CAUTIONARY AND ADVISORY LABELS 28
  - EXCIPIENTS: May contain Propylene glycol, wool fat and related substances including lanolin. SYNALAR N (Derma UK Ltd)
  - Fluocinolone acetonide 250 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram SYNALAR N cream | 30 gram £4.36

  **Ointment**
  - CAUTIONARY AND ADVISORY LABELS 28
  - EXCIPIENTS: May contain Propylene glycol, wool fat and related substances including lanolin
  - SYNALAR N (Derma UK Ltd)
  - Fluocinolone acetonide 250 microgram per 1 gram, Neomycin sulfate 5 mg per 1 gram SYNALAR N ointment | 30 gram £4.36

Hydrocortisone with chlorhexidine hydrochloride and nystatin

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 692, chlorhexidine p. 656.

- **INDICATIONS AND DOSE**
  - Mild inflammatory skin disorders such as eczemas
  - **TO THE SKIN**
    - Child: To be applied thinly (consult product literature)
  - **POTENCY**
    - Hydrocortisone 0.5% with chlorhexidine hydrochloride 1% and nystatin cream: mild
    - Hydrocortisone 1% with chlorhexidine hydrochloride 1% and nystatin ointment: mild

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be given advice on application of chlorhexidine hydrochloride with hydrocortisone and nystatin preparations.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Cream**
  - CAUTIONARY AND ADVISORY LABELS 28
  - EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates, propylene glycol.
  - SYNALAR N (Derma UK Ltd)
  - Fluocinolone acetonide 250 microgram per 1 gram, Chlorhexidine hydrochloride 10 mg per 1 gram, Nystatin 100000 unit per 1 gram Nystaform HC cream | 30 gram £2.66

  **Ointment**
  - CAUTIONARY AND ADVISORY LABELS 28
  - EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens), polysorbates, propylene glycol.
  - SYNALAR N (Derma UK Ltd)
  - Fluocinolone acetonide 250 microgram per 1 gram, Chlorhexidine hydrochloride 10 mg per 1 gram, Nystatin 100000 unit per 1 gram Nystaform HC ointment | 30 gram £2.66

Hydrocortisone with clotrimazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 692, clotrimazole p. 678.

- **INDICATIONS AND DOSE**
  - Mild inflammatory skin disorders such as eczemas (associated with fungal infection)
  - **TO THE SKIN**
    - Child: (consult product literature)
  - **POTENCY**
    - Clotrimazole with hydrocortisone 1% cream: mild

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be given advice on how to administer clotrimazole with hydrocortisone cream.

- **EXCEPTIONS TO LEGAL CATEGORY**
  - A 15-g tube is on sale to the public for the treatment of athlete’s foot and fungal infection of skin folds with associated inflammation in patients 10 years and over.
Hydrocortisone with fusidic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 692, fusidic acid p. 336.

- **INDICATIONS AND DOSE**
  - **Mild inflammatory skin disorders such as eczemas**
  - **TO THE SKIN**
  - **Child:** To be applied thinly (consult product literature)

- **POTENCY**
  - Hydrocortisone with fusidic acid cream: mild

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be advised on application of hydrocortisone with fusidic acid preparations.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - CAUTIONARY AND ADVISORY LABELS 28
    - EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol), polyoxylates, potassium sorbate
    - **Fucidin H (Fusidic acid / Hydrocortisone)**
      - 1 gram Fucidin H cream | 30 gram (P) £2.42 DT price = £2.42
      - **Canesten Hydrocortisone (Bayer Plc)**
      - Clotrimazole 10 mg per 1 gram, Hydrocortisone 10 mg per 1 gram Canesten Hydrocortisone cream | 15 gram (P) £3.11 DT price = £3.11
      - Combinations available: Hydrocortisone with fusidic acid, below
      - Hydrocortisone with oxytetracycline, below

- **Hydrocortisone with miconazole**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 692, miconazole p. 679.

- **INDICATIONS AND DOSE**
  - **Mild inflammatory skin disorders such as eczemas**
  - **TO THE SKIN**
  - **Child:** (consult product literature)

- **POTENCY**
  - Hydrocortisone 1% with miconazole cream and ointment: mild

- **INTERACTIONS**
  - → Appendix 1 (antifungals, imidazole).

- **PATIENT AND CARER ADVICE**
  - Patients or carers should be advised on application of hydrocortisone with miconazole preparations.

- **PROFESSION SPECIFIC INFORMATION**
  - **Dental practitioners’ formulary**
    - May be prescribed as Miconazole and Hydrocortisone Cream or Ointment for max. 7 days.

- **EXCEPTIONS TO LEGAL CATEGORY**
  - A 15-g tube of hydrocortisone with miconazole cream is on sale to the public for the treatment of athlete’s foot and candidal intertrigo in children over 10 years.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - CAUTIONARY AND ADVISORY LABELS 28
    - EXCIPIENTS: May contain Butylated hydroxyanisole, disodium edetate
    - **Daktacort (Janssen-Cilag Ltd)**
      - Hydrocortisone 10 mg per 1 gram, Miconazole nitrate 20 mg per 1 gram Daktacort Hydrocortisone cream | 15 gram (P) £3.17 DT price = £3.17
      - Daktacort 2% / 1% cream | 30 gram (P) £2.49 DT price = £2.49
    - **Ointment**
      - CAUTIONARY AND ADVISORY LABELS 28
      - Daktacort (Janssen-Cilag Ltd)
      - Hydrocortisone 10 mg per 1 gram, Miconazole nitrate 20 mg per 1 gram Daktacort ointment | 30 gram (P) £2.50 DT price = £2.50

- **Hydrocortisone with oxytetracycline**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hydrocortisone p. 692, oxytetracycline p. 334.

- **INDICATIONS AND DOSE**
  - **Mild inflammatory skin disorders such as eczemas**
  - **TO THE SKIN**
  - **Child 12-17 years:** (consult product literature)

- **POTENCY**
  - Hydrocortisone 1% with oxytetracycline ointment: mild.

- **CONTRA-INDICATIONS**
  - Children under 12 years

- **PREGNANCY**
  - Tetracyclines should not be given to pregnant women. Effects on skeletal development have been documented when tetracyclines have been used in the first trimester in animal studies. Administration during the second or third trimester may cause discoloration of the child’s teeth.

- **BREAST FEEDING**
  - Tetracyclines should not be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).

- **PATIENT AND CARER ADVICE**
  - Patients should be given advice on the application of hydrocortisone with oxytetracycline ointment.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Ointment**
    - CAUTIONARY AND ADVISORY LABELS 28
    - Terra-Cortril (IntraPharm Laboratories Ltd)
    - Hydrocortisone 10 mg per 1 gram, Oxytetracycline (as Oxytetracycline hydrochloride) 30 mg per 1 gram Terra-Cortril ointment | 30 gram (P) £5.01 DT price = £5.01
**DERMATOLOGICAL DRUGS > ANTI-INFECTIVES**

**Ichthammol**

- **INDICATIONS AND DOSE**
  - Chronic lichenified eczema
  - **TO THE SKIN**
  - Child: 1-17 years: Apply 1–3 times a day

- **UNLICENSED USE** No information available.

- **SIDE-EFFECTS** Skin irritation

- **MEDIATE FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, paste

  **Liquid**
  - Ichthammol (Non-proprietary)
    - Ichthammol 1 mg per 1 mg Ichthammol liquid | 100 gram £11.42
  - (Smith & Nephew Healthcare Ltd)

**Ichthammol with zinc oxide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, ichthammol above.

- **INDICATIONS AND DOSE**
  - Chronic lichenified eczema
  - **TO THE SKIN**
  - Child: (consult product literature)

- **MEDIATE FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream, ointment

  **Impregnated dressing**
  - Ichthopaste
    - Ichthopaste bandage 7.5cm × 6m | 1 bandage £3.68

**DERMATOLOGICAL DRUGS > ANTRACEN DERIVATIVES**

**Dithranol** (Anthralin)

- **INDICATIONS AND DOSE**
  - Subacute and chronic psoriasis
  - **TO THE SKIN**
  - Child: (consult product literature)

**Dithrocream®**

- **INDICATIONS AND DOSE**
  - Subacute and chronic psoriasis
  - **TO THE SKIN**
  - Child: For application to skin or scalp, 0.1–0.5% cream suitable for overnight treatment, 1–2% cream for maximum 1 hour (consult product literature)

**Micanol®**

- **INDICATIONS AND DOSE**
  - Subacute and chronic psoriasis
  - **TO THE SKIN**
  - Child: Apply once daily, for application to skin or scalp, to be applied for up to 30 minutes, apply 1% cream, if necessary 3% cream can be used under medical supervision

- **UNLICENSED USE**

  **Dithrocream®** is licensed for use in children (age range not specified by manufacturer).

  **Micanol®** licensed for use in children, but not recommended for infants or young children (age range not specified by manufacturer).

- **CONTRA-INDICATIONS** Acute and postural psoriasis - hypersensitivity

- **CAUTIONS**
  - Avoid sensitive areas of skin - avoid use near eyes

- **SIDE-EFFECTS**
  - Local burning sensation - local irritation - stains hair - stains skin

- **PREGNANCY** No adverse effects reported.

- **BREAST FEEDING** No adverse effects reported.

- **DIRECTIONS FOR ADMINISTRATION**
  - When applying dithranol, hands should be protected by gloves or they should be washed thoroughly afterwards. Dithranol should be applied to chronic exposer plaques only, carefully avoiding normal skin.

  **Micanol®** At the end of contact time, use plenty of lukewarm (not hot) water to rinse off cream; soap may be used after the cream has been rinsed off; use shampoo before applying cream to scalp and if necessary after cream has been rinsed off.

  **PRESCRIBING AND DISPENSING INFORMATION**
  - Treatment should be started with a low concentration. Dithranol 0.1%, and the strength increased gradually every few days up to 3%, according to tolerance.

**PATIENT AND CARER ADVICE**

- Dithranol can stain the skin, hair and fabrics.

- **EXCEPTIONS TO LEGAL CATEGORY**
  - Prescription only medicine if dithranol content more than 1%, otherwise may be sold to the public.

- **MEDIATE FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment

  **Cream**

  **CAUTIONARY AND ADVISORY LABELS**
  - 2B
  - **EXCipients:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), chlorocresol
  - **Dithrocream®** (Dermal Laboratories Ltd)
    - Dithranol 1 mg per 1 gram Dithrocream 0.1% cream | 50 gram P £3.77
    - Dithranol 2.5 mg per 1 gram Dithrocream 0.25% cream | 50 gram P £4.04
    - Dithranol 5 mg per 1 gram Dithrocream 0.5% cream | 50 gram P £4.66
    - Dithranol 10 mg per 1 gram Dithrocream HP 1% cream | 50 gram P £5.42
    - Dithranol 20 mg per 1 gram Dithrocream 2% cream | 50 gram P £5.77
    - Micanol® (Derma UK Ltd)
      - Dithranol 10 mg per 1 gram Micanol 1% cream | 50 gram P £16.18
      - Dithranol 30 mg per 1 gram Micanol 3% cream | 50 gram P £20.15

  **Combinations available:** Coal tar with dithranol and salicylic acid, p. 700

**Dithranol with salicylic acid and zinc oxide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, dithranol above.

- **INDICATIONS AND DOSE**
  - Subacute and chronic psoriasis
  - **TO THE SKIN**
  - Child: (consult local protocol)

- **MEDIATE FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, paste
DERMATOLOGICAL DRUGS › TARS

 Coal tar

● INDICATIONS AND DOSE

Psoriasis | Chronic atopic eczema
▶ TO THE SKIN USING PASTE
Child: Apply 1–3 times a day, start application with low-strength preparations
▶ TO THE SKIN
Child: 100 mL/bath, to be added to an adult sized bath; add proportionally less for a child’s bath. Use Coal Tar Solution BP

ALPHOSYL 2 IN 1™ SHAMPOO

Psoriasis | Seborrhoic dermatitis | Scaling | Itching
▶ TO THE SKIN
Child: Apply every 2–3 days

Dandruff
▶ TO THE SKIN
Child: Apply 1–2 times a week as required

EXOREX® LOTION

Psoriasis
▶ TO THE SKIN
Child: Apply 2–3 times a day, to be applied to skin or scalp; can be diluted with a few drops of water before applying

● CONTRA-INDICATIONS
Avoid broken or inflamed skin - avoid eye area - avoid genital area - avoid mucosal areas - avoid rectal area - infection - sore, acute, or pustular psoriasis

● CAUTIONS
Application to face - application to skin flexures

● SIDE-EFFECTS
Acne-like eruptions - photosensitivity - skin irritation

● PRESCRIBING AND DISPENSING INFORMATION
Coal Tar Solution BP contains coal tar 20%, Strong Coal Tar Solution BP contains coal tar 40%.

● HANDLING AND STORAGE
Use suitable chemical protection gloves for extemporaneous preparation. May stain skin, hair and fabric.

● PATIENT AND CARER ADVICE
May stain skin, hair and fabric.

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

Coal tar with arachis oil extract of coal tar, cade oil, light liquid paraffin and tar

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar above.

● INDICATIONS AND DOSE

Psoriasis | Eczema | Atopic dermatoses | Pruritic dermatoses
▶ TO THE SKIN
Child: 2–4 capfuls/bath, alternatively 15–30 mL, to be added in an adult-size bath and soak for 20 minutes (proportionally less for a child’s bath)

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Coal tar with coconut oil and salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar above.

● INDICATIONS AND DOSE

Scaly scalp disorders | Psoriasis | Seborrhoic dermatitis | Dandruff | Cradle cap
▶ TO THE SKIN USING SHAMPOO
Child: Apply daily as required

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Shampoo
Capasal (Dermal Laboratories Ltd)

Salicylic acid 5 mg per 1 gram, Coal tar distilled 10 mg per 1 gram,
Coconut oil 10 mg per 1 gram Capasal Therapeutic shampoo
250 ml P £4.69

Coal tar with dithranol and salicylic acid

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar above, dithranol p. 699.

● INDICATIONS AND DOSE

Subacute and chronic psoriasis
▶ TO THE SKIN
Child: Apply up to twice daily

● UNLICENSED USE

Psorin® is licensed for use in children (age range not specified by manufacturer).

● MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment
Coal tar with lecithin

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 700.

- **INDICATIONS AND DOSE**
  - **PSORIDERM® CREAM**
    - Psoriasis
      - **TO THE SKIN**
      - Child: Apply 1–2 times a day, cream to be applied to the skin or scalp
  - **PSORIDERM® SCALP LOTION**
    - Scalp psoriasis
      - **TO THE SKIN**
      - Child: Apply as required

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Cream**
    - **EXCIPIENTS:** May contain Isopropyl palmitate, propylene glycol
      - Psoriderm (Dermal Laboratories Ltd)
      - Lecithin 4 mg per 1 gram, Coal tar distilled 60 mg per 1 gram
      - Psoriderm cream | 225 ml | £3.92
  - **Shampoo**
    - **EXCIPIENTS:** May contain Disodium edetate
      - Psoriderm (Dermal Laboratories Ltd)
      - Lecithin 3 mg per 1 ml, Coal tar distilled 25 mg per 1 ml
      - Psoriderm scalp lotion | 250 ml | £4.74

Coal tar with salicylic acid and precipitated sulfur

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 700.

- **INDICATIONS AND DOSE**
  - **COCOS® OINTMENT**
    - Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff
      - **INITIALLY TO THE SKIN USING SCALP OINTMENT**
      - Child 6–11 years: Medical supervision required
      - Child 12–17 years: Apply as required, alternatively apply daily for the first 3–7 days (if severe), shampoo off after 1 hour
  - **SEBCO® OINTMENT**
    - Scaly scalp disorders including psoriasis, eczema, seborrhoeic dermatitis and dandruff
      - **TO THE SKIN USING SCALP OINTMENT**
      - Child 6–11 years: Medical supervision required
      - Child 12–17 years: Apply as required, alternatively apply daily for the first 3–7 days (if severe), shampoo off after 1 hour

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Ointment**
    - **EXCIPIENTS:** May contain Cetostearyl alcohol (including cetyl and stearyl alcohol)
      - Cocos (Focus Pharmaceuticals Ltd)
      - Salicylic acid 20 mg per 1 gram, Sulphur precipitated 40 mg per 1 gram, Coal tar solution 120 mg per 1 gram
      - Cocos ointment | 40 gram | £6.22 | 100 gram | £11.69
      - Sebco (Derma UK Ltd)
      - Salicylic acid 20 mg per 1 gram, Sulphur precipitated 40 mg per 1 gram, Coal tar solution 120 mg per 1 gram
      - Sebco ointment | 40 gram | £5.91 | 100 gram | £11.11

Coal tar with zinc oxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 700.

- **INDICATIONS AND DOSE**
  - **Psoriasis** | Chronic atopic eczema
    - **TO THE SKIN**
    - Child: Apply 1–2 times a day

- **PRESCRIBING AND DISPENSING INFORMATION**
  - No preparations available—when prepared extemporaneously, the BP states Zinc and Coal Tar Paste, BP consists of zinc oxide 6%, coal tar 6%, emulsifying wax 5%, starch 30%, yellow soft paraffin 45%.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: ointment, paste

Extract of coal tar with arachis oil

The properties listed below are those particular to the combination only. For the properties of the components please consider, coal tar p. 700.

- **INDICATIONS AND DOSE**
  - **Scalp disorders** | Psoriasis | Seborrhoea | Eczema | Pruritus | Dandruff
    - **TO THE SKIN**
    - Child: Apply 1–2 times a week, to the scalp

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - No licensed medicines listed.

**IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS**

Pimecrolimus

- **INDICATIONS AND DOSE**
  - Short-term treatment of mild to moderate atopic eczema (including flares) when topical corticosteroids cannot be used (initiated by a specialist)
    - **TO THE SKIN**
    - Child: 2–17 years: Apply twice daily until symptoms resolve (stop treatment if eczema worsens or no response after 6 weeks)

- **CONTRA-INDICATIONS**
  - Application to malignant or potentially malignant skin lesions · application under occlusion · congenital epidermal barrier defects · contact with eyes · contact with mucous membranes · generalised erythroderma · immunodeficiency · infection at treatment site

- **CAUTIONS**
  - Alcohol consumption (risk of facial flushing and skin irritation) · avoid other topical treatments except emollients at treatment site · UV light (avoid excessive exposure to sunlight and sunlamps)

- **INTERACTIONS**
  - Concomitant use with drugs that cause immunosuppression is contra-indicated (may be prescribed in exceptional circumstances by specialists).
Tacrolimus

**DRUG ACTION** Tacrolimus is a calcineurin inhibitor.

**INDICATIONS AND DOSE**

**Short-term treatment of moderate to severe atopic eczema (including flares) in patients unresponsive to, or intolerant of, conventional therapy (initiated by a specialist)**

- **TO THE SKIN**
  - Child 2–15 years: Apply twice daily for up to 3 weeks (consider other treatment if eczema worsens or if no improvement after 2 weeks), 0.03% ointment to be applied thinly, then reduced to once daily until lesion clears.
  - Child 16–17 years: Apply twice daily until lesion clears (consider other treatment if eczema worsens or no improvement after 2 weeks), initially 0.1% ointment to be applied thinly, reduce frequency to once daily or strength of ointment to 0.03% if condition allows.

**Prevention of flares in patients with moderate to severe atopic eczema and 4 or more flares a year who have responded to initial treatment with topical tacrolimus (initiated by a specialist)**

- **TO THE SKIN**
  - Child 2–15 years: Apply twice weekly, 0.03% ointment to be applied thinly, with an interval of 2–3 days between applications, use short-term treatment regimen during an acute flare; review need for preventative therapy after 1 year.
  - Child 16–17 years: Apply twice weekly, 0.1% ointment to be applied thinly, with an interval of 2–3 days between applications, use short-term treatment regimen during an acute flare; review need for preventative therapy after 1 year.

**SIDE-EFFECTS**

- **Common or very common** Burning sensation · erythema · folliculitis · pruritus · skin infections
- **Uncommon** Herpes simplex · herpes zoster · impetigo · molluscum contagiosum
- **Rare** Dryness · local reactions including pain · oedema · papilloma · paraesthesia · peeling · skin discoloration · worsening of eczema
- **Frequency not known** Skin malignancy
- **PREGNANCY** Manufacturer advises avoid unless essential; toxicity in animal studies following systemic administration.
- **BREAST FEEDING** Manufacturer advises caution; ensure infant does not come in contact with treated areas.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Tacrolimus and pimecrolimus for atopic eczema (August 2004) NICE TA82
  - Topical pimecrolimus is an option for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy).
  - Topical tacrolimus is recommended for moderate atopic eczema on the face and neck of children aged 2–16 years. Pimecrolimus should be used within its licensed indications.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

- **Exciipients:** May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), propylene glycol
- **Elidel® (Meda Pharmaceuticals Ltd)**
  - Pimecrolimus 10 mg per 1 gram
    - 30 gram tube: £37.41 DT price = £35.46
    - 60 gram tube: £38.47 DT price = £36.51
  - 100 gram tube: £59.07 DT price = £59.07

**CONTRA-INDICATIONS**

- Application to malignant or potentially malignant skin lesions · application under occlusion · avoid contact with eyes · avoid contact with mucous membranes · congenital epidermal barrier defects · generalised erythroderma · immunodeficiency · infection at treatment site

**CAUTIONS**

- UV light (avoid excessive exposure to sunlight and sunlamps)
- Interactions Interactions do not generally apply to tacrolimus used topically. Concomitant use with drugs that cause immunosuppression (may be prescribed in exceptional circumstances by specialists). Risk of facial flushing and skin irritation with alcohol consumption (does not apply to tacrolimus taken systemically).

**INTERACTIONS**

- **Common or very common** Application-site infections · application-site reactions · herpes simplex infection · irritation (at application-site) · Kaposi’s varicelliform eruption · pain at application-site · rash
- **Uncommon** Acne
- **Frequency not known** Cutaneous lymphoma · malignancies · other types of lymphomas · rosacea · skin malignancy

**ALLERGY AND CROSS-SENSITIVITY**

- Contra-indicated if history of hypersensitivity to macrolides.
- **PREGNANCY** Manufacturer advises avoid unless essential; toxicity in animal studies following systemic administration.
- **BREAST FEEDING** Avoid—present in breast milk (following systemic administration).

**PATIENT AND CARER ADVICE**

- Avoid excessive exposure to UV light including sunlight.

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Tacrolimus and pimecrolimus for atopic eczema (August 2004) NICE TA82
  - Topical tacrolimus is an option for atopic eczema not controlled by maximal topical corticosteroid treatment or if there is a risk of important corticosteroid side-effects (particularly skin atrophy). Topical tacrolimus is recommended for moderate to severe atopic eczema in adults and children over 2 years. Tacrolimus should be used within its licensed indications.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Ointment**

- **Exciipients:** May contain Beeswax
- **Protopic® (Astellas Pharma Ltd)**
  - Tacrolimus (as Tacrolimus monohydrate) 300 microgram per 1 gram
    - 30 gram tube: £15.44 DT price = £15.44
    - 60 gram tube: £35.46 DT price = £35.46
  - Tacrolimus (as Tacrolimus monohydrate) 1 mg per 1 gram
    - 30 gram tube: £12.60 DT price = £12.60
    - 60 gram tube: £39.40 DT price = £39.40
RETINOID AND RELATED DRUGS

Acitretin

DRUG ACTION  Acitretin is a metabolite of etretinate.

INDICATIONS AND DOSE

Severe extensive psoriasis resistant to other forms of therapy (under expert supervision) / Palmoplantar pustular psoriasis (under expert supervision) / Severe congenital ichthyosis (under expert supervision)

- **BY MOUTH**
  - Child 1 month-11 years: 0.5 mg/kg once daily; increased if necessary to 1 mg/kg once daily, to be taken with food or milk, careful monitoring of musculoskeletal development required; maximum 35 mg per day
  - Child 12-17 years: Initially 25–30 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily, increased to up to 75 mg daily, dose only increased to 75 mg daily for short periods in psoriasis

Severe Darier’s disease (keratosis follicularis) (under expert supervision)

- **BY MOUTH**
  - Child 1 month-11 years: 0.5 mg/kg once daily; increased if necessary to 1 mg/kg once daily, to be taken with food or milk, careful monitoring of musculoskeletal development required; maximum 35 mg per day
  - Child 12-17 years: Initially 10 mg daily for 2–4 weeks, then adjusted according to response to 25–50 mg daily

Harlequin ichthyosis (under expert supervision)

- **BY MOUTH**
  - Neonate: 0.5 mg/kg once daily; increased if necessary to 1 mg/kg once daily, to be taken with food or milk, careful monitoring of musculoskeletal development required.

CONTRA-INDICATIONS

- Hyperlipidaemia

CAUTIONS

- Avoid excessive exposure to sunlight and unsupervised use of sunlamps / diabetes (can alter glucose tolerance—initial frequent blood glucose checks) / do not donate blood during and for 2 years after stopping therapy (theratogenic risk) / children use only in exceptional circumstances and monitor growth parameters and bone development (premature epiphyseal closure reported) / investigate atypical musculoskeletal symptoms

INTERACTIONS  → Appendix 1 (retinoids)

SIDE-EFFECTS

- Common or very common  Abdominal pain / abnormal hair texture / alopecia (reversible on withdrawal) / arthralgia / brittle nails / dermatitis / diarrhoea / dryness and inflammation of mucous membranes / dryness of conjunctiva (causing conjunctivitis and decreased tolerance to contact lenses) / epidermal fragility / erythema / headache / myalgia / nausea / paronychia / peripheral oedema / pruritus / reversible increase in serum-cholesterol (with high doses) / reversible increase in serum-triglyceride concentrations (with high doses) / skin exfoliation / sticky skin / vomiting
- Uncommon  Dizziness / hepatitis / photosensitivity / visual disturbances
- Rare  Peripheral neuropathy
- Very rare  Benign intracranial hypertension / bone pain / exostosis / night blindness / ulcerative keratitis
- Frequency not known  Drowsiness / dry skin / flushing / granulomatous lesions / impaired hearing / initial worsening of psoriasis / malaise / rectal haemorrhage / sweating / taste disturbance / tinnitus

SIDE-EFFECTS, FURTHER INFORMATION

- Exostosis  Skeletal hyperostosis and extra-osseous calcification reported following long-term treatment with etretinate (of which Acitretin is a metabolite) and premature epiphyseal closure in children.

- Benign intracranial hypertension  Discontinue if severe headache, nausea, vomiting, or visual disturbances occur.

CONCEPTION AND CONTRACEPTION  Effective contraception must be used.

Pregnancy prevention  In females of child-bearing potential (including those with a history of infertility), exclude pregnancy up to 3 days before treatment, every month during treatment, and every 1–3 months for 3 years after stopping treatment. Treatment should be started on day 2 or 3 of menstrual cycle. Females of child-bearing age must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 3 years after stopping treatment. Females should be advised to use at least 1 method of contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone but can be used in conjunction with other contraceptive methods. Females should be advised to seek medical attention immediately if they become pregnant during treatment or within 3 years of stopping treatment. They should also be advised to avoid alcohol during treatment and for 2 months after stopping treatment.

PREGNANCY  Avoid—teratogenic.

BREAST FEEDING  Avoid.

HEPATIC IMPAIRMENT  Avoid in severe impairment—risk of further impairment.

RENNAL IMPAIRMENT  Avoid in severe impairment; increased risk of toxicity.

MONITORING REQUIREMENTS

- Monitor serum triglyceride and serum-cholesterol concentrations before treatment, 1 month after starting, then every 3 months.
- Check liver function at start, at least every 4 weeks for first 2 months and then every 3 months.

PRESCRIBING AND DISPENSING INFORMATION

Prescribing for women of child-bearing potential  Each prescription for acitretin should be limited to a supply of up to 30 days’ treatment and dispensed within 7 days of the date stated on the prescription.

PATIENT AND CARER ADVICE  A patient information leaflet should be provided.

Patient advice required around conception and contraception  Females of child-bearing potential must be advised on pregnancy prevention.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

| CAUTIONARY AND ADVISORY LABELS | 10, 11, 21 |
| Actretin (Non-proprietary) |
| Acitretin 10 mg | Actretin 10mg capsules | 60 capsule | £23.80  DT price + £23.80 |
| Acitretin 25 mg | Actretin 25mg capsules | 60 capsule | £55.24  DT price + £55.24 |
| Neotigason (Actavis UK Ltd) |
| Acitretin 10 mg | Neotigason 10mg capsules | 60 capsule | £17.30  OT price + £23.80 (Hospital only) |
| Acitretin 25 mg | Neotigason 25mg capsules | 60 capsule | £43.00  OT price + £55.24 (Hospital only) |
SALICYLIC ACID AND DERIVATIVES

Salicylic acid with zinc oxide

**INDICATIONS AND DOSE**

Hyperkeratotic skin disorders

- **TO THE SKIN**
  - Child: Apply twice daily

**CAUTIONS**

Avoid broken skin - avoid inflamed skin

**SIDE-EFFECTS**

Excessive drying - irritation - sensitivity - systemic effects (after widespread use)

**PRESCRIBING AND DISPENSING INFORMATION**

Zinc and Salicylic Acid Paste BP is also referred to as Lassar's Paste. When prepared extemporaneously, the BP states Zinc and Salicylic Acid Paste, BP (Lassar's Paste) consists of zinc oxide 24%, salicylic acid 2%, starch 24%, white soft paraffin 50%.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: paste

VITAMINS AND TRACE ELEMENTS

**VITAMIN D AND ANALOGUES**

Calcipotriol

**INDICATIONS AND DOSE**

Plaque psoriasis

- **TO THE SKIN USING OINTMENT**
  - Child 6-11 years: Apply twice daily, when preparations used together maximum total calcipotriol 2.5 mg in any one week (e.g. scalp solution 20 mL with ointment 30 g); maximum 50 g per week
  - Child 12-17 years: Apply twice daily, when preparations used together maximum total calcipotriol 3.75 mg in any one week (e.g. scalp solution 30 mL with ointment 45 g); maximum 75 g per week

Scalp psoriasis

- **TO THE SKIN USING SCALP LOTION**
  - Child 6-11 years (specialist use only): Apply twice daily, when preparations used together maximum total calcipotriol 2.5 mg in any one week (e.g. scalp solution 20 mL with ointment 30 g); maximum 30 mL per week
  - Child 12-17 years (specialist use only): Apply twice daily, when preparations used together maximum total calcipotriol 3.75 mg in any one week (e.g. scalp solution 30 mL with ointment 45 g); maximum 45 mL per week

**UNLICENSED USE**

Calcipotriol ointment and scalp solution not licensed for use in children.

**CONTRA-INDICATIONS**

Calcium metabolism disorders

**CAUTIONS**

Avoid excessive exposure to sunlight and sunlamps - avoid use on face - erythrodernic exfoliative psoriasis (enhanced risk of hypercalcaemia) - generalised pustular psoriasis (enhanced risk of hypercalcaemia)

**SIDE-EFFECTS**

- **Common or very common**
  - Burning - dermatitis - erythema - itching - local skin reactions - paraesthesia
  - **Rare**
    - Facial dermatitis - perioral dermatitis

**PREGNANCY**

Manufacturers advise avoid unless essential.

**BREAST FEEDING**

No information available.
## Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

**Ointment**
- **Siliks** (Galderma (UK) Ltd)
  - Calcitriol 3 microgram per 1 gram Siliks ointment | 100 gram | £18.06

**Lotions**
- **Curatoderm** (Almirall Ltd)
  - Calcitriol 3 microgram per 1 gram Curatoderm lotion | 30 mL | £12.73

- **Silkis** (Galderma (UK) Ltd)
  - Calcitriol 3 microgram per 1 gram Silkis lotion | 30 mL | £12.73

- **Calcitriol** (Almirall Ltd)
  - Calcitriol 3 microgram per 1 gram Calcitriol lotion | 30 mL | £12.73

- **Calcitriol** (Galderma (UK) Ltd)
  - Calcitriol 3 microgram per 1 gram Calcitriol lotion | 30 mL | £12.73

### Tacalcitol

**Indications and Dose**

**Plaque psoriasis**
- **Child** 12-17 years: Apply once daily, preferably at bedtime, maximum 10 g ointment or 10 mL lotion daily, when lotion and ointment used together, maximum total tacalcitol 280 micrograms in any one week (e.g. lotion 30 mL with ointment 40 g)

**Ointment**
- **Curatoderm** (Almirall Ltd)
  - Tacalcitol (as Tacalcitol monohydrate) 4 microgram per 1 gram Curatoderm ointment | 50 gram | £30.86
  - Tacalcitol (as Tacalcitol monohydrate) 4 microgram per 1 gram Curatoderm ointment | 150 gram | £75.00

**Lotion**
- **Silkis** (Galderma (UK) Ltd)
  - Tacalcitol (as Tacalcitol monohydrate) 4 microgram per 1 gram Silkis lotion | 30 mL | £18.06
  - Tacalcitol (as Tacalcitol monohydrate) 4 microgram per 1 gram Silkis lotion | 150 mL | £75.00

**Unlicensed Use**
- Licensed for use in children (age range not specified by manufacturer).

**Contra-Indications**
- Calcium metabolism disorders

**Caution**
- Avoid eyes - erythropoietic exfoliative psoriasis (enhanced risk of hypercalcaemia) - generalised pustular psoriasis (enhanced risk of hypercalcaemia) - if used in conjunction with UV treatment

**Caution, Further Information**
- UV treatment: If tacalcitol is used in conjunction with UV treatment, UV radiation should be given in the morning and tacalcitol applied at bedtime.

**Side-Effects**
- **Common or very common** Burning - dermatitis - erythema - itching - local skin reactions - paraesthesia

**Frequency not known**
- **Aggravation of psoriasis**

**Pregnancy**
- Manufacturer advises avoid unless no safer alternative — no information available.

**Breast Feeding**
- Manufacturer advises avoid application to breast area; no information available on presence in milk.

**Renal Impairment**
- Monitor serum calcium concentration.

**Monitoring Requirements**
- Monitor serum calcium if risk of hypercalcaemia.

**Patient and carer advice**
- Hands should be washed thoroughly after application to avoid inadvertent transfer to other body areas.

**Medicinal Forms**
- There can be variation in the licensing of different medicines containing the same drug.

**Liquid**
- **Exciptiens:** May contain Disodium edetate, propylene glycol

**Curatoderm** (Almirall Ltd)
- Tacalcitol (as Tacalcitol monohydrate) 4 microgram per 1 gram Curatoderm 4 micrograms/g lotion | 30 mL | £12.73

**Ointment**
- **Curatoderm** (Almirall Ltd)
  - Tacalcitol (as Tacalcitol monohydrate) 4 microgram per 1 gram Curatoderm 4 micrograms/g ointment | 50 gram | £30.86
  - Tacalcitol (as Tacalcitol monohydrate) 4 microgram per 1 gram Curatoderm 4 micrograms/g ointment | 100 gram | £41.28

**Powder**
- **Calcitriol** (Almirall Ltd)
  - Calcitriol 0.25 microgram Calcitriol powder | 50 micrograms | £0.50
  - Calcitriol 0.5 microgram Calcitriol powder | 50 micrograms | £0.50

### Antimuscarinics

#### Glycopyrronium bromide

**Overview**
- Aluminium chloride hexahydrate p. 706 is a potent antiperspirant used in the treatment of axillary, palmar, and plantar hyperhidrosis. Aluminium salts are also incorporated in preparations used for minor fungal skin infections associated with hyperhidrosis.

- In more severe cases specialists use tap water or glycopyrronium bromide below (as a 0.05% solution) in the iontophoretic treatment of hyperhidrosis of palms and soles. **Botox** contains botulinum toxin type A complex p. 243 and is available for use intradermally for severe hyperhidrosis of the axillae unresponsive to topical antiperspirant or other antihidrotic treatment; intradermal treatment is unlikely to be tolerated by most children and should be administered under hospital specialist supervision.

#### 4.1 Hyperhidrosis

**Antimuscarinics**

**Glycopyrronium bromide**

**Indications and Dose**

**Iontophoretic treatment of hyperhidrosis**
- **Child:** Only 1 site to be treated at a time, maximum 2 sites treated in any 24 hours, treatment not to be repeated within 7 days (consult product literature)

**Unlicensed Use**
- Licensed for use in children (age range not specified by manufacturer).

**Contra-Indications**
- Infections affecting the treatment site

**Caution, Further Information**
- Contra-indications applicable to systemic use should be considered; however, glycopyrronium is poorly absorbed and systemic effects unlikely with topical use.

**Caution**
- Cautions applicable to systemic use should be considered; however, glycopyrronium is poorly absorbed and systemic effects unlikely with topical use.

**Side-Effects**
- Tingling at administration site

**Side-Effects, Further Information**
- The possibility of systemic side-effects should be considered; however, glycopyrronium is poorly absorbed and systemic effects unlikely with topical use.

**Medicinal Forms**
- There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for iontophoresis**
- Glycopyrronium bromide (Non-proprietary)

**Glycopyrronium bromide 1 mg per 1 mg Glycopyrronium bromide powder for solution for iontophoresis | 3 gram | £11.92**
Photodamage

Actinic keratoses occur very rarely in healthy children; actinic cheilitis may occur on the lips of adolescents following excessive sun exposure. Diclofenac gel (Solaraze®) and topical preparations of fluorouracil are licensed for the treatment of actinic keratoses but they are not licensed for use in children. In children with photosensitivity disorders, such as erythropoietic protoporphyria, specialists may use betacarotene below, mepacrine, chloroquine or hydroxychloroquine to reduce skin reactions.

VITAMINS AND TRACE ELEMENTS › VITAMIN A

Betacarotene

- **INDICATIONS AND DOSE**
  - Management of photosensitivity reactions in erythropoietic protoporphyria (specialist use only)
    - **BY MOUTH**
      - Child 1–4 years: 60–90 mg daily, to be given as a single dose or in divided doses
      - Child 5–8 years: 90–120 mg daily, to be given as a single dose or in divided doses
      - Child 9–11 years: 120–150 mg daily, to be given as a single dose or in divided doses
      - Child 12–15 years: 150–180 mg daily, to be given as a single dose or in divided doses
      - Child 16–17 years: 180–300 mg daily, to be given as a single dose or in divided doses

- **SIDE-EFFECTS**
  - Use with caution.
  - Use with caution.

- **UNLICENSED USE**
  - Not licensed.

- **CAUTIONS**
  - Monitor vitamin A intake
  - Avoid strong sunlight and use sunscreen preparations; generally 2–6 weeks of treatment (resulting in yellow coloration of palms and soles) necessary before increasing exposure to sunlight; dose should be adjusted according to level of exposure to sunlight.

- **INTERACTIONS**
  - → Appendix 1 (vitamins).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Capsule**
    - Betacarotene (Non-proprietary)
      - Betacarotene 30 mg Lumitone 30 mg capsules [P] 100 capsule no price available
      - Betacarotene 9 mg Bio-Carotene 9 mg capsules [P] 150 capsule no price available
      - Super Betavit (Health+Plus Ltd)
        - Betacarotene 15 mg Super Betavit 15 mg capsules [P] 30 capsule £1.59

**5 Photodamage**

**Photodamage**

Actinic keratoses occur very rarely in healthy children; actinic cheilitis may occur on the lips of adolescents following excessive sun exposure. Diclofenac gel (Solaraze®) and topical preparations of fluorouracil are licensed for the treatment of actinic keratoses but they are not licensed for use in children. In children with photosensitivity disorders, such as erythropoietic protoporphyria, specialists may use betacarotene below, mepacrine, chloroquine or hydroxychloroquine to reduce skin reactions.
6 Pruritus

Topical local antipruritics

Overview

Pruritus may be caused by systemic disease (such as obstructive jaundice, endocrine disease, chronic renal disease, iron deficiency, and certain malignant diseases), skin disease (such as eczema, psoriasis, urticaria, and scabies), drug hypersensitivity, or as a side-effect of opioid analgesics. Where possible, the underlying cause should be treated. Local antipruritics have a role in the treatment of pruritus in palliative care. Pruritus caused by cholestasis generally requires a bile acid sequestrant.

An emollient may be of value where the pruritus is associated with dry skin. Preparations containing calamine or crotamiton below are sometimes used but are of uncertain value.

A topical preparation containing doxepin 5% below is licensed for the relief of pruritus in eczema in children over 12 years; it can cause drowsiness and there may be a risk of sensitisation.

Topical antihistamines and local anaesthetics are only intractable where sedation is desirable. Calamine preparations or emollients are of little value for the treatment of insect stings or bites.

In pruritus ani, the underlying cause such as faecal soiling, eczema, psoriasis, or helminth infection should be treated.

Drugs used for Pruritus not listed below

Antipruritics

Calamine with zinc oxide

- INDICATIONS AND DOSE
  - Pruritus
    - TO THE SKIN
  - Child: (consult product literature)

- CONTRA-INDICATIONS
  - Avoid application of preparations containing zinc oxide prior to x-ray (zinc oxide may affect outcome of x-ray)

- LESS SUITABLE FOR PRESCRIBING
  - Less suitable for prescribing.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Liquid
    - Calamine with zinc oxide (Non-proprietary)
      - Phenol liquefied 5 mg per 1 ml, Bentonite 30 mg per 1 ml, Calamine 150 mg per 1 ml, Zinc oxide 50 mg per 1 ml, Calamine lotion 200 ml £0.96
      - Cala Soothe (Ennogen Healthcare Ltd)
        - Phenol liquefied 5 mg per 1 ml, Sodium citrate 5 mg per 1 ml, Bentonite 30 mg per 1 ml, Calamine 150 mg per 1 ml, Zinc oxide 50 mg per 1 ml, Calamine 200 ml £0.96

Crotamiton

- INDICATIONS AND DOSE
  - Pruritus (including pruritus after scabies)
    - TO THE SKIN
  - Child 1 month-2 years (on doctor’s advice only): Apply once daily
  - Child 3-17 years: Apply 2–3 times a day

- CONTRA-INDICATIONS
  - Acute exudative dermatoses

- CAUTIONS
  - Avoid use in buccal mucosa - avoid use near eyes - avoid use on broken skin
  - Avoid use on very inflamed skin
  - Use on doctor’s advice for children under 3 years

PREGNANCY

Manufacturer advises avoid, especially during the first trimester—no information available.

BREAST FEEDING

No information available; avoid application to nipple area.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.
  - Cream
    - Calamine with zinc oxide (Non-proprietary)
      - Phenoxethanol 5 mg per 1 gram, Zinc oxide 30 mg per 1 gram, Calamine 40 mg per 1 gram, Cetomacrogol emulsifying wax 50 mg per 1 gram, Self-emulsifying glyceryl monostearate 50 mg per 1 gram, Liquid paraffin 200 mg per 1 gram
    - Aqueous calamine cream 100 gram £1.29 DT price = £1.29
    - Cala Soothe (Ennogen Healthcare Ltd)
      - Phenoxethanol 5 mg per 1 gram, Zinc oxide 30 mg per 1 gram, Calamine 40 mg per 1 gram, Cetomacrogol emulsifying wax 50 mg per 1 gram, Self-emulsifying glyceryl monostearate 50 mg per 1 gram, Liquid paraffin 200 mg per 1 gram
    - Cala Soothe cream 100 ml £18.80
  - Crotamiton (Non-proprietary)
    - Crotamiton 100 mg per 1 gram
    - Boots Derma Care Itch Relief cream 30 gram £2.50
    - Brands may include Euxan

Doxepin

- INDICATIONS AND DOSE
  - Pruritus in eczema
    - TO THE SKIN
  - Child 12-17 years: Apply up to 3 g 3–4 times a day, apply thinly; coverage should be less than 10% of body surface area; maximum 12 g per day

- CAUTIONS
  - Avoid application to large areas - cardiac arrhythmias - mania - severe heart disease - susceptibility to angle-closure glaucoma - urinary retention

- INTERACTIONS
  - Appendix 1 (antidepressants, tricyclic).

- SIDE-EFFECTS
  - Common or very common
    - Antimuscarinic effects - dizziness - drowsiness - fever - gastrointestinal disturbances - headache - irritation - local burning - rash - stinging - tingling

PREGNANCY

Manufacturer advises use only if potential benefit outweighs risk.

BREAST FEEDING

Manufacturer advises use only if potential benefit outweighs risk.

HEPATIC IMPAIRMENT

Manufacturer advises caution in severe liver disease.
Rosacea and Acne

Acne vulgaris
Acne vulgaris commonly affects children around puberty and occasionally affects infants. Treatment of acne should be commenced early to prevent scarring; lesions may worsen before improving. The choice of treatment depends on age, severity, and whether the acne is predominantly inflammatory or comedonal.

**Mild to moderate acne** is generally treated with topical preparations, such as benzoyl peroxide p. 710, azelaic acid p. 711, and retinoids.

For **moderate to severe inflammatory acne** or where topical preparations are not tolerated or are ineffective or where application to the site is difficult, systemic treatment with oral antibacterials may be effective. Co-cyprindiol (cyproterone acetate with ethinylestradiol) p. 709 has anti-androgenic properties and may be useful in young women with acne refractory to other treatments.

**Severe acne**, acne unresponsive to prolonged courses of oral antibacterials, acne with scarring, or acne associated with psychological problems calls for early referral to a consultant dermatologist who may prescribe oral isotretinoin p. 712.

**Neonatal and infantile acne**
Inflammatory papules, pustules, and occasionally comedones may develop at birth or within the first month; most clears with acne but do not require treatment. Acne developing at 3–6 months of age may be more severe and persistent; lesions are usually confined to the face. Topical preparations containing benzoyl peroxide (at the lowest strength possible to avoid irritation), adapalene p. 711, or tretinoin p. 514 may be used if treatment for infantile acne is necessary. In infants with inflammatory acne, oral erythromycin p. 310 is used because topical preparations for acne are not well tolerated. In cases of erythromycin-resistant acne, oral isotretinoin can be given on the advice of a consultant dermatologist.

**Topical preparations for acne**
In mild to moderate acne, comedones and inflamed lesions respond well to benzoyl peroxide or topical retinoids. Alternatively, topical application of an antibacterial such as erythromycin or clindamycin p. 710 may be effective for inflammatory acne. However, topical antibacterials are probably no more effective than benzoyl peroxide and may promote the emergence of resistant organisms. If topical preparations prove inadequate, oral preparations may be needed. The choice of product and formulation (gel, solution, lotion, or cream) is largely determined by skin type, patient preference, and previous usage of acne products.

**Benzoyl peroxide and azelaic acid**
Benzoyl peroxide is effective in mild to moderate acne. Both comedones and inflamed lesions respond well to benzoyl peroxide. The lower concentrations seem to be as effective as higher concentrations in reducing inflammation. It is usual to start with a lower strength and to increase the concentration of benzoyl peroxide gradually. The usefulness of benzoyl peroxide washes is limited by the short time the products are in contact with the skin. Adverse effects include local skin irritation, particularly when therapy is initiated, but the scaling and redness often subside with a reduction in benzoyl peroxide concentration, frequency, and area of application. If the acne does not respond after 2 months then use of a topical antibacterial should be considered.

Azelaic acid has antimicrobial and anti-comedonal properties. It may be used as an alternative to benzoyl peroxide or to a topical retinoid for treating mild to moderate comedonal acne, particularly of the face; azelaic acid is less likely to cause local irritation than benzoyl peroxide.

**Topical antibacterials for acne**
In the treatment of mild to moderate inflammatory acne, topical antibacterials may be more effective than topical benzoyl peroxide or tretinoin. Topical antibacterials are probably best reserved for children who wish to avoid oral antibacterials who cannot tolerate them.

Topical preparations of erythromycin and clindamycin may be used to treat *inflamed lesions* in mild to moderate acne when topical benzoyl peroxide or tretinoin is ineffective or poorly tolerated. Topical benzoyl peroxide, azelaic acid, or retinoids used in combination with an antibacterial (topical or systemic) may be more effective than an antibacterial used alone. Topical antibacterials can produce mild irritation of the skin, and on rare occasions cause sensitisation; gastro-intestinal disturbances have been reported with topical clindamycin.

Antibacterial resistance of *Propionibacterium acnes* is increasing; there is cross-resistance between erythromycin and clindamycin. To avoid development of resistance:

- when possible use non-antibiotic antimicrobials (such as benzoyl peroxide or azelaic acid);
- avoid concomitant treatment with different oral and topical antibacterials;
- if a particular antibacterial is effective, use it for repeat courses if needed (short intervening courses of benzoyl peroxide or azelaic acid may eliminate any resistant propionibacteria);
- do not continue treatment for longer than necessary (but treatment with a topical preparation should be continued for at least 6 months).

**Topical retinoids and related preparations for acne**
Topical tretinoin, its isomer isotretinoin, and adapalene (a retinoid-like drug), are useful for treating comedones and inflammatory lesions in mild to moderate acne. Patients should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop.

Tretinoin can be used under specialist supervision to treat infantile acne; adapalene can also be used.

**Other topical preparations for acne**
A topical preparation of nicotinamide p. 714 is available for inflammatory acne.

**Oral preparations for acne**
Oral antibacterials may be used in **moderate to severe inflammatory acne** when topical treatment is not adequately
effective or is inappropriate. Concomitant antimedonal treatment with topical benzoyl peroxide or azelaic acid may also be required.

Tetracyclines should not be given to children under 12 years. In children over 12 years, either oxytetracycline p. 334 or tetracycline p. 334 is usually given for acne. If there is no improvement after the first 3 months another oral antibacterial should be used. Maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer. Doxycycline p. 332 and lymecycline p. 333 are alternatives to tetracycline in children over 12 years.

Although minocycline p. 333 is as effective as other tetracyclines for acne, it is associated with a greater risk of lupus erythematosus–like syndrome. Minocycline sometimes causes irreversible pigmentation.

Erythromycin is an alternative for the management of moderate to severe acne with inflamed lesions, but propionibacteria strains resistant to erythromycin are becoming widespread and this may explain poor response. In cases of erythromycin-resistant P. acnes in infants, oral isotretinoin may be used on the advice of a consultant dermatologist.

Concomitant use of different topical and systemic antibacterials is undesirable owing to the increased likelihood of the development of bacterial resistance.

### Hormone treatment for acne

Co-cyprindiol (cyproterone acetate with ethinylestradiol) below contains an anti-androgen. It is no more effective than an oral broad-spectrum antibacterial but is useful in females of childbearing age who also wish to receive oral contraception.

Improvement of acne with co-cyprindiol probably occurs because of decreased sebum secretion which is under androgen control. Some females with moderately severe hirsutism may also benefit because hair growth is also androgen-dependent.

#### Oral retinoid for acne

The retinoid isotretinoin p. 712 reduces sebum secretion. It is used for the systemic treatment of nodulo–cystic and conglobate acne, severe acne, acne with scarring, or for acne which has not responded to an adequate course of a systemic antibacterial. Isotretinoin is used for the treatment of severe infantile acne resistant to erythromycin p. 310.

Isotretinoin is a toxic drug that should be prescribed only by, or under the supervision of, a consultant dermatologist. It is given for at least 15 weeks; repeat courses are not normally required. The drug is **tetragenic** and must not be given to females of child-bearing age unless they practise effective contraception (oral progestogen-only contraceptives not considered effective) and then only after detailed assessment and explanation by the physician. They must also be registered with a pregnancy prevention programme.

Although a causal link between isotretinoin use and psychiatric changes (including suicidal ideation) has not been established, the possibility should be considered before initiating treatment; if psychiatric changes occur during treatment, isotretinoin should be stopped, the prescriber informed, and a specialist psychiatric advice should be sought.

### Rosacea

The adult form of rosacea rarely occurs in children. Persistent or repeated use of potent topical corticosteroids may cause periocular rosacea (steroid acne). The pustules and papules of rosacea may be treated for at least 6 weeks with a topical metronidazole preparation p. 676, or a systemic antibacterial such as erythromycin, or for a child over 12 years, oxytetracycline p. 334. Tetracyclines are **contra-indicated** in children under 12 years of age.

---

### 7.1 Acne

#### Anti-androgens

##### Co-cyprindiol

- **INDICATIONS AND DOSE**
  - Moderate to severe acne in females of child-bearing age refractory to topical therapy or oral antibacterials
  - Moderately severe hirsutism

- **BY MOUTH**
  - Females of childbearing potential: 1 tablet daily for
  - 21 days, to be started on day 1 of menstrual cycle; subsequent courses repeated after a 7–day interval (during which withdrawal bleeding occurs), time to symptom remission, at least 3 months; review need for treatment regularly

- **CONTRA-INDICATIONS** Acute porphyria - gallstones - heart disease associated with pulmonary hypertension or risk of embolus - history during pregnancy of cholestatic jaundice - history during pregnancy of chorea - history during pregnancy of pemphigoid gestationis - history during pregnancy of pruritus - history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable - history of haemolytic uraemic syndrome - migraine with aura - personal history of venous or arterial thrombosis - sclerosing treatment for varicose veins - severe or multiple risk factors for arterial disease or for venous thromboembolism - systemic lupus erythematosus with (or unknown) antiphospholipid antibodies - transient cerebral ischaemic attacks without headaches - undiagnosed vaginal bleeding

- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma- gonadotrophin concentration) - seek specialist advice - arterial disease - gene mutations associated with breast cancer (e.g. BRCA 1) - history of severe depression especially if induced by hormonal contraceptive - hyperprolactinaemia - seek specialist advice - inflammatory bowel disease including Crohn’s disease - migraine - personal or family history of hypertiglyceridaemia (increased risk of pancreatitis) - risk factors for venous thromboembolism - sickle-cell disease - undiagnosed breast mass

- **CAUTIONS, FURTHER INFORMATION** Venous thromboembolism There is an increased risk of venous thromboembolism in women taking co-cyprindiol, particularly during the first year of use. The incidence of venous thromboembolism is 1.5–2 times higher in women using co-cyprindiol than in women using combined oral contraceptives containing third generation progestogens (desogestrel and gestodene) or drospirenone. Women requiring co-cyprindiol may have an inherently increased risk of cardiovascular disease.

- **INTERACTIONS** → Appendix 1 (oestrogens).

- **SIDE-EFFECTS**
  - Rare: Rarely gallstones - systemic lupus erythematosus
  - Very rare: Photosensitivity
  - Frequency not known: Abdominal cramps - absence of withdrawal bleeding - amenorrhoea after discontinuation - breast enlargement - breast secretion - breast tenderness - cervical erosion - changes in libido - changes in lipid metabolism - changes in vaginal discharge - chloasma - chorea - contact lenses may irritate - depression - fluid retention - headache - hepatic tumours - hypertension - irritability - leg cramps - liver impairment - nausea - nervousness - reduced menstrual loss - skin reactions - thrombosis (more common when factor V Leiden present or
in blood groups A, B, and AB - visual disturbances - vomiting - 'spotting' in early cycles

- **PREGNANCY** Avoid—risk of feminisation of male fetus with cyproterone.
- **BREAST FEEDING** Manufacturer advises avoid; possibility of anti-androgen effects in neonate with cyproterone.
- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.
- **PRESCRIBING AND DISPENSING INFORMATION** A mixture of cyproterone acetate and ethinylestradiol in the mass proportions 2000 parts to 35 parts, respectively.

**MEDICINAL FORMS**
- Co-cyprindiol (Non-proprietary) Ethinylestradiol 35 microgram, Cyproterone acetate 2 mg. Co-cyprindiol 2000microgram/35microgram tablets | 63 tablet £1.20 DT price = £0.85
- Clairette (Stragen UK Ltd) ▼ Ethinylestradiol 35 microgram, Cyproterone acetate 2 mg Clairette 2000/35 tablets | 63 tablet £0.90 DT price = £0.65
- Dianette (Bayer Plc, Mylan Ltd) ▼ Ethinylestradiol 35 microgram, Cyproterone acetate 2 mg Dianette tablets | 63 tablet £1.71-£11.10 DT price = £0.55
- Teragezza (Morningside Healthcare Ltd) Ethinylestradiol 35 microgram, Cyproterone acetate 2 mg Teragezza 2000microgram/35microgram tablets | 63 tablet £1.10 DT price = £0.55

**ANTIBACTERAIALS > MACROLIDES**

**Erythromycin with zinc acetate**

- **INDICATIONS AND DOSE**
  - **Acne vulgaris** ▶ TO THE SKIN
  - **Child:** Apply twice daily

- **CAUTIONS** Some manufacturers advise preparations containing alcohol are not suitable for use with benzoyl peroxide

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- **Liquid** Zineryt (Astellas Pharma Ltd) Zinc acetate 12 mg per 1 ml, Erythromycin 40 mg per 1 ml Zineryt lotion | 30 ml £7.71 DT price = £7.71 | 90 ml £16.68 DT price = £16.68

**ANTISEPTICS AND DISINFECTANTS > PEROXIDES**

**Benzoyl peroxide**

- **INDICATIONS AND DOSE**
  - **Acne vulgaris** ▶ TO THE SKIN
  - **Child 12-17 years:** Apply 1–2 times a day, preferably after washing with soap and water, start treatment with lower-strength preparations

- **Infantile acne** ▶ TO THE SKIN
  - **Child 1 month-1 year:** Apply 1–2 times a day, start treatment with lower-strength preparations

- **UNLICENSED USE** Not licensed for use in treatment of infantile acne.
- **CAUTIONS** Avoid contact with broken skin - avoid contact with eyes - avoid contact with mouth - avoid contact with mucous membranes - avoid excessive exposure to sunlight

- **SIDE-EFFECTS** Skin irritation

- **SIDE-EFFECTS, FURTHER INFORMATION** Skin irritation Reduce frequency or suspend use until irritation subsides and re-introduce at reduced frequency.

- **PATIENT AND CARER ADVICE** May bleach fabrics and hair.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.
- **Liquid** EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), fragrances, isopropyl palmitate, propylene glycol
  - Brevoxyl (GlaxoSmithKline Consumer Healthcare) Benzoyl peroxide 40 mg per 1 gram Brevoxyl 4% cream | 50 gram £4.13 DT price = £4.13
  - PanOxy (GlaxoSmithKline Consumer Healthcare) Benzoyl peroxide 50 mg per 1 gram PanOxy 5 cream | 40 gram £1.89 DT price = £1.89
- **Gel** EXCIPIENTS: May contain Fragrances, propylene glycol
  - Acnecide (Gelderma (UK) Ltd) Benzoyl peroxide 50 mg per 1 gram Acnecide 5% gel | 30 gram £5.44 DT price = £5.44 | 60 gram £10.68
  - Acnecide Wash 5% gel | 50 gram £5.44
  - PanOxy 2.5 Aquagel (GlaxoSmithKline Consumer Healthcare) Benzoyl peroxide 25 mg per 1 gram PanOxy 2.5 Aquagel | 40 gram £1.76 DT price = £1.76
  - PanOxy 5 Aquagel | 40 gram £1.92 DT price = £1.92
  - Benzoyl peroxide 100 mg per 1 gram PanOxy 10 Aquagel | 40 gram £2.13 DT price = £2.13

**Clindamycin**

  - **Liquid** EXCIPIENTS: May contain Propylene glycol, hydroxybenzoates (parabens), propylene glycol
    - PanOxyl Aquagel (Crawford Healthcare Ltd) Clindamycin (as Clindamycin phosphate) 10 mg per 1 gram PanOxyl Aquagel | 30 gram £0.86 DT price = £0.86
    - PanOxyl 5 Aquagel | 40 gram £1.92 DT price = £1.92
    - PanOxyl 10 Aquagel | 40 gram £2.13 DT price = £2.13
**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Gel**

**EXCIPIENTS:** May contain Diisodium edetate, hydroxybenzoates. There can be variation in the licensing of different medicines containing the same drug.

**COMBINED PRODUCTS TO THE SKIN**

**Panoxyl Acnegel** (GlaxoSmithKline Consumer Healthcare)  
Benzoyl peroxide 100 mg per 1 gram  PanOxyl 10 Acnegel  
40 gram  £1.99 DT price  =  £2.13

Combinations available: **Adapalene with benzoyl peroxide**, below

### BENZOYL PEROXIDE WITH CLINDAMYCIN

The properties listed below are those particular to the combination only. For the properties of the components please consider, benzoyl peroxide p. 710, clindamycin p. 710.

#### MILD TO MODERATE ACNE VULGARIS

**INDICATIONS AND DOSE**

**Acne vulgaris**

**TO THE SKIN**

- Child 12-17 years: Apply once daily, dose to be applied in the evening

**Adapalene**

#### INDICATIONS AND DOSE

**Mild to moderate acne vulgaris**

**TO THE SKIN**

- Child 12-17 years: Apply once daily, apply thinly in the evening

**Infantile acne**

- Child 1 month-1 year: Apply once daily, apply thinly in the evening

#### UNLICENSED USE

Not licensed for use in infantile acne.

#### CAUTIONS

Avoid accumulation in angles of the nose, avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin - avoid exposure to UV light (including sunlight, solariums) - avoid in severe acne involving large areas - caution in sensitive areas such as the neck.

**CONCEPTION AND CONTRACEPTION**

Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

**PREGNANCY**

Avoid.

**BREAST FEEDING**

Amount of drug in milk probably too small to be harmful; ensure infant does not come in contact with treated areas.

**PATIENT AND CARER ADVICE**

If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

### RETINOID AND RELATED DRUGS

**Azelaic acid**

#### INDICATIONS AND DOSE

**FINACEA**

**Facial acne vulgaris**

**TO THE SKIN**

- Child 12-17 years: Apply twice daily, discontinue if no improvement after 1 month

**SKINOREN**

**Acne vulgaris**

**TO THE SKIN**

- Child 12-17 years: Apply twice daily

**Acne vulgaris in patients with sensitive skin**

**TO THE SKIN**

- Child 12-17 years: Apply once daily for 1 week, then apply twice daily

#### CAUTIONS

Avoid contact with eyes - avoid contact with mouth - avoid contact with mucous membranes

#### SIDE-EFFECTS

- Common or very common Local irritation (reduce frequency or discontinue temporarily)
- Uncommon Skin discoloration
- Frequency not known Worsening of asthma

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

**EXCIPIENTS:** May contain Disodium edetate, hydroxybenzoates  (parabens)

- Adapalene (Non-proprietary)  
  Adapalene 0.1% cream  45 gram  £19.73 DT price  =  £16.43  
  Differin (Galderma (UK) Ltd)  
  Adapalene 0.1% cream  45 gram  £16.43 DT price  =  £16.43

**Gel**

**EXCIPIENTS:** May contain Disodium edetate, hydroxybenzoates  (parabens), propylene glycol

- Adapalene (Non-proprietary)  
  Adapalene 0.1% gel  45 gram  £19.73 DT price  =  £16.43  
  Differin (Galderma (UK) Ltd)  
  Adapalene 0.1% gel  45 gram  £16.43 DT price  =  £16.43

**Adapalene with benzoyl peroxide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, adapalene above, benzoyl peroxide p. 710.

#### INDICATIONS AND DOSE

**Acne vulgaris**

**TO THE SKIN**

- Child 9-17 years: Apply once daily, to be applied thinly in the evening

#### CONCEPTION AND CONTRACEPTION

Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

---
Rosacea and acne

Patient and carer advice
Gel may bleach clothing and hair.

National funding/access decisions
Scottish Medicines Consortium (SMC) decisions
The Scottish Medicines Consortium has advised (March 2014) that Epiduo® should be restricted for use in mild to moderate facial acne when monotherapy with benzoyl peroxide or adapalene is inappropriate.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Gel

Cautionary and advisory labels

11

Excipients: May contain Disodium edetate, polysorbates, propylene glycol

Adapalene with benzoyl peroxide (Non-proprietary)
Adapalene 1 mg per 1 gram, Benzoyl peroxide 25 mg per
1 gram
Adapalene 0.1% / Benzoyl peroxide 2.5% gel | 45 gram
Epiduo (Galderma (UK) Ltd)
Adapalene 1 mg per 1 gram, Benzoyl peroxide 25 mg per
1 gram
Epiduo 0.1%/2.5% gel | 45 gram

Interactions

With oral use Appendix 1 (retinoids). Avoid keratolytics.

Side-effects

Common or very common
With oral use Anaemia - arthralgia - dryness of eyes (with blepharitis and conjunctivitis) - dryness of lips (sometimes cheilitis) - dryness of nasal mucosa (with epistaxis) - dryness of pharyngeal mucosa (with hoarseness) - dryness of skin (with dermatitis, scaling, thinning, erythema, pruritus) - epidermal fragility (trauma may cause blistering) - haematuria - headache - myalgia - neutropenia - proteinuria - raised blood-glucose concentration - raised plasma-triglyceride concentration - raised serum-cholesterol concentration (with reduced high-density lipoprotein concentration) - raised serum-transaminase concentration - thrombocytopenia - thrombocytosis

Rare
With oral use Aggressive behaviour - alopecia - anxiety - depression - mood changes - skin reactions

Very rare
With oral use Acne fulminans - allergic vasculitis - arthritis - benign intracranial hypertension - blurred vision - bone changes following long-term administration - calcification of tendons and ligaments following long-term administration - cataracts - colour blindness - convulsions - corneal opacities - decreased night vision - decreased tolerance to contact lenses - diabetes mellitus - dizziness - drowsiness - early epiphyseal closure following long-term administration - exacerbation of acne - gastrointestinal haemorrhage - glomerulonephritis - Gram-positive infections of skin and mucous membranes - granulomatous lesions - haemorrhagic diarrhoea - hepatitis - hirsutism - hyperuricaemia - impaired hearing - increased sweating - inflammatory bowel disease - keratitis - lymphadenopathy - malaise - nail dystrophy - nausea - papilloedema - paronychia - photophobia - photosensitivity - psychosis - raised serum-creatinine kinase concentration - reduced bone density following long-term administration - skeletal hyperostosis following long-term administration - skin hyperpigmentation - suicidal ideation - tendinitis - visual disturbances

Frequency not known
With oral use Stevens-Johnson syndrome - toxic epidermal necrolysis

With topical use Blistering of skin - burning - crusting of skin - dry or peeling skin - erythema - eye irritation - increased sensitivity to UVB light or sunlight - oedema - pruritus - stinging

Side-effects, further information

Management of side-effects Risk of pancreatitis if triglycerides above 9 mmol/litre—discontinue if uncontrolled hypertriglyceridaemia or pancreatitis.
Psychiatric side-effects require expert referral.
Discontinue treatment if skin peeling severe or haemorrhagic diarrhoea develops.
Visual disturbances require expert referral and possible withdrawal.

Conception and contraception

Pregnancy prevention
With oral use Effective contraception must be used. In women of child-bearing potential, exclude pregnancy up to 3 days before treatment (start treatment on day 2 or 3 of menstrual cycle), every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of

Isotretinoin

Indications and dose

Topical treatment of mild to moderate acne

To the skin
Child: Apply 1–2 times a day, to be applied thinly
Severe acne (under expert supervision) Acne which is associated with psychological problems (under expert supervision) Acne with scarring (under expert supervision) Systemic treatment of nodulo-cystic and conglobate acne (under expert supervision)

By mouth
Child 12-17 years: Initially 500 micrograms/kg daily in 1–2 divided doses, increased if necessary to 1 mg/kg daily for 16–24 weeks, repeat treatment course after a period of at least 8 weeks if relapse after first course; maximum 150 mg/kg per course
Severe infantile acne (under expert supervision)

By mouth
Child 1 month–1 year: Initially 200 micrograms/kg daily in 1–2 divided doses, increased if necessary to 1 mg/kg daily for 16–24 weeks; maximum 150 mg/kg per course

Unlicensed use
With oral use Not licensed for use in infantile acne.

Contra-indications
With oral use Hyperlipidaemia - hypervitaminosis A
With topical use Perioral dermatitis - rosacea

Caution
With oral use Avoid blood donation during treatment and for at least 1 month after treatment - diabetes - dry eye syndrome (associated with risk of keratitis) - history of depression - monitor for depression
With topical use Allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid - alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application) - avoid accumulation in angles of the nose - avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin - avoid exposure to UV light (including sunlight, solariums) - avoid in severe acne involving large areas - avoid use of topical retinoids with abrasive cleaners, comedogenic or astringent cosmetics - caution in sensitive areas such as the neck - personal or familial history of non-melanoma skin cancer

Interactions
With oral use Appendix 1 (retinoids). Avoid keratolytics.

Side-effects

Common or very common
With oral use Anaemia - arthralgia - dryness of eyes (with blepharitis and conjunctivitis) - dryness of lips (sometimes cheilitis) - dryness of nasal mucosa (with epistaxis) - dryness of pharyngeal mucosa (with hoarseness) - dryness of skin (with dermatitis, scaling, thinning, erythema, pruritus) - epidermal fragility (trauma may cause blistering) - haematuria - headache - myalgia - neutropenia - proteinuria - raised blood-glucose concentration - raised plasma-triglyceride concentration - raised serum-cholesterol concentration (with reduced high-density lipoprotein concentration) - raised serum-transaminase concentration - thrombocytopenia - thrombocytosis

Rare
With oral use Aggressive behaviour - alopecia - anxiety - depression - mood changes - skin reactions

Very rare
With oral use Acne fulminans - allergic vasculitis - arthritis - benign intracranial hypertension - blurred vision - bone changes following long-term administration - calcification of tendons and ligaments following long-term administration - cataracts - colour blindness - convulsions - corneal opacities - decreased night vision - decreased tolerance to contact lenses - diabetes mellitus - dizziness - drowsiness - early epiphyseal closure following long-term administration - exacerbation of acne - gastrointestinal haemorrhage - glomerulonephritis - Gram-positive infections of skin and mucous membranes - granulomatous lesions - haemorrhagic diarrhoea - hepatitis - hirsutism - hyperuricaemia - impaired hearing - increased sweating - inflammatory bowel disease - keratitis - lymphadenopathy - malaise - nail dystrophy - nausea - papilloedema - paronychia - photophobia - photosensitivity - psychosis - raised serum-creatinine kinase concentration - reduced bone density following long-term administration - skeletal hyperostosis following long-term administration - skin hyperpigmentation - suicidal ideation - tendinitis - visual disturbances

Frequency not known
With oral use Stevens-Johnson syndrome - toxic epidermal necrolysis

With topical use Blistering of skin - burning - crusting of skin - dry or peeling skin - erythema - eye irritation - increased sensitivity to UVB light or sunlight - oedema - pruritus - stinging

Side-effects, further information

Management of side-effects Risk of pancreatitis if triglycerides above 9 mmol/litre—discontinue if uncontrolled hypertriglyceridaemia or pancreatitis.
Psychiatric side-effects require expert referral.
Discontinue treatment if skin peeling severe or haemorrhagic diarrhoea develops.
Visual disturbances require expert referral and possible withdrawal.

Conception and contraception

Pregnancy prevention
With oral use Effective contraception must be used. In women of child-bearing potential, exclude pregnancy up to 3 days before treatment (start treatment on day 2 or 3 of menstrual cycle), every month during treatment (unless there are compelling reasons to indicate that there is no risk of pregnancy), and 5 weeks after stopping treatment—perform pregnancy test in the first 3 days of the menstrual cycle. Women must practise effective contraception for at least 1 month before starting treatment, during treatment, and for at least 1 month after stopping treatment. Women should be advised to use at least 1 method of
contraception, but ideally they should use 2 methods of contraception. Oral progestogen-only contraceptives are not considered effective. Barrier methods should not be used alone, but can be used in conjunction with other contraceptive methods. Each prescription for isotretinoin should be limited to a supply of up to 30 days’ treatment and dispensed within 7 days of the date stated on the prescription; repeat prescriptions or faxed prescriptions are not acceptable. Women should be advised to discontinue treatment and to seek prompt medical attention if they become pregnant during treatment or within 1 month of stopping treatment.

With topical use

- Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

- **PREGNANCY** Contra-indicated in pregnancy (teratogenic).
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT**
  - With oral use Avoid—further impairment may occur.
- **RENAI IMPAIRMENT**
  - With oral use In severe impairment, reduce initial dose and increase gradually, if necessary, up to 1 mg/kg daily as tolerated.
- **MONITORING REQUIREMENTS**
  - With oral use Measure hepatic function and serum lipids before treatment, 1 month after starting and then every 3 months (reduce dose or discontinue if transaminase or serum lipids persistently raised).
- **PRESCRIBING AND DISPENSING INFORMATION** Isotretinoin is an isomer of tretinoin.
- **PATIENT AND CARER ADVICE**
  - With oral use Warn patient to avoid wax epilation (risk of epidermal stripping), dermabrasion, and laser skin treatments (risk of scarring) during treatment and for at least 6 months after stopping; patient should avoid exposure to UV light (including sunlight) and use sunscreen and emollient (including lip balm) preparations from the start of treatment.
  - With oral use Patients and carers should be told how to recognise signs and symptoms of psychiatric disorders such as depression, anxiety, and rarely suicidal thoughts.
  - With topical use Patients should be warned that some redness and skin peeling can occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop. If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  **Capsule**
  - **Isotretinoin (Non-proprietary)**

  **INDICATIONS AND DOSE**
  - **Facial acne**
    - **Child 12-17 years:** Apply daily, (to be applied thinly at bedtime)

  **CONTRA-INDICATIONS**
  - Perioral dermatitis - personal or familial history of non-melanoma skin cancer - rosacea

  **CAUTIONS**
  - Allow peeling (resulting from other irritant treatments) to subside before using a topical retinoid - alternating a preparation that causes peeling with a topical retinoid may give rise to contact dermatitis (reduce frequency of retinoid application) - avoid accumulation in angles of the nose - avoid contact with eyes, nostrils, mouth and mucous membranes, eczematous, broken or sunburned skin - avoid exposure to UV light (including sunlight, solariums) - avoid in severe acne involving large areas - avoid use of topical retinoids with abrasive cleaners, comedogenic or astringent cosmetics - caution in sensitive areas such as the neck

  **SIDE-EFFECTS**
  - Blistering of skin - burning - crusting of skin - dry or peeling skin (discontinue if severe) - erythema - eye irritation - increased sensitivity to UVB light or sunlight - oedema - pruritus - stinging - temporary changes of skin pigmentation

  **CONCEPTION AND CONTRACEPTION**
  - Females of child-bearing age must use effective contraception (oral progestogen-only contraceptives not considered effective).

  **PREGNANCY** Contra-indicated in pregnancy.

  **BREAST FEEDING** Amount of drug in milk after topical application probably too small to be harmful; ensure infant does not come in contact with treated areas.

  **PATIENT AND CARER ADVICE**
  - If sun exposure is unavoidable, an appropriate sunscreen or protective clothing should be used. Patients and carers should be warned that some redness and skin peeling can
occur initially but settles with time. If undue irritation occurs, the frequency of application should be reduced or treatment suspended until the reaction subsides; if irritation persists, discontinue treatment. Several months of treatment may be needed to achieve an optimal response and the treatment should be continued until no new lesions develop.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Gel**
- NICAM (Dermal Laboratories Ltd)
- Treclin 250 microgram per 1 gram, Erythromycin 40 mg per 1 gram Treclin 1%/0.025% gel | 30 gram £11.94

**VITAMINS AND TRACE ELEMENTS**

### Nicotinamide

**INDICATIONS AND DOSE**

**Inflammatory acne vulgaris**
- **TO THE SKIN**
- Child: Apply twice daily, reduced to once daily or on alternate days, dose reduced if irritation occurs

**UNLICENSED USE**
Licensed for use in children (age range not specified by manufacturer).

**CAUTIONS**
Avoid contact with eyes - avoid contact with mucous membranes (including nose and mouth) - reduce frequency of application if excessive dryness, irritation or peeling

**SIDE-EFFECTS**
- Burning - dry skin - erythema - irritation - pruritus

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Gel**
- Freederm (Dendron Ltd)
  - Nicotinamide 40 mg per 1 gram Freederm 4% gel | 25 gram £5.56
- Nicam (Dermal Laboratories Ltd)
  - Nicotinamide 40 mg per 1 gram Nicam 4% gel | 60 gram £7.10

### Scalp and hair conditions

**Overview**
The detergent action of shampoo removes grease (sebum) from hair. Prepubertal children produce very little grease and require shampoo less frequently than adults. Shampoos can be used as vehicles for medicinal products, but their usefulness is limited by the short time the product is in contact with the scalp and by their irritant nature.

Oils and ointments are very useful for scaly, dry scalp conditions; if a greasy appearance is cosmetically unacceptable, the preparation may be applied at night and washed out in the morning. Alcohol-based lotions are rarely used in children; alcohol causes painful stinging on broken skin and the fumes may exacerbate asthma.

Itchy, inflammatory, eczematous scalp conditions may be relieved by a simple emollient oil such as olive oil or coconut oil (arachis oil (ground nut oil, peanut oil) is best avoided in children under 5 years). In more severe cases a topical corticosteroid may be required. Preparations containing coal tar are used for the common scaly scalp conditions of childhood including seborrhoeic dermatitis, dandruff (a mild form of seborrhoeic dermatitis), and psoriasis; salicylic acid is used as a keratolytic in some scalp preparations.

Shampoos containing antimicrobials such as selenium p. 715 or ketoconazole p. 678 are used for seborrhoeic dermatitis and dandruff in which yeast infection has been implicated, and for tinea capitis (ringworm of the scalp).
Bacterial infection affecting the scalp (usually secondary to eczema, head lice, or ringworm) may be treated with shampoos containing antimicrobials such as pyrithione zinc, cetrimide, or povidone-iodine p. 633.

In neonates and infants, cradle cap (which is also a form of seborrhoeic eczema) can be treated by massaging coconut oil or olive oil into the scalp; a bland emollient such as emulsifying ointment can be rubbed onto the affected area once or twice daily before bathing and a mild shampoo used.

### Antiseptics and Disinfectants

#### Undecenoates

**Cetrimide with undecenoic acid**

- **Indications and Dose**
  - Scalp psoriasis | Seborrhoeic dermatitis | Dandruff
    - **To the skin**
    - **Child:** Apply 3 times a week for 1 week, then apply twice weekly

- **Medicinal Forms**
  
  There can be variation in the licensing of different medicines containing the same drug.

  **Shampoo**
  - Ceanel (Alliance Pharmaceuticals Ltd)
    - Undecenoic acid 10 mg per 1 ml, Phenylethyl alcohol 75 mg per 1 ml
    - Ceanel Concentrate shampoo 150 ml (£3.40) | 500 ml (£9.80)

**Benzalkonium chloride**

- **Indications and Dose**
  - Seborrhoeic scalp conditions associated with dandruff and scaling
    - **To the skin**
    - **Child:** Apply as required

- **Medicinal Forms**
  
  There can be variation in the licensing of different medicines containing the same drug.

  **Shampoo**
  - Dermax (Dermax Laboratories Ltd)
    - Benzalkonium chloride 5 mg per 1 ml Dermax Therapeutic 0.5% shampoo 250 ml (£5.69)

### Vitamins and Trace Elements

**Selenium**

- **Indications and Dose**
  - Seborrhoeic dermatitis | Dandruff
    - **To the skin using shampoo**
    - **Child 5-17 years:** Apply twice weekly for 2 weeks, then apply once weekly for 2 weeks, then apply as required

  **Pityriasis versicolor**
    - **To the skin using shampoo**
    - **Child 5-17 years:** Apply once daily for 7 days, apply to the affected area and leave on for 10 minutes before rinsing off. The course may be repeated if necessary. Diluting with a small amount of water prior to application can reduce irritation

- **Unlicensed Use**
  
  The use of selenium sulphide shampoo as a lotion for the treatment of pityriasis (tinea) versicolor is an unlicensed indication.

### Skin Cleansers, Antiseptics and Desloughing Agents

**Skin cleansers, antiseptics and desloughing agents**

**Skin cleansers and antiseptics**

Soap or detergent is used with water to cleanse intact skin but they can irritate infantile skin; emollient preparations such as aqueous cream or emulsifying ointment can be used in place of soap or detergent for cleansing dry or irritated skin.

An antiseptic is used for skin that is infected or that is susceptible to recurrent infection. Detergent preparations containing chlorhexidine p. 717 or povidone-iodine p. 716, which should be thoroughly rinsed off, are used. Emollients may also contain antiseptics.

Antiseptics such as chlorhexidine or povidone-iodine are used on intact skin before surgical procedures; their antiseptic effect is enhanced by an alcoholic solvent. Antiseptic solutions containing cetrimide can be used if a detergent effect is also required.

Preparations containing alcohol, and regular use of povidone-iodine, should be avoided on neonatal skin.

Hydrogen peroxide p. 718, an oxidising agent, is available as a cream and can be used for superficial bacterial skin infections.

For irrigating ulcers or wounds, lukewarm sterile sodium chloride 0.9% solution p. 718 is used but tap water is often appropriate.

Potassium permanganate p. 716 solution 1 in 10 000, a mild antiseptic with astringent properties, can be used as a soak for exudative eczematous areas; treatment should be stopped when the skin becomes dry.

**Desloughing agents**

Alginate, hydrogel, and hydrocolloid dressings are effective in wound debridement. Sterile larvae (maggots) (available from BioMonde) are also used for managing sloughing wounds and are prescribable on the NHS.

Desloughing solutions and creams are of little clinical value. Substances applied to an open area are easily absorbed and perilesional skin is easily sensitised.
ANTISEPTICS AND DISINFECTANTS

Potassium permanganate

**INDICATIONS AND DOSE**
Cleansing and deodorising suppurating eczematous reactions and wounds

- TO THE SKIN
  - Child: For wet dressings or baths, use approximately 0.01% (1 in 10 000) solution

**CAUTIONS** Irritant to mucous membranes

**DIRECTIONS FOR ADMINISTRATION** Potassium permanganate 0.1% solution to be diluted 1 in 10 to provide a 0.01% (1 in 10 000) solution. With potassium permanganate tablets for solution, 1 tablet dissolved in 4 litres of water provides a 0.01% (1 in 10 000) solution.

**PATIENT AND CARER ADVICE** Can stain clothing, skin and nails (especially with prolonged use).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid.

- Tablet for cutaneous solution
  - Potassium permanganate (Non-proprietary)
    - Potassium permanganate 400 mg | 30 tablet | no price available
    - EN-Potabs 400mg tablets for cutaneous solution | 30 tablet | no price available
    - Permitabs (Alliance Pharmaceuticals Ltd)
      - Potassium permanganate 400 mg | 30 tablet | £17.50 DT price = £17.50

**ANTISEPTICS AND DISINFECTANTS > ALCOHOL DISINFECTANTS**

Alcohol (Industrial methylated spirit)

**INDICATIONS AND DOSE**
Skin preparation before injection

- TO THE SKIN
  - Child: As required

**CONTRA-INDICATIONS** Neonates

**CAUTIONS** Avoid broken skin · flammable · patients have suffered severe burns when diathermy has been preceded by application of alcoholic skin disinfectants

**INTERACTIONS** For the interactions following the ingestion of alcohol, see Appendix 1 (alcohol).

**SIDE-EFFECTS**
Overdose
Features of acute alcohol intoxication include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis.

For details on the management of poisoning, see Appendix 1 (alcohol).

**PRESCRIBING AND DISPENSING INFORMATION**
Industrial methylated spirits defined by the BP as a mixture of 19 volumes of ethyl alcohol of an appropriate strength with 1 volume of approved wood naphtha.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

- Liquid
  - Alcohol (Non-proprietary)
    - Wood naphtha 50 ml per 1 litre, Ethanol 950 ml per 1 litre Industrial methylated spirit 95% | 600 ml £5.04 | 1000 ml £4.42–£6.02
    - Industrial methylated spirit 70% | 600 ml £6.00

ANTISEPTICS AND DISINFECTANTS > IODINE PRODUCTS

Povidone-iodine

**INDICATIONS AND DOSE**
Skin disinfection

- TO THE SKIN
  - Child: (consult product literature)

**BETADINE® DRY POWDER SPRAY**
Skin disinfection, particularly minor wounds and infections

- TO THE SKIN
  - Child 2-17 years: Not for use in serous cavities (consult product literature)

**SAVLON® DRY**
Skin disinfection of minor wounds

- TO THE SKIN
  - Child: (consult product literature)

**VIDENE® SOLUTION**
Skin disinfection

- TO THE SKIN
  - Child: Apply undiluted in pre-operative skin disinfection and general antisepsis

**VIDENE® SURGICAL SCRUB®**
Skin disinfection

- TO THE SKIN
  - Child: Use as a pre-operative scrub for hand and skin disinfection

**VIDENE® TINCTURE**
Skin disinfection

- TO THE SKIN
  - Child: Apply undiluted in pre-operative skin disinfection

**CONTRA-INDICATIONS** Concomitant use of lithium · corrected gestational age under 32 weeks · infants body-weight under 1.5 kg · regular use in neonates

**VIDENE® TINCTURE** Neonates

**CAUTIONS** Broken skin · large open wounds

**CAUTIONS, FURTHER INFORMATION**
The application of povidone-iodine to large wounds or severe burns may produce systemic adverse effects such as metabolic acidosis, hypernatraemia and impairment of renal function.

**VIDENE® TINCTURE** Procedures involving hot wire cautery and diathermy

**SIDE-EFFECTS**
- Rare Sensitivity

**PREGNANCY** Sufficient iodine may be absorbed to affect the fetal thyroid in the second and third trimester.

**BREAST FEEDING** Avoid regular or excessive use.

**RENAIL IMPAIRMENT** Avoid regular application to inflamed or broken skin or mucosa.

**EFFECT ON LABORATORY TESTS** May interfere with thyroid function tests.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: liquid

- Liquid
  - CAUTIONARY AND ADVISORY LABELS 15 (Only for use with alcoholic solutions)
    - Videne (Ecolab Healthcare Division)
      - Povidone-iodine 75 mg per 1 ml Videne 7.5% surgical scrub solution
        - 500 ml £17.30
      - Povidone-iodine 100 mg per 1 ml Videne 10% antiseptic solution
        - 500 ml £17.30
Skin cleansers, antiseptics and desloughing agents

ANTISEPTICS AND DISINFECTANTS

**Chlorhexidine**

- **INDICATIONS AND DOSE**
  - CX ANTISEPTIC DUSTING POWDER
    - For skin disinfection
      - TO THE SKIN
      - Child: (consult product literature)
    - CEPTON® LOTION
      - For skin disinfection in acne
        - TO THE SKIN
        - Child: (consult product literature)
    - CEPTON® SKIN WASH
      - For use as skin wash in acne
        - TO THE SKIN
        - Child: (consult product literature)
  - HIBITANE® PLUS 5% CONCENTRATE SOLUTION
    - General and pre-operative skin disinfection
      - TO THE SKIN
      - Child: (consult product literature)
    - HIBISCARB®
      - Pre-operative hand and skin disinfection | General hand and skin disinfection
        - TO THE SKIN
        - Child: Use as alternative to soap (consult product literature)
    - HIBITANE OBSTETRIC®
      - For use in obstetrics and gynaecology as an antiseptic and lubricant
        - TO THE SKIN
        - Child: To be applied to skin around vulva and perineum and to hands of midwife or doctor
    - HIBI® LIQUID HAND RUB+
      - Hand and skin disinfection
        - TO THE SKIN
        - Child: To be used undiluted (consult product literature)
  - HYDREX® SOLUTION
    - For pre-operative skin disinfection
      - TO THE SKIN
      - Child: (consult product literature)
  - HYDREX® SURGICAL SCRUB
    - For pre-operative hand and skin disinfection | General hand disinfection
      - TO THE SKIN
      - Child: (consult product literature)

**UNESEPT®**

For cleansing and disinfecting wounds and burns and swabbing in obstetrics

- TO THE SKIN
- Child: (consult product literature)

**IMPORTANCE OF SAFETY INFORMATION**

In preterm neonates, use sparingly, monitor for skin reactions, and do not allow solution to pool—risk of severe chemical burns.

- **CONTRA-INDICATIONS**
  - Alcoholic solutions not suitable before diathermy - alcoholic solutions not suitable for use on neonatal skin - not for use in body cavities

- **CAUTIONS**
  - Avoid contact with brain - avoid contact with eyes - avoid contact with meninges - avoid contact with middle ear

- **SIDE-EFFECTS**
  - Chemical burns in preterm neonates - sensitivity

- **DIRECTIONS FOR ADMINISTRATION**
  - HIBITANE® PLUS 5% CONCENTRATE SOLUTION
    - For pre-operative skin preparation, dilute 1 in 10 (0.5%) with alcohol 70%. For general skin disinfection, dilute 1 in 100 (0.05%) with water. Alcoholic solutions not suitable for use before diathermy or on neonatal skin.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Liquid**

CAUTIONARY AND ADVISORY LABELS 15 (For ethanolic solutions (e.g. Chloraprep® and Hydrex® only)

EXCIPIENTS: May contain Fragrances

- Cepton (Boston Healthcare Ltd)
  - Chlorhexidine gluconate 10 mg per 1 ml Cepton 1% medicated skin wash | 150 ml GSP £6.78
- HIBITane Plus (Molnlycke Health Care Ltd)
  - Chlorhexidine gluconate 50 mg per 1 ml HibiTane Plus 5% concentrate solution | 500 ml GSP £14.25
- HiBi (Molnlycke Health Care Ltd)
  - Chlorhexidine gluconate 5 mg per 1 ml HiBi Liquid Hand Rub+ 0.5% solution | 50 ml | 500 ml GSP £5.25

    - Chloraprep solution 26 ml applicators | 25 applicator GSL £162.50

**Chlorhexidine with cetrimide**

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 717.

**INDICATIONS AND DOSE**

- **TO THE SKIN**
  - **Child**: To be used undiluted

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Liquid**
  - **Savlon disinfectant** (Novartis Consumer Health UK Ltd)
    - Chlorhexidine gluconate 3 mg per 1 ml, Cetrimide 30 mg per 1 ml
    - Savlon disinfectant liquid | 500 ml £1.32
  - **Sterets Tisept** (Molnycke Health Care Ltd)
    - Chlorhexidine gluconate 150 microgram per 1 ml, Cetrimide 1.5 mg per 1 ml
    - Sterets Tisept solution 25 ml sachets | 25 sachet £5.33
    - Sterets Tisept solution 100 ml sachets | 10 sachet £6.85

- **Cream**
  - **Chlorhexidine with cetrimide (Non-proprietary)**
    - Chlorhexidine gluconate 1 mg per 1 gram, Cetrimide 5 mg per 1 gram
    - Savlon antiseptic cream | 15 gram GSK £0.86
    - 30 gram GSK £1.14 | 60 gram GSK £1.82 | 100 gram GSK £2.65

- **Irrigation solution**
  - **Chlorhexidine with cetrimide (Non-proprietary)**
    - Chlorhexidine acetate 150 microgram per 1 ml, Cetrimide 1.5 mg per 1 ml
    - Chlorhexidine acetate 0.015% / Cetrimide 0.15% irrigation solution 2 litre bottles | 1 bottle no price available

**Diethyl phthalate with methyl salicylate**

**INDICATIONS AND DOSE**

- **Skin preparation before injection**
  - **TO THE SKIN**
  - **Child**: Apply to the area to be disinfected

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Liquid**
  - **Diethyl phthalate with methyl salicylate (Non-proprietary)**
    - Methyl salicylate 5 ml per 1 litre, Diethyl phthalate 20 ml per 1 litre
    - Castor oil 25 ml per 1 litre, Industrial methylated spirit 950 ml per 1 litre
    - Surgical spirit | 200 ml GSK £1.06–£1.11 DT price = £3.40 | 500 ml GSK £1.95 | 1000 ml GSK £3.29

**Hydrogen peroxide**

**INDICATIONS AND DOSE**

- **CRYSTACIDE**
  - Superficial bacterial skin infection
    - **TO THE SKIN**
    - **Child**: Apply 2–3 times a day for up to 3 weeks

- **UNLICENSED USE**
  - Licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS**
  - Avoid on eyes - avoid on healthy skin - incompatible with products containing iodine or potassium permanganate

- **HANDLING AND STORAGE**
  - Hydrogen peroxide bleaches fabric.

**Proflavine**

**INDICATIONS AND DOSE**

- **Infected wounds | infected burns**
  - **TO THE SKIN**
  - **Child**: (consult product literature)

- **PATIENT AND CARER ADVICE**
  - Stains clothing.

**Irrigation solutions**

**IRRIGATION SOLUTIONS**

- Flowfusor sodium chloride 0.9% irrigation solution 120 ml bottles (Fresenius Kabi Ltd)
- Sodium chloride 9 mg per 1 ml 1 bottle
  - NHS indicative price = £1.53 - Drug Tariff (Part IXa)
- Irriclens sodium chloride 0.9% irrigation solution aerosol spray (Convatec Ltd)
  - Sodium chloride 9 mg per 1 ml 240 ml
  - NHS indicative price = £1.50 - Drug Tariff (Part IXa)
- Normosal sodium chloride 0.9% irrigation solution 100 ml sachets (Molnycke Health Care Ltd)
  - Sodium chloride 9 mg per 1 ml 10 unit dose
  - NHS indicative price = £0.83 - Drug Tariff (Part IXa)
Skincare

9.1 Minor cuts and abrasions

Minor cuts and abrasions

Management

Many preparations traditionally used to manage minor burns, and abrasions have fallen out of favour. Preparations containing camphor and sulfonamides should be avoided. Preparations such as magnesium sulfate paste are now rarely used to treat carbuncles and boils, as these are best treated with antibiotics.

Flexible collodion (see castor oil with collodion and colophony below) may be used to seal minor cuts and wounds that have partially healed; skin tissue adhesives are used similarly, and also for additional suture support.

DERMATOLOGICAL DRUGS > COLLODIONS

Castor oil with collodion and colophony

- INDICATIONS AND DOSE

Used to seal minor cuts and wounds that have partially healed

- TO THE SKIN

Child: (consult product literature)

- ALLERGY AND CROSS-SENSITIVITY

Contra-indicated if patient has an allergy to colophony in elastic adhesive plasters and tape.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Liquid

* Castor oil with collodion and colophony (Non-proprietary)
  * Castor oil 25 mg per 1 ml, Collodion methylated 950 microlitre per 1 ml, Colophony 25 mg per 1 ml Flexible collodion methylated

| NHS indicative price = £11.54 | 500 ml £27.52 |

- Skin adhesives

**SKIN ADHESIVES**

**DermaFlex skin adhesive** (Chenonce Ltd)
  * 5 ml - NHS indicative price = £5.36 · Drug Tariff (Part IXa)

**Dermabond ProPen skin adhesive** (Ethicon Ltd)
  * 5 ml - NHS indicative price = £19.26 · Drug Tariff (Part IXa)

**Histoacryl L skin adhesive** (B.Braun Medical Ltd)
  * 2 gram · NHS indicative price = £6.20 · Drug Tariff (Part IXa)

**Histoacryl skin adhesive** (B.Braun Medical Ltd)
  * 2 gram · NHS indicative price = £6.41 · Drug Tariff (Part IXa)

**Indermil skin adhesive** (Covidien (UK) Commercial Ltd)
  * 5 gram · NHS indicative price = £6.50 · Drug Tariff (Part IXa)

**LiquiBand flow control tissue adhesive** (Medlogic Global Ltd)
  * 5 gram · NHS indicative price = £5.50 · Drug Tariff (Part IXa)

**LiquiBand tissue adhesive** (Medlogic Global Ltd)
  * 5 gram · NHS indicative price = £5.50 · Drug Tariff (Part IXa)

10 Skin disfigurement

Camouflagers

Overview

Disfigurement of the skin can be very distressing to patients and may have a marked psychological effect. In skilled hands, or with experience, camouflage cosmetics can be very effective in concealing scars and birthmarks. The depigmented patches in vitiligo are also very disfiguring and camouflage creams are of great cosmetic value.

Opaque cover foundation or cream is used to mask skin pigment abnormalities; careful application using a combination of dark- and light-coloured cover creams set with powder helps to minimise the appearance of skin deformities.

Borderline substances

The preparations marked 'ACBS' can be prescribed on the NHS for postoperative scars and other deformities and as adjunctive therapy in the relief of emotional disturbances due to disfiguring skin disease, such as vitiligo.
11 Superficial soft-tissue injuries and superficial thrombophlebitis

Topical circulatory preparations

Overview

These preparations are used to improve circulation in conditions such as bruising and superficial thrombophlebitis but are of little value. First aid measures such as rest, ice, compression, and elevation should be used. Chilblains are best managed by avoidance of exposure to cold; neither systemic nor topical vasodilator therapy is established as being effective.

Heparinoids

Heparinoid

**INDICATIONS AND DOSE**

**Superficial thrombophlebitis | Bruising | Haematoma**

- **To the skin**
- Child 5–17 years: Apply up to 4 times a day

**CONTRA-INDICATIONS**

Should not be used on large areas of skin, broken or sensitive skin, or mucous membranes

**LESS SUITABLE FOR PRESCRIBING**

Hirudoid® is less suitable for prescribing.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), hydroxybenzoates (parabens)

- Hirudoid (Genus Pharmaceuticals Ltd)
  - Heparinoid 3 mg per 1 gram: Hirudoid 0.3% cream | 50 gram [P] £3.99 DT price = £3.99

**Gel**

EXCIPIENTS: May contain Fragrances, propylene glycol

- Hirudoid (Genus Pharmaceuticals Ltd)
  - Heparinoid 3 mg per 1 gram: Hirudoid 0.3% gel | 50 gram [P] £3.99 DT price = £3.99

12 Warts and calluses

Warts and calluses

Overview

Warts (verruca vulgaris) are common, benign, self-limiting, and usually asymptomatic. They are caused by a human papillomavirus, which most frequently affects the hands, feet (plantar warts), and the anogenital region; treatment usually relies on local tissue destruction and is required only if the warts are painful, unsightly, persistent, or cause distress. In immunocompromised children, warts may be more difficult to eradicate.

Preparations of salicylic acid, formaldehyde p. 721, glutaraldehyde p. 721 or silver nitrate p. 721 are used for the removal of warts on hands and feet. Salicylic acid is a useful keratolytic which may be considered first-line in the treatment of warts; it is also suitable for the removal of corns and calluses. Preparations of salicylic acid in a collodion basis are available but some patients may develop an allergy to colophony in the formulation; collodion should be avoided in children allergic to elastic adhesive plaster. Cryotherapy causes pain, swelling, and blistering, and may be no more effective than topical salicylic acid in the treatment of warts.

Anogenital warts

Anogenital warts (condylomata acuminata) in children are often asymptomatic and require only a simple barrier preparation. If treatment is required it should be supervised by a hospital specialist. Persistent warts on genital skin may require treatment with cryotherapy or other forms of physical ablation under general anaesthesia.

Podophyllotoxin below (the major active ingredient of podophyllum), or imiquimod p. 722 are used to treat external anogenital warts; these preparations can cause considerable irritation of the treated area and are therefore suitable only for children who are able to co-operate with the treatment.

Antineoplastic Drugs > Plant Alkaloids

Podophyllotoxin

**INDICATIONS AND DOSE**

**CONDYLINE®**

Condylomata acuminata affecting the penis or the female external genitalia

- TO THE LESION

- Child 2-17 years (initiated under specialist supervision): Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of five 3-day treatment courses, direct medical supervision for lesions in the female and for lesions greater than 4 cm² in the male, maximum 50 single applications (‘loops’) per session (consult product literature)

**WARTICON® CREAM**

Condylomata acuminata affecting the penis or the female external genitalia

- TO THE LESION

- Child 2-17 years (initiated under specialist supervision): Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm²
WARTICON® LIQUID
Condylomata acuminata affecting the penis or the female external genitalia
> TO THE LESION
> Child 2–17 years (initiated under specialist supervision): Apply twice daily for 3 consecutive days, treatment may be repeated at weekly intervals if necessary for a total of four 3-day treatment courses, direct medical supervision for lesions greater than 4 cm², maximum 50 single applications (‘loops’) per session (consult product literature).

> UNLICENSED USE Not licensed for use in children.
> CAUTIONS Avoid normal skin - avoid open wounds - keep away from face - very irritant to eyes
> SIDE-EFFECTS Local irritation
> PREGNANCY Avoid.
> BREAST FEEDING Avoid.

> MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

      - **To the lesion**
      - Child: Apply daily, treatment may need to be continued for up to 3 months

### ANTIVIRALS > IMMUNE RESPONSE MODIFIERS

#### Imiquimod

**INDICATIONS AND DOSE**

- **ALDARA®**
  - **Warts (external genital and perianal)**
    - **To the lesion**
    - Child (initiated under specialist supervision): Apply 3 times a week until lesions resolve (maximum 16 weeks), to be applied thinly at night

**UNLICENSED USE**

- **ALDARA®** Not licensed for use in children.
- **CAUTIONS**
  - Autoimmune disease - avoid broken skin - avoid normal skin - avoid open wounds - immunosuppressed patients - not suitable for internal genital warts - uncircumcised males (risk of phimosis or stricture of foreskin)
- **SIDE-EFFECTS**
  - **Common or very common** Burning sensation - erosion - exfoliation - headache - influenza-like symptoms - itching - local reactions - myalgia - oedema - scabbing
  - **Uncommon** Alopecia - local ulceration
  - **Rare** Cutaneous lupus erythematosus - like effect - Stevens-Johnson syndrome
  - **Very rare** Dysuria
  - **Frequency not known** Permanent hyperpigmentation - permanent hypopigmentation
- **CONCEPTION AND CONTRACEPTION** May damage latex condoms and diaphragms.
- **PREGNANCY**
  - **No evidence of teratogenicity or toxicity in animal studies; manufacturer advises caution.**

**BREAST FEEDING**

- **No information available.**

**DIRECTIONS FOR ADMINISTRATION**

- **ALDARA®**
  - **Important** Should be rubbed in and allowed to stay on the treated area for 6–10 hours then washed off with mild soap and water (uncircumcised males treating warts under foreskin should wash the area daily). The cream should be washed off before sexual contact.

**PATIENT AND CARER ADVICE**

- A patient information leaflet should be provided.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Cream**
  - **CAUTIONARY AND ADVISORY LABELS 15**

1 Immunoglobulin therapy

IMMUNE SERA AND IMMUNOGLOBULINS

IMMUNOGLOBULINS

Passive immunity

Immunity with immediate protection against certain infectious organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought. The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated. Antibodies of human origin are usually termed immunoglobulins. The term antiserum is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antiserum, this therapy has been replaced wherever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins but reports of such reactions are very rare.

Two types of human immunoglobulin preparation are available, normal immunoglobulin p. 727 and disease-specific immunoglobulins.

Human immunoglobulin is a sterile preparation of concentrated antibodies (immune globulins) recovered from pooled human plasma or serum obtained from outside the UK; tested and found non-reactive for hepatitis B surface antigen and for antibodies against hepatitis C virus and human immunodeficiency virus (types 1 and 2). A global shortage of human immunoglobulin and the rapidly increasing range of clinical indications for treatment with immunoglobulins has resulted in the need for a Demand Management programme in the UK, for further information consult www.ivig.nhs.uk and Clinical Guidelines for Immunoglobulin Use, www.gov.uk/dh.

Further information on the use of immunoglobulins is included in Public Health England’s Immunoglobulin Handbook www.gov.uk/phe, and in the Department of Health’s publication, Immunisation against Infectious Disease, www.gov.uk/dh.

Availability

Normal immunoglobulin for intramuscular administration is available from some regional Public Health laboratories for the protection of contacts and the control of outbreaks of hepatitis A, measles, and rubella only. For other indications, subcutaneous or intravenous normal immunoglobulin should be purchased from the manufacturer.

Disease-specific immunoglobulins are available from some regional Public Health laboratories, with the exception of tetanus immunoglobulin p. 729 which is available from BPL, hospital pharmacies, or blood transfusion departments. Rabies immunoglobulin p. 729 is available from the Specialist and Reference Microbiology Division, Public Health England, Colindale. Hepatitis B immunoglobulin p. 727 required by transplant centres should be obtained commercially.

In Scotland all immunoglobulins are available from the Scottish National Blood Transfusion Service (SNBTS). In Wales all immunoglobulins are available from the Welsh Blood Service (WBS). In Northern Ireland all immunoglobulins are available from the Northern Ireland Blood Transfusion Service (NIBTS).

Normal immunoglobulin

Human normal immunoglobulin (’HNIG’) is prepared from pools of at least 1000 donations of human plasma; it contains immunoglobulin G (IgG) and antibodies to hepatitis A, measles, mumps, rubella, varicella, and other viruses that are currently prevalent in the general population.

Uses

Normal immunoglobulin (containing 10–18% protein) is administered by intramuscular injection for the protection of susceptible contacts against hepatitis A virus (infectious hepatitis), measles and, to a lesser extent, rubella. Injection of immunoglobulin produces immediate protection lasting for several weeks.

Normal immunoglobulin (containing 3–12% protein) for intravenous administration is used as replacement therapy for children with congenital agammaglobulinaemia and hypogammaglobulinaemia, and for the short-term treatment of idiopathic thrombocytopenic purpura and Kawasaki disease; it is also used for the prophylaxis of infection following bone-marrow transplantation and in children with symptomatic HIV infection who have recurrent bacterial infections. Normal immunoglobulin for replacement therapy may also be given intramuscularly or subcutaneously, but intravenous formulations are normally preferred.

Intravenous immunoglobulin is also used in the treatment of Guillain-Barré syndrome as an alternative to plasma exchange.

The dose of normal immunoglobulin used as replacement therapy in patients with immunodeiciencies is not the same as the dose required for treatment of acute conditions. For Kawasaki disease a single dose by intravenous infusion should be given with concomitant aspirin p. 83 within 10 days of onset of symptoms (but children with a delayed diagnosis may also benefit).

For guidance on the use of intravenous normal immunoglobulin and alternative therapies for other conditions, consult Clinical Guidelines for Immunoglobulin Use (www.gov.uk/dh).

Hepatitis A

Hepatitis A vaccine p. 749 is preferred for individuals at risk of infection including those visiting areas where the disease is highly endemic (all countries excluding Northern and...
Western Europe, North America, Japan, Australia, and New Zealand). In unimmunised individuals, transmission of hepatitis A is reduced by good hygiene. Intramuscular normal immunoglobulin is no longer recommended for routine prophylaxis in travellers, but it may be indicated for immunocompromised patients if their antibody response to the vaccine is unlikely to be adequate.

Intramuscular normal immunoglobulin is recommended for prevention of infection in close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed; normal immunoglobulin should be given as soon as possible, preferably within 14 days of exposure to the primary case. However, normal immunoglobulin can still be given to contacts at risk of severe disease up to 28 days after exposure to the primary case. Hepatitis A vaccine can be given at the same time, but it should be given at a separate injection site.

**Measles**

Intravenous or subcutaneous normal immunoglobulin may be given to prevent or attenuate an attack of measles in individuals who do not have adequate immunity. Children with compromised immunity who have come into contact with measles should receive intravenous or subcutaneous normal immunoglobulin as soon as possible after exposure. It is most effective if given within 72 hours but can be effective if given within 6 days.

Subcutaneous or intramuscular normal immunoglobulin should also be considered for the following individuals if they have been in contact with a confirmed case of measles or with a person associated with a local outbreak:

- Non-immune pregnant women
- Infants under 9 months

Further advice should be sought from the Centre for Infections, Public Health England (tel. (020) 8200 6868). Individuals who are not in the above categories and who have not been fully immunised against measles, can be given measles, mumps and rubella vaccine, live p. 753 for prophylaxis following exposure to measles.

**Rubella**

Intramuscular immunoglobulin after exposure to rubella does not prevent infection in non-immune contacts and is not recommended for protection of pregnant women exposed to rubella. It may, however, reduce the likelihood of a clinical attack which may possibly reduce the risk to the fetus. Risk of intra-uterine transmission is greatest in the first 11 weeks of pregnancy, between 16 and 20 weeks there is minimal risk of deafness only, after 20 weeks there is no increased risk. Intramuscular normal immunoglobulin p. 727 should be used only if termination of pregnancy would be unacceptable to the pregnant woman—it should be given as soon as possible after exposure. Serological follow-up of recipients is essential to determine if the woman has become infected despite receiving immunoglobulin.

For routine prophylaxis against Rubella, see measles, mumps and rubella vaccine, live p. 753.

**Disease-specific immunoglobulins**

Specific immunoglobulins are prepared by pooling the plasma of selected human donors with high levels of the specific antibody required. For further information, see Immunoglobulin Handbook (www.gov.uk/phe).

There are no specific immunoglobulins for hepatitis A, measles, or rubella—normal immunoglobulin is used in certain circumstances. There is no specific immunoglobulin for mumps; neither normal immunoglobulin nor measles, mumps and rubella vaccine, live is effective as postexposure prophylaxis.

**Hepatitis B immunoglobulin**

Disease-specific hepatitis B immunoglobulin (‘HBIG’) p. 727 is available for use in association with hepatitis B vaccine p. 750 for the prevention of infection in infants born to mothers who have become infected with this virus in pregnancy or who are high-risk carriers (see hepatitis B vaccine). Hepatitis B immunoglobulin will not inhibit the antibody response when given at the same time as hepatitis B vaccine but should be given at different sites.

An intravenous and preparation of hepatitis B immunoglobulin is licensed for the prevention of hepatitis B recurrence in HBV-DNA negative patients who have undergone liver transplantation for liver failure caused by the virus.

**Rabies immunoglobulin**

Following exposure of an unimmunised individual to an animal in or from a country where the risk of rabies is high the site of the bite should be washed with soap and water to prevent infection in non-immune contacts and is ineffective if given within 7 days of the bite. Rabies vaccine p. 754 should also be given intramuscularly at a different site (for details see rabies vaccine). If there is delay in giving the rabies immunoglobulin, it should be given within 7 days of starting the course of rabies vaccine.

**Tetanus immunoglobulin**

For the management of tetanus-prone wounds, tetanus immunoglobulin p. 729 should be used in addition to wound cleansing and, where appropriate, antibacterial prophylaxis and a tetanus-containing vaccine. Tetanus immunoglobulin, together with metronidazole p. 313 and wound cleansing, should also be used for the treatment of established cases of tetanus.

**Varicella-zoster immunoglobulin**

Varicella-zoster immunoglobulin (VZIG) p. 730 is recommended for individuals who are at increased risk of severe varicella and who have no antibodies to varicella–zoster virus and who have significant exposure to chickenpox or herpes zoster. Those at increased risk include:

- Neonates whose mothers develop chickenpox in the period 7 days before to 7 days after delivery;
- Susceptible neonates exposed in the first 7 days of life;
- Susceptible neonates or infants exposed whilst requiring intensive or prolonged special care nursing;
- Susceptible women exposed at any stage of pregnancy (but when supplies of VZIG are short, may only be issued to those exposed in the first 20 weeks’ gestation or to those near term) providing VZIG is given within 10 days of contact;
- Immunocompromised individuals including those who have received corticosteroids in the previous 3 months at the following dose equivalents of prednisolone; children 2 mg/kg daily (or more than 40 mg) for at least 1 week or 1 mg/kg daily for 1 month.

**Important:** For full details consult Immunisation against Infectious Disease. Varicella-zoster vaccine p. 755 is available.
To rhesus-negative woman for prevention of Rh(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) up to 20 weeks’ gestation
  ▶ BY DEEP INTRAMUSCULAR INJECTION
    • Females of childbearing potential: 250 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh(D) sensitisation, following any potentially sensitising episode (e.g. stillbirth, abortion, amniocentesis) after 20 weeks’ gestation
  ▶ BY DEEP INTRAMUSCULAR INJECTION
    • Females of childbearing potential: 500 units per episode, dose to be administered immediately or within 72 hours, subcutaneous route used for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh(D) sensitisation, antenatal prophylaxis
  ▶ BY DEEP INTRAMUSCULAR INJECTION
    • Females of childbearing potential: 1000–1650 units, dose to be given at weeks 28 and 34 of pregnancy, alternatively 1500 units for 1 dose, to be given between 28 and 30 weeks gestation

To rhesus-negative woman for prevention of Rh(D) sensitisation, following Rh(D) incompatible blood transfusion
  ▶ BY DEEP INTRAMUSCULAR INJECTION
    • Females of childbearing potential: 100–125 units per mL of transfused rhesus-positive red cells, subcutaneous route used for patients with bleeding disorders

RHOPHYLAC®

To rhesus-negative woman for prevention of Rh(D) sensitisation, following birth of rhesus-positive infant
  ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
    • Females of childbearing potential: 1000–1500 units, dose to administered immediately or within 72 hours; for large transplacental bleed, extra 100 units per mL fetal red cells (preferably by intravenous injection), intravenous route recommended for patients with bleeding disorders

To rhesus-negative woman for prevention of Rh(D) sensitisation, following any potentially sensitising episode (e.g. abortion, amniocentesis, chorionic villous sampling) up to 12 weeks’ gestation
  ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
    • Females of childbearing potential: 1000 units per episode, dose to be administered immediately or within 72 hours, intravenous route recommended for patients with bleeding disorders, higher doses may be required after 12 weeks gestation

To rhesus-negative woman for prevention of Rh(D) sensitisation, antenatal prophylaxis
  ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
    • Females of childbearing potential: 1500 units, dose to be given between weeks 28–30 of pregnancy; if infant rhesus-positive, a further dose is still needed immediately or within 72 hours of delivery, intravenous route recommended for patients with bleeding disorders

CONTRA-INDICATIONS
Treatment of idiopathic thrombocytopoenia purpura in rhesus negative patients - treatment of idiopathic thrombocytopoenia purpura in splenectomised patients

CAUTIONS
Immunoglobulin A deficiency - possible interference with live virus vaccines

CAUTIONS, FURTHER INFORMATION
MMR vaccine may be given in the postpartum period with anti-D (Rh(D)) immunoglobulin injection provided that separate syringes are used and the products are administered into different limbs. If blood is transfused, the antibody response to the vaccine may be inhibited—measure rubella antibodies after 6–8 weeks and revaccinate if necessary.

INTERACTIONS
  ▶ Appendix 1 (immunoglobulins).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Rare
Anaphylaxis - dyspnoea - hypotension - tachycardia - urticaria

Frequency not known

SPECIFIC SIDE-EFFECTS
With intravenous use
Abdominal distension - blood pressure fluctuations - deep vein thrombosis - haemolytic anaemia - injection site reactions - myocardial infarction - pulmonary embolism - stroke - thromboembolic events

HANDLING AND STORAGE
Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)
  ▶ Routine antenatal anti-D prophylaxis for rhesus-negative women (August 2008) NICE TA156
Routine antenatal anti-D prophylaxis should be offered to all non-sensitised pregnant women who are rhesus negative.
www.nice.org.uk/TA156

**Hepatitis B immunoglobulin**

**INDICATIONS AND DOSE**

Prophylaxis against hepatitis B infection
- BY INTRAMUSCULAR INJECTION
  - Neonate: 200 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure.
  - Child 1 month–4 years: 200 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure.
  - Child 5–9 years: 300 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure.
  - Child 10–17 years: 500 units, dose to be administered as soon as possible after exposure; ideally within 12–48 hours, but no later than 7 days after exposure.

Prevention of transmitted infection at birth
- BY INTRAMUSCULAR INJECTION
  - Neonate: 200 units, dose to be administered as soon as possible after birth; for full details consult Immunisation against Infectious Disease (www.dh.gov.uk).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Rare Anaphylaxis - chest tightness - dyspnoea
- Frequency not known Arthralgia - buccal ulceration - dizziness - facial oedema - glossitis - pain at injection site - swelling at injection site - tremor

**SPECIFIC SIDE-EFFECTS**
- With intravenous use Abdominal distension - blood pressure fluctuations - deep vein thrombosis - haemolytic anaemia - injection site reactions - myocardial infarction - pulmonary embolism - stroke - thromboembolic events

**PRESCRIBING AND DISPENSING INFORMATION**
Vials containing 200 units or 500 units (for intramuscular injection), available from selected Public Health England and NHS laboratories (except for Transplant Centres), also available from BPL.

**HANDLING AND STORAGE**
Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze.

**Indications**
- Hepatitis B immunoglobulin 1500 unit D-Gam Anti-D immunoglobulin 1,500 unit solution for injection vials | 1 vial £89.00
- **Rhophylac (CSL Behring UK Ltd)**
- **Anti-D (RHO) immunoglobulin 750 unit per 1 ml** Rhophylac 1,500 units/2 ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £39.52

**Normal immunoglobulin**

**INDICATIONS AND DOSE**

To control outbreaks of hepatitis A
- BY DEEP INTRAMUSCULAR INJECTION
  - Child 1 month–9 years: 250 mg
  - Child 10–17 years: 500 mg

Rubella in pregnancy, prevention of clinical attack
- BY DEEP INTRAMUSCULAR INJECTION
  - Females of childbearing potential: 750 mg

Antibody deficiency syndromes
- BY SUBCUTANEOUS INJECTION
  - Child: (consult product literature)

Kawasaki disease (with concomitant aspirin)
- BY INTRAVENOUS INJECTION
  - Child: 2 g/kg daily for 1 dose, treatment should be given within 10 days of onset of symptom (but children with a delayed diagnosis may also benefit).

**SUBGAM**

**Hepatitis A prophylaxis in outbreaks**
- BY INTRAMUSCULAR INJECTION
  - Child 1 month–9 years: 500 mg
  - Child 10–17 years: 750 mg

**UNLICENSED USE**

**SUBGAM** Subgam is not licensed for prophylactic use, but due to difficulty in obtaining suitable immunoglobulin products, Public Health England recommends intramuscular use for prophylaxis against Hepatitis A or rubella.

**CONTRA-INDICATIONS**
Patients with selective IgA deficiency who have known antibody against IgA

**PRIVIGEN** Hyperprolinaemia (contains -proline)

**GAMMAPLEX** Hereditary fructose intolerance (contains sorbitol)

**HIZENTRA** Hyperprolinaemia (contains -proline)

**FLEBOGAMMA DIF** Hereditary fructose intolerance (contains sorbitol)

Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Hepatitis B immunoglobulin (Non-proprietary)
  - **Hepatitis B immunoglobulin human 200 unit** Hepatitis B immunoglobulin human 200 unit solution for injection vials | 1 vial £112.44
  - **Hepatitis B immunoglobulin human 500 unit** Hepatitis B immunoglobulin human 500 unit solution for injection vials | 1 vial £266.33
- Zutectra (Biotest (UK) Ltd)
  - Zutectra 500 units/ml solution for injection pre-filled syringes | 5 syringe (P25) £1,275.00

**Solution for infusion**
- Hepact CP (Biotest (UK) Ltd)
  - Hepact CP human 50 unit per 1 ml Hepact CP 50 units/ml solution for infusion vials | 1 vial (P25) £35.00
  - Hepact CP 200 units/ml solution for infusion vials | 1 vial (P25) £935.00
  - Hepact CP 500 units/ml solution for infusion vials | 1 vial (P25) £2,550.00
  - Omri-Hep-B (Imported (Israel))
  - Hepatitis B immunoglobulin human 50 unit per 1 ml Omri-Hep-B 500 units/ml solution for infusion vials | 1 vial (P25) no price available

DIRECTIONS FOR ADMINISTRATION

Interference with live virus vaccines

- With intravenous use
- Ensure adequate hydration - obesity - renal insufficiency - risk factors for arterial or venous thromboembolic events - thrombophilic disorders

CAUTIONS, FURTHER INFORMATION

Interference with live virus vaccines Normal immunoglobulin may interfere with the immune response to live virus vaccines which should therefore only be given at least 3 weeks before or 3 months after an injection of normal immunoglobulin (this does not apply to yellow fever vaccine since normal immunoglobulin does not contain antibody to this virus).

OCTAGAM® Falsely elevated results with blood glucose testing systems (contains maltose)

INTERACTIONS → Appendix 1 (immunoglobulins).

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Rare Acute renal failure - anaphylaxis - aseptic meningitis - cutaneous skin reactions - hypotension
- Frequency not known Arthralgia - chill - diarhoea - dizziness - fever - headache - low back pain - muscle spasms - myalgia - nausea

SPECIFIC SIDE-EFFECTS

- With intravenous use Abdominal distension - abdominal pain - blood pressure fluctuation - deep vein thrombosis - haemolytic anaemia - injection site reactions - myocardial infarction - pulmonary embolism - stroke - thromboembolic events

SIDE-EFFECTS, FURTHER INFORMATION

Adverse reactions are more likely to occur in patients receiving normal immunoglobulin for the first time, or following a prolonged period between treatments, or when a different brand of normal immunoglobulin is administered.

MONITORING REQUIREMENTS

Monitor for acute renal failure; consider discontinuation if renal function deteriorates. Intravenous preparations with added sucrose have been associated with cases of renal dysfunction and acute renal failure.

DIRECTIONS FOR ADMINISTRATION

Preparations for subcutaneous use May be administered by intramuscular injection if subcutaneous route not possible; intramuscular route not for patients with thrombocytopenia or other bleeding disorders.

GAMUNEX® Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

KIOVIG® Use Glucose 5% intravenous infusion if dilution prior to infusion is required.

PRESCRIBING AND DISPENSING INFORMATION

Antibody titres can vary widely between normal immunoglobulin preparations from different manufacturers – formulations are not interchangeable; patients should be maintained on the same formulation throughout long-term treatment to avoid adverse effects.

With intramuscular use Available from the Centre for Infections and other regional Public Health England offices (for contacts and control of outbreaks only).

HANDLING AND STORAGE

Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

ELECTROLYTES: May contain Sodium

- GAMmANORM (Octapharma Ltd)
  - Normal immunoglobulin human 165 mg per 1 ml Gammanorm 8g/48ml solution for injection vials | 1 vial £34.00
  - Gammanorm 2g/12ml solution for injection vials | 1 vial £11.70
  - Gammanorm 4g/24ml solution for injection vials | 1 vial £23.40
  - Gammanorm 1.65g/10ml solution for injection vials | 1 vial £34.00
  - Gammanorm 3.3g/20ml solution for injection vials | 1 vial £193.55
  - Gammanorm 3g/6ml solution for injection vials | 1 vial £58.65

- Subcuvia (Baxalta UK Ltd)
  - Normal immunoglobulin human 160 mg per 1 ml Subcuvia 800mg/5ml solution for injection vials | 1 vial £43.20 no price available
  - Subcuvia 1.6g/10ml solution for injection vials | 1 vial £43.20 no price available

- Subgam (Bio Products Laboratory Ltd)
  - Normal immunoglobulin human 150 mg per 1 ml Subgam 750mg/5ml solution for injection vials | 1 vial £34.00
  - Subgam 1.5g/10ml solution for injection vials | 1 vial £68.40

Powder and solvent for solution for injection

- Gammagard S/D (Baxalta UK Ltd)
  - Normal immunoglobulin human 500 mg Gammagard S/D 500mg powder and solvent for solution for injection bottles | 1 bottle £34.20 no price available

- Normal immunoglobulin human 2.5 gram Gammagard S/D 2.5g powder and solvent for solution for injection bottles | 1 bottle £58.65 no price available

- Normal immunoglobulin human 5 gram Gammagard S/D 5g powder and solvent for solution for injection bottles | 1 bottle £117.30 no price available

- Normal immunoglobulin human 10 gram Gammagard S/D 10g powder and solvent for solution for injection bottles | 1 bottle £234.60 no price available

Solution for infusion

EXCIPIENTS: May contain Glucose, maltose, sorbitol, sucrose

- Normal immunoglobulin human 50 mg per 1 ml Aragam 5g/100ml solution for infusion vials | 1 vial £20.00 no price available

- Normal immunoglobulin human 100 mg per 1 ml Aragam 5g/100ml solution for infusion vials | 1 vial £34.00 no price available

- Normal immunoglobulin human 165 mg per 1 ml Aragam 5g/100ml solution for infusion vials | 1 vial £65.00 no price available

- Flebogamadif (Grifols UK Ltd)
  - Normal immunoglobulin human 50 mg per 1 ml Flebogamadif Dif 10g/200ml solution for infusion vials | 1 vial £51.00
  - Flebogamadif Dif 2.5g/50ml solution for infusion vials | 1 vial £127.50
  - Flebogamadif Dif 5g/100ml solution for infusion vials | 1 vial £255.00
  - Flebogamadif Dif 500mg/10ml solution for infusion vials | 1 vial £30.00
  - Flebogamadif Dif 20g/400ml solution for infusion vials | 1 vial £1,020.00

- Normal immunoglobulin human 100 mg per 1 ml Flebogamadif Dif 10g/100ml solution for infusion vials | 1 vial £51.00
  - Flebogamadif Dif 20g/200ml solution for infusion vials | 1 vial £1,020.00
  - Flebogamadif Dif 5g/50ml solution for infusion vials | 1 vial £255.00
Gammaplex (Bio Products Laboratory Ltd)
Normal immunoglobulin human 50 mg per 1 ml Gammaplex 10g/200ml solution for infusion vials | 1 vial (£418.00 (Hospital only)) Gammaplex 5g/100ml solution for infusion vials | 1 vial (£209.00 (Hospital only)) Gammaplex 20g/400ml solution for infusion vials | 1 vial (£660.00 (Hospital only)) Gammaplex 2.5g/50ml solution for infusion vials | 1 vial (£104.50 (Hospital only))

Gamunex (Grifols US Ltd)
Normal immunoglobulin human 100 mg per 1 ml Gamunex 10% 1g/10ml solution for infusion vials | 1 vial (£42.50) Gamunex 10% 10g/100ml solution for infusion vials | 1 vial (£425.00)
Gamunex 10% 20g/200ml solution for infusion vials | 1 vial (£580.00) Gamunex 10% 5g/50ml solution for infusion vials | 1 vial (£122.50)

Hizentra (CSL Behring UK Ltd)
Normal immunoglobulin human 200 mg per 1 ml Hizentra 2g/10ml solution for infusion vials | 1 vial (£91.80) Hizentra 1g/5ml solution for infusion vials | 1 vial (£45.90) Hizentra 4g/20ml solution for infusion vials | 1 vial (£183.60)

Intratect (Biostat Ltd)
Normal immunoglobulin human 50 mg per 1 ml Intratect 5g/100ml solution for infusion vials | 1 vial (£191.25) Intratect 1g/20ml solution for infusion vials | 1 vial (£38.25)
Intratect 2.5g/50ml solution for infusion vials | 1 vial (£95.63) Intratect 10g/200ml solution for infusion vials | 1 vial (£382.50)

Normal immunoglobulin human 100 mg per 1 ml Intratect 10g/100ml solution for infusion vials | 1 vial (£382.50) Intratect 20g/200ml solution for infusion vials | 1 vial (£765.00) Intratect 5g/50ml solution for infusion vials | 1 vial (£191.25) Intratect 1g/10ml solution for infusion vials | 1 vial (£38.25)

Kiovig (Baxalta UK Ltd)
Normal immunoglobulin human 100 mg per 1 ml Kiovig 5g/50ml solution for infusion vials | 1 vial (£no price available) Kiovig 20g/200ml solution for infusion vials | 1 vial (£no price available) Kiovig 10g/100ml solution for infusion vials | 1 vial (£no price available) Kiovig 2.5g/25ml solution for infusion vials | 1 vial (£no price available) Kiovig 1g/10ml solution for infusion vials | 1 vial (£no price available)

Octagam (Octapharma Ltd)
Normal immunoglobulin human 50 mg per 1 ml Octagam 5% 10g/200ml solution for infusion bottles | 1 bottle (£408.00 (Hospital only)) Octagam 5g/100ml solution for infusion bottles | 1 bottle (£204.00 (Hospital only)) Octagam 1g/100ml solution for infusion bottles | 1 bottle (£102.00 (Hospital only))

Normal immunoglobulin human 100 mg per 1 ml Octagam 10% 20g/200ml solution for infusion bottles | 1 bottle (£1,173.00 (Hospital only)) Octagam 10g/100ml solution for infusion bottles | 1 bottle (£586.50 (Hospital only)) Octagam 10g/200ml solution for infusion bottles | 1 bottle (£1,173.00 (Hospital only))

Privigen (CSL Behring UK Ltd)
Normal immunoglobulin human 100 mg per 1 ml Privigen 5g/50ml solution for infusion vials | 1 vial (£229.50) Privigen 10g/100ml solution for infusion vials | 1 vial (£459.00) Privigen 20g/200ml solution for infusion vials | 1 vial (£918.00) Privigen 2.5g/25ml solution for infusion vials | 1 vial (£114.75)

Vigam (Bio Products Laboratory Ltd)
Normal immunoglobulin human 50 mg per 1 ml Vigam Liquid 5g/100ml solution for infusion vials | 1 vial (£209.00) Vigam Liquid 10g/200ml solution for infusion vials | 1 vial (£418.00)

Vigam Liquid 5g/100ml solution for infusion vials | 1 vial (£209.00) Vigam Liquid 10g/200ml solution for infusion vials | 1 vial (£418.00)

### Rabies immunoglobulin

**INDICATIONS AND DOSE**
- **Post-exposure prophylaxis against rabies infection**
  - **By local infiltration, or by intramuscular injection**
  - Child: 20 units/kg, dose administered by infiltration in and around the cleansed wound; if the wound not visible or healed or if infiltration of whole volume not possible, give remainder by intramuscular injection into anterolateral thigh (remote from vaccination site)

**CAUTIONS**
- IgA deficiency - interference with live virus vaccines
- **SIDE-EFFECTS**
  - Rare: Anaphylaxis - arthralgia - buccal ulceration - chest tightness - dizziness - dyspnoea - glossitis - tremor
  - Frequency not known: Facial oedema - injection site pain - injection site swelling

**PRESCRIBING AND DISPENSING INFORMATION**
The potency of individual batches of rabies immunoglobulin from the manufacturer may vary; potency may also be described differently by different manufacturers. It is therefore critical to know the potency of the batch to be used and the weight of the patient in order to calculate the specific volume required to provide the necessary dose. Available from Specialist and Reference Microbiology Division, Public Health England (also from BPL).

**HANDLING AND STORAGE**
Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Rabies immunoglobulin (Non-proprietary)
- Rabies immunoglobulin human 500 unit
  - Rabies immunoglobulin human 500 unit solution for injection vials | 1 vial (£421.13)

### Tetanus immunoglobulin

**INDICATIONS AND DOSE**
- **Post-exposure prophylaxis**
  - **By intramuscular injection**
  - Child: Initially 250 units, then increased to 500 units, dose is only increased if more than 24 hours have elapsed or there is risk of heavy contamination or following burns

**Treatment of tetanus infection**
- **By intramuscular injection**
  - Child: 150 units/kg, dose may be given over multiple sites

**CAUTIONS**
- IgA deficiency - interference with live virus vaccines
- **SIDE-EFFECTS**
  - Rare: Anaphylaxis - arthralgia - buccal ulceration - chest tightness - dizziness - dyspnoea - glossitis - tremor
  - Frequency not known: Facial oedema - injection site pain - injection site swelling

**HANDLING AND STORAGE**
Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. **Refrigerated storage** is usually necessary; many immunoglobulins need
Varicella-zoster immunoglobulin (Antivaricella-zoster Immunoglobulin)

**INDICATIONS AND DOSE**

**Prophylaxis against varicella infection**

- **Neonate:** 250 mg, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease.
- **Child 1 month–5 years:** 250 mg, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease.
- **Child 6–10 years:** 500 mg, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease.
- **Child 11–14 years:** 750 mg, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease.
- **Child 15–17 years:** 1 g, to be administered as soon as possible—not later than 10 days after exposure, second dose to be given if further exposure occurs more than 3 weeks after first dose, no evidence that effective in severe disease.

**CAUTIONS**

- IgA deficiency · interference with live virus vaccines
- **SIDE-EFFECTS**
  - Rare Anaphylaxis
  - Frequency not known Injection site pain · injection site swelling

**DIRECTIONS FOR ADMINISTRATION**

Normal immunoglobulin for intravenous use may be used in those unable to receive intramuscular injections.

**PRESCRIBING AND DISPENSING INFORMATION**

Available from selected Public Health England and NHS laboratories (also from BPL).

**HANDLING AND STORAGE**

Care must be taken to store all immunological products under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many immunoglobulins need to be stored at 2–8°C and not allowed to freeze. Immunoglobulins should be protected from light. Opened multidose vials must be used within the period recommended in the product literature.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Varicella-Zoster (Bio Products Laboratory Ltd)**
  - Varicella-Zoster immunoglobulin human 250 mg
  - Varicella-Zoster immunoglobulin human 250 mg solution for injection vials
    - 1 vial (POC) £350.00

---

**2 Post-exposure prophylaxis**

**IMMUNE SERA AND IMMUNOGLOBULINS**

**ANTITOXINS**

**Botulism antitoxin**

**DRUG ACTION**

A preparation containing the specific antitoxin globulins that have the power of neutralising the toxins formed by types A, B, and E of *Clostridium botulinum*.

**INDICATIONS AND DOSE**

**Post exposure prophylaxis of botulism**

- **Child:** (consult product literature)

**SIDE-EFFECTS**

Hypersensitivity reactions

**SIDE-EFFECTS, FURTHER INFORMATION**

Hypersensitivity reactions. It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g., asthma, hay fever, etc.

**PRE-TREATMENT SCREENING**

All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).

**PRESCRIBING AND DISPENSING INFORMATION**

Available from local designated centres, for details see TOXBASE (requires registration) www.toxbase.org. For supplies outside working hours apply to other designated centres or to the Public Health England Colindale duty doctor (Tel (020) 8200 6868). For major incidents, obtain supplies from the local blood bank. The BP title Botulinum Antitoxin is not used because the preparation currently in use may have a different specification.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

- **Botulism-antitoxin (Novartis Vaccines and Diagnostics Ltd)**
  - Botulinum antitoxin type E 50 unit per 1 ml
  - Botulinum antitoxin type A/B 500 unit per 1 ml
  - Botulinum antitoxin type A 750 unit per 1 ml
  - Botulinum-Antitoxin Behring 25g/250ml solution for infusion bottles
    - 1 bottle (POC) no price available

**Diphtheria antitoxin**

(Dip/Ser)

**INDICATIONS AND DOSE**

Passive immunisation in suspected cases of diphtheria

- **Child:** Dose should be given without waiting for bacteriological confirmation (consult product literature)
4 Vaccination

Vaccines

Active immunity

Active immunity can be acquired by natural disease or by vaccination. Vaccines stimulate production of antibodies and other components of the immune mechanism; they consist of either:

- a live attenuated form of a virus (e.g. measles, mumps and rubella vaccine) or bacteria (e.g. BCG vaccine), or
- inactivated preparations of the virus (e.g. influenza vaccine) or bacteria, or
- detoxified exotoxins produced by a micro-organism (e.g. tetanus vaccine), or
- extracts of a micro-organism, which may be derived from the organism (e.g. pneumococcal vaccine) or produced by recombinant DNA technology (e.g. hepatitis B vaccine).

Live attenuated vaccines usually produce a durable immunity, but not always as long-lasting as that resulting from natural infection.

Inactivated vaccines may require a primary series of injections of vaccine to produce an adequate antibody response, and in most cases booster (reinforcing) injections are required; the duration of immunity varies from months to many years. Some inactivated vaccines are adsorbed onto an adjuvant (such as aluminium hydroxide) to enhance the antibody response.

Advice reflects that in the handbook *Immunisation against Infectious Disease, (2013)* which in turn reflects the guidance of the Joint Committee on Vaccination and Immunisation (JCVI).

Chapters from the handbook are available at [www.immunisation.dh.gov.uk](http://www.immunisation.dh.gov.uk). The advice also incorporates changes announced by the Chief Medical Officer and Health Department Updates.

Children with unknown or incomplete immunisation history

For children born in the UK who present with an inadequate or unknown immunisation history, investigation into immunisations received should be carried out. Outstanding doses should be administered where the routine childhood immunisation schedule has not been completed. For advice on the immunisation of children coming to the UK, consult the handbook *Immunisation against Infectious Disease (2006)* (available at [www.dh.gov.uk](http://www.dh.gov.uk)).

Immunisation schedule

Vaccines for the childhood immunisation schedule should be obtained from local health organisations or from ImmForm ([www.immform.dh.gov.uk](http://www.immform.dh.gov.uk)) – not to be prescribed on FP10 (HS21 in Northern Ireland; GP10 in Scotland; WP10 in Wales).
Routine immunisation schedule

<table>
<thead>
<tr>
<th>When to immunise (for preterm infants—see note below)</th>
<th>Vaccine given and dose schedule (for details of dose, see under individual vaccines)</th>
</tr>
</thead>
</table>
| Neonates at risk only                                  | ➢ Bacillus calmette-guérin vaccine p. 744  
➤ Hepatitis B vaccine p. 750 |
| 2 months                                              | ➢ Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 743 First dose  
➤ Meningococcal group B vaccine (rDNA, component, adsorbed) p. 746 First dose  
➤ Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 747 First dose  
➤ Rotavirus vaccine p. 754 First dose |
| 3 months                                              | ➢ Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 743 Second dose  
➤ Meningococcal group C vaccine p. 746 First dose  
➤ Rotavirus vaccine p. 754 Second dose |
| 4 months                                              | ➢ Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 743 Third dose  
➤ Meningococcal group B vaccine (rDNA, component, adsorbed) p. 746 Second dose  
➤ Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 747 Second dose |
| 12-13 months                                          | ➢ Measles, mumps and rubella vaccine, live p. 753 First dose  
➤ Meningococcal group B vaccine (rDNA, component, adsorbed) p. 746 Single booster dose  
➤ Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 747 Single booster dose  
➤ Haemophilus influenzae type B with meningococcal group C vaccine p. 745 Single booster dose |
| 2-6 years (including children in school years 1 and 2) | ➢ Influenza vaccine p. 752 Each year from September Note: Flu nasal spray is recommended (Fluenz Tetra®). If contra-indicated and child is in clinical risk group, use inactivated flu vaccine |
| Between 3 years and 4 months, and 5 years             | ➢ Diphtheria with pertussis, poliomyelitis vaccine and tetanus p. 743 Single booster dose. 
Note: Preferably allow interval of at least 3 years after completing primary course  
➤ Measles, mumps and rubella vaccine, live p. 753 Second dose |
| 11-14 years (females only). First dose of HPV vaccine will be offered to females aged 12-13 years of age in England, Wales, and Northern Ireland, and 11-14 years of age in Scotland. | ➢ Human papillomavirus vaccine 2 doses; second dose 12 months after first dose. If a 3-dose course of HPV vaccine has been started under the 2013/2014 programme, where possible, the course should be completed. The two human papillomavirus vaccines are not interchangeable and, ideally, one vaccine product should be used for the entire course. However, for those females who started the schedule with Cervarix® under the national immunisation programme, but did not complete the vaccination course, the course can be completed with Gardasil®. |
| 13-15 years                                           | ➢ Meningococcal groups A with C and W135 and Y vaccine p. 746 Single booster dose |
| 13-18 years                                           | ➢ Diphtheria with poliomyelitis and tetanus vaccine p. 744 Single booster dose. Note: Can be given at the same time as the booster dose of meningococcal group A with C and W135 and Y vaccine at 13-15 years of age |
| During adult life, women of child-bearing age susceptible to rubella | ➢ Measles, mumps and rubella vaccine, live p. 753 Women of child-bearing age who have not received 2 doses of a rubella-containing vaccine or who do not have a positive antibody test for rubella should be offered rubella immunisation (using the MMR vaccine)—exclude pregnancy before immunisation. |

For the most up to date date immunisation schedule consult ‘The complete routine immunisation schedule’, available at www.gov.uk.

Preterm birth

Babies born preterm should receive all routine immunisations based on their actual date of birth. The risk of apnoea following vaccination is increased in preterm babies, particularly in those born at or before 28 weeks postmenstrual age. If babies at risk of apnoea are in hospital at the time of their first immunisation, they should be monitored for 48 hours after immunisation. If a baby develops apnoea, bradycardia, or desaturation after the first immunisation, the second immunisation should also be given in hospital with similar monitoring. Seroconversion may be unreliable in babies born earlier than 28 weeks’ gestation or in babies treated with corticosteroids for chronic lung disease; consideration should be given to testing for antibodies against Haemophilus influenzae type b, meningococcal C, and hepatitis B after primary immunisation.

Vaccines and HIV infection

HIV-positive children with or without symptoms can receive the following live vaccines:

- MMR (but avoid if immunity significantly impaired), varicella-zoster vaccine against chickenpox (but avoid if immunity significantly impaired—consult product literature; use of normal immunoglobulin should be considered after exposure to measles and varicella–zoster immunoglobulin considered after exposure to chickenpox or herpes zoster), rotavirus; and the following inactivated vaccines:

- Anthrax, cholera (oral), diphtheria, haemophilus influenzae type b, hepatitis A, hepatitis B, human papillomavirus, influenza (injection), meningococcal, pertussis, pneumococcal, poliomyelitis (inactivated poliomyelitis vaccine is now used instead of oral poliomyelitis vaccine for routine immunisation of children), rabies, tetanus, tick-borne encephalitis, typhoid (injection).

HIV-positive children should not receive:

- BCG, influenza nasal spray (unless stable HIV infection and receiving antiretroviral therapy), typhoid (oral), yellow fever (if yellow fever risk is unavoidable, specialist advice should be sought).
The above advice differs from that for other immunocompromised patients; Immunisation of HIV infected Children issued by Children’s HIV Association (CHIVA) are available at www.chiva.org.uk.

**Vaccines and asplenia**

The following vaccines are recommended for asplenic patients, those with splenic dysfunction or complement disorders, depending on the age at which their condition is diagnosed:

- Haemophilus influenzae type B with meningococcal group C vaccine;
- Influenza vaccine;
- Meningococcal groups A with C and W135 and Y vaccine;
- Pneumococcal polysaccharide vaccine.

*Children first diagnosed under 2 years of age should be vaccinated according to the Immunisation Schedule, including the 12 month boosters. If meningococcal group C vaccine p. 746 has not yet been given as part of routine schedule, give one dose of meningococcal groups A with C and W135 and Y vaccine p. 746 followed by a second dose at least one month apart. If meningococcal group C vaccine has already been given as part of routine schedule, then give one additional dose of meningococcal groups A with C and W135 and Y vaccine at least one month later. Following routine 12 month booster vaccines, give a dose of meningococcal groups A with C and W135 and Y vaccine and an additional dose of 13-valent pneumococcal polysaccharide vaccine 2 months later. An additional dose of haemophilus influenzae type B with meningococcal group C vaccine p. 745 and 23-valent pneumococcal polysaccharide vaccine should be given after the second birthday. The influenza vaccine should be administered annually in children aged 6 months or older.*

*Children first diagnosed over 2 years of age should be vaccinated according to the Immunisation schedule, including the 12 month boosters. The child should receive one additional booster dose of haemophilus influenzae type B with meningococcal group C vaccine along with the 23-valent pneumococcal polysaccharide vaccine, followed by one dose of meningococcal groups A with C and W135 and Y vaccine after 2 months. The influenza vaccine should be administered annually.*

**Passive immunity**

Immunity with immediate protection against certain infective organisms can be obtained by injecting preparations made from the plasma of immune individuals with adequate levels of antibody to the disease for which protection is sought (see under Immunoglobulins). The duration of this passive immunity varies according to the dose and the type of immunoglobulin. Passive immunity may last only a few weeks; when necessary, passive immunisation can be repeated.

Antibodies of human origin are usually termed *immunoglobulins*. The term *antisera* is applied to material prepared in animals. Because of serum sickness and other allergic-type reactions that may follow injections of antisera, this therapy has been replaced whenever possible by the use of immunoglobulins. Reactions are theoretically possible after injection of human immunoglobulins, but reports of such reactions are very rare.

**Vaccines and antiserum availability**

Anthrax vaccine and yellow fever vaccine, live p. 756, botulism antitoxin p. 730, diphtheria antitoxin p. 730, and snake and spider venom antitoxins are available from local designated holding centres.

For antivenom, see Emergency Treatment of Poisoning. Enquiries for vaccines not available commercially can also be made to:

Vaccines and Countermeasures Response Department
Public Health England
Wellington House
133–155 Waterloo Road
London
SE1 8UG
vaccinesupply@phe.gov.uk

In Scotland information about availability of vaccines can be obtained from a Specialist in Pharmaceutical Public Health. In Wales enquiries for vaccines not available commercially should be directed to:

Welsh Medicines Information Centre
University Hospital of Wales
Cardiff
CF14 4XW
(029) 2074 2979

In Northern Ireland:
Pharmacy and Medicines Management Centre
Northern Health and Social Care Trust
Beech House
Antrim Hospital Site
Bush Road
Antrim
BT41 2RL
rphps.admin@northerntrust.hscni.net

For further details of availability, see under individual vaccines.

**Anthrax vaccine**

Anthrax vaccine is rarely required for children.

**BCG vaccine**

BCG (bacillus calmette-guérin vaccine p. 744) is a live attenuated strain derived from *Mycobacterium bovis* which stimulates the development of hypersensitivity to *M. tuberculosis*. Bacillus calmette-guérin vaccine should be given intradermally by operators skilled in the technique. The expected reaction to successful bacillus calmette-guérin vaccine is induration at the site of injection followed by a local lesion which starts as a papule 2 or more weeks after vaccination; the lesion may ulcerate then subside over several weeks or months, leaving a small flat scar. A dry dressing may be used if the ulcer discharges, but air should not be excluded.

All children of 6 years and over being considered for bacillus calmette-guérin vaccine must first be given a skin test for hypersensitivity to tuberculoprotein (see under Diagnostic agents). A skin test is not necessary for a child under 6 years, provided that the child has not stayed for longer than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000 (a list of countries or primary care trusts where the incidence of tuberculosis is greater than 40 cases per 100 000 is available at www.gov.uk/phe), the child has not had contact with a person with tuberculosis, and there is no family history of tuberculosis within the last 5 years. Bacillus calmette-guérin vaccine is recommended for the following groups of children if BCG immunisation has not previously been carried out and they are negative for tuberculoprotein hypersensitivity:

- neonates with a family history of tuberculosis in the last 5 years;
- all neonates and infants (0–12 months) born in areas where the incidence of tuberculosis is greater than 40 per 100 000;
- neonates, infants, and children under 16 years with a parent or grandparent born in a country with an incidence of tuberculosis greater than 40 per 100 000;
- new immigrants aged under 16 years who were born in, or lived for more than 3 months in a country with an incidence of tuberculosis greater than 40 per 100 000;
Bacillus calmette-guérin vaccine can be given simultaneously with another live vaccine, but if they are not given at the same time, an interval of 4 weeks should normally be allowed between them. When bacillus calmette-guérin vaccine is given to infants, there is no need to delay routine primary immunisations. No further vaccination should be given to children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

For primary immunisation of children aged between 2 months and 10 years vaccination is recommended usually in the form of 3 doses (separated by 1-month intervals) of diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed) (see Immunisation schedule). In immunised individuals aged over 10 years the primary course comprises of 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine.

A booster dose should be given 3 years after the primary course (this interval can be reduced to a minimum of 1 year if the primary course was delayed). Children under 10 years should receive either adsorbed diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine or adsorbed diphtheria [low dose], tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine. Individuals aged over 10 years should receive adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine. A second booster dose, of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, should be given 10 years after the previous booster dose (this interval can be reduced to a minimum of 5 years if previous doses were delayed). For children who have been vaccinated following a tetanus-prone wound, see tetanus vaccines.

Diphtheria vaccine
Diphtheria vaccines are prepared from the toxin of Corynebacterium diphtheriae and adsorption on aluminium hydroxide or aluminium phosphate improves antigenicity. The vaccine stimulates the production of the protective antitoxin. The quantity of diphtheria toxoid in a preparation determines whether the vaccine is defined as ‘high dose’ or ‘low dose’. Vaccines containing the higher dose of diphtheria toxoid are used for primary immunisation of children under 10 years of age. Vaccines containing the lower dose of diphtheria toxoid are used for primary immunisation in adults and children over 10 years. Single-antigen diphtheria vaccine is not available and adsorbed diphtheria vaccine is given as a combination product containing other vaccines.

Botulism antitoxin
A polyvalent botulism antitoxin p. 730 is available for the post-exposure prophylaxis of botulism and for the treatment of persons thought to be suffering from botulism. It specifically neutralises the toxins produced by Clostridium botulinum types A, B, and E. It is not effective against infantile botulism as the toxin (type A) is seldom, if ever, found in the blood in this type of infection.

Hypersensitivity reactions are a problem. It is essential to read the contra-indications, warnings, and details of sensitivity tests on the package insert. Prior to treatment checks should be made regarding previous administration of any antitoxin and history of any allergic condition, e.g. asthma, hay fever, etc. All patients should be tested for sensitivity (diluting the antitoxin if history of allergy).

Cholera vaccine
Cholera vaccine p. 745 (oral) contains inactivated Inaba (including El-Tor biotype) and Ogawa strains of Vibrio cholerae, serotype O1 together with recombinant B-subunit of the cholera toxin produced in Inaba strains of V.cholerae, serotype O1.

Oral cholera vaccine is licensed for travellers to endemic or epidemic areas on the basis of current recommendations. Immunisation should be completed at least 1 week before potential exposure. However, there is no requirement for cholera vaccination for international travel.

Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that acute illness due to food, water, and personal hygiene is essential. Injectable cholera vaccine provides unreliable protection and is no longer available in the UK.

Haemophilus influenzae type b conjugate vaccine
Haemophilus influenzae type b (Hib) vaccine is made from capsular polysaccharide; it is conjugated with a protein such as tetanus toxoid to increase immunogenicity, especially in young children. Haemophilus influenzae type b vaccine immunisation is given in combination with diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine, as a component of the primary course of childhood immunisation (see Immunisation schedule) (see under Diphtheria-containing Vaccines). For infants under 1 year, the course consists of 3 doses of a vaccine containing Haemophilus influenzae type b component with an interval of 1 month between doses. A
booster dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) should be given at 12–13 months of age.

Children 1–10 years who have not been immunised against *Haemophilus influenzae* type b need to receive only 1 dose of Haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine). However, if a primary course of immunisation has not been completed, these children should be given 3 doses of diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus p. 743. The risk of infection falls sharply in older children and the vaccine is not normally required for children over 10 years.

Haemophilus influenzae type b vaccine may be given to those over 10 years who are considered to be at increased risk of invasive *H. influenzae* type b disease (such as those with sickle-cell disease or complement deficiency, or those receiving treatment for malignancy).

**Invasive Haemophilus influenzae type b disease**

After recovery from infection, unimmunised and partially immunised index cases under 10 years of age should complete their age-specific course of immunisation. Previously vaccinated cases under 10 years of age should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if Hib antibody concentrations are low or it is not possible to measure antibody concentrations. Index cases of any age with asplenia or splenic dysfunction should complete their immunisation according to the recommendations below; fully vaccinated cases with asplenia or splenic dysfunction should be given an additional dose of haemophilus influenzae type b vaccine (combined with meningococcal group C conjugate vaccine) if they received their previous dose over 1 year ago.

Also see use of rifampicin p. 342 in the prevention of secondary cases of *Haemophilus influenzae* type b disease.

**Hepatitis A vaccine**

Hepatitis A vaccine p. 749 is prepared from formaldehyde-inactivated hepatitis A virus grown in human diploid cells. Immunisation is recommended for:

- residents of homes for those with severe learning difficulties;
- children with haemophilia or other conditions treated with plasma-derived clotting factors;
- children with severe liver disease;
- children travelling to high-risk areas;
- adolescents who are at risk due to their sexual behaviour;
- parenteral drug abusers.

Immunisation should be considered for:

- children with chronic liver disease including chronic hepatitis B or chronic hepatitis C;
- prevention of secondary cases in close contacts of confirmed cases of hepatitis A, within 14 days of exposure to the primary case (within 8 weeks of exposure to the primary case where there is more than 1 contact in the household).

A booster dose of hepatitis A vaccine is usually given 6–12 months after the initial dose. A second booster dose can be given 20 years after the previous booster dose to those who continue to be at risk. Specialist advice should be sought on re-immunisation of immunocompromised individuals.

In children under 16 years, a single dose of the combined vaccine *Ambirix®* can be used to provide rapid protection against hepatitis A. Intramuscular normal immunoglobulin p. 727 is recommended for use in addition to hepatitis A vaccine for close contacts (of confirmed cases of hepatitis A) who have chronic liver disease or HIV infection, or who are immunosuppressed.

Post-exposure prophylaxis is not required for healthy children under 1 year of age, so long as all those involved in nappy changing are vaccinated against hepatitis A. However, children 2–12 months of age can be given a dose of hepatitis A vaccine if it is not possible to vaccinate their carers, or if the child becomes a source of infection to others [unlicensed use]; in these cases, if the child goes on to require long-term protection against hepatitis A after the first birthday, the full course of 2 doses should be given.

**Hepatitis B vaccine**

Hepatitis B vaccine p. 750 contains inactivated hepatitis B virus surface antigen (HBsAg) adsorbed on to aluminium hydroxide adjuvant. It is made biosynthetically using recombinant DNA technology. The vaccine is used in individuals at high risk of contracting hepatitis B.

In the UK, high-risk groups include:

- parenteral drug misusers, their sexual partners, and household contacts; other drug misusers who are likely to ‘progress’ to injecting;
- adolescents who are at risk from their sexual behaviour;
- close family contacts of an individual with chronic hepatitis B infection;
- babies whose mothers have had acute hepatitis B during pregnancy or are positive for hepatitis B surface antigen (regardless of e-antigen markers); hepatitis B vaccination is started immediately on delivery and *hepatitis B immunoglobulin* given at the same time (but at a different site). Babies whose mothers are positive for hepatitis B surface antigen and for e-antigen antibody should receive the vaccine only (but babies weighing 1.5 kg or less should also receive the immunoglobulin regardless of the mother’s e-antigen antibody status);
- children with haemophilia, those receiving regular blood transfusions or blood products, and carers responsible for the administration of such products;
- children with chronic renal failure including those on haemodialysis. Children receiving haemodialysis should be monitored for antibodies annually and re-immunised if necessary. Home carers (of dialysis patients) should be vaccinated;
- children with chronic liver disease;
- patients of day-care or residential accommodation for those with severe learning difficulties;
- children in custodial institutions;
- children travelling to areas of high or intermediate prevalence who are at increased risk or who plan to remain there for lengthy periods;
- families adopting children from countries with a high or intermediate prevalence of hepatitis B;
- foster carers and their families.

Different immunisation schedules for hepatitis B vaccine are recommended for specific circumstances; an ‘accelerated schedule’ is recommended for pre-exposure prophylaxis in high-risk groups where rapid protection is required, and for post-exposure prophylaxis. Generally, three or four doses are required for primary immunisation. Immunisation may take up to 6 months to confer adequate protection; the duration of immunity is not known precisely, but a single booster 5 years after the primary course may be sufficient to maintain immunity for those who continue to be at risk.

Immunisation does not eliminate the need for commonsense precautions for avoiding the risk of infection from known carriers by the routes of infection which have been clearly established, consult Guidance for Clinical Health Care Workers: Protection against Infection with Blood-borne Viruses (available at www.dh.gov.uk). Accidental inoculation of hepatitis B virus-infected blood into a wound, incision, needle-prick, or abrasion may lead to infection, whereas it is unlikely that indirect exposure to a carrier will do so.

Following significant exposure to hepatitis B, an accelerated schedule, with the second dose given 1 month, and the third dose 2 months after the initial dose, is recommended. For those at continued risk, a fourth dose...
Vaccines

should be given 12 months after the first dose. More detailed guidance is given in the *Immunisation against Infectious Disease* handbook.

Specific hepatitis B immunoglobulin (‘HBIG’) p. 727 is available for use with the vaccine in those accidentally inoculated and in neonates at special risk of infection. A combined hepatitis A and B vaccine p. 748 is also available.

**Human papillomavirus vaccine**

Human papillomavirus vaccine is available as a bivalent vaccine (*Cervarix®*) or a quadrivalent vaccine (*Gardasil®*). *Cervarix®* is licensed for use in females for the prevention of cervical cancer and other pre-cancerous lesions caused by human papillomavirus types 16 and 18. *Gardasil®* is licensed for use in females for the prevention of cervical and anal cancers, genital warts and pre-cancerous genital (cervical, vulvar, and vaginal) and anal lesions caused by human papillomavirus types 6, 11, 16, and 18. The vaccines may also provide limited protection against disease caused by other types of human papillomavirus. The two vaccines are not interchangeable and one vaccine product should be used for an entire course.

Human papillomavirus vaccine will be most effective if given before sexual activity starts. From September 2014, a 2-dose schedule is recommended, as long as the first dose is received before the age of 15 years. The first dose is given to females aged 11 to 14 years, and the second dose is given 6-24 months after the first dose (for the purposes of planning the national immunisation programme, it is appropriate to give the second dose 12 months after the first—see Immunisation schedule). If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more. Females aged 15 years or older require a 3-dose schedule (see *Cervarix®* and *Gardasil®*), with the second and third doses given 1 and 4–6 months after the first dose; all 3 doses should be given within a 12-month period. If the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses. If a 3-dose course of vaccination has been started before September 2014, then where possible this should be completed; if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses. Under the national programme in England, females remain eligible to receive the vaccine up to the age of 18 years if they did not receive the vaccine when scheduled. Where appropriate, immunisation with human papillomavirus vaccine should be offered to females coming into the UK as they may not have been offered protection in their country of origin. The duration of protection has not been established, but current studies suggest that protection is maintained for at least 6 years after completion of the primary course.

**Influenza vaccine**

While most viruses are antigenically stable, the influenza viruses A and B (especially A) are constantly altering their antigenic structure as indicated by changes in the haemagglutinins (H) and neuraminidases (N) on the surface of the viruses. It is essential that influenza vaccine p. 752 in use contain the H and N components of the prevalent strain or strains recommended each year by the World Health Organization.

Immunisation is recommended for persons at high risk, and to reduce transmission of infection. Annual immunisation is strongly recommended for children (including infants that were preterm or low birth-weight) aged over 6 months with the following conditions:

- chronic respiratory disease (includes asthma treated with continuous or repeated use of inhaled or systemic corticosteroids or asthma with previous exacerbations requiring hospital admission);
- chronic heart disease;
- chronic liver disease;
- chronic renal disease;
- chronic neurological disease;
- complement disorders;
- diabetes mellitus;
- immunosuppression because of disease (including asplenia or splenic dysfunction) or treatment (including prolonged systemic corticosteroid treatment [for over 1 month at dose equivalents of prednisolone: child under 20 kg, 1 mg/kg or more daily; child over 20 kg, 20 mg or more daily]) and chemotherapy);
- HIV infection (regardless of immune status).

Seasonal influenza vaccine is also recommended for all pregnant women, for children living in long-stay facilities, and for carers of children whose welfare may be at risk if the carer falls ill. Influenza immunisation should also be considered for household contacts of immunocompromised individuals.

From September 2015, seasonal influenza vaccine will also be offered to all children aged 2–18 years (including those in school years 1 and 2). Unless contra-indicated, the live influenza vaccine, *Fluenz Tetra*, is preferred in children aged 2–18 years because it provides a higher level of protection than inactivated influenza vaccine.

Further information on pandemic influenza, avian influenza, and swine influenza may be found at www.dh.gov.uk/pandemicflu and at www.gov.uk/phe.

**Japanese encephalitis vaccine**

Japanese encephalitis vaccine p. 753 is indicated for travellers to areas in Asia and the Far East where infection is endemic and for laboratory staff at risk of exposure to the virus. The primary immunisation course of 2 doses should be completed at least one week before potential exposure to Japanese encephalitis virus.

Up-to-date information on the risk of Japanese encephalitis in specific countries can be obtained from the National Travel Health Network and Centre (www.nathnac.org).

**Management of Measles, Mumps and Rubella**

Measles vaccine has been replaced by a combined measles, mumps and rubella vaccine, live (MMR vaccine) p. 753.

A combined measles, mumps and rubella vaccine, live (MMR vaccine) aims to eliminate measles, mumps, and rubella (German measles) and congenital rubella syndrome. Every child should receive two doses of measles, mumps and rubella vaccine, live by entry to primary school, unless there is a valid contra-indication. Measles, mumps and rubella vaccine, live should be given irrespective of previous measles, mumps, or rubella infection or vaccination.

The first dose of measles, mumps and rubella vaccine, live is given to children aged 12–13 months. A second dose is given before starting school at 3 years and 4 months–5 years of age (see Immunisation Schedule).

Children presenting for pre-school booster who have not received the first dose of measles, mumps and rubella vaccine, live should be given a dose of measles, mumps and rubella vaccine, live followed 3 months later by a second dose.

At school-leaving age or at entry into further education, MMR immunisation should be offered to individuals of both sexes who have not received 2 doses during childhood. In those who have received only a single dose of MMR in childhood, a second dose is recommended to achieve full protection. If 2 doses of measles, mumps and rubella...
vaccine, live are required, the second dose should be given one month after the initial dose.

Measles, mumps and rubella vaccine, live should be used to protect against rubella in seronegative women of childbearing age (see Immunisation Schedule); unimmunised healthcare workers who might put pregnant women and other vulnerable groups at risk of rubella or measles should be vaccinated. Measles, mumps and rubella vaccine, live may also be offered to previously unimmunised and seronegative post-partum women (see measles, mumps and rubella vaccine, live)—vaccination a few days after delivery is important because about 60% of congenital abnormalities from rubella infection occur in babies of women who have borne more than one child. Immigrants arriving after the age of school immunisation are particularly likely to require immunisation.

Contacts
Measles, mumps and rubella vaccine, live may also be used in the control of outbreaks of measles and should be offered to susceptible children aged over 6 months who are contacts of a case, within 3 days of exposure to infection. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose may be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given. Children aged under 9 months for whom avoidance of measles infection is particularly important (such as those with history of recent severe illness) can be given normal immunoglobulin p. 727 after exposure to measles; routine MMR immunisation should then be given after at least 3 months at the appropriate age.

Measles, mumps and rubella vaccine, live p. 753 is not suitable for prophylaxis following exposure to mumps or rubella since the antibody response to the mumps and rubella components is too slow for effective prophylaxis.

Children with impaired immune response should not receive live vaccines (for advice on HIV). If they have been exposed to measles infection they should be given normal immunoglobulin p. 727.

Travel
Unimmunised travellers, including children over 6 months, to areas where measles is endemic or epidemic should receive measles, mumps and rubella vaccine, live. Children immunised before 12 months of age should still receive two doses of measles, mumps and rubella vaccine, live at the recommended ages. If one dose of measles, mumps and rubella vaccine, live has already been given to a child, then the second dose should be brought forward to at least one month after the first, to ensure complete protection. If the child is under 18 months of age and the second dose is given within 3 months of the first, then the routine dose before starting school at 3 years and 4 months–5 years should still be given.

Meningococcal vaccine
Almost all childhood meningococcal disease in the UK is caused by Neisseria meningitidis serogroups B and C. Meningococcal group C conjugate vaccine protects only against infection by serogroup C and meningococcal group B vaccine protects only against infection by serogroup B. The risk of meningococcal disease declines with age—immunisation is not generally recommended after the age of 25 years.

Tetravalent meningococcal vaccines that cover serogroups A, C, W135, and Y are available. Although the duration of protection has not been established, the meningococcal groups A, C, W135, and Y conjugate vaccine is likely to provide longer-lasting protection than the unconjugated meningococcal polysaccharide vaccine. The antibody response to serogroup C in unconjugated meningococcal polysaccharide vaccines in young children may be suboptimal [not currently available in the UK]. A meningococcal group B vaccine (rDNA, component, adsorbed) p. 746, Bexsero®, is licensed in the UK against infection caused by Neisseria meningitidis serogroup B and is recommended in the Immunisation Schedule. Bexsero® contains 3 recombinant Neisseria meningitidis serogroup B proteins and the outer membrane vesicles from the NZ 98/254 strain, in order to achieve broad protection against Neisseria meningitidis serogroup B; the proteins are adsorbed onto an aluminium compound to stimulate an enhanced immune response.

Childhood immunisation
Meningococcal group C conjugate vaccine provides long-term protection against infection by serogroup C of Neisseria meningitidis. Immunisation consists of 1 dose given at 3 months of age; 2 booster doses are recommended, the first is given at 12–13 months of age (combined with haemophilus influenzae type b vaccine), and the second is given at 13–15 years of age (combined with meningococcal A, W135 and Y vaccine) (see Immunisation Schedule).

Meningococcal group B vaccine provides protection against infection by serogroup B of Neisseria meningitidis. Immunisation consists of 1 dose given at 2 months of age, a second dose at 4 months of age, and a booster dose at 12 months of age (see Immunisation Schedule).

Unimmunised children aged under 12 months should be given 1 dose of meningococcal group B and group C conjugate vaccines, followed by a second dose of meningococcal group B vaccine (rDNA, component, adsorbed) two months later. They should then be vaccinated according to the Immunisation Schedule. Unimmunised children aged 12–23 months should be given a single dose of the meningococcal group C vaccine p. 746 and 2 doses of meningococcal group B vaccine (rDNA, component, adsorbed) separated by an interval of two months. Children aged 2–9 years who have not received the meningococcal group C vaccine since 12–13 months should be given a single dose of meningococcal group C vaccine only, followed by a booster dose of meningococcal groups A with C and W135 and Y vaccine p. 746 at 13–15 years of age.

From 2015, unimmunised individuals aged 10–25 years, including those aged under 25 years who are attending university for the first time, should be given a single dose of meningococcal groups A with C and W135 and Y vaccine; a booster dose is not required. All students attending university for the first time who are unimmunised against meningococcal group C, irrespective of age, should be offered a single dose of meningococcal group C vaccine.

Children with confirmed serogroup C disease, who have previously been immunised with meningococcal group C vaccine, should be offered meningococcal group C conjugate vaccine before discharge from hospital.

Travel
Individuals travelling to countries of risk should be immunised with meningococcal groups A, C, W135, and Y conjugate vaccine, even if they have previously received meningococcal group C conjugate vaccine. If an individual has recently received meningococcal group C conjugate vaccine, an interval of at least 4 weeks should be allowed before administration of the tetravalent (meningococcal groups A, C, W135, and Y) vaccine.

Vaccination is particularly important for those living or working with local people or visiting an area of risk during outbreaks.

Immunisation recommendations and requirements for visa entry for individual countries should be checked before travelling, particularly to countries in Sub-Saharan Africa, Asia, and the Indian sub-continent where epidemics of
meningococcal outbreaks and infection are reported. Country-by-country information is available from the National Travel Health Network and Centre (www.nathnic.org).

Proof of vaccination with the tetravalent (meningococcal groups A, C, W135, and Y) vaccine is required for those travelling to Saudi Arabia during the Hajj and Umrah pilgrimages (where outbreaks of the W135 strain have occurred).

Contacts
For advice on the immunisation of laboratory workers and close contacts of cases of meningococcal disease in the UK and on the role of the vaccine in the control of local outbreaks, consult Guidelines for Public Health Management of Meningococcal Disease in the UK at www.gov.uk/phe. Also see antibacterial prophylaxis for prevention of secondary cases of meningococcal meningitis.

Pertussis vaccine
Pertussis vaccine is given as a combination preparation containing other vaccines. Acellular vaccines are derived from highly purified components of Bordetella pertussis. Primary immunisation against pertussis (whooping cough) requires 3 doses of an acellular pertussis-containing vaccine (see Immunisation schedule), given at intervals of 1 month from the age of 2 months.

All children up to the age of 10 years should receive primary immunisation with diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed).

A booster dose of an acellular pertussis-containing vaccine should ideally be given 3 years after the primary course, although, the interval can be reduced to 1 year if the primary course was delayed.

Children aged 1–10 years who have not received a pertussis-containing vaccine as part of their primary immunisation should be offered 1 dose of a suitable pertussis-containing vaccine; after an interval of at least 1 year, a booster dose of a suitable pertussis-containing vaccine should be given. Immunisation against pertussis is not routinely recommended in individuals over 10 years of age.

Vaccination of pregnant women against pertussis
In response to the pertussis outbreak, the UK health departments introduced a temporary programme (October 2012) to vaccinate pregnant women against pertussis, and this programme will continue until further notice. The aim of the programme is to boost the levels of pertussis vaccine as part of their primary course.

Contacts
For advice on the immunisation of laboratory workers and close contacts of cases with pertussis who have been offered antibacterial prophylaxis. Unimmunised or partially immunised contacts under 10 years of age should complete their vaccination against pertussis. A booster dose of an acellular pertussis-containing vaccine is recommended for contacts aged over 10 years who have not received a pertussis-containing vaccine in the last 5 years and who have not received adsorbed diphtheria [low dose], tetanus, and poliomyelitis (inactivated) vaccine in the last month.

Side-effects
Local reactions do not contra-indicate further doses.

The vaccine should not be withheld from children with a history to a preceding dose of:
- fever, irrespective of severity;
- persistent crying or screaming for more than 3 hours;
- severe local reaction, irrespective of extent.

Pneumococcal vaccine
Pneumococcal polysaccharide conjugate vaccine (adsorbed) p. 747 protect against infection with Streptococcus pneumoniae (pneumococcus); the vaccines contain polysaccharide from capsular pneumococci. Pneumococcal polysaccharide vaccine contains purified polysaccharide from 23 capsular types of pneumococcus, whereas pneumococcal polysaccharide conjugate vaccine (adsorbed) contains polysaccharide from either 10 capsular types (Synflorix®) or 13 capsular types (Prevenar 13®) with the polysaccharide being conjugated to protein.

The 13-valent conjugate vaccine is used for childhood immunisation. The recommended schedule consists of 3 doses, the first at 2 months of age, the second at 4 months, and the third at 12–13 months (see Immunisation Schedule). Pneumococcal vaccination is recommended for individuals at increased risk of pneumococcal infection as follows:
- child under 5 years with a history of invasive pneumococcal disease;
- asplenia or splenic dysfunction (including homozygous sickle cell disease and coeliac disease which could lead to splenic dysfunction);
- chronic respiratory disease (includes asthma treated with continuous or frequent use of a systemic corticosteroid);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological conditions;
- complement disorders;
- diabetes mellitus;
- immune deficiency because of disease (e.g. HIV infection) or treatment (including prolonged systemic corticosteroid treatment for over 1 month at dose equivalents of prednisolone: child under 20 kg, 1 mg/kg or more daily; child over 20 kg, 20 mg or more daily);
- presence of cochlear implant;
- conditions where leakage of cerebrospinal fluid could occur.

Where possible, the vaccine should be given at least 2 weeks before splenectomy, cochlear implant surgery, chemotherapy, or radiotherapy; children and carers should be given advice about increased risk of pneumococcal infection. If it is not practical to vaccinate at least 2 weeks before splenectomy, chemotherapy, or radiotherapy, the vaccine should be given at least 2 weeks after the splenectomy or, where possible, at least 3 months after completion of chemotherapy or radiotherapy. Prophylactic antibacterial therapy against pneumococcal infection should not be stopped after immunisation. A patient card and information leaflet for patients with asplenia are available from the Department of Health or in Scotland from the Scottish Government, Health Protection Division (Tel (0131) 244 2879).

Choice of vaccine
Children under 2 years at increased risk of pneumococcal infection (see list above) should receive the 13-valent

BNFC 2016–2017
pneumococcal polysaccharide conjugate vaccine (adsorbed) at the recommended ages, followed by a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday. Children at increased risk of pneumococcal infection presenting late for vaccination should receive 2 doses (separated by at least 1 month) of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) before the age of 12 months, and a third dose at 12–13 months. Children over 12 months and under 5 years (who have not been vaccinated or not completed the primary course) should receive a single dose of 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed) (2 doses separated by an interval of 2 months in the immunocompromised or those with asplenia or splenic dysfunction). All children under 5 years at increased risk of pneumococcal infection should receive a single dose of the 23-valent pneumococcal polysaccharide vaccine after their second birthday and at least 2 months after the final dose of the 13-valent pneumococcal polysaccharide conjugate vaccine (adsorbed).

Children over 5 years who are at increased risk of pneumococcal disease should receive a single dose of the 23-valent unconjugated pneumococcal polysaccharide vaccine.

Reimmunisation

In individuals with higher concentrations of antibodies to pneumococcal polysaccharides, reimmunisation with the 23-valent pneumococcal polysaccharide vaccine more commonly produces adverse reactions. Reimmunisation is therefore not recommended, except every 5 years in individuals in whom the antibody concentration is likely to decline rapidly (e.g. asplenia, splenic dysfunction and nephrotic syndrome). If there is doubt, the need for reimmunisation should be discussed with a haematologist, immunologist, or microbiologist.

Poliomyelitis vaccine

Two types of poliomyelitis vaccines (containing strains of poliovirus types 1, 2, and 3) are available, inactivated poliomyelitis vaccines (for injection) and live (oral) poliomyelitis vaccines. Inactivated poliomyelitis vaccines, only available in combined preparation, is recommended for routine immunisation; it is given by injection and contains inactivated strains of human poliovirus types 1, 2 and 3. A course of primary immunisation consists of 3 doses of a combined preparation containing inactivated poliomyelitis vaccines starting at 2 months of age with intervals of 1 month between doses (see Immunisation schedule). A course of 3 doses should also be given to all unimmunised children; no child should remain unimmunised against poliomyelitis.

Two booster doses of a preparation containing inactivated poliomyelitis vaccines are recommended, the first before school entry and the second before leaving school (see Immunisation schedule). Further booster doses should be given every 10 years only to individuals at special risk. Live (oral) poliomyelitis vaccines is no longer available for routine use; its use may be considered during large outbreaks, but advice should be sought from Public Health England. The live (oral) vaccine poses a very rare risk of vaccine-associated paralytic polio because the attenuated strain of the virus can revert to a virulent form. For this reason the live (oral) vaccine must not be used for immunosuppressed individuals or their household contacts. The use of inactivated poliomyelitis vaccines removes the risk of vaccine-associated paralytic polio altogether.

Travel

Unimmunised travellers to areas with a high incidence of poliomyelitis should receive a full 3–dose course of a preparation containing inactivated poliomyelitis vaccines. Those who have not been vaccinated in the last 10 years should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine.

Information about countries with a high incidence of poliomyelitis can be obtained from www.travax.nhs.uk or from the National Travel Health Network and Centre, (www.nathnac.org).

Rabies vaccine

Rabies vaccine p. 754 contains inactivated rabies virus cultivated in either human diploid cells or purified chick embryo cells; vaccines are used for pre- and postexposure prophylaxis.

Pre-exposure prophylaxis

Immunisation should be offered to children at high risk of exposure to rabies—where there is limited access to prompt medical care for those living in areas where rabies is enzootic, for those travelling to such areas for longer than 1 month, and for those on shorter visits who may be exposed to unusual risk. Transmission of rabies by humans has not been recorded but it is advised that those caring for children with the disease should be vaccinated.

Up-to-date country-by-country information on the incidence of rabies can be obtained from the National Travel Health Network and Centre (www.nathnac.org) and, in Scotland, from Health Protection Scotland (www.hps.scot.nhs.uk).

Post-exposure prophylaxis

Following potential exposure to rabies, the wound or site of exposure (e.g. mucous membrane) should be cleansed under running water and washed for several minutes with soapy water as soon as possible after exposure. Disinfectant and a simple dressing can be applied, but suturing should be delayed because it may increase the risk of introducing rabies virus into the nerves.

Post-exposure prophylaxis against rabies depends on the level of risk in the country, the nature of exposure, and the individual’s immunity. In each case, expert risk assessment and advice on appropriate management should be obtained from the local Public Health England Centre or Public Health England’s Virus Reference Department, Colindale (tel. (020) 8200 4400) or the PHE Colindale Duty Doctor (tel. (020) 8200 6868), in Wales from the Public Health Wales local Health Protection Team or Public Health Wales Virus Reference Laboratory (tel. (029) 2074 7747), in Scotland from the local on-call infectious diseases consultant, and in Northern Ireland from the Public Health Agency Duty Room (tel (028) 9063 3970/(028) 9063 2662) or the Regional Virology Service (tel. (028) 9024 0503).

There are no specific contra-indications to the use of rabies vaccine for post-exposure prophylaxis and its use should be considered whenever a child has been attacked by an animal in a country where rabies is enzootic, even if there is no direct evidence of rabies in the attacking animal. Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis.

For post-exposure prophylaxis of fully immunised individuals (who have previously received pre-exposure or post-exposure prophylaxis with cell-derived rabies vaccine), 2 doses of cell-derived vaccine are likely to be sufficient; the first dose is given on day 0 and the second dose is given between day 3–7. Rabies immunoglobulin p. 729 is not necessary in such cases.

Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete) comprises 5 doses of rabies vaccine given over 1 month (on days 0, 3, 7, 14, and the fifth dose is given between day 28–30); also, depending on the level of risk (determined by factors such as
the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine. The immunisation course can be discontinued if it is proven that the child was not at risk.

**Rotavirus vaccine**
Rotavirus vaccine p. 754 is a live, oral vaccine that protects young children against gastro-enteritis caused by rotavirus infection. The recommended schedule consists of 2 doses, the first at 2 months of age, and the second at 3 months of age (see Immunisation schedule). The first dose of rotavirus vaccine must be given between 6–15 weeks of age and the second dose should be given after an interval of at least 4 weeks; the vaccine should not be started in children 15 weeks of age or older. Ideally, the full course should be completed before 16 weeks of age to provide protection before the main burden of disease, and to avoid a temporal association between vaccination and intussusception; the course must be completed before 24 weeks of age.

The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus. Carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby’s nappies.

**Smallpox vaccine**
Limited supplies of smallpox vaccine are held at the Specialist and Reference Microbiology Division, Public Health England Colindale (Tel. (020) 8200 4400) for the exclusive use of workers in laboratories where pox viruses (such as vaccinia) are handled.

If a wider use of the vaccine is being considered, Guidelines for smallpox response and management in the post-eradication era should be consulted at www.gov.uk/phe.

**Tetanus vaccine**
Tetanus vaccine contains a cell-free purified toxin of Clostridium tetani adsorbed on aluminium hydroxide or aluminium phosphate to improve antigenicity.

Primary immunisation for children under 10 years consists of 3 doses of a combined preparation containing adsorbed tetanus vaccine, with an interval of 1 month between doses. Following routine childhood vaccination, 2 booster doses of a preparation containing adsorbed tetanus vaccine are recommended, the first before school entry and the second before leaving school (see Immunisation schedule).

The recommended schedule of tetanus vaccination not only gives protection against tetanus in childhood but also gives the basic immunity for subsequent booster doses. In most circumstances, a total of 5 doses of tetanus vaccine is considered sufficient for long term protection.

For primary immunisation of adults and children over 10 years previously unimmunised against tetanus, 3 doses of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine are given with an interval of 1 month between doses.

When an individual presents for a booster dose but has been vaccinated following a tetanus-prone wound, the vaccine preparation administered at the time of injury should be determined. If this is not possible, the booster should still be given to ensure adequate protection against all antigens in the booster vaccine.

Very rarely, tetanus has developed after abdominal surgery; patients awaiting elective surgery should be asked about tetanus immunisation and immunised if necessary.

Parenteral drug abuse is also associated with tetanus; those abusing drugs by injection should be vaccinated if unimmunised—booster doses should be given if there is any doubt about their immunisation status.

All laboratory staff should be offered a primary course if unimmunised.

**Wounds**
Wounds are considered to be tetanus-prone if they are sustained more than 6 hours before surgical treatment or at any interval after injury and are puncture-type (particularly if contaminated with soil or manure) or show much devitalised tissue or are septic or are compound fractures or contain foreign bodies. All wounds should receive thorough cleansing.

- For clean wounds: fully immunised individuals (those who have received a total of 5 doses of a tetanus-containing vaccine at appropriate intervals) and those whose primary immunisation is complete (with boosters up to date), do not require tetanus vaccine; individuals whose primary immunisation is incomplete or whose boosters are not up to date require a reinforcing dose of a tetanus-containing vaccine (followed by further doses as required to complete the schedule); non-immunised individuals (or those whose immunisation status is not known or who have been fully immunised but are now immunocompromised) should be given a dose of the appropriate tetanus-containing vaccine immediately (followed by completion of the full course of the vaccine if records confirm the need)

- For tetanus-prone wounds: management is as for clean wounds with the addition of a dose of tetanus immunoglobulin given at a different site; in fully immunised individuals and those whose primary immunisation is complete (with boosters up to date) the immunoglobulin is needed only if the risk of infection is especially high (e.g. contamination with manure).

Antibacterial prophylaxis (with benzylpenicillin, co-amoxiclav, or metronidazole) may also be required for tetanus-prone wounds.

**Tick-borne encephalitis vaccine**
Tick-borne encephalitis vaccine, inactivated p. 755 contains inactivated tick-borne encephalitis virus cultivated in chick embryo cells. It is recommended for immunisation of those working in, or visiting, high-risk areas (see International Travel). Those working, walking or camping in warm forested areas of Central and Eastern Europe, Scandinavia, Northern and Eastern China, and some parts of Japan, particularly from April to November when ticks are most prevalent, are at greatest risk of tick-borne encephalitis. For full protection, 3 doses of the vaccine are required; booster doses are required every 3–5 years for those still at risk. Ideally, immunisation should be completed at least one month before travel.

**Typhoid vaccine**
Typhoid vaccine p. 747 is available as Vi capsular polysaccharide (from Salmonella typhi) vaccine for injection and as live attenuated Salmonella typhi vaccine for oral use. Typhoid immunisation is advised for children travelling to:

- areas where typhoid is endemic, especially if staying with or visiting local people;
- endemic areas where frequent or prolonged exposure to poor sanitation and poor food hygiene is likely;

Typhoid vaccination is not a substitute for scrupulous personal hygiene.

Capsular polysaccharide typhoid vaccine is usually given by intramuscular injection. Children under 2 years may respond suboptimally to the vaccine, but children aged between 1–2 years should be immunised if the risk of typhoid fever is considered high (immunisation is not recommended for infants under 12 months). Revaccination is needed every 3 years on continued exposure.

Oral typhoid vaccine is a live attenuated vaccine contained in an enteric-coated capsule. One capsule taken on alternate days for a total of 3 doses provides protection.
7–10 days after the last dose. Protection may persist for up to 3 years in those constantly (or repeatedly) exposed to Salmonella typhi, but those who only occasionally travel to endemic areas require further courses at intervals of 1 year.

**Varicella-zoster vaccine**

Varicella-zoster vaccine (live) p. 755 is licensed for immunisation against varicella (chickenpox) in seronegative individuals. It is not recommended for routine use in children but can be given to seronegative healthy children over 1 year who come into close contact with individuals at high risk of severe varicella infections.

Rarely, the varicella-zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:

- varicella-susceptible pregnant females;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Varicella-zoster immunoglobulin p. 730 is used to protect susceptible children at increased risk of varicella infection.

**Yellow fever vaccine**

Live yellow fever vaccine, live p. 756 is indicated for those travelling to or living in areas where infection is endemic. Infants under 6 months of age should not be vaccinated because there is a small risk of encephalitis; infants aged 6–9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (seek expert advice). The immunity which probably lasts for life is officially accepted for 10 years starting from 10 days after primary immunisation and for a further 10 years immediately after revaccination.

Very rarely vaccine-associated adverse effects have been reported, such as viscerotrophic disease (yellow fever vaccine, live-associated viscerotropic disease, YEL–AVD) p. 756, a syndrome which may include metabolic acidosis, muscle and liver cytolysis, and multi-organ failure. Neurological disorders (yellow fever vaccine, live-associated neurotropic disease, YEL–AND) such as encephalitis have also been reported. These very rare adverse effects have usually occurred after the first dose of yellow fever vaccine, live in those with no previous immunity.

**Vaccines for travel**

**Immunisation**

See advice on Malaria, treatment p. 365.

No special immunisation is required for travellers to the United States, Europe, Australia, or New Zealand, although all travellers should have immunity to tetanus and poliomyelitis (and childhood immunisations should be up to date); Tick-borne encephalitis vaccine is recommended for immunisation of those working in, or visiting, high-risk areas. Certain special precautions are required in non-European areas surrounding the Mediterranean, in Africa, the Middle East, Asia, and South America.

Travellers to areas that have a high incidence of poliomyelitis or tuberculosis should be immunised with the appropriate vaccine; in the case of poliomyelitis previously immunised travellers may be given a booster dose of a preparation containing inactivated poliomyelitis vaccine. BCG immunisation is recommended for travellers aged under 16 years proposing to stay for longer than 3 months (or in close contact with the local population) in countries with an incidence of tuberculosis greater than 40 per 100 000 (list of countries where the incidence of tuberculosis is greater than 40 cases per 100 000 is available from www.gov.uk/phe); it should preferably be given 3 months or more before departure.

Yellow fever immunisation is recommended for travel to the endemic zones of Africa and South America. Many countries require an International Certificate of Vaccination from individuals arriving from, or who have been travelling through, endemic areas; other countries require a certificate from all entering travellers (consult the Department of Health handbook, *Health Information for Overseas Travel*, www.dh.gov.uk).

Immunisation against meningococcal meningitis is recommended for a number of areas of the world.

Protection against hepatitis A is recommended for travellers to high-risk areas outside Northern and Western Europe, North America, Japan, Australia and New Zealand. Hepatitis A vaccine is preferred and it is likely to be effective even if given shortly before departure; normal immunoglobulin is no longer given routinely but may be indicated in the immunocompromised. Special care must also be taken with food hygiene.

Hepatitis B vaccine is recommended for those travelling to areas of high or intermediate prevalence who intend to seek employment as healthcare workers or who plan to remain there for lengthy periods and who may therefore be at increased risk of acquiring infection as the result of medical or dental procedures carried out in those countries. Short-term tourists or business travellers are not generally at increased risk of infection but may put themselves at risk by their sexual behaviour when abroad.

Prophylactic immunisation against rabies is recommended for travellers to enzootic areas on long journeys or to areas out of reach of immediate medical attention.

Travellers who have not had a tetanus booster in the last 10 years and are visiting areas where medical attention may not be accessible should receive a booster dose of adsorbed diphtheria [low dose], tetanus and poliomyelitis (inactivated) vaccine, even if they have received 5 doses of a tetanus-containing vaccine previously.

**Typhoid vaccine** is indicated for travellers to countries where typhoid is endemic, but the vaccine is no substitute for personal precautions.

There is no requirement for cholera vaccination as a condition for entry into any country, but oral cholera vaccine should be considered for backpackers and those travelling to situations where the risk is greatest (e.g. refugee camps). Regardless of vaccination, travellers to areas where cholera is endemic should take special care with food hygiene.

Advice on diphtheria, on Japanese encephalitis, and on tick-borne encephalitis is included in *Health Information for Overseas Travel*.

**Food hygiene**

In areas where sanitation is poor, good food hygiene is important to help prevent hepatitis A, typhoid, cholera, and other diarrhoeal diseases (including travellers’ diarrhoea). Food should be freshly prepared and hot, and uncooked vegetables (including green salads) should be avoided; only fruits which can be peeled should be eaten. Only suitable bottled water, or tap water that has been boiled or treated with sterilising tablets, should be used for drinking.

**Information on health advice for travellers**

Health professionals and travellers can find the latest information on immunisation requirements and precautions for avoiding disease while travelling from www.nathnae.org. The handbook, *Health Information for Overseas Travel* (2010), which draws together essential information for healthcare professionals regarding health advice for travellers, can also be obtained from this website.
Immunisation requirements change from time to time, and information on the current requirements for any particular country may be obtained from the embassy or legation of the appropriate country or from:

**VACCINES**

---

**742 Vaccination**

**Specialist advice should be sought for those being treated with high doses of corticosteroids (dose equivalents of prednisolone: children, 2 mg/kg (or more than 40 mg) daily for at least 1 week or 1 mg/kg daily for 1 month), or other immunosuppressive drugs, and those being treated for malignant conditions with chemotherapy or generalised radiotherapy. Live vaccines should be postponed until at least 3 months after stopping high-dose systemic corticosteroids and at least 6 months after stopping other immunosuppressive drugs or generalised radiotherapy (at least 12 months after discontinuing immunosuppressants following bone-marrow transplantation).**

The Royal College of Paediatrics and Child Health has produced a statement, *Immunisation of the Immunocompromised Child (2002)* (available at [www.rcpch.ac.uk](http://www.rcpch.ac.uk)).

Predisposition to neurological problems When there is a personal or family history of febrile convulsions, there is an increased risk of these occurring during fever from any cause including immunisation, but this is not a contra-indication to immunisation. In children who have had a seizure associated with fever without neurological deterioration, immunisation is recommended; advice on the management of fever (see Post-immunisation Pyrexia in Infants) should be given before immunisation. When a child has had a convulsion not associated with fever, and the neurological condition is not deteriorating, immunisation is recommended.

Children with stable neurological disorders (e.g. spina bifida, congenital brain abnormality, and peri-natal hypoxic-ischaemic encephalopathy) should be immunised according to the recommended schedule.

When there is a *still evolving neurological problem*, including poorly controlled epilepsy, immunisation should be deferred and the child referred to a specialist. Immunisation is recommended if a cause for the neurological disorder is identified. If a cause is not identified, immunisation should be deferred until the condition is stable.

**INTERACTIONS**—Appendix 1 (vaccines).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Fatigue - fever - gastro-intestinal disturbances - headache - irritability - loss of appetite - lymphangitis - malaise - myalgia
- **Very rare** Anaphylaxis (can be fatal) - angioedema (can be fatal) - bronchospasm (can be fatal) - hypersensitivity reactions (can be fatal) - urticaria (can be fatal)
- **Frequency not known** Arthralgia - asthenia - dizziness - drowsiness - influenza-like symptoms - lymphadenopathy - paraesthesia - rash

**SPECIFIC SIDE-EFFECTS**

- **Common or very common**
- With intradermal or intramuscular or subcutaneous use Induration may develop at the injection site - inflammation - local reactions - pain - redness - sterile abscess may develop at the injection site

**SIDE-EFFECTS, FURTHER INFORMATION**

Occasionally serious adverse reactions can occur—these should always be reported to the CHM. Post-immunisation pyrexia in infants The parent should be advised that if pyrexia develops after childhood immunisation, and the infant seems distressed, paracetamol can be given. Ibuprofen can be used if paracetamol is unsuitable. The parent should be warned to seek medical advice if the pyrexia persists.

**ALLERGY AND CROSS-SENSITIVITY**

Contra-indicated in patients with a confirmed anaphylactic reaction to a preceding dose of a vaccine containing the same antigens.
or vaccine component (such as antibacterials in viral vaccines).

- **PREGNANCY** Live vaccines should not be administered routinely to pregnant women because of the theoretical risk of fetal infection but where there is a significant risk of exposure to disease, the need for vaccination usually outweighs any possible risk to the fetus. Termination of pregnancy following inadvertent immunisation is not recommended. There is no evidence of risk from vaccinating pregnant women with inactivated viral or bacterial vaccines or toxoids.

- **BREAST FEEDING** Although there is a theoretical risk of live vaccine being present in breast milk, vaccination is not contra-indicated for women who are breast-feeding when there is significant risk of exposure to disease. There is no evidence of risk from vaccinating pregnant women who are breast-feeding, with inactivated viral or bacterial vaccines or toxoids.

- **DIRECTIONS FOR ADMINISTRATION** If alcohol or disinfectant is used for cleansing the skin it should be allowed to evaporate before vaccination to prevent possible inactivation of live vaccines.

When 2 or more live vaccines are required (and are not available as a combined preparation), they can be administered at any time before or after each other at different sites, preferably in a different limb; if more than one injection is to be given in the same limb, they should be administered at least 2.5 cm apart. See also bacillus calmette-guérin vaccine p. 744.

Vaccines should not be given intravenously. Most vaccines are given by the intramuscular route, although some are given by either the intradermal, deep subcutaneous, or oral route. The intramuscular route should not be used in patients with bleeding disorders such as haemophilia or thrombocytopenia; vaccines usually given by the intramuscular route should be given by deep subcutaneous injection instead.

The Department of Health has advised against the use of jet guns for vaccination owing to the risk of transmitting blood borne infections, such as HIV.

Particular attention must be paid to instructions on the use of diluents. Vaccines which are liquid suspensions or are reconstituted before use should be adequately mixed to ensure uniformity of the material to be injected.

- **HANDLING AND STORAGE** Care must be taken to store all vaccines under the conditions recommended in the product literature, otherwise the preparation may become ineffective. Refrigerated storage is usually necessary; many vaccines need to be stored at 2–8°C and not allowed to freeze. Vaccines should be protected from light.

Reconstituted vaccines and opened multidose vials must be used within the period recommended in the product literature. Unused vaccines should be disposed of by incineration at a registered disposal contractor.

VACCINES > BACTERIAL AND VIRAL VACCINES, COMBINED

Diphtheria with haemophilus influenzae type b vaccine, pertussis, poliomyelitis and tetanus

- **INDICATIONS AND DOSE**

  **Primary immunisation**
  - BY INTRAMUSCULAR INJECTION
  - Child 2 months-10 years: 0.5 mL every 1 month for 3 doses

**UNLICENSED USE** Infanrix-IPV + Hib® not licensed for use in children over 36 months; Pediacel® not licensed in children over 4 years. However, the Department of Health recommends that these be used for children up to 10 years.

- **SIDE-EFFECTS** Atopic dermatitis · hypotonia · restlessness · sleep disturbances · unusual crying in infants

**SIDE-EFFECTS, FURTHER INFORMATION**

- Side effects of vaccines containing pertussis. The incidence of local and systemic effects is generally lower with vaccines containing acellular pertussis components than with the whole-cell pertussis vaccine used previously. However, compared with primary vaccination, booster doses with vaccines containing acellular pertussis are reported to increase the risk of injection-site reactions (some of which affect the entire limb); local reactions do not contra-indicate further doses.

  The vaccine should not be withheld from children with a history to a preceding dose of:
  - fever, irrespective of severity;
  - persistent crying or screaming for more than 3 hours;
  - severe local reaction, irrespective of extent.

- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood schedule from health organisations or ImmForm.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

**EXCIPIENTS:** May contain Neomycin, polymyxin b, streptomycin
- Pediacel (sanofi pasteur MSD Ltd) Pediacel vaccine suspension for injection 0.5ml vials | 1 vial £59.20

**Powder and suspension for suspension for injection**

- Infanrix-IPV + Hib (GlaxoSmithKline UK Ltd) Infanrix-IPV + Hib vaccine powder and suspension for suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection £27.86

**Diphtheria with pertussis, poliomyelitis vaccine and tetanus**

- **INDICATIONS AND DOSE**

  **First booster dose**
  - BY INTRAMUSCULAR INJECTION
  - Child 3–9 years: 0.5 mL, to be given 3 years after primary immunisation

**Vaccination of pregnant women against pertussis (using low dose vaccines)**

- BY INTRAMUSCULAR INJECTION
- Females of childbearing potential: 0.5 mL for 1 dose

- **SIDE-EFFECTS** Restlessness · sleep disturbances · unusual crying in infants

**SIDE-EFFECTS, FURTHER INFORMATION**

- Side effects of vaccines containing pertussis. The incidence of local and systemic effects is generally lower with vaccines containing acellular pertussis components than with the whole-cell pertussis vaccine used previously. However, compared with primary vaccination, booster doses with vaccines containing acellular pertussis are reported to increase the risk of injection-site reactions (some of which affect the entire limb); local reactions do not contra-indicate further doses.

  The vaccine should not be withheld from children with a history to a preceding dose of:
  - fever, irrespective of severity;
  - persistent crying or screaming for more than 3 hours;
  - severe local reaction, irrespective of extent.

- **PREGNANCY** Contra-indicated in pregnant women with a history of encephalopathy of unknown origin within 7 days.
PRESCRIBING AND DISPENSING INFORMATION

Pregnant women should be vaccinated using low dose vaccines (brands may include Boostrix-IPV® or Repevax®). Available as part of childhood immunisation schedule from health organisations or ImmForm.

Available for vaccination of pregnant women from ImmForm.

DIRECTIONS FOR ADMINISTRATION

Intradermal injection technique

Skin is stretched between thumb and forefinger and needle (size 25G or 26G) inserted (bevel upwards) for about 3 mm into superficial layers of dermis (almost parallel with surface). Needle should be short with short bevel (can usually be seen through epidermis during insertion). Tense raised blanched bleb showing tips of hair follicles is sign of correct injection; 7 mm bleb \( \equiv \) 0.1 mL injection, 3 mm bleb \( \equiv \) 0.05 mL injection; if considerable resistance not felt, needle too deep and should be removed and reinserted before giving more vaccine.

PRESCRIBING AND DISPENSING INFORMATION Available from health organisations or direct from ImmForm www.immform.dh.gov.uk (SSI brand, multidose vial with diluent).
Cholera vaccine

**INDICATIONS AND DOSE**

**Immunisation against cholera (for travellers to endemic or epidemic areas on the basis of current recommendations)**

- **BY MOUTH**
  - Child 2–5 years: A single booster dose can be given within 6 months after primary course, if more than 6 months have elapsed since the last vaccination, the primary course should be repeated.
  - Child 6–17 years: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated.

**Booster**

- **BY INTRAMUSCULAR INJECTION**
  - Child 2–5 years: A single booster dose can be given within 6 months after primary course, if more than 6 months have elapsed since the last vaccination, the primary course should be repeated.
  - Child 6–17 years: A single booster dose can be given within 2 years after primary course, if more than 2 years have elapsed since the last vaccination, the primary course should be repeated.

**SIDE-EFFECTS**

- Acute gastro-intestinal illness
- Rare: Cough - respiratory symptoms - rhinitis
- Very rare: Insomnia - sore throat
- Frequency not known: Abdominal pain and cramps - diarrhoea - nausea - vomiting

**DIRECTIONS FOR ADMINISTRATION**

Dissolve effervescent sodium bicarbonate granules in a glassful of water or chlorinated water (approximately 150 mL). For children over 6 years, add vaccine suspension to make one dose. For child 2–5 years, discard half (approximately 75 mL) of the solution, then add vaccine suspension to make one dose. Drink within 2 hours. Food, drink, and other oral medicines should be avoided for 1 hour before and after vaccination.

**PATIENT AND CARER ADVICE**

Counselling on administration advised. Immunisation with cholera vaccine does not provide complete protection and all travellers to a country where cholera exists should be warned that scrupulous attention to food, water, and personal hygiene is essential.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

- **Dukoral (Valneva UK Ltd)**
  - Dukoral cholera vaccine oral suspension: 2 dose [PBN] £23.42

---

**Haemophilus influenzae type B with meningococcal group C vaccine**

**INDICATIONS AND DOSE**

**Booster dose (for infants who have received primary immunisation with a vaccine containing Haemophilus influenzae type b component)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 12–13 months: 0.5 mL for 1 dose

**Booster dose (for children who have not been immunised against Haemophilus influenza type b)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 1–9 years: 0.5 mL for 1 dose

**Booster dose after recovery from Haemophilus influenzae type b disease (for index cases previously vaccinated, with low Hib antibody concentration or if it is not possible to measure antibody concentration)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 1–9 years: 0.5 mL for 1 dose

**Booster dose after recovery from Haemophilus influenzae type b disease (for fully vaccinated index cases with asplenia or splenic dysfunction, if previous dose received over 1 year ago)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 1–9 years: 0.5 mL for 1 dose

**Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at under 2 years of age)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 1–9 years: 0.5 mL for 1 dose

**Booster dose (for patients diagnosed with asplenia, splenic dysfunction or complement deficiency at over 2 years of age)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 2–17 years: 0.5 mL for 1 dose

**UNLICENSED USE**

Not licensed for use in patients over 2 years.

**SIDE-EFFECTS**

- Rare: Symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis)
- Frequency not known: Atopic dermatitis - hypotonia

**PRESCRIBING AND DISPENSING INFORMATION**

Available as part of the childhood immunisation schedule from ImmunForm.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- **Menitorix (GlaxoSmithKline UK Ltd)**
  - Menitorix vaccine powder and solvent for solution for injection 0.5 mL vials: 1 vial [PBN] £37.76
Meningococcal group B vaccine
(rDNA, component, adsorbed)

**INDICATIONS AND DOSE**

Immunisation against *Neisseria meningitidis*, primary immunisation

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 2 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants).
  - Three doses of 60 mg prophylactic paracetamol should be given post primary meningococcal B immunisation, at 2 months and 4 months of age. Further information can be found at www.gov.uk.
  - Child 4 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants).
  - Three doses of 60 mg prophylactic paracetamol should be given post primary meningococcal B immunisation, at 2 months and 4 months of age. Further information can be found at www.gov.uk.

Immunisation against *Neisseria meningitidis*, primary immunisation booster dose

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 12-23 months: 0.5 mL for 1 dose, injected preferably into deltoid region (or anterolateral thigh in infants)

Immunisation against *Neisseria meningitidis*, primary immunisation (in unimmunised patients)

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 6-11 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given 12-24 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
  - Child 12-23 months: 0.5 mL for 2 doses, separated by an interval of at least 2 months; booster dose of 0.5 mL given 12-24 months after completion of primary immunisation, injected preferably into deltoid region (or anterolateral thigh in infants)
  - Child 2-10 years: 0.5 mL for 2 doses, separated by an interval of at least 2 months. Injected preferably into deltoid region (or anterolateral thigh in infants)
  - Child 11-17 years: 0.5 mL for 2 doses, separated by an interval of at least 1 month. Injected preferably into deltoid region

**SIDE-EFFECTS**

- Rare Kawasaki disease - symptoms of meningitis reported (but no evidence that the vaccine causes meningococcal C meningitis)
- Frequency not known - Unusual crying

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

**EXCIPIENTS:** May contain Kanamycin
- Bexsero (GlaxoSmithKline UK Ltd) ▼
  - Bexsero vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [POM] £75.00

Meningococcal group C vaccine

**INDICATIONS AND DOSE**

Primary immunisation against *Neisseria meningitidis*

- **BY INTRAMUSCULAR INJECTION**
  - Child 3 months: 0.5 mL for 1 dose, the primary immunisation dose is followed by a booster dose of meningococcal group C conjugate vaccine combined with haemophilus influenzae type b vaccine at 12–13 months of age

Second booster dose for immunisation against *Neisseria meningitidis*

- **BY INTRAMUSCULAR INJECTION**
  - Child 13-15 years: 0.5 mL for 1 dose

Immunisation against *Neisseria meningitidis* in an unimmunised patient

- **BY INTRAMUSCULAR INJECTION**
  - Child 4-11 months: 0.5 mL for 1 dose, the primary immunisation dose is followed by a booster dose of meningococcal group C conjugate vaccine combined with haemophilus influenzae type b vaccine at 12–13 months of age, then 0.5 mL for 1 dose, this second booster dose to be given at 13–15 years of age
  - Child 1-9 years: 0.5 mL for 1 dose, then 0.5 mL for 1 dose, this booster dose to be given at 13–15 years of age
  - Child 10-17 years: 0.5 mL for 1 dose, booster dose is not required

Patients with confirmed serogroup C disease (who have previously been immunised)

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-7 years: 0.5 mL for 1 dose, dose to be given before discharge from hospital

**SIDE-EFFECTS**

- Rare Symptoms of meningitis (but no evidence that vaccine causes meningococcal C meningitis)
- **DIRECTIONS FOR ADMINISTRATION** Menjugate Kit® may be used via subcutaneous route in children with bleeding disorders.
- **PRESCRIBING AND DISPENSING INFORMATION** Available as part of childhood immunisation schedule from www.immunform.dh.gov.uk.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection**

- Menjugate (Novartis Vaccines and Diagnostics Ltd)
  - Menjugate vaccine powder and solvent for suspension for injection 0.5ml vials | 1 vial [POM] no price available | 10 vial [POM] no price available

**Suspension for injection**

- Menิงtice (Nurun Biotech B.V.)
  - Meningitec vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection [POM] £4.13 | 10 pre-filled disposable injection [POM] £43.30
  - NeisVac-C (Pfizer Ltd)
  - NeisVac-C vaccine suspension for injection 0.5ml pre-filled syringes | 10 pre-filled disposable injection [POM] £187.50

Meningococcal groups A with C and W135 and Y vaccine

**INDICATIONS AND DOSE**

**MENVEO®**

Primary immunisation against *Neisseria meningitidis*

- **BY INTRAMUSCULAR INJECTION**
  - Child 13-15 years: 0.5 mL for 1 dose, dose preferably injected into deltoid region

Immunisation against *Neisseria meningitidis* in those at risk of exposure to prevent invasive disease

- **BY INTRAMUSCULAR INJECTION**
  - Child 3-11 months: 0.5 mL every 1 month for 2 doses, dose preferably injected into deltoid region
  - Child 1-17 years: 0.5 mL for 1 dose, dose preferably injected into deltoid region
Pneumococcal polysaccharide conjugate vaccine (adsorbed)

**INDICATIONS AND DOSE**

PREVENAR 13®

Primary immunisation against pneumococcal infection (first dose)

- BY INTRAMUSCULAR INJECTION
- Child 2 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

Primary immunisation against pneumococcal infection (second dose)

- BY INTRAMUSCULAR INJECTION
- Child 4 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

Primary immunisation against pneumococcal infection (booster dose)

- BY INTRAMUSCULAR INJECTION
- Child 12-13 months: 0.5 mL for 1 dose, anterolateral thigh is preferred site of injection in infants

Immunisation against pneumococcal infection (in patients who have not been vaccinated or not completed the primary course)

- BY INTRAMUSCULAR INJECTION
- Child 12 months–4 years: 0.5 mL for 1 dose, deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants

Immunisation against pneumococcal infection, in immunocompromised or asplenic patients or patients with splenic dysfunction (who have not been vaccinated or not completed the primary course)

- BY INTRAMUSCULAR INJECTION
- Child 12 months–4 years: 0.5 mL every 2 months for 2 doses, deltoid muscle is preferred site of injection in young children; anterolateral thigh is preferred site in infants
Vaccines

- **UNLICENSED USE**
  - With intramuscular use Not licensed for use in children under 2 years.
- **CONTRA-INDICATIONS**
  - With oral use Acute gastro-intestinal illness
- **INTERACTIONS**
  - Oral typhoid vaccine is inactivated by concomitant administration of antibacterials or antimalarials:
    - Antibacterials should be avoided for 3 days before and after oral typhoid vaccination;
    - Mefloquine should be avoided for at least 12 hours before or after oral typhoid;
  - For other antimalarials vaccination with oral typhoid vaccine should be completed at least 3 days before the first dose of the antimalarial (except proguanil hydrochloride with atovaquone, which may be given concomitantly).
- **SIDE-EFFECTS**
  - With oral use Abdominal cramps - abdominal pain - diarrhoea - nausea - vomiting
- **DIRECTIONS FOR ADMINISTRATION** Capsule should be taken one hour before a meal. Swallow as soon as possible after placing in mouth with a cold or lukewarm drink.
- **HANDLING AND STORAGE**
  - With oral use It is important to store capsules in a refrigerator.
- **PATIENT AND CARER ADVICE**
  - With oral use Patients or carers should be given advice on how to administer and store typhoid vaccine capsules.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Gastro-resistant capsule**

**CAUTIONARY AND ADVISORY LABELS 25**

- Ambirix (GlaxoSmithKline UK Ltd)
- Vivotif (Paxvax Ltd)

**Solution for injection**

- Typhixa (GlaxoSmithKline UK Ltd)
- Typherix (Sanofi Pasteur MSD Ltd)
- Vivotif (Paxvax Ltd)

**Combinations available:** Hepatitis A with typhoid vaccine, p. 749

**VACCINES > VIRAL VACCINES**

**Hepatitis A and B vaccine**
The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine p. 749, hepatitis B vaccine p. 750.

**INDICATIONS AND DOSE**

**AMBITRIX®**

**Immunisation against hepatitis A and hepatitis B infection (primary course)**

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-15 years: Initially 1 mL every 1 month for 2 doses, then 1 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**TWINRIX® ADULT**

Immunisation against hepatitis A and hepatitis B infection (primary course)

- **BY INTRAMUSCULAR INJECTION**
  - Child 16-17 years: Initially 1 mL every 1 month for 2 doses, then 1 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**TWINRIX® PAEDIATRIC**

Immunisation against hepatitis A and hepatitis B infection (primary course)

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-15 years: Initially 0.5 mL every 1 month for 2 doses, then 0.5 mL after 5 months for 1 dose, the deltoid region is the preferred site of injection in older children; anterolateral thigh is the preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced), subcutaneous route used for patients with bleeding disorders (but immune response may be reduced)

**IMPORTANT SAFETY INFORMATION**

Ambirix® and TWINRIX® are not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular, or mucous membrane exposure to hepatitis B virus.

**PRESCRIBING AND DISPENSING INFORMATION**

**TWINRIX® PAEDIATRIC**
Primary course should be completed with TWINRIX® (single component vaccines given at appropriate intervals may be used for booster dose).

**TWINRIX® ADULT**
Primary course should be completed with TWINRIX® (single component vaccines given at appropriate intervals may be used for booster dose).

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

**EXCipients:** May contain Neomycin

- Ambirix (GlaxoSmithKline UK Ltd)
- TWINRIX® (GlaxoSmithKline UK Ltd)

**Vaccines**

- Typhim Vi (Sanofi Pasteur MSD Ltd)
- Typherix (Sanofi Pasteur MSD Ltd)

**Combinations available:** Typhim Vi and Typherix (Sanofi Pasteur MSD Ltd)

**Unlicensed use**

**Oral typhoid vaccine is inactivated by concomitant administration of antibacterials or antimalarials:**

- Antibacterials should be avoided for 3 days before and after oral typhoid vaccination;
- Mefloquine should be avoided for at least 12 hours before or after oral typhoid;
- For other antimalarials vaccination with oral typhoid vaccine should be completed at least 3 days before the first dose of the antimalarial (except proguanil hydrochloride with atovaquone, which may be given concomitantly).

**Side-effects**

- With oral use Abdominal cramps - abdominal pain - diarrhoea - nausea - vomiting

**Directions for administration** Capsule should be taken one hour before a meal. Swallow as soon as possible after placing in mouth with a cold or lukewarm drink.

**Handling and storage**

- With oral use It is important to store capsules in a refrigerator.

**Patient and carer advice**

- With oral use Patients or carers should be given advice on how to administer and store typhoid vaccine capsules.

**Solution for injection**

- Typhim Vi (Sanofi Pasteur MSD Ltd)
- Typherix (Sanofi Pasteur MSD Ltd)

**Combinations available:** Typhim Vi and Typherix (Sanofi Pasteur MSD Ltd)

**Importance of safety information**

- Ambirix® and TWINRIX® are not recommended for post-exposure prophylaxis following percutaneous (needle-stick), ocular, or mucous membrane exposure to hepatitis B virus.
Hepatitis A vaccine

**INDICATIONS AND DOSE**

**AVAXIM®**

Immunisation against hepatitis A infection

- **BY INTRAMUSCULAR INJECTION**
  - Child 16-17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders; not to be injected into the buttock (vaccine efficacy reduced).

**EPAXAL®**

Immunisation against hepatitis A infection

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 4 years if not given after recommended interval following primary dose. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders.

Immunisation against hepatitis A infection (splenectomised patients)

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 1–6 months, dose given as booster; booster dose may be delayed by up to 4 years if not given after recommended interval following primary dose. The deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders.

**HAVRIX MONODOSE®**

Immunisation against hepatitis A infection

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-15 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders.
  - Child 16-17 years: Initially 1 mL for 1 dose, then 1 mL after 6–12 months, dose given as booster; booster dose may be delayed by up to 3 years if not given after recommended interval following primary dose, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders.

**VAQTÀ® PEDIATRIC**

Immunisation against hepatitis A infection

- **BY INTRAMUSCULAR INJECTION**
  - Child 1-17 years: Initially 0.5 mL for 1 dose, then 0.5 mL after 6–18 months, dose given as booster, the deltoid region is the preferred site of injection. The subcutaneous route may be used for patients with bleeding disorders (but immune response may be reduced).

**ALLERGY AND CROSS-SENSITIVITY**

Epaxal® contains influenza virus haemagglutinin grown in the allantoic cavity of chick embryos, therefore contra-indicated in those hypersensitive to eggs or chicken protein.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

**EXCIPIENTS:** May contain Neomycin

- Avaxim (sanofi pasteur MSD Ltd)
  - Avaxim vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection £18.10 | 10 pre-filled disposable injection £181.00
- Havrix (GlaxoSmithKline UK Ltd)
  - Havrix Monodose vaccine suspension for injection 1mL pre-filled syringes | 1 pre-filled disposable injection £22.14 | 10 pre-filled disposable injection £221.43
  - Havrix Junior Monodose vaccine suspension for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection £16.77 | 10 pre-filled disposable injection £167.68

**Emulsion for injection**

- Epaxal (Janssen-Cilag Ltd)
  - Epaxal vaccine emulsion for injection 0.5mL pre-filled syringes | 1 pre-filled disposable injection £23.81 | 10 pre-filled disposable injection £238.10

**Hepatitis A with typhoid vaccine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, hepatitis A vaccine above, typhoid vaccine p. 747.

**INDICATIONS AND DOSE**

**HEPATYRIX®**

Immunisation against hepatitis A and typhoid infection (primary course)

- **BY INTRAMUSCULAR INJECTION**
  - Child 15-17 years: 1mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines.

**VIATIM®**

Immunisation against hepatitis A and typhoid infection (primary course)

- **BY INTRAMUSCULAR INJECTION**
  - Child 16-17 years: 1mL for 1 dose, the deltoid region is the preferred site of injection; not to be injected into the buttock (vaccine efficacy reduced). The subcutaneous route may be used for patients with bleeding disorders, booster dose given using single component vaccines.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

**EXCIPIENTS:** May contain Neomycin

- Hepatyrix (GlaxoSmithKline UK Ltd)
  - Hepatyrix vaccine suspension for injection 1mL pre-filled syringes | 1 pre-filled disposable injection £37.21 | 10 pre-filled disposable injection £372.10
- VIATIM (sanofi pasteur MSD Ltd)
  - VIATIM vaccine suspension for injection 1mL pre-filled syringes | 1 pre-filled disposable injection £29.80
Hepatitis B vaccine

INDICATIONS AND DOSE

ENGEXIR® 8

Immunisation against hepatitis B infection
> BY INTRAMUSCULAR INJECTION

- Neonate: 10 micrograms for 1 dose, then 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, deltoid muscle is preferred site in neonates; not to be injected into the buttck (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.
- Child 1 month-15 years: 10 micrograms for 1 dose, then 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection in infants and young children; anterolateral thigh is preferred site in neonates; not to be injected into the buttck (vaccine efficacy reduced).
- Child 16-17 years: 20 micrograms every 1 month for 1 dose, then 20 micrograms after 1 month for 1 dose, followed by 20 micrograms after 5 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttck (vaccine efficacy reduced).

Immunisation against hepatitis B infection (accelerated schedule)
> BY INTRAMUSCULAR INJECTION

- Neonate: 10 micrograms every 1 month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttck (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.
- Child 1 month-15 years: 10 micrograms every 1 month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection in infants and young children; anterolateral thigh is preferred site in neonates; not to be injected into the buttck (vaccine efficacy reduced).
- Child 16-17 years: 20 micrograms every 1 month for 3 doses, followed by 20 micrograms after 10 months for 1 dose, deltoid muscle is preferred site of injection; not to be injected into the buttck (vaccine efficacy reduced).

Immunisation against hepatitis B infection, alternative accelerated schedule
> BY INTRAMUSCULAR INJECTION

- Child 11-15 years: 20 micrograms for 1 dose, followed by 20 micrograms after 6 months, this schedule is not suitable if high risk of infection between doses or if compliance with second dose uncertain, deltoid muscle is preferred site of injection; not to be injected into the buttck (vaccine efficacy reduced).

Immunisation against hepatitis B infection (for neonates born to hepatitis B surface antigen-positive mother)
> BY INTRAMUSCULAR INJECTION

- Neonate: 10 micrograms once a month for 3 doses, first dose to be given at birth with hepatitis B immunoglobulin injection (separate site), followed by 10 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttck (vaccine efficacy reduced).

Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients)
> BY INTRAMUSCULAR INJECTION

- Neonate: 10 micrograms every 1 month for 2 doses, followed by 10 micrograms after 5 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttck (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.
- Child 1 month-15 years: 10 micrograms every 1 month for 2 doses, followed by 10 micrograms after 5 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in infants and young children; anterolateral thigh is preferred site in neonates; not to be injected into the buttck (vaccine efficacy reduced).
- Child 16-17 years: 40 micrograms every 1 month for 3 doses, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttck (vaccine efficacy reduced).

Immunisation against hepatitis B infection (in renal insufficiency, including haemodialysis patients (accelerated schedule))
> BY INTRAMUSCULAR INJECTION

- Neonate: 10 micrograms every 1 month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttck (vaccine efficacy reduced), this dose should not be given to neonates born to hepatitis B surface antigen positive mother.
- Child 1 month-15 years: 10 micrograms every 1 month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttck (vaccine efficacy reduced).
- Child 16-17 years: 40 micrograms every 1 month for 3 doses, followed by 40 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection in infants and young children; anterolateral thigh is preferred site in neonates; not to be injected into the buttck (vaccine efficacy reduced).

FENDRIX®

Immunisation against hepatitis B infection in renal insufficiency (including pre- haemodialysis and haemodialysis patients)
> BY INTRAMUSCULAR INJECTION

- Child 15-17 years: 20 micrograms every 1 month for 3 doses, followed by 20 micrograms after 4 months for 1 dose, immunisation schedule and booster doses may need to be adjusted in those with low antibody concentration, deltoid muscle is preferred site of injection; not to be injected into the buttck (vaccine efficacy reduced).
HBVAXPRO®

Immunisation against hepatitis B infection

- BY INTRAMUSCULAR INJECTION

- Neonate: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.

- Child 1 month–15 years: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

- Child 16–17 years: 10 micrograms for 1 dose, followed by 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

**Immunisation against hepatitis B infection (accelerated schedule)**

- BY INTRAMUSCULAR INJECTION

- Neonate: 5 micrograms every 1 month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.

- Child 1 month–15 years: 5 micrograms every 1 month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)

- Child 16–17 years: 10 micrograms every 1 month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

**Neonate born to hepatitis B surface antigen-positive mother**

- BY INTRAMUSCULAR INJECTION

- Neonate: 5 micrograms every 1 month for 3 doses, first dose given at birth with hepatitis B immunoglobulin (separate site), followed by 5 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced).

**Chronic haemodialysis patients**

- BY INTRAMUSCULAR INJECTION

- Child 16–17 years: 40 micrograms every 1 month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

---

**Human papillomavirus vaccines**

- **INDICATIONS AND DOSE**

  **CEVARI®**

  Prevention of premalignant genital lesions and cervical cancer

  - BY INTRAMUSCULAR INJECTION

  - Child 9–14 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 5–7 months for 1 dose, if second dose administered earlier than 5 months after the first, a third dose should be administered, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

  - Child 15–17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL after 1–2.5 months for 1 dose, then 0.5 mL after 5–12 months from the first dose for 1 dose, dose to be administered into deltoid region, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

  **GARDASIL®**

  Prevention of premalignant genital (cervical, vulvar and vaginal) and anal lesions, cervical and anal cancers, and genital warts

  - BY INTRAMUSCULAR INJECTION

  - Child 9–17 years (female): 0.5 mL for 1 dose, followed by 0.5 mL for 1 dose, second dose to be given at least 1 month after the first dose, then 0.5 mL for 1 dose, third dose to be given at least 3 months after the second dose, schedule should be completed within 12 months of the first dose, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, allowing the appropriate interval between the remaining doses.

---

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

EXCIPIENTS: May contain Thiomersal

- Engerix B (GlucoSmithKline Ltd) Hepatitis B virus surface antigen 20 microgram per 1 ml
  - Engerix B 20 micrograms/1 ml vaccine suspension for injection pre-filled syringes | 1 vial (PFS) £12.34 | 10 vial (PFS) £123.41
  - Engerix B 10 micrograms/0.5 ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection (PFS) £6.67
  - Engerix B 20 micrograms/1 ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection (PFS) £12.99 | 10 pre-filled disposable injection (PFS) £123.92

- Fendrix (GlucoSmithKline Ltd) Hepatitis B virus surface antigen 40 microgram per 1 ml
  - Fendrix 20 micrograms/0.5 ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection (PFS) £38.10

- HBVAXPRO (sanofi pasteur MSD Ltd) Hepatitis B virus surface antigen 10 microgram per 1 ml
  - HBVAXPRO 10 micrograms/1 ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection (PFS) £12.20
  - HBVAXPRO 5 micrograms/0.5 ml vaccine suspension for injection pre-filled syringes | 1 pre-filled disposable injection (PFS) £8.95

**HBVAXPRO 40 microgram per 1 ml**

- HBVAXPRO 40 micrograms/1 ml vaccine suspension for injection vials | 1 vial (PFS) £27.60

---

**HBVAXPRO®**

Immunisation against hepatitis B infection

- Neonate: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.

- Child 1 month–15 years: 5 micrograms for 1 dose, followed by 5 micrograms after 1 month for 1 dose, then 5 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

- Child 16–17 years: 10 micrograms for 1 dose, followed by 10 micrograms after 1 month for 1 dose, followed by 10 micrograms after 5 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

**Immunisation against hepatitis B infection (accelerated schedule)**

- Neonate: 5 micrograms every 1 month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced), dose not to be used for neonate born to hepatitis B surface antigen positive mother.

- Child 1 month–15 years: 5 micrograms every 1 month for 3 doses, followed by 5 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; anterolateral thigh is preferred site in infants; not to be injected into the buttock (vaccine efficacy reduced)

- Child 16–17 years: 10 micrograms every 1 month for 3 doses, followed by 10 micrograms after 10 months for 1 dose, booster doses may be required in immunocompromised patients with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)

**Neonate born to hepatitis B surface antigen-positive mother**

- Neonate: 5 micrograms every 1 month for 3 doses, first dose given at birth with hepatitis B immunoglobulin (separate site), followed by 5 micrograms after 10 months for 1 dose, anterolateral thigh is preferred site in neonates; not to be injected into the buttock (vaccine efficacy reduced).

**Chronic haemodialysis patients**

- Child 16–17 years: 40 micrograms every 1 month for 2 doses, followed by 40 micrograms after 5 months for 1 dose, booster doses may be required in those with low antibody concentration, deltoid muscle is preferred site of injection in adults and older children; not to be injected into the buttock (vaccine efficacy reduced)
Prevention of premalignant genital (cervical, vulvar, and vaginal) and anal lesions, cervical and anal cancers, and genital warts (alternative schedule)

- **BY INTRAMUSCULAR INJECTION**
  - Child 9–13 years (female): 0.5 mL, for 1 dose, followed by 0.5 mL after 6 months for 1 dose, if the second dose is administered earlier than 6 months after the first dose, a third dose should be administered, dose to be administered preferably into deltoid region or higher anterolateral thigh, if the course is interrupted, it should be resumed (using the same vaccine) but not repeated, even if more than 24 months have elapsed since the first dose or if the girl is then aged 15 years or more.

- **CONTRA-INDICATIONS**
  - Pregnancy

- **PRESCRIBING AND DISPENSING INFORMATION** To avoid confusion, prescribers should specify the brand to be dispensed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

- **SUSPENSION FOR INJECTION**
  - **Cervarix** (GlaxoSmithKline UK Ltd)
    - Cervarix vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PS) £80.50
  - **Gardasil** (sanofi pasteur MSD Ltd)
    - Gardasil vaccine suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection (PS) £86.50

- **ALLERGY AND CROSS-SENSITIVITY**
  - Individuals with a history of egg allergy can be immunised with either an egg free influenza vaccine, if available, or an influenza vaccine with an ovalbumin content less than 120 nanograms/mL. (facilities should be available to treat anaphylaxis). Vaccines with an ovalbumin content more than 120 nanograms/mL or where content is not stated should not be used in individuals with egg allergy. If an influenza vaccine containing ovalbumin is being considered in those with a history of anaphylaxis to egg or egg allergy with uncontrolled asthma, these individuals should be referred to a specialist in hospital.

- **PREGNANCY**
  - Inactivated vaccines not known to be harmful.

- **FLUENZ TETRA** Avoid in pregnancy.

- **BREAST FEEDING**
  - Avoid in breast-feeding.

- **PRESCRIBING AND DISPENSING INFORMATION**

- **FLUARIX TETRA** Ovalbumin content less than 100 nanograms/mL.

- **PATIENT AND CARER ADVICE**
  - FLUENZ TETRA Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.

### Influenza vaccine

- **INDICATIONS AND DOSE**
  - Annual immunisation against seasonal influenza (for children who have not received seasonal influenza vaccine previously)
    - **BY INTRAMUSCULAR INJECTION**
      - Child 6 months–9 years: 0.5 mL for 1 dose, followed by 0.5 mL after at least 4 weeks for 1 dose
    - **BY INTRANASAL ADMINISTRATION**
      - Child 2–9 years: 0.1 mL for 1 dose, followed by 0.1 mL after at least 4 weeks for 1 dose, 0.1 mL dose to be administered into each nostril

- **ANNUAL IMMUNISATION AGAINST SEASONAL INFLUENZA**
  - **BY INTRAMUSCULAR INJECTION**
    - Child 6 months–17 years: 0.5 mL for 1 dose
  - **BY INTRANASAL ADMINISTRATION**
    - Child 2–17 years: 0.1 mL for 1 dose, dose to be administered into each nostril

- **UNLICENSED USE**
  - Some products containing inactivated influenza vaccine (surface antigens) are not licensed for use in children under 4 years—check product literature.

- **FLUVIRIN** Not licensed for use in children under 4 years.

- **FLUARIX TETRA** Not licensed for use in children under 3 years of age.

- **OPTAFLU** Not licensed for use in children and adolescents under 18 years.

- **CONTRA-INDICATIONS**
  - Preparations marketed by Pfizer, or CSL Biotherapies in child under 5 years—increased risk of febrile convulsions

- **FLUENZ TETRA** Active wheezing - concomitant use with antiviral therapy for influenza - concomitant use with salicylates - severe asthma

- **CONTRA-INDICATIONS, FURTHER INFORMATION**
  - Concomitant use with antivirals: Avoid antivirals for at least 2 weeks after immunisation; avoid immunisation for at least 48 hours after stopping the antiviral.

- **ENZIRA** Child under 5 years—increased risk of febrile convulsions

- **CAUTIONS**
  - Increased risk of fever in child 5–9 years with preparations marketed by Pfizer or CSL Biotherapies—use alternative influenza vaccine if available

- **ENZIRA** Child 5–9 years (increased risk of fever)—use alternative influenza vaccine if available

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
  - Uncommon: Epistaxis
  - Frequency not known: Febrile convulsions - transient thrombocytopenia

- **SPECIFIC SIDE-EFFECTS**
  - With intranasal use: Rhinorrhea

- **ALLERGY AND CROSS-SENSITIVITY**
  - Individuals with a history of egg allergy can be immunised with either an egg free influenza vaccine, if available, or an influenza vaccine with an ovalbumin content less than 120 nanograms/mL. (facilities should be available to treat anaphylaxis). Vaccines with an ovalbumin content more than 120 nanograms/mL or where content is not stated should not be used in individuals with egg allergy. If an influenza vaccine containing ovalbumin is being considered in those with a history of anaphylaxis to egg or egg allergy with uncontrolled asthma, these individuals should be referred to a specialist in hospital.

- **PREGNANCY**
  - Concomitant use with antivirals

- **PRESCRIBING AND DISPENSING INFORMATION**

- **FLUARIX TETRA** Ovalbumin content less than 100 nanograms/mL.

- **PATIENT AND CARER ADVICE**
  - FLUENZ TETRA Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

### Suspension for injection

- **EXCIPIENTS:** May contain Gentamicin, kanamycin, neomycin, penicillins, polymyxin B, thiomersal.

- **GENERAL SIDE-EFFECTS**
  - Transient
  - Febrile convulsions

- **FLUENZ TETRA** Avoid in breast-feeding.

- **PRESCRIBING AND DISPENSING INFORMATION**

- **FLUARIX TETRA** Ovalbumin content less than 100 nanograms/mL.

- **PATIENT AND CARER ADVICE**
  - FLUENZ TETRA Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.

### Medicinal forms

- **PRESCRIBING AND DISPENSING INFORMATION**

- **FLUARIX TETRA** Ovalbumin content less than 100 nanograms/mL.

- **PATIENT AND CARER ADVICE**
  - FLUENZ TETRA Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.

### Medicinal forms

- **PRESCRIBING AND DISPENSING INFORMATION**

- **FLUARIX TETRA** Ovalbumin content less than 100 nanograms/mL.

- **PATIENT AND CARER ADVICE**
  - FLUENZ TETRA Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.

### Medicinal forms

- **PRESCRIBING AND DISPENSING INFORMATION**

- **FLUARIX TETRA** Ovalbumin content less than 100 nanograms/mL.

- **PATIENT AND CARER ADVICE**
  - FLUENZ TETRA Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.

### Medicinal forms

- **PRESCRIBING AND DISPENSING INFORMATION**

- **FLUARIX TETRA** Ovalbumin content less than 100 nanograms/mL.

- **PATIENT AND CARER ADVICE**
  - FLUENZ TETRA Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.

### Medicinal forms

- **PRESCRIBING AND DISPENSING INFORMATION**

- **FLUARIX TETRA** Ovalbumin content less than 100 nanograms/mL.

- **PATIENT AND CARER ADVICE**
  - FLUENZ TETRA Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.

### Medicinal forms

- **PRESCRIBING AND DISPENSING INFORMATION**

- **FLUARIX TETRA** Ovalbumin content less than 100 nanograms/mL.

- **PATIENT AND CARER ADVICE**
  - FLUENZ TETRA Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.

### Medicinal forms

- **PRESCRIBING AND DISPENSING INFORMATION**

- **FLUARIX TETRA** Ovalbumin content less than 100 nanograms/mL.

- **PATIENT AND CARER ADVICE**
  - FLUENZ TETRA Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.

### Medicinal forms

- **PRESCRIBING AND DISPENSING INFORMATION**

- **FLUARIX TETRA** Ovalbumin content less than 100 nanograms/mL.

- **PATIENT AND CARER ADVICE**
  - FLUENZ TETRA Avoid close contact with severely immunocompromised patients for 1–2 weeks after vaccination.
Japanese encephalitis vaccine

**INDICATIONS AND DOSE**

**Immunisation against Japanese encephalitis**

- **BY INTRAMUSCULAR INJECTION**
- **Spray**
  - EXCIPENTS: May contain Gelatin, gentamicin
  - FluMist Quadrivalent (AstraZeneca UK Ltd)
    - FluMist Quadrivalent vaccine nasal suspension 0.2ml unit dose
      - 10 unit dose (pump) £180.00
  - Fluenz Tetra (AstraZeneca UK Ltd)
    - Fluenz Tetra vaccine nasal suspension 0.2ml unit dose
      - 10 unit dose (pump) £180.00

**SIDE-EFFECTS**

- Uncommon Cough
- **PREGNANCY** Although manufacturer advises avoid use of limited information, miscarriage has been associated with Japanese encephalitis virus infection acquired during the first 2 trimesters of pregnancy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Japanese encephalitis vaccine (Non-proprietary)
- Japanese encephalitis GVC vaccine solution for injection 1ml vials
  - 1 vial no price available

- Japanese encephalitis GVC vaccine solution for injection 20ml vials
  - 1 vial no price available

- Japanese encephalitis GVC vaccine solution for injection 10ml vials
  - 1 vial no price available

**Suspension for injection**

- Ixiaro (Valneva UK Ltd)
  - Ixiaro vaccine suspension for injection 0.5ml pre-filled syringes
    - 1 pre-filled disposable injection (pump) £59.50

Measles, mumps and rubella vaccine, live

**INDICATIONS AND DOSE**

**Primary immunisation against measles, mumps, and rubella (first dose)**

- **BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION**
- Child 12-13 months: 0.5 mL for 1 dose

**Primary immunisation against measles, mumps, and rubella (second dose)**

- **BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION**
- Child 40 months-5 years: 0.5 mL for 1 dose

**Rubella immunisation (in seronegative women, susceptible to rubella and in unimmunised, seronegative women, post-partum)**

- **BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION**
- Females of childbearing potential: (consult product literature or local protocols)

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Antibody response to measles component may be reduced after immunoglobulin administration or blood transfusion–leave an interval of at least 3 months before MMR immunisation**

- **Administration with other vaccines**
  - MMR vaccine should not be administered on the same day as yellow fever vaccine; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered.

**Unlicensed Use**

Not licensed for use in children under 9 months.

**IMMUNISATION AGAINST MEASLES, MUMPS AND RUBELLA**

- **BY INTRAMUSCULAR INJECTION, OR BY DEEP SUBCUTANEOUS INJECTION**
- Child 6 years-7 years: (consult product literature or local protocols)

**SIDE-EFFECTS**

- Uncommon Parotid swelling (usually in the third week) • Sleep disturbances • Unusual crying in infants

**RARE**

- Arthropathy (2 to 3 weeks after immunisation)
- Idiopathic thrombocytopenic purpura

**FREQUENCY NOT KNOWN**

- Optic neuritis • Peripheral neuritis

**SIDE-EFFECTS, FURTHER INFORMATION**

**Malaise, fever, or a rash can occur after the first dose of MMR vaccine–most commonly about a week after vaccination and lasting about 2 to 3 days. Leaflets are available for parents on advice for reducing fever (including the use of paracetamol).**

- **Feverish seizures**–occur rarely 6 to 11 days after MMR vaccination (the incidence is lower than that following measles infection)

**Idiopathic thrombocytopenic purpura**

- Idiopathic thrombocytopenic purpura has occurred rarely following MMR vaccination, usually within 6 weeks of the first dose. The risk of idiopathic thrombocytopenic purpura after MMR vaccine is much less than the risk after infection with wild measles or rubella virus. Children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR should undergo serological testing before the second dose is due; if the results suggest incomplete immunity against measles, mumps or rubella then a second dose of MMR is recommended.

- *The Specialist and Reference Microbiology Division, Health Protection Agency offers free serological testing for*
children who develop idiopathic thrombocytopenic purpura within 6 weeks of the first dose of MMR.

- Aseptic meningitis Post-vaccination aseptic meningitis was reported (rarely and with complete recovery) following vaccination with MMR vaccine containing Urabe mumps vaccine, which has now been discontinued; no cases have been confirmed in association with the currently used Jeryl Lynn mumps vaccine. Children with post-vaccination symptoms are not infectious.

- Frequency of side effects Adverse reactions are considerably less frequent after the second dose of MMR vaccine than after the first.

- ALLERGY AND CROSS-SENSITIVITY MMR vaccine can be given safely even when the child has had an anaphylactic reaction to food containing egg. Dislike of eggs, refusal to eat egg, or confirmed anaphylactic reactions to egg-containing food is not a contra-indication to MMR vaccination. Children with a confirmed anaphylactic reaction to the MMR vaccine should be assessed by a specialist.

- CONCEPTION AND CONTRACEPTION Exclude pregnancy before immunisation. Avoid pregnancy for at least 1 month after vaccination.

- PRESCRIBING AND DISPENSING INFORMATION Available as part of childhood immunisation schedule from health organisations or ImmForm www.immform.dh.gov.uk.

---

**Vaccines**

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Powder and solvent for solution for injection**
  - Priorix (GlaxoSmithKline UK Ltd)
  - M-M-RVAXPRO (sanofi pasteur MSD Ltd)

- **Powder and solvent for suspension for injection**
  - Priorix vaccine powder and solvent for suspension for injection 0.5ml vials 1 vial (PPI) £7.64
  - Rabipur vaccine powder and solvent for suspension for injection 1ml vials 1 vial (PPI) £11.00

---

**Rabies vaccine**

- **INDICATIONS AND DOSE**

  - **Pre-exposure prophylaxis**
    - BY INTRAMUSCULAR INJECTION
    - Child: 1 mL for 2 doses (on days 0 and 7), followed by 1 mL for 1 dose (on day 28), to be administered in deltoid region or anterolateral thigh in infants, for those at continuous risk, measure plasma-concentration of antirabies antibodies every 6 months and give a booster dose if the titre is less than 0.5 units/mL, final dose may be given from day 21, if insufficient time before travel

  - **Pre-exposure prophylaxis booster dose (for patients at frequent risk of exposure)**
    - BY INTRAMUSCULAR INJECTION
    - Child: 1 mL after 1 year for 1 dose, to be given 1 year after primary course is completed, then 1 mL every 3–5 years, to be administered in deltoid region or anterolateral thigh in infants, the frequency of booster doses may alternatively be determined according to plasma-concentration of antirabies antibodies

  - **Pre-exposure prophylaxis booster dose (for patients at infrequent risk of exposure)**
    - BY INTRAMUSCULAR INJECTION
    - Child: 1 mL for 1 dose, to be given 10 years after primary course is completed, administered in deltoid region or anterolateral thigh in infants

---

**Post-exposure prophylaxis of fully immunised individuals**

- **BY INTRAMUSCULAR INJECTION**
- Child (administered on expert advice): 1 mL for 1 dose, followed by 1 mL after 3–7 days for 1 dose, to be administered in deltoid region or anterolateral thigh in infants, rabies immunoglobulin is not necessary

**Post-exposure treatment for unimmunised individuals (or those whose prophylaxis is possibly incomplete)**

- **BY INTRAMUSCULAR INJECTION**
- Child (administered on expert advice): 1 mL 5 times a month for 1 month, doses should be given on days 0, 3, 7, 14, and the fifth dose is given between day 28–30, to be administered in deltoid region or anterolateral thigh in infants, depending on the level of risk (determined by factors such as the nature of the bite and the country where it was sustained), rabies immunoglobulin is given to unimmunised individuals on day 0 or within 7 days of starting the course of rabies vaccine, the immunisation course can be discontinued if it is proved that the individual was not at risk

- **SIDE-EFFECTS** Paresis

- **PREGNANCY** Because of the potential consequences of untreated rabies exposure and because rabies vaccination has not been associated with fetal abnormalities, pregnancy is not considered a contra-indication to post-exposure prophylaxis. Immunisation against rabies is indicated during pregnancy if there is substantial risk of exposure to rabies and rapid access to post-exposure prophylaxis is likely to be limited.

---

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Powder and solvent for solution for injection**
  - Rabipur vaccine powder and solvent for suspension for injection 0.5ml pre-filled syringes | 1 pre-filled disposable injection £34.56

---

**Rotavirus vaccine**

- **INDICATIONS AND DOSE**

  - **Immunisation against gastro-enteritis caused by rotavirus**
    - BY MOUTH
    - Child 6–23 weeks: 1.5 mL for 2 doses separated by an interval of at least 4 weeks, first dose must be given between 6–14 weeks of age; course should be completed before 24 weeks of age (preferably before 16 weeks)

- **CONTRA-INDICATIONS** History of intussusception - predisposition to intussusception - severe combined immunosuppression

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- **Immunosupression** With the exception of severe combined immunodeficiency, rotavirus vaccine is not contra-indicated in immunosuppressed patients—benefit from
Vaccination is likely to outweigh the risk, if there is any doubt, seek specialist advice.

- **CAUTIONS** Diarrhoea (postpone vaccination) • immunosuppressed close contacts • vomiting (postpone vaccination)

**CAUTIONS, FURTHER INFORMATION**
The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; however, vaccination of those with immunosuppressed close contacts may protect the contacts from wild-type rotavirus disease and outweigh any risk from transmission of vaccine virus.

- **SIDE-EFFECTS** Abdominal cramps • abdominal pain • diarrhoea • nausea • vomiting

**PATIENT AND CARER ADVICE** The rotavirus vaccine virus is excreted in the stool and may be transmitted to close contacts; carers of a recently vaccinated baby should be advised of the need to wash their hands after changing the baby’s nappies.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**
- Rotarix (GlaxoSmithKline UK Ltd)
  Rotarix vaccine live oral suspension 1.5ml pre-filled syringes | 1 unit dose £34.76

**Tick-borne encephalitis vaccine, inactivated**

- **INDICATIONS AND DOSE**
  **Initial immunisation against tick-borne encephalitis**
  - By intramuscular injection
    - Child 1-5 years: 0.25 mL for 1 dose, followed by 0.25 mL after 1–3 months for 1 dose, then 0.25 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, to be administered in deltoid region or anterolateral thigh in infants, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved
    - Child 6–17 years: 0.5 mL for 1 dose, followed by 0.5 mL after 1–3 months for 1 dose, then 0.5 mL after further 5–12 months for 1 dose, to achieve more rapid protection, second dose may be given 14 days after first dose, to be administered in deltoid region, in immunocompromised patients (including those receiving immunosuppressants), antibody concentration may be measured 4 weeks after second dose and dose repeated if protective levels not achieved

  **Immunisation against tick-borne encephalitis, booster doses**
  - By intramuscular injection
    - Child 1-7 years: First dose to be given within 3 years after initial course completed and then every 3–5 years, dose to be administered in deltoid region or anterolateral thigh in infants (consult product literature)

**ALLERGY AND CROSS-SENSITIVITY** Individuals with evidence of previous anaphylactic reaction to egg should not be given tick-borne encephalitis vaccine.

**Varicella-zoster vaccine**

- **INDICATIONS AND DOSE**
  **VARILRIX®**
  Prevention of varicella infection (chickenpox)
  - By subcutaneous injection
    - Child 1-17 years: 0.5 mL every 4–6 weeks for 2 doses, to be administered preferably into the deltoid region
  **VARIVAX®**
  Prevention of varicella infection (chickenpox)
  - By subcutaneous injection, or by intramuscular injection
    - Child 1-12 years: 0.5 mL for 2 doses, interval of at least 4 weeks between each dose, to be administered into the deltoid region (or higher anterolateral thigh in young children)
    - Child 13–17 years: 0.5 mL every 4–8 weeks for 2 doses, to be administered preferably into the deltoid region

**Prevention of varicella infection (chickenpox) in children with asymptomatic HIV infection**
- By subcutaneous injection, or by intramuscular injection
  - Child 1-12 years: 0.5 mL every 12 weeks for 2 doses, to be administered into the deltoid region (or higher anterolateral thigh in young children)

**CAUTIONS** Post-vaccination close contact with susceptible individuals

**CAUTIONS, FURTHER INFORMATION**
Rarely, the varicella–zoster vaccine virus has been transmitted from the vaccinated individual to close contacts. Therefore, contact with the following should be avoided if a vaccine-related cutaneous rash develops within 4–6 weeks of the first or second dose:
- varicella–susceptible pregnant women;
- individuals at high risk of severe varicella, including those with immunodeficiency or those receiving immunosuppressive therapy.

Healthcare workers who develop a generalised papular or vesicular rash on vaccination should avoid contact with patients until the lesions have crusted. Those who develop a localised rash after vaccination should cover the lesions and be allowed to continue working unless in contact with patients at high risk of severe varicella.

- Administration with MMR vaccine Varicella–zoster and MMR vaccines can be given on the same day or separated by a 4-week minimum interval. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of the vaccine given second may be considered.

**SIDE-EFFECTS**
- Rare Thrombocytopenia
- Frequency not known Conjunctivitis • varicella-like rash

**CONCEPTION AND CONTRACEPTION** Avoid pregnancy for 3 months after vaccination.
Yellow fever vaccine, live

**INDICATIONS AND DOSE**

**Immunisation against yellow fever**

- **BY DEEP SUBCUTANEOUS INJECTION**
  - Child 6–8 months (administered on expert advice): Infants under 9 months should be vaccinated only if the risk of yellow fever is high and unavoidable (consult product literature or local protocols)
  - Child 9 months–17 years: 0.5 mL for 1 dose

**CONTRA-INDICATIONS**

- Children under 6 months
- History of thymus dysfunction

**CAUTIONS**

- Administration with MMR vaccine: Yellow fever and MMR vaccines should not be administered on the same day; there should be a 4-week minimum interval between the vaccines. When protection is rapidly required, the vaccines can be given at any interval and an additional dose of MMR may be considered.

**SIDE-EFFECTS**

- Neurotropic disease
- Viscerotropic disease

**SIDE-EFFECTS, FURTHER INFORMATION**

- Vaccine-associated adverse effects: Very rare adverse effects, such as viscerotropic disease (yellow-fever vaccine-associated viscerotropic disease, YEL-AVD), a syndrome which may include metabolic acidosis, muscle and liver cirrhosis, and multi-organ failure. Neurological disorders (yellow fever vaccine-associated neurotropic disease, YEL-AND) such as encephalitis have also been reported. These very rare adverse effects usually occur after the first dose of yellow fever vaccine in those with no previous immunity.

**ALLERGY AND CROSS-SENSITIVITY**

- Yellow fever vaccine should only be considered under the guidance of a specialist in individuals with evidence of previous anaphylactic reaction to egg.

**PREGNANCY**

- Live yellow fever vaccine should not be given during pregnancy because there is a theoretical risk of fetal infection. Pregnant women should be advised not to travel to areas at high risk of yellow fever. If exposure cannot be avoided during pregnancy, then the vaccine should be given if the risk from disease in the mother outweighs the risk to the fetus from vaccination.

**BREAST FEEDING**

- Avoid; seek specialist advice if exposure to virus cannot be avoided.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection**

- *Stamaril* (sanofi pasteur MSD Ltd)
  - Stamaril vaccine powder and solvent for suspension for injection 0.5ml vials | 1 vial £33.10
General anaesthesia

Overview
Several different types of drug are given together during general anaesthesia. Anaesthesia is induced with either a volatile drug given by inhalation or with an intravenously administered drug; anaesthesia is maintained with an intravenous or inhalational anaesthetic. Analgesics, usually short-acting opioids, are also used. The use of neuromuscular blocking drugs necessitates intermittent positive-pressure ventilation. Following surgery, anticholinesterases can be given to reverse the effects of neuromuscular blocking drugs; specific antagonists can be used to reverse central and respiratory depression caused by some drugs used in surgery. A local topical anaesthetic can be used to reduce pain at the injection site.

Individual requirements vary considerably and the recommended doses are only a guide. Smaller doses are indicated in ill, shocked, or debilitated children and in significant hepatic impairment, while robust individuals may require larger doses. The required dose of induction agent may be less if the patient has been premedicated with a sedative agent or if an opioid analgesic has been used.

Intravenous anaesthetics
Intravenous anaesthetics may be used either to induce anaesthesia or for maintenance of anaesthesia throughout surgery. Intravenous anaesthetics nearly all produce their effect in one arm-brain circulation time. Extreme care is required in surgery of the mouth, pharynx, or larynx where the airway may be difficult to maintain (e.g. in the presence of a tumour in the pharynx or larynx).

To facilitate tracheal intubation, induction is usually followed by a neuromuscular blocking drug or a short-acting opioid.

The effects of all intravenous anaesthetic drugs should be titrated to effect (except when using ‘rapid sequence induction’).

Total intravenous anaesthesia
This is a technique in which major surgery is carried out with all drugs given intravenously. Respiration can be spontaneous, or controlled with oxygen-enriched air.

Neuromuscular blocking drugs can be used to provide relaxation and prevent reflex muscle movement. The main problem to be overcome is the assessment of depth of anaesthesia. Target Controlled Infusion (TCI) systems can be used to titrate intravenous anaesthetic infusions to predicted plasma-drug concentrations; specific models with paediatric pharmacokinetic data should be used for children.

Drugs used for intravenous anaesthesia
Propofol p. 759, the most widely used intravenous anaesthetic, can be used for induction or maintenance of anaesthesia in children, but it is not commonly used in neonates. Propofol is associated with rapid recovery and less hangover effect than other intravenous anaesthetics. Propofol can also be used for sedation during diagnostic procedures.

Thiopental sodium p. 209 is a barbiturate that is used for induction of anaesthesia, but has no analgesic properties. Induction is generally smooth and rapid, but dose-related cardiovascular and respiratory depression can occur. Awakening from a moderate dose of thiopental sodium is rapid because the drug redistributes into other tissues, particularly fat. However, metabolism is slow and sedative effects can persist for 24 hours. Repeated doses have a cumulative effect particularly in neonates and recovery is much slower.

Etomidate p. 758 is an intravenous agent associated with rapid recovery without a hangover effect. Etomidate causes less hypotension than thiopental sodium and propofol during induction. It produces a high incidence of extraneous muscle movements, which can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.

Ketamine p. 773 causes less hypotension than thiopental sodium and propofol during induction. It is sometimes used in children requiring repeat anaesthesia (such as for serial burns dressings), however recovery is relatively slow and there is a high incidence of extraneous muscle movements. Ketamine can cause hallucinations, nightmares, and other transient psychotic effects; these can be reduced by a benzodiazepine such as diazepam p. 207 or midazolam p. 210.

Inhalational anaesthetics
Inhalational anaesthetics include gases and volatile liquids. Gaseous anaesthetics require suitable equipment for storage and administration. Volatile liquid anaesthetics are administered using calibrated vaporisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times. Higher concentrations of oxygen (greater than 30%) are usually required during inhalational anaesthesia when nitrous oxide p. 762 is being administered.

Volatile liquid anaesthetics
Volatile liquid anaesthetics can be used for induction and maintenance of anaesthesia, and following induction with an intravenous anaesthetic. Isoflurane p. 761 is a volatile liquid anaesthetic. Heart rhythm is generally stable during isoflurane anaesthesia, but heart-rate can rise. Systemic arterial pressure and cardiac
output can fall, owing to a decrease in systemic vascular resistance. Muscle relaxation occurs and the effects of muscle relaxant drugs are potentiated. Isoflurane is not recommended for induction of anaesthesia in infants and children of all ages because of the occurrence of cough, breath-holding, desaturation, increased secretions, and laryngospasm. Isoflurane is the preferred inhalational anaesthetic for use in obstetrics.

Desflurane p. 761 is a rapid acting volatile liquid anaesthetic; it is reported to have about one-fifth the potency of isoflurane. Emergence and recovery from anaesthesia are particularly rapid because of its low solubility. Desflurane is not recommended for induction of anaesthesia as it is irritant to the upper respiratory tract.

Sevoflurane p. 762 is a rapid acting volatile liquid anaesthetic and is more potent than desflurane. Emergence and recovery are particularly rapid, but slower than desflurane. Sevoflurane is non-irritant and is therefore often used for inhalational induction of anaesthesia.

Nitrous oxide
Nitrous oxide is used for maintenance of anaesthesia and, in sub-anaesthetic concentrations, for analgesia. For anaesthesia, it is commonly used in a concentration of 50 to 66% in oxygen as part of a balanced technique in association with other inhalational or intravenous agents. Nitrous oxide is unsatisfactory as a sole anaesthetic owing to lack of potency, but is useful as part of a combination of drugs since it allows a significant reduction in dosage.

For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox®, Equanox®) is used. Self-administration using a demand valve may be used in children who are able to self-regulate their intake (usually over 5 years of age) for painful dressing changes, as an aid to postoperative physiotherapy, for wound debridement and in emergency ambulances.

Nitrous oxide may have a deleterious effect if used in children with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

Malignant hyperthermia
Malignant hyperthermia is a rare but potentially lethal complication of anaesthesia. It is characterised by a rapid rise in temperature, increased muscle rigidity, tachycardia, and acidosis. The most common triggers of malignant hyperthermia are the volatile anaesthetics. Suxamethonium chloride p. 766 has also been implicated, but malignant hyperthermia is more likely if it is given following a volatile anaesthetic. Volatile anaesthetics and suxamethonium chloride should be avoided during anaesthesia in children at high risk of malignant hyperthermia.

Dantrolene sodium p. 775 is used in the treatment of malignant hyperthermia.

Sedation, anaesthesia, and resuscitation in dental practice
Overview
Sedation for dental procedures should be limited to conscious sedation whenever possible. Nitrous oxide p. 762 alone and midazolam p. 210 are effective for many children.

For details of anaesthesia, sedation, and resuscitation in dental practice see A Conscious Decision: A review of the use of general anaesthesia and conscious sedation in primary dental care; report by a group chaired by the Chief Medical Officer and Chief Dental Officer, July 2000 and associated documents. Further details can also be found in Standards for Conscious Sedation in the Provision of Dental Care; report of an Intercollegiate Advisory Committee for Sedation in Dentistry, 2015 www.rcseng.ac.uk/fds/Documents/dental-sedation-report-2015-web-v2.pdf.

Surgery and long-term medication
Overview
The risk of losing disease control on stopping long-term medication before surgery is often greater than the risk posed by continuing it during surgery. It is vital that the anaesthetist knows about all drugs that a patient is (or has been) taking.

Patients with adrenal atrophy resulting from long-term corticosteroid use may suffer a precipitous fall in blood pressure unless corticosteroid cover is provided during anaesthesia and in the immediate postoperative period. Anaesthetists must therefore know whether a patient is, or has been, receiving corticosteroids (including high-dose inhaled corticosteroids).

Other drugs that should normally not be stopped before surgery include drugs for epilepsy, asthma, immunosuppression, and metabolic, endocrine and cardiovascular disorders (but see potassium sparing diuretics). Expert advice is required for children receiving antivirals for HIV infection. See general advice on surgery in children with diabetes in Insulins and anti-diabetic drugs p. 417, Diabetes and surgery.

Children taking antiplatelet medication or an oral anticoagulant present an increased risk for surgery. In these circumstances, the anaesthetist and surgeon should assess the relative risks and decide jointly whether the antiplatelet or the anticoagulant drug should be stopped or replaced with heparin (unfractionated) p. 87 or low molecular weight heparin therapy.

Drugs that should be stopped before surgery include combined oral contraceptives, see Contraceptives, hormonal p. 461. If antidepressants need to be stopped, they should be withdrawn gradually to avoid withdrawal symptoms. Tricyclic antidepressants need not be stopped, but there may be an increased risk of arrhythmias and hypotension (and dangerous interactions with vasopressor drugs); therefore, the anaesthetist should be informed if they are not stopped. Lithium should be stopped 24 hours before major surgery but the normal dose can be continued for minor surgery (with careful monitoring of fluids and electrolytes). Potassium-sparing diuretics may need to be withheld on the morning of surgery because hyperkalaemia may develop if renal perfusion is impaired or if there is tissue damage. Herbal medicines may be associated with adverse effects when given with anaesthetic drugs and consideration should be given to stopping them before surgery.

Etomidate

- **INDICATIONS AND DOSE**
  - **Induction of anaesthesia**
    - BY SLOW INTRAVENOUS INJECTION
    - Child 1 month-14 years: 150–300 micrograms/kg (max. per dose 60 mg), to be administered over 30–60 seconds (60 seconds for children in whom hypotension might be hazardous), increased if necessary to 400 micrograms/kg
**Etomidate**

**INDICATIONS AND DOSE**

- **Induction of anaesthesia using 0.5% or 1% injection**
  - By slow intravenous injection, or by intravenous infusion
  - Child 1-month to 16-years: Usual dose 2.5–4 mg/kg, dose adjusted according to age, body-weight and response
  - Child 17-years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response

- **Induction of anaesthesia using 2% injection**
  - By intravenous infusion
  - Child 3–16-years: Usual dose 2.5–4 mg/kg, dose adjusted according to age, body-weight and response
  - Child 17-years: Usual dose 1.5–2.5 mg/kg, to be administered at a rate of 20–40 mg every 10 seconds until response

- **Maintenance of anaesthesia using 1% injection**
  - By continuous intravenous infusion
  - Child 1-month to 16-years: Usual dose 9–15 mg/kg/hour, dose adjusted according to age, body-weight and response
  - Child 17-years: Usual dose 4–12 mg/kg/hour, adjusted according to response

- **Maintenance of anaesthesia using 2% injection**
  - By continuous intravenous infusion
  - Child 3–16-years: Usual dose 9–15 mg/kg/hour, dose adjusted according to age, body-weight and response
  - Child 17-years: Usual dose 4–12 mg/kg/hour, adjusted according to response

**Induction of sedation for surgical and diagnostic procedures using 0.5% or 1% injection**

- By slow intravenous injection
  - Child 1-month to 16-years: Initially 1–2 mg/kg, dose and rate of administration adjusted according to desired level of sedation and response
  - Child 17-years: Initially 0.5–1 mg/kg, to be administered over 1–5 minutes, dose and rate of administration adjusted according to desired level of sedation and response

**Maintenance of sedation for surgical and diagnostic procedures using 0.5% injection**

- Initially by intravenous infusion
  - Child 17-years: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, (if rapid increase in sedation required)

**Maintenance of sedation for surgical and diagnostic procedures using 1% injection**

- Initially by intravenous infusion
  - Child 1-month to 16-years: Usual dose 3.5–9 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response
  - Child 17-years: Initially 3.5–9 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by gas...
**General anaesthesia**

(by slow intravenous injection) 10–20 mg, (if rapid increase in sedation required)

**Maintenance of sedation for surgical and diagnostic procedures using 2% injection**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Child 3-16 years: Usual dose 1.5–9 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response
  - Child 17 years: Initially 1.5–4.5 mg/kg/hour, dose and rate of administration adjusted according to desired level of sedation and response, followed by (by slow intravenous injection) 10–20 mg, using 0.5% or 1% injection (if rapid increase in sedation required)

**IMPORTANT SAFETY INFORMATION**

Propofol should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS** Children under 16 years receiving intensive care

**CONTRA-INDICATIONS, FURTHER INFORMATION**

Use in intensive care associated with a risk of propofol infusion syndrome (potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure).

- **CAUTIONS** Acute circulatory failure (shock)-cardiac impairment - cardiovascular disease - epilepsy - fixed cardiac output - hypotension - hypovolaemia - raised intracranial pressure - respiratory impairment

**SIDE-EFFECTS**

- Common or very common Headache - hypotension - tachycardia - transient apnoea
- Uncommon Phlebitis - thrombosis
- Rare Anaphylaxis - arrhythmia - convulsions (onset can be delayed) - delayed recovery from anaesthesia - euphoria
- Very rare Discoloration of urine - pancreatitis - pulmonary oedema - sexual disinhibition
- Frequency not known Bradycardia - pain on intravenous injection - propofol infusion syndrome - significant extraneous muscle movements

**SIDE-EFFECTS, FURTHER INFORMATION**

- Bradycardia Bardycardia may be profound and may be treated with intravenous administration of an antimuscarinic drug.
- Extraneous muscle movement Extraneous muscle movements can be minimised by an opioid analgesic or a short-acting benzodiazepine given just before induction.
- Pain on injection Can be reduced by intravenous lidocaine.
- Propofol infusion syndrome Prolonged infusion of propofol doses exceeding 4 mg/kg/hour may result in potentially fatal effects, including metabolic acidosis, arrhythmias, cardiac failure, rhabdomyolysis, hyperlipidaemia, hyperkalaemia, hepatomegaly, and renal failure.

**PREGNANCY**

Max. dose for maintenance of anaesthesia 6 mg/kg/hour. May depress neonatal respiration if used during delivery.

- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

**HEPATIC IMPAIRMENT** Use with caution.

**RENAL IMPAIRMENT** Use with caution.

**MONITORING REQUIREMENTS** Monitor blood-lipid concentration if risk of fat overload or if sedation longer than 3 days.

- **DIRECTIONS FOR ADMINISTRATION** Shake before use; microbiological filter not recommended; may be administered via a Y-piece close to injection site co-administered with Glucose 5% or Sodium chloride 0.9%. 0.5% emulsion for injection or intermittent infusion; may be administered undiluted, or diluted with Glucose 5% or Sodium chloride 0.9%; dilute to a concentration not less than 1 mg/mL. 1% emulsion for injection or infusion; may be administered undiluted, or diluted with Glucose 5% (Diprivan®) or (Propofol-Lipuro®) or Sodium chloride 0.9% (Propofol-Lipuro®) only; dilute to a concentration not less than 2 mg/mL; use within 6 hours of preparation. 2% emulsion for infusion; do not dilute.

- **PATIENT AND CARER ADVICE**

  - Driving and skilled tasks Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

- **MEDICINAL FORMS**

  There can be variation in the licensing of different medicines containing the same drug.

**Emulsion for injection**

- Diprivan AstraZeneca UK Ltd
  - Propofol 10 mg per 1 ml Diprivan 1% emulsion for injection 20ml ampoules | 5 ampoules (RE) £15.36 (Hospital only)
  - Propofol-Lipuro (B.Braun Medical Ltd)
  - Propofol 5 mg per 1 ml Propofol-Lipuro 0.5% emulsion for injection 20ml ampoules | 5 ampoules (RE) £14.71

**Emulsion for infusion**

- Diprivan AstraZeneca UK Ltd
  - Propofol 10 mg per 1 ml Diprivan 1% emulsion for infusion 50ml pre-filled syringes | 1 pre-filled disposable injection (RE) £10.68
  - Propofol 20 mg per 1 ml Diprivan 2% emulsion for infusion 50ml pre-filled syringes | 1 pre-filled disposable injection (RE) £15.16

**ANAESTHETICS, GENERAL**

**VOLATILE LIQUID ANAESTHETICS**

**Volatile halogenated anaesthetics**

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS** Susceptibility to malignant hyperthermia

**CAUTIONS** Can trigger malignant hyperthermia - neuromuscular disease (inhaled anaesthetics are very rarely associated with hyperkalaemia, resulting in cardiac arrhythmias and death) - raised intracranial pressure (can increase cerebrospinal pressure)

- **SIDE-EFFECTS**

  - Common or very common Arrhythmias - cardiorespiratory depression - hypotension
  - Frequency not known Convulsions - mood changes (that can last several days)

- **ALLERGY AND CROSS-SENSITIVITY** Can cause hepatotoxicity in those sensitised to halogenated anaesthetics.

- **DIRECTIONS FOR ADMINISTRATION** Volatile liquid anaesthetics are administered using calibrated vapourisers, using air, oxygen, or nitrous oxide-oxygen mixtures as the
carrier gas. To prevent hypoxia, the inspired gas mixture should contain a minimum of 25% oxygen at all times.

### PATIENT AND CARER ADVICE

**Drinking and skilled tasks**

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of driving or undertaking skilled tasks afterwards. For a short general anaesthetic, the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

### Desflurane

#### INDICATIONS AND DOSE

**Induction of anaesthesia (but not recommended)**

- **BY INHALATION**
  - Child 12–17 years: 4–11%, to be inhaled through a calibrated vaporiser.

**Maintenance of anaesthesia (in nitrous oxide–oxygen)**

- **BY INHALATION**
  - Neonate: 2–6%, to be inhaled through a specifically calibrated vaporiser.
  - Child: 2–6%, to be inhaled through a specifically calibrated vaporiser.

**Maintenance of anaesthesia (in oxygen or oxygen-enriched air)**

- **BY INHALATION**
  - Neonate: 2.5–8.5%, to be inhaled through a specifically calibrated vaporiser.
  - Child: 2.5–8.5%, to be inhaled through a specifically calibrated vaporiser.

#### INTERACTIONS

- Appendix 1 (anaesthetics, general).

#### SIDE-EFFECTS

- Apnoea, breath-holding, cough, increased secretions, laryngospasm.

#### PREGNANCY

- May depress neonatal respiration if used during delivery.

#### BREAST FEEDING

- Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

### PATIENT AND CARER ADVICE

**Driving and skilled tasks**

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic, the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

### Isoflurane

#### INDICATIONS AND DOSE

**Induction of anaesthesia (in oxygen or nitrous oxide–oxygen) (but indication not recommended in infants and children of all ages)**

- **BY INHALATION**
  - Neonate: Initially 0.5%, increased to 3%, adjusted according to response, administered using specifically calibrated vaporiser.
  - Child: Initially 0.5%, increased to 3%, adjusted according to response, administered using specifically calibrated vaporiser.

**Maintenance of anaesthesia (in nitrous oxide–oxygen)**

- **BY INHALATION**
  - Neonate: 1–2.5%, to be administered using specifically calibrated vaporiser; an additional 0.5–1% may be required when given with oxygen alone.
  - Child: 1–2.5%, to be administered using specifically calibrated vaporiser; an additional 0.5–1% may be required when given with oxygen alone.

**Maintenance of anaesthesia in caesarean section (in nitrous oxide–oxygen)**

- **BY INHALATION**
  - Child: 0.5–0.75%, to be administered using specifically calibrated vaporiser.

#### IMPORTANT SAFETY INFORMATION

Isoflurane is not recommended for induction of anaesthesia in infants and children of all ages because of the occurrence of cough, breath-holding, desaturation, increased secretions, and laryngospasm.

#### CAUTIONS

- Children under 2 years—limited experience

#### INTERACTIONS

- Appendix 1 (anaesthetics, general).

#### SIDE-EFFECTS

- Breath-holding, cough, irritate mucus membrane, laryngospasm.

#### PREGNANCY

- May depress neonatal respiration if used during delivery.

#### BREAST FEEDING

- Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

### PATIENT AND CARER ADVICE

**Driving and skilled tasks**

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic, the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

### MEDICINAL FORMS

**Inhalation vapour**

- Suprane (Baxter Healthcare Ltd)
  - Desflurane 1 ml per 1 ml Suprane volatile liquid | 240 ml price available (Hospital only)
  - Isoflurane 1 ml per 1 ml Isoflurane inhalation vapour | 250 ml price £35.23 (Hospital only)
  - Isoflurane volatile liquid | 250 ml | £47.50 (Hospital only)
  - AErrane (Baxter Healthcare Ltd)
  - Desflurane 1 ml per 1 ml AErrane volatile liquid | 250 ml price available (Hospital only)
Nitrous oxide

- **INDICATIONS AND DOSE**
  - **Maintenance of anaesthesia in conjunction with other anaesthetic agents**
    - By Inhalation
    - Neonate: 50–66%, to be administered using suitable anaesthetic apparatus in oxygen.
    - Child: 50–66%, to be administered using suitable anaesthetic apparatus in oxygen.

- **Analgesia**
  - By Inhalation
  - Neonate: Up to 50%, to be administered using suitable anaesthetic apparatus in oxygen, adjusted according to the patient’s needs.
  - Child: Up to 50%, to be administered using suitable anaesthetic apparatus in oxygen, adjusted according to the patient’s needs.

**IMPORTANT SAFETY INFORMATION**

Nitrous oxide should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CAUTIONS**
  - Entrapped air following recent underwater dive
  - Pneumothorax
  - Presence of intracranial air after head injury
  - Recent intra-ocular gas injection

**CAUTIONS, FURTHER INFORMATION**

Nitrous oxide may have a deleterious effect if used in patients with an air-containing closed space since nitrous oxide diffuses into such a space with a resulting increase in pressure. This effect may be dangerous in conditions such as pneumothorax, which may enlarge to compromise respiration, or in the presence of intracranial air after head injury, entrapped air following recent underwater dive, or recent intra-ocular gas injection.

- **INTERACTIONS**→ Appendix 1 (anaesthetics, general).
- **SIDE-EFFECTS**
  - Depression of white cell formation
  - Megaloblastic anaemia
  - Neurological toxic effects

**SIDE-EFFECTS, FURTHER INFORMATION**

Hypoxia
- Hypoxia can occur immediately following the administration of nitrous oxide; additional oxygen should always be given for several minutes after stopping the flow of nitrous oxide.

Prolonged exposure
- Exposure of patients to nitrous oxide for prolonged periods, either by continuous or by intermittent administration, may result in megaloblastic anaemia owing to interference with the action of vitamin B12; neurological toxic effects can occur without preceding overt haematological changes. Depression of white cell formation may also occur.

- **PREGNANCY**
  - May depress neonatal respiration if used during delivery.

- **BREAST FEEDING**
  - Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

- **MONITORING REQUIREMENTS**
  - Assessment of plasma-vitamin B12 concentration should be considered in those at risk of deficiency, including those who have a poor, vegetarian, or vegan diet, and those with a history of anaemia.
  - Nitrous oxide should not be given continuously for longer than 24 hours or more frequently than every 4 days without close supervision and haematological monitoring.

- **DIRECTIONS FOR ADMINISTRATION**
  - For analgesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 50% of each gas (Entonox®, Equanox®) is used.
  - For anaesthesia (without loss of consciousness), a mixture of nitrous oxide and oxygen containing 66% of each gas (Entonox®) is used.

- **HANDLING AND STORAGE**
  - Exposure of theatre staff to nitrous oxide should be minimised (risk of serious side-effects).

- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Nitrous oxide for pain
  - www.medicinesforchildren.org.uk/nitrous-oxide-for-pain

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Inhalation gas**

- Nitrous oxide (Non-proprietary)
  - Nitrous oxide 1 ml per 1 ml Nitrous oxide cylinders size E | 1800 litre (50% no price available
  - Medical Nitrous Oxide cylinders size D | 900 litre (no price available
  - Medical Nitrous Oxide cylinders size G | 9000 litre (no price available
  - Nitrous oxide cylinders size F | 3600 litre (no price available
  - Nitrous oxide cylinders size J | 18000 litre (no price available
  - Nitrous oxide cylinders size G | 9000 litre (no price available
  - Nitrous oxide cylinders size C | 450 litre (no price available
  - Medical Nitrous Oxide cylinders size F | 3600 litre (no price available
  - Nitrous oxide cylinders size D | 900 litre (no price available
  - Medical Nitrous Oxide cylinders size E | 1800 litre (no price available

Sevoflurane

- **INDICATIONS AND DOSE**
  - **Induction of anaesthesia (in oxygen or nitrous oxide–oxygen)**
    - By Inhalation
    - Neonate: Up to 4%, adjusted according to response, to be administered using specifically calibrated vaporiser.
    - Child: Initially 0.5–1%, then increased to up to 8%, increased gradually, according to response, to be administered using specifically calibrated vaporiser.

  - **Maintenance of anaesthesia (in oxygen or nitrous oxide–oxygen)**
    - By Inhalation
    - Neonate: 0.5–2%, adjusted according to response, to be administered using specifically calibrated vaporiser.
    - Child: 0.5–3%, adjusted according to response, to be administered using specifically calibrated vaporiser.

- **CAUTIONS**
  - Susceptibility to QT-interval prolongation
  - **INTERACTIONS**→ Appendix 1 (anaesthetics, general).
  - Sevoflurane can interact with carbon dioxide absorbents to form compound A, a potentially nephrotoxic vinyl ether. However, in spite of extensive use, no cases of sevoflurane-induced permanent renal injury have been reported and the carbon dioxide absorbents used in the UK produce very low concentrations of compound A, even in low-flow anaesthetic systems.

- **SIDE-EFFECTS**
  - Agitation
  - Cardiac arrest
  - Dystonia
  - Leucopenia
  - Torsade de pointes
  - Urinary retention

- **PREGNANCY**
  - May depress neonatal respiration if used during delivery.

- **BREAST FEEDING**
  - Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.

- **RENAL IMPAIRMENT**
  - Use with caution.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
  - Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks.
afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Inhalation vapour**

- **Sevoflurane (Non-proprietary)**  
  Sevoflurane 1 ml per 1 ml Sevoflurane volatile liquid | 250 ml £53.00
  £123.00 (Hospital only)

### 1 Anaesthesia adjuvants

#### Pre-medication and peri-operative drugs

**Drugs that affect gastric pH**

Regurgitation and aspiration of gastric contents (Mendelson’s syndrome) can be a complication of general anaesthesia, particularly in obstetrics and in gastrointestinal reflux disease; prophylaxis against acid aspiration is not routinely used in children but may be required in high-risk cases.

An H₂-receptor antagonist can be used before surgery to increase the pH and reduce the volume of gastric fluid. It does not affect the pH of fluid already in the stomach and this limits its value in emergency procedures; an oral H₂-receptor antagonist can be given 1–2 hours before the procedure.

**Antimuscarinic drugs**

Antimuscarinic drugs are used (less commonly nowadays) as premedicants to dry bronchial and salivary secretions which are increased by intubation, upper airway surgery, or some inhalational anaesthetics. They are also used before or with neostigmine p. 602 to prevent bradycardia, excessive salivation, and other muscarinic actions of neostigmine. They also prevent bradycardia and hypotension associated with drugs such as propofol p. 759 and suxamethonium chloride p. 766.

Atropine sulfate p. 764 is now rarely used for premedication but still has an emergency role in the treatment of vagotonic side-effects. Atropine sulfate may have a role in cardiopulmonary resuscitation.

Hyoscine hydrobromide p. 250 reduces secretions and also provides a degree of amnesia, sedation, and anti-emesis. Unlike atropine sulfate it may produce bradycardia rather than tachycardia.

Glycopyrronium bromide p. 765 reduces salivary secretions. When given intravenously it produces less tachycardia than atropine sulfate. It is widely used with neostigmine for reversal of non-depolarising muscle relaxants.

Glycopyrronium bromide or hyoscine hydrobromide are also used to control excessive secretions in upper airways or hypersalivation in palliative care and in children unable to control posture or with abnormal swallowing reflex; effective dose varies and tolerance may develop. The intramuscular route should be avoided if possible. Hyoscine hydrobromide transdermal patches may also be used.

**Sedative drugs**

**Premedication**

Fear and anxiety before a procedure (including the night before) can be minimised by using a sedative drug, usually a benzodiazepine. Premedication may also augment the action of anaesthetics and provide some degree of pre-operative amnesia. The choice of drug depends on the individual, the nature of the procedure, the anaesthetic to be used, and other prevailing circumstances such as outpatients, obstetrics, and availability of recovery facilities. The choice also varies between elective and emergency procedures. Oral administration is preferred if possible; the rectal route should only be used in exceptional circumstances.

Premedicants can be given the night before major surgery; a further, smaller dose may be required before surgery. Alternatively, the first dose may be given on the day of the procedure.

Oral midazolam p. 210 is the most common premedicant for children; temazepam p. 774 may be used in older children. The antihistamine alimemazine tartrate p. 167 is occasionally used orally, but when given alone it may cause postoperative restless in the presence of pain.

**Benzodiazepines**

Benzodiazepines possess useful properties for premedication including relief of anxiety, sedation, and amnesia; short-acting benzodiazepines taken by mouth are the most common premedicants. Benzodiazepines are also used for sedation prior to clinical procedures and for sedation in intensive care.

Benzodiazepines may occasionally cause marked respiratory depression and facilities for its treatment are essential; flumazenil p. 794 is used to antagonise the effects of benzodiazepines.

Midazolam, a water-soluble benzodiazepine, is the preferred benzodiazepine for premedication and for sedation for clinical procedures in children. It has a fast onset of action, and recovery is faster than for other benzodiazepines. Recovery may be longer in children with a low cardiac output, or after repeated dosing.

Midazolam can be given by mouth [unlicensed], but its bitter acidic taste may need to be disguised. It can also be given buccally [unlicensed indication] or intranasally [unlicensed]. Midazolam is associated with profound sedation when high doses are given or when it is used with certain other drugs. It can cause severe disinhibition and restlessness in some children. Midazolam is not recommended for prolonged sedation in neonates; drug accumulation is likely to occur.

Temazepam is given by mouth for premedication in older children and has a short duration of action. Anxiolytic and sedative effects last about 90 minutes, although there may be residual drowsiness. Temazepam is rarely used for dental procedures in children.

Lorazepam p. 209 produces more prolonged sedation than temazepam and it has marked amnesic effects.

Peri-operative use of diazepam p. 207 is not recommended in children; onset and magnitude of response are unreliable, and paradoxical effects may occur. Diazepam is not used for dental procedures in children.

**Antagonists for central and respiratory depression**

Respiratory depression is a major concern with opioid analgesics and it may be treated by artificial ventilation or be reversed by an opioid antagonist. Naloxone hydrochloride p. 796 given intravenously immediately reverses opioid-induced respiratory depression but the dose may have to be repeated because of its short duration of action. Intramuscular injection of naloxone hydrochloride produces a more gradual and prolonged effect but absorption may be erratic. Care is required in children requiring pain relief because naloxone hydrochloride also antagonises the analgesic effect of opioids.

Flumazenil is a benzodiazepine antagonist for the reversal of the central sedative effects of benzodiazepines after anaesthetic and similar procedures. Flumazenil has a shorter half-life and duration of action than diazepam or midazolam so patients may become re sedated.
Neonates

Naloxone hydrochloride is used in newborn infants to reverse respiratory depression and sedation resulting from the use of opioids by the mother, usually for pain during labour. In neonates the effects of opioids may persist for up to 48 hours and in such cases naloxone hydrochloride is often given by intramuscular injection for its prolonged effect. In severe respiratory depression after birth, breathing should first be established (using artificial means if necessary) and naloxone hydrochloride administered only if use of opioids by the mother is thought to cause the respiratory depression; the infant should be monitored closely and further doses of naloxone hydrochloride administered as necessary.

ANTIMUSCARINICS

Atropine sulfate

**INDICATIONS AND DOSE**
- **Bradycardia due to acute massive overdosage of beta-blockers**
  - BY INTRAVENOUS INJECTION
    - Child: 40 micrograms/kg (max. per dose 3 mg)

- **Treatment of poisoning by organophosphorus insecticide or nerve agent (in combination with pralidoxime chloride)**
  - BY INTRAVENOUS INJECTION
    - Child: 20 micrograms/kg every 5–10 minutes (max. per dose 2 mg) until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished, frequency of administration dependent on the severity of poisoning

- **Premedication**
  - BY INTRAVENOUS INJECTION
    - Neonate: 10 micrograms/kg, to be administered immediately before induction of anaesthesia.
    - Child 1 month–11 years: 20 micrograms/kg, to be administered immediately before induction of anaesthesia (minimum 100 micrograms, max. 600 micrograms)
    - Child 12–17 years: 300–600 micrograms, to be administered immediately before induction of anaesthesia
  - BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
    - Neonate: 10 micrograms/kg, to be administered 30–60 minutes before induction of anaesthesia.
    - Child 1 month–11 years: 10–30 micrograms/kg, to be administered 30–60 minutes before induction of anaesthesia (minimum 100 micrograms, max. 600 micrograms)
    - Child 12–17 years: 300–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia
  - BY MOUTH
    - Neonate: 20–40 micrograms/kg, to be administered 1–2 hours before induction of anaesthesia.
    - Child: 20–40 micrograms/kg (max. per dose 900 micrograms), to be administered 1–2 hours before induction of anaesthesia

- **Intra-operative bradycardia**
  - BY INTRAVENOUS INJECTION
    - Neonate: 10–20 micrograms/kg.
    - Child 1 month–11 years: 10–20 micrograms/kg
    - Child 12–17 years: 300–600 micrograms, larger doses may be used in emergencies

**Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block**
- BY INTRAVENOUS INJECTION
  - Neonate: 20 micrograms/kg.
    - Child 1 month–11 years: 20 micrograms/kg (max. per dose 1.2 mg)
    - Child 12–17 years: 0.6–1.2 mg

**UNLICENSED USE** Not licensed for use in children under 12 years for intra-operative bradycardia or by intravenous route for premedication. Not licensed for use by oral route.

**IMPORTANT SAFETY INFORMATION**
Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

- **PREGNANCY** Not known to be harmful; manufacturer advises caution.
- **BREAST FEEDING** May suppress lactation; small amount present in milk—manufacturer advises caution.
- **MONITORING REQUIREMENTS**
  - Control of muscarinic side-effects of neostigmine in reversal of competitive neuromuscular block Since atropine has a shorter duration of action than neostigmine, late unopposed bradycardia may result; close monitoring of the patient is necessary.
  - DIRECTIONS FOR ADMINISTRATION For administration by mouth, injection solution may be given orally.
- **EXCEPTIONS TO LEGAL CATEGORY**
  - With intramuscular use or intravenous use or subcutaneous use Prescription only medicine restriction does not apply where administration is for saving life in emergency.
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection, solution for infusion

**Tablet**
- Atropine sulfate (Non-proprietary)
  - Atropine sulfate 600 microgram
    - 28 tablet (PZN) £25.75 DT price = £25.75

**Solution for injection**
- Atropine sulfate 100 microgram per 1 ml
  - Atropine 500micrograms/5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PZN) £7.40–£13.00 | 10 pre-filled disposable injection (PZN) £69.00–£130.00
  - Atropine sulfate 200 microgram per 1 ml
    - Atropine 1mg/5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PZN) £7.08–£13.00 | 10 pre-filled disposable injection (PZN) £110.00
  - Atropine sulfate 300 microgram per 1 ml
    - Atropine 3mg/10ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PZN) £7.08–£13.00 | 10 pre-filled disposable injection (PZN) £110.00
  - Atropine sulfate 400 microgram per 1 ml
    - Atropine 400micrograms/1ml solution for injection ampoules | 10 ampoule (PZN) £67.78–£74.56 DT price = £71.17
  - Atropine sulfate 600 microgram per 1 ml
    - Atropine 600micrograms/1ml solution for injection ampoules | 10 ampoule (PZN) £11.71 DT price = £11.70
    - Atropine 600micrograms/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PZN) £7.08
  - Atropine sulfate 1 mg per 1 ml
    - Atropine 1mg/1ml solution for injection ampoules | 10 ampoule (PZN) £57.66–£63.43 DT price = £60.55
Glycopyrronium bromide (Glycopyrrylate)

- **INDICATIONS AND DOSE**
  - Premedication at induction
    - By intramuscular injection, or by intravenous injection
  - Neonate: 5 micrograms/kg.
  - Child 1 month–11 years: 4–8 micrograms/kg (max. per dose 200 micrograms)
  - Child 12–17 years: 200–400 micrograms, alternatively 4–5 micrograms/kg (max. per dose 400 micrograms)

- **Intra-operative bradycardia**
  - By intravenous injection

  - Neonate: 10 micrograms/kg, repeated if necessary.
  - Child: 4–8 micrograms/kg (max. per dose 200 micrograms), repeated if necessary

- **Control of muscarinic side-effects of neostigmine in reversal of non-depolarising neuromuscular block**
  - By intravenous injection

  - Neonate: 10 micrograms/kg.
  - Child 1 month–11 years: 10 micrograms/kg (max. per dose 500 micrograms)
  - Child 12–17 years: 10–15 micrograms/kg, alternatively, 200 micrograms per 1 mg of neostigmine to be administered

- **Control of upper airways secretion | Hypersalivation**

  - By mouth
    - Child: 40–100 micrograms/kg 3–4 times a day (max. per dose 2 mg), adjusted according to response
  - By subcutaneous infusion
    - Child 1 month–11 years: 12–40 micrograms/kg (max. per dose 1.2 mg) over 24 hours
    - Child 12–17 years: 0.6–1.2 mg/24 hours
  - By subcutaneous injection, or by intramuscular injection, or by intravenous injection
    - Child 1 month–11 years: 4–10 micrograms/kg 4 times a day (max. per dose 200 micrograms) as required
    - Child 12–17 years: 200 micrograms every 4 hours as required

- **UNLICENSED USE** Not licensed for use in control of upper airways secretion and hypersalivation.

- **IMPORTANT SAFETY INFORMATION**
  - Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth, injection solution may be given or crushed tablets suspended in water.

- **PRESCRIBING AND DISPENSING INFORMATION** Tablets may be available on a named-patient basis from specialist importing companies.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, liquid

  - **Tablet**
    - Glycopyrronium bromide (Non-proprietary)
      - Glycopyrronium bromide 1 mg | Roblinul Forte 2mg tablets | 100 tablet no price available
      - Glycopyrronium bromide 1mg tablets | 30 tablet | £18.50
      - Glycopyrronium bromide 1mg tablets | 30 tablet | £18.50-£21.60 OT price = £197.25

  - Glycopyrronium bromide 2 mg | Roblinul Forte 2mg tablets | 100 tablet no price available
  - Glycopyrronium bromide 2mg tablets | 30 tablet | £19.80–£23.76 OT price = £220.80

- **Solution for injection**
  - Glycopyrronium bromide (Non-proprietary)
  - Glycopyrronium bromide 200 microgram per 1 ml Glycopyrronium bromide 200 micrograms/1ml solution for injection ampoules | 10 ampoule | £14.00 OT price = £8.28
  - Glycopyrronium bromide 600 micrograms/3ml solution for injection ampoules | 3 ampoule | £8.00–£8.56 | 10 ampoule | £11.50

# 1.1 Neuromuscular blockade

## Neuromuscular blockade

### Neuromuscular blocking drugs

Neuromuscular blocking drugs used in anaesthesia are also known as muscle relaxants. By specific blockade of the neuromuscular junction they enable light anaesthesia to be used with adequate relaxation of the muscles of the abdomen and diaphragm. They also relax the vocal cords and allow the passage of a tracheal tube. Their action differs from the muscle relaxants used in musculoskeletal disorders that act on the spinal cord or brain.

Children who have received a neuromuscular blocking drug should always have their respiration assisted or controlled until the drug has been inactivated or antagonised. They should also receive sufficient concomitant inhalational or intravenous anaesthetic or sedative drugs to prevent awareness.

#### Non-depolarising neuromuscular blocking drugs

Non-depolarising neuromuscular blocking drugs (also known as competitive muscle relaxants) compete with acetylcholine for receptor sites at the neuromuscular junction and their action can be reversed with anticholinesterases such as neostigmine p. 602. Non-depolarising neuromuscular blocking drugs can be divided into the aminosteroid group, comprising pancuronium bromide p. 768, rocuronium bromide p. 769, and vecuronium bromide p. 769, and the benzylisoquinolinium group, comprising atracurium besilate p. 767, cisatracurium p. 768, and mivacurium p. 768.

Non-depolarising neuromuscular blocking drugs have a slower onset of action than suxamethonium chloride p. 766. These drugs can be classified by their duration of action as short-acting (15–30 minutes), intermediate-acting (30–40 minutes), and long-acting (60–120 minutes), although duration of action is dose-dependent. Drugs with a shorter or intermediate duration of action, such as atracurium besilate and vecuronium bromide, are more widely used than those with a longer duration of action, such as pancuronium bromide.

Non-depolarising neuromuscular blocking drugs have no sedative or analgesic effects and are not considered to trigger malignant hyperthermia.

For patients receiving intensive care and who require tracheal intubation and mechanical ventilation, a non-depolarising neuromuscular blocking drug is chosen according to its onset of effect, duration of action, and side-effects. Rocuronium bromide, with a rapid onset of effect, may facilitate intubation. Atracurium besilate or cisatracurium may be suitable for long-term neuromuscular blockade since their duration of action is not dependent on elimination by the liver or the kidneys.

Atracurium besilate, a mixture of 10 isomers, is a benzylisoquinolinium neuromuscular blocking drug with an intermediate duration of action. It undergoes non-enzymatic metabolism which is independent of liver and kidney function, thus allowing its use in children with hepatic or
Anaesthesia adjuvants

NEUROMUSCULAR BLOCKING DRUGS

DEPOLARISING

Suxamethonium chloride
(Succinylcholine chloride)

- **DRUG ACTION** Suxamethonium acts by mimicking acetylcholine at the neuromuscular junction but hydrolysis is much slower than for acetylcholine; depolarisation is therefore prolonged, resulting in neuromuscular blockade.

- **INDICATIONS AND DOSE**
  - **Neuromuscular blockade (short duration) during surgery**
    - **BY INTRAVENOUS INJECTION**
      - Neonate: 2 mg/kg, produces 5–10 minutes neuromuscular blockade.
      - Child 1–11 months: 2 mg/kg
      - Child 1–17 years: 1 mg/kg
      - **BY INTRAMUSCULAR INJECTION**
        - Neonate: Up to 4 mg/kg, produces 10–30 minutes neuromuscular blockade.
        - Child 1–11 months: Up to 5 mg/kg
        - Child 1–11 years: Up to 4 mg/kg (max. per dose 150 mg)

- **PHARMACOKINETICS**
  - With intramuscular use Intramuscular injection has a duration of onset of 2–3 minutes.

- **IMPORTANT SAFETY INFORMATION**
  - Should only be administered by, or under the direct supervision of, personnel experienced in its use.

- **CONTRA-INDICATIONS** Duchenne muscular dystrophy • family history of malignant hyperthermia • hyperkalaemia • low plasma-cholinesterase activity (including severe liver disease) • major trauma • neurological disease involving acute wasting of major muscle • personal or family history of congenital myotonic disease • prolonged immobilisation (risk of hyperkalaemia) • severe burns

- **CAUTIONS** Cardiac disease • neuromuscular disease • raised intra-ocular pressure (avoid in penetrating eye injury) • respiratory disease • severe sepsis (risk of hyperkalaemia)

- **INTERACTIONS** → Appendix 1 (muscle relaxants).

- **SIDE-EFFECTS**
  - **Common or very common** Flushing • hyperkalaemia • increased gastric pressure • increased intra-ocular pressure • myoglobinemia • myoglobinuria • postoperative muscle pain • rash
  - **Rare** Apnoea • arrhythmias • bronchospasm • cardiac arrest • limited jaw mobility • prolonged respiratory depression
  - **Very rare** Anaphylactic reactions • malignant hyperthermia
  - **Frequency not known** Bradycardia (may occur with the first dose) • hypertension • hypotension • rhabdomyolysis • tachycardia (occurs with single use)

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Bradycardia Premedication with atropine reduces bradycardia as well as the excessive salivation associated with suxamethonium use.

- **ALLERGY AND CROSS-SENSITIVITY** Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.

- **PREGNANCY** Mildly prolonged maternal neuromuscular blockade may occur.

- **BREAST FEEDING** Unlikely to be present in breast milk in significant amounts (ionised at physiological pH). Breast-feeding may be resumed once the mother recovered from neuromuscular block.

renal impairment. Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute. Neonates may be more sensitive to the effects of atracurium besilate and lower doses may be required.

Cisatracurium is a single isomer of atracurium besilate. It is more potent and has a slightly longer duration of action than atracurium besilate and provides greater cardiovascular stability because cisatracurium lacks histamine-releasing effects. In children aged 1 month to 12 years, cisatracurium has a shorter duration of action and produces faster spontaneous recovery.

Mivacurium, a benzylisoquinolinium neuromuscular blocking drug, has a short duration of action. It is metabolised by plasma cholinesterase and muscle paralysis is prolonged in individuals deficient in this enzyme. It is not associated with vagolytic activity or ganglionic blockade although histamine release can occur, particularly with rapid injection. In children under 12 years mivacurium has a faster onset, shorter duration of action, and produces more rapid spontaneous recovery.

Pancuronium bromide, an aminosteroid neuromuscular blocking drug, has a long duration of action and is often used in children receiving long-term mechanical ventilation in intensive care units. It lacks a histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension. The half-life of pancuronium bromide is prolonged in neonates; neonates should receive postoperative intermittent positive pressure ventilation.

Rocuronium bromide exerts an effect within 2 minutes and has the most rapid onset of any of the non-depolarising neuromuscular blocking drugs. It is an aminosteroid neuromuscular blocking drug with an intermediate duration of action. It is reported to have minimal cardiovascular effects; high doses produce mild vagolytic activity. In most children, the duration of action of rocuronium bromide may be shorter than in adults; however, in neonates and children under 2 years, usual doses may produce a more prolonged action.

Vecuronium bromide, an aminosteroid neuromuscular blocking drug, has an intermediate duration of action. It does not generally produce histamine release and lacks cardiovascular effects. In most children, the duration of action of vecuronium bromide may be shorter than in adults; however, in neonates and children under 2 years, usual doses may produce a more prolonged action.

**DEPOLARISING neuromuscular blocking drugs**

Suxamethonium chloride has the most rapid onset of action of any of the neuromuscular blocking drugs and is ideal if fast onset and brief duration of action are required e.g. with tracheal intubation. Neonates and young children are less sensitive to suxamethonium chloride and a higher dose may be required. Unlike the non-depolarising neuromuscular blocking drugs, its action cannot be reversed and recovery is spontaneous; anticholinesterases such as neostigmine potentiate the neuromuscular block.

Suxamethonium chloride should be given after anaesthetic induction because paralysis is usually preceded by painful muscle fasciculations. Bradycardia may occur; premedication with atropine sulfate p. 764 reduces bradycardia as well as the excessive salivation associated with suxamethonium chloride use.

Prolonged paralysis may occur in dual block, which occurs with high or repeated doses of suxamethonium chloride and is caused by the development of a non-depolarising block following the initial depolarising block. Children with myasthenia gravis are resistant to suxamethonium chloride but can develop dual block resulting in delayed recovery. Prolonged paralysis may also occur in those with low or atypical plasma cholinesterase. Assisted ventilation should be continued until muscle function is restored.
Neuromuscular blockade 767

Non-depolarising neuromuscular blocking drugs

**IMPORTANT SAFETY INFORMATION**
Non-depolarising neuromuscular blocking drugs should only be administered by, or under direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

**CAUTIONS**
Burns (resistance can develop, increased doses may be required) - cardiorespiratory disease (reduce rate of administration) - electrolyte disturbances (response unpredictable) - fluid disturbances (response unpredictable) - hypothermia (activity prolonged, lower doses required) - myasthenia gravis (activity prolonged, lower doses required) - neuromuscular disorders (response unpredictable)

**INTERACTIONS**
Appendix 1 (muscle relaxants).

**ALLERGY AND CROSS-SENSITIVITY**
Allergic cross-reactivity between neuromuscular blocking drugs has been reported; caution is advised in cases of hypersensitivity to these drugs.

**PREGNANCY**
Non-depolarising neuromuscular blocking drugs are highly ionised at physiological pH and are therefore unlikely to cross the placenta in significant amounts.

**BREAST FEEDING**
Non-depolarising neuromuscular blocking drugs are ionised at physiological pH and are unlikely to be present in milk in significant amounts. Breast-feeding may be resumed once the mother has recovered from neuromuscular block.

**INDICATIONS AND DOSE**
Neuromuscular blockade (short to intermediate duration) for surgery

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Neonate: Initially 300–500 micrograms/kg, followed by (by intravenous injection) 100–200 micrograms/kg, repeated if necessary, alternatively (by intravenous infusion) 300–400 micrograms/kg/hour, adjusted according to response.
  - Child: Initially 300–600 micrograms/kg, then (by intravenous injection) 100–200 micrograms/kg.

---

**NEUROMUSCULAR BLOCKING DRUGS NON-DEPOLARISING**

**Anaphylactoid reactions**
Acute myopathy (after prolonged use in intensive care) - bronchospasm - hypotension - seizures - skin flushing - tachycardia

**SIDE-EFFECTS, FURTHER INFORMATION**
Cardiovascular effects Cardiovascular effects are associated with significant histamine release; histamine release can be minimised by administering slowly or in divided doses over at least 1 minute. Neonates may be more sensitive to the effects of atracurium and lower doses may be required.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For continuous intravenous infusion, dilute to a concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9%; stability varies with diluent.

- With intravenous use in neonates Neonatal intensive care, dilute 60 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; minimum concentration of 500 micrograms/mL, maximum concentration of 5 mg/mL; an intravenous infusion rate of 0.1 mL/hour provides a dose of 120 micrograms/kg/hour.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Atracurium besilate (Non-proprietary)
  - Atracurium besilate 10 mg per 1 ml
    - Atracurium besilate 250mg/25ml solution for injection vials | 1 vial (£16.50)
    - Atracurium besilate 25mg/2.5ml solution for injection ampoules | 5 ampoule (£8.50–£9.25)
  - Atracurium besilate 50mg/5ml solution for injection vials | 5 ampoule (£15.00–£17.50)
  - Tracrium (GlaxoSmithKline UK Ltd)
    - Tracrium (GlaxoSmithKline UK Ltd) 10 mg per 1 ml
      - Tracrium 250mg/25ml solution for injection vials | 2 vial (£25.81)
      - Tracrium 25mg/2.5ml solution for injection ampoules | 5 ampoule (£8.28)
      - Tracrium 50mg/5ml solution for injection ampoules | 5 ampoule (£15.02)

---

**DOSAGES AT EXTREMES OF BODY-WEIGHT**
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**UNLICENSED USE**
Not licensed for use in neonates.
Cisatracurium

- **INDICATIONS AND DOSE**
  - Neuromuscular blockade (intermediate duration) during surgery
    - **INITIALLY BY INTRAVENOUS INJECTION**
      - Child 1 month–1 year: Initially 150 micrograms/kg, then (by intravenous injection) 30 micrograms/kg every 20 minutes as required
      - Child 2–11 years: Initially 150 micrograms/kg, 80–100 micrograms/kg if not for intubation, then (by intravenous injection) 20 micrograms/kg every 10 minutes as required, alternatively (by intravenous injection) initially 150 micrograms/kg, followed by (by intravenous infusion) 180 micrograms/kg/hour, (by intravenous infusion) reduced to 60–120 micrograms/kg/hour, adjusted according to response
      - Child 12–17 years: Initially 150 micrograms/kg, then (by intravenous injection) 30 micrograms/kg every 20 minutes as required, alternatively (by intravenous injection) initially 150 micrograms/kg, followed by (by intravenous infusion) 180 micrograms/kg/hour, (by intravenous infusion) reduced to 60–120 micrograms/kg/hour, adjusted according to response
  - Neuromuscular blockade (long duration) during surgery
    - **INITIALLY BY INTRAVENOUS INJECTION**
      - Child 12–17 years: Initially 70–250 micrograms/kg, then (by intravenous injection) 100 micrograms/kg every 15 minutes as required, alternatively (by intravenous infusion) 8–10 micrograms/kg/minute, (by intravenous infusion) adjusted in steps of 1 microgram/kg/minute every 3 minutes if required; (by intravenous infusion) usual dose 11–14 micrograms/kg/minute
    - **CAUTIONS** Burns (low plasma cholestérol activity; dose titration required)
    - **SIDE-EFFECTS** Very rare Anaphylacticoid reactions
    - **Frequency not known** Bronchospasm, hypotension
    - **Hepatic Impairment** Reduce dose in severe impairment.
    - **Renal Impairment** Clinical effect prolonged in renal failure—reduce dose accordingly to response.
  - **DOSES AT EXTREMES OF BODY-WEIGHT**
    - To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **SIDE-EFFECTS** Acute myopathy (after prolonged use in intensive care) · bradycardia
- **DIRECTIONS FOR ADMINISTRATION** For continuous intravenous infusion, dilute to a concentration of 0.1–2 mg/mL with Glucose 5% or Sodium Chloride 0.9%; solutions of 2 mg/mL and 5 mg/mL may be infused undiluted.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - **Cisatracurium (Non-proprietary)**
      - Cisatracurium (as Cisatracurium besilate) 2 mg per 1 ml
      - 1 ml Cisatracurium besilate 20mg/10ml solution for injection ampoules | 5 ampoule £3.03
      - Cisatracurium besilate 20mg/10ml solution for injection vials | 5 vial £37.75
    - **Cisatracurium (as Cisatracurium besilate) 5 mg per 1 ml**
      - 1 ml Cisatracurium besilate 30mg/30ml solution for injection vials | 5 ampoules £45.00 (Hospital only) | 1 vial £18.66
    - **Nimbex (GlaxoSmithKline UK Ltd)**
      - Cisatracurium (as Cisatracurium besilate) 2 mg per 1 ml
      - Nimbex 20mg/10ml solution for injection ampoules | 5 ampoule £37.75
      - Cisatracurium (as Cisatracurium besilate) 5 mg per 1 ml
      - Nimbex Forte 30mg/30ml solution for injection vials | 1 vial £31.09

Mivacurium

- **INDICATIONS AND DOSE**
  - Neuromuscular blockade (short duration) during surgery
    - **INITIALLY BY INTRAVENOUS INJECTION**
      - Child 2–5 months: Initially 150 micrograms/kg, then (by intravenous injection) 100 micrograms/kg every 6–9 minutes as required, alternatively (by intravenous infusion) 8–10 micrograms/kg/minute, (by intravenous infusion) adjusted in steps of 1 microgram/kg/minute every 3 minutes if required; (by intravenous infusion) usual dose 11–14 micrograms/kg/minute
      - Child 6 months–11 years: Initially 200 micrograms/kg, then (by intravenous injection) 100 micrograms/kg/minute
  - Neuromuscular blockade (intermediate duration) during surgery
    - **INITIALLY BY INTRAVENOUS INJECTION**
      - Child 1 month–1 year: Initially 150 micrograms/kg, then (by intravenous injection) 30 micrograms/kg every 20 minutes as required
      - Child 2–11 years: Initially 150 micrograms/kg, 80–100 micrograms/kg if not for intubation, then (by intravenous injection) 20 micrograms/kg every 10 minutes as required, alternatively (by intravenous injection) initially 150 micrograms/kg, followed by (by intravenous infusion) 180 micrograms/kg/hour, (by intravenous infusion) reduced to 60–120 micrograms/kg/hour, adjusted according to response
    - **DOSES AT EXTREMES OF BODY-WEIGHT**
      - To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **SIDE-EFFECTS** Acute myopathy (after prolonged use in intensive care) · hypertension · tachycardia
- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection, give undiluted or dilute in Glucose 5% or Sodium Chloride 0.9%; doses up to 150 micrograms/kg may be given over 5–15 seconds, higher doses should be given over 30 seconds. In asthma, cardiovascular disease or in those sensitive to reduced arterial blood pressure, give over 60 seconds.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - **Mivacurium (as Mivacurium chloride) 2 mg per 1 ml**
      - Mivacuron 10mg/5ml solution for injection ampoules | 5 ampoule £13.95
      - Mivacuron 20mg/10ml solution for injection ampoules | 5 ampoule £22.57

Pancuronium bromide

- **INDICATIONS AND DOSE**
  - Neuromuscular blockade (long duration) during surgery
    - **BY INTRAVENOUS INJECTION**
      - Neonate: Initially 100 micrograms/kg, then 50 micrograms/kg, repeated if necessary.
      - Child: Initially 100 micrograms/kg, then 20 micrograms/kg, repeated if necessary
  - **DOSES AT EXTREMES OF BODY-WEIGHT**
    - To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **SIDE-EFFECTS** Acute myopathy (after prolonged use in intensive care) · hypertension · tachycardia
- **SPECIAL INFORMATION**
  - Pancuronium lacks histamine-releasing effect, but vagolytic and sympathomimetic effects can cause tachycardia and hypertension.
  - **Hepatic Impairment** Possibly slower onset, higher dose requirement, and prolonged recovery time.
  - **Renal Impairment** Use with caution; prolonged duration of block.
  - **DIRECTIONS FOR ADMINISTRATION** For intravenous injection, give undiluted or dilute in Glucose 5% or Sodium Chloride 0.9%.
**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Pancuronium bromide (Non-proprietary)
  - **Pancuronium bromide 2 mg per 1 ml** Pancuronium bromide 4mg/2ml solution for injection ampoules | 10 ampoule (PSM) £50.00

---

**Rocuronium bromide**

**INDICATIONS AND DOSE**

**Neuromuscular blockade (intermediate duration) during surgery**
- **INITIALLY BY INTRAVENOUS INJECTION**
  - Neonate: Initially 600 micrograms/kg, then (by intravenous injection) 150 micrograms/kg, repeated if necessary, alternatively (by intravenous infusion) 300–600 micrograms/kg/hour, adjusted according to response.
  - Child: Initially 600 micrograms/kg, then (by intravenous injection) 150 micrograms/kg, repeated if necessary, alternatively (by intravenous infusion) 300–600 micrograms/kg/hour, adjusted according to response.

**DOSES AT EXTREMES OF BODY-WEIGHT**
To avoid excessive dosage, doses should be calculated on the basis of ideal bodyweight.

- UNLICENSED USE Not licensed for assisted ventilation in intensive care.
- SIDE-EFFECTS
  - Very rare Anaphylactoid reactions
  - Frequency not known Acute myopathy (after prolonged use in intensive care) - bronchospasm - hypotension - skin flushing - tachycardia
- HEPATIC IMPAIRMENT Reduce dose.
- RENAL IMPAIRMENT Reduce maintenance dose; prolonged paralysis.
- DIRECTIONS FOR ADMINISTRATION For continuous intravenous infusion OR via drip tubing, may be diluted with Glucose 5% or Sodium Chloride 0.9%.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Rocuronium bromide (Non-proprietary)
  - **Rocuronium bromide 10 mg per 1 ml** Rocuronium bromide 50mg/5ml solution for injection vials | 10 vial (PSM) £28.00-£30.00
  - Rocuronium bromide 100mg/10ml solution for injection vials | 10 vial (PSM) £57.00-£60.00
  - **Esmeron** (Merck Sharp & Dohme Ltd)
    - **Rocuronium bromide 10 mg per 1 ml** Esmeron 50mg/5ml solution for injection vials | 10 vial (PSM) £28.92 (Hospital only)
    - Esmeron 100mg/10ml solution for injection vials | 10 vial (PSM) £57.85 (Hospital only)

- UNLICENSED USE Not licensed for assisted ventilation in intensive care.
- SIDE-EFFECTS
  - Very rare Anaphylactoid reactions
  - Frequency not known Acute myopathy (after prolonged use in intensive care) - bronchospasm - hypotension - skin flushing - tachycardia
- HEPATIC IMPAIRMENT Use with caution in significant impairment.
- RENAL IMPAIRMENT Use with caution.
- DIRECTIONS FOR ADMINISTRATION
  - With intravenous use Reconstitute each vial with 5mL Water for Injections to give 2 mg/mL solution; alternatively reconstitute with up to 10 mL Glucose 5% or Sodium Chloride 0.9% or Water for Injections unsuitable for further dilution if not reconstituted with Water for Injections. For continuous intravenous infusion, dilute reconstituted solution to a concentration up to 40 micrograms/mL. Glucose 5% or Sodium Chloride 0.9%; reconstituted solution can also be given via drip tubing.
  - With intravenous use in neonates Neonatal intensive care, reconstitute each vial with 5 mL Water for Injections to give 2 mg/mL solution. Dilute 5 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.8–1.4 micrograms/kg/min half an hour provides a dose of 50 micrograms/kg/hour, minimum concentration of 40 micrograms/mL.

---

**Vecuronium bromide**

**INDICATIONS AND DOSE**

**Neuromuscular blockade (intermediate duration) during surgery**
- **INITIALLY BY INTRAVENOUS INJECTION**
  - Neonate: Initially 80 micrograms/kg, then (by intravenous injection) 30–50 micrograms/kg, adjusted according to response.
  - Child: Initially 80–100 micrograms/kg, then (by intravenous injection) 20–30 micrograms/kg, repeated if necessary, alternatively (by intravenous infusion) 0.8–1.4 micrograms/kg/minute, adjusted according to response

**Assisted ventilation in intensive care**
- **INITIALLY BY INTRAVENOUS INJECTION**
  - Neonate: Initially 80 micrograms/kg, then (by intravenous injection) 30–50 micrograms/kg, adjusted according to response, alternatively (by intravenous infusion) initially 80 micrograms/kg, then (by intravenous infusion) 0.8–1.4 micrograms/kg/minute, adjusted according to response, risk of accumulation—consider interruption of infusion.
  - Child: Initially 80–100 micrograms/kg, initial dose is optional, then (by intravenous infusion) 0.8–1.4 micrograms/kg/minute, adjusted according to response, (by intravenous infusion) increased if necessary up to 3 micrograms/kg/minute

**DOSES AT EXTREMES OF BODY-WEIGHT**
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal bodyweight.
1.2 Neuromuscular blockade reversal

Drugs for reversal of neuromuscular blockade

Anticholinesterases

Anticholinesterases reverse the effects of the non-depolarising (competitive) neuromuscular blocking drugs such as pancuronium bromide but they prolong the action of the depolarising neuromuscular blocking drug suxamethonium chloride.

Neostigmine is used specifically for reversal of non-depolarising (competitive) blockade. It acts within one minute of intravenous injection and its effects last for 20 to 30 minutes; a second dose may then be necessary. Glycopyrronium bromide p. 765 or alternatively atropine sulfate, given before or with neostigmine, prevent bradycardia, excessive salivation, and other muscarinic effects of neostigmine.

Other drugs for reversal of neuromuscular blockade

Sugammadex below is a modified gamma cyclodextrin that can be used in children for the routine reversal of neuromuscular blockade induced by rocuronium bromide.

ANTICHOLINESTERASES

Neostigmine with glycopyrronium bromide

The properties listed below are those particular to the combination only. For the properties of the components please consider, neostigmine p. 602, glycopyrronium bromide p. 765.

- **INDICATIONS AND DOSE**
  - **Reversal of non-depolarising neuromuscular blockade**
    - **BY INTRAVENOUS INJECTION**
    - Child: 0.02 mL/kilogram, repeated if necessary, alternatively dilute to 1 in 10 solution and give 0.2 mL/kg; maximum 2 mL per course

- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection, may be diluted with Sodium Chloride 0.9%, give over 10–30 seconds

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Solution for injection**
    - Neostigmine with glycopyrronium bromide (Non-proprietary)
      - Glycopyrronium bromide 500 microgram per 1 mL, Neostigmine methylsulfate 2.5 mg per 1 mL, Neostigmine 2.5mg/2mL / Glycopyrronium bromide 500microgram/1mL solution for injection ampoules | 10 ampoule £11.50

ANTIDOTES AND CHELATORS

Sugammadex

- **INDICATIONS AND DOSE**
  - Routine reversal of neuromuscular blockade induced by rocuronium
    - BY INTRAVENOUS INJECTION
    - Child 2-17 years: 2 mg/kg (consult product literature)

- **IMPORTANT SAFETY INFORMATION**
  - Should only be administered by, or under the direct supervision of, personnel experienced in its use.

  - **CAUTIONS**
    - Cardiovascular disease (recovery may be delayed) · pre-existing coagulation disorders · recurrence of neuromuscular blockade— monitor respiratory function until fully recovered · use of anticoagulants (unrelated to surgery) · wait 24 hours before re-administering rocuronium
  - **INTERACTIONS** → Appendix 1 (sugammadex).
  - **SIDE-EFFECTS**
    - Bradycardia · bronchospasm · cardiac arrest · hypersensitivity reactions
  - **PREGNANCY**
    - Use with caution—no information available.
  - **RENAL IMPAIRMENT**
    - Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
  - **DIRECTIONS FOR ADMINISTRATION**
    - For intravenous injection dose may be diluted to a concentration of 10 mg/mL with Sodium Chloride 0.9%.
  - **NATIONAL FUNDING/ACCESS DECISIONS**
    - Scottish Medicines Consortium (SMC) Decisions
      - The Scottish Medicines Consortium, has advised (February 2013) that sugammadex (Bridion®) is accepted for restricted use within NHS Scotland for the routine reversal of neuromuscular blockade in high-risk patients only, or where prompt reversal of neuromuscular block is required.

  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Solution for injection**
      - ELECTROLYTES: May contain Sodium
        - Bridion (Merk Sharp & Dohme Ltd)
          - Sugammadex (as Sugammadex sodium) 100 mg per 1 mL Bridion 500mg/5ml solution for injection vials | 10 vial £1,491.00 (Hospital only)
          - Bridion 200mg/2ml solution for injection vials | 10 vial £596.40 (Hospital only)

1.3 Peri-operative analgesia

Peri-operative analgesia

Non-opioid analgesics

Since non-steroidal anti-inflammatory drugs (NSAIDs) do not depress respiration, do not impair gastro-intestinal motility, and do not cause dependence, they may be useful alternatives or adjuncts to opioids for the relief of postoperative pain. NSAIDs may be inadequate for the relief of severe pain.

Diclofenac sodium p. 605, diclofenac potassium p. 605, ibuprofen p. 608, paracetamol p. 254, and ketorolac trometamol p. 771 are used to relieve postoperative pain in children; diclofenac sodium and paracetamol can be given parenterally and rectally as well as by mouth. Ketorolac trometamol is given by intravenous injection.
Opioid analgesics

Opioid analgesics are now rarely used as premedicants; they are more likely to be administered at induction. Pre-operative use of opioid analgesics is generally limited to children who require control of existing pain. The main side-effects of opioid analgesics are respiratory depression, cardiovascular depression, nausea, and vomiting; see general notes on opioid analgesics and their use in postoperative pain.

See the management of opioid-induced respiratory depression in Pre-medication and peri-operative drugs p. 763.

Intra-operative analgesia

Opioid analgesics given in small doses before or with induction reduce the dose requirement of some drugs used during anaesthesia. Allantoin p. 772, fentanyl p. 262, and remifentanil p. 772 are particularly useful because they act within 1–2 minutes and have short durations of action. The initial doses of allantoin or fentanyl are followed either by successive intravenous injections or by an intravenous infusion; prolonged infusions increase the duration of effect. In contrast to other opioids which are metabolised in the liver, remifentanil undergoes rapid metabolism by nonspecific blood and tissue esterases; its short duration of action allows prolonged administration at high dosage, without accumulation, and with little risk of residual postoperative respiratory depression. Remifentanil should not be given by intravenous injection intraoperatively, but it is well suited to continuous infusion; a supplementary analgesic is given before stopping the infusion of remifentanil.

Analgesics > Non-steroidal anti-inflammatory drugs

Ketorolac trometamol

- Indications and dose
  - Short-term management of moderate to severe acute postoperative pain only
    - By intramuscular injection, or by intravenous injection
      - Child 16-17 years (body-weight up to 50 kg): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 60 mg per day
      - Child 16-17 years (body-weight 50 kg and above): Initially 10 mg, then 10–30 mg every 4–6 hours as required for maximum duration of treatment 2 days, frequency may be increased to up to every 2 hours during initial postoperative period; maximum 90 mg per day
    - By intravenous injection
      - Child 6 months–15 years: Initially 0.5–1 mg/kg (max. per dose 15 mg), then 500 micrograms/kg every 6 hours (max. per dose 15 mg) as required for maximum duration of treatment 2 days; maximum 60 mg per day
  - Unlicensed use: Not licensed for use in children under 16 years.
  - Contra-indications: Active or history of gastro-intestinal bleeding; active or history of gastro-intestinal ulceration; coagulation disorders; complete or partial syndrome of nasal polyps; confirmed or suspected cerebrovascular bleeding; dehydration; following operations with high risk of haemorrhage or incomplete haemostasis; haemorrhagic diatheses; history of gastro-intestinal perforation; hypovolaemia; severe heart failure.
  - Cautions: Allergic disorders; cardiac impairment (NSAIDs may impair renal function); cerebrovascular disease.
  - Coagulation defects; connective-tissue disorders; Crohn’s disease (may be exacerbated); heart failure; ischaemic heart disease; peripheral arterial disease; risk factors for cardiovascular events; ulcerative colitis (may be exacerbated); uncontrolled hypertension.

Interactions > Appendix 1 (NSAIDs).

Side-effects

- Rare: Alveolitis; aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible); hepatic damage; interstitial fibrosis associated with NSAIDs can lead to renal failure; pancreatitis; papillary necrosis associated with NSAIDs can lead to renal failure; pulmonary eosinophilia; Stevens-Johnson syndrome; toxic epidermal necrolysis.

Frequency not known: Abnormal dreams; angioedema; asthma; blood disorders; bradycardia; bronchospasm; chest pain; colitis (induction of or exacerbation of); confusion; convulsions; Crohn’s disease (induction of or exacerbation of); depression; diarrhoea; dizziness; drowsiness; dry mouth; dyspnoea; euphoria; fluid retention (rarely precipitating congestive heart failure); flushing; gastro-intestinal bleeding; gastro-intestinal discomfort; gastro-intestinal disturbances; gastro-intestinal ulceration; haematuria; hallucinations; haemolysis; hearing disturbance; hyperkalaemia; hyperkinesia; hypersensitivity reactions; hypotension; hyponatraemia; insomnia; malaise; myalgia; nausea; nervousness; optic neuritis; pain at injection site; pallor; palpitation; paraesthesia; photosensitivity; psychosis; purpura; raised blood pressure; rashes; renal failure (especially in patients with pre-existing renal impairment); sweating; taste disturbances; thirst; tinnitus; urinary frequency; vertigo; visual disturbances.

Side-effects, further information

- Serious side-effects: For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 604.
- Allergy and cross-sensitivity: Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- Pregnancy: Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus in utero and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- Breastfeeding: Amount too small to be harmful.
- Hepatic impairment: Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- Renal impairment: Avoid if possible or use with caution. Avoid if serum creatinine greater than 160 micromol/litre.
- The lowest effective dose should be used for the shortest possible duration. Max. 60 mg daily by intramuscular injection or intravenous injection.
- Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- Directions for administration: For intravenous injection, give over at least 15 seconds.
- Medicinal forms: There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Ketorolac trometamol (Non-proprietary)
  - Ketorolac trometamol 30 mg per 1 ml

Ketorolac trometamol 30 mg/1 ml solution for injection ampoules | 6 ampoule 56.56
**Anaesthesia adjuvants**

**Analgesics > Opioids**

### Alfentanil

- **Indications and Dose**
  - Assisted ventilation: analgesia and enhancement of anaesthesia for short procedures
    - By intravenous injection
      - Neonate: Initially 5–20 micrograms/kg, dose to be administered over 30 seconds; supplemental doses up to 10 micrograms/kg.
      - Child: Initially 10–20 micrograms/kg, dose to be administered over 30 seconds; supplemental doses up to 10 micrograms/kg.
  - Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia for longer procedures
    - By intravenous infusion
      - Neonate: Initially 10–50 micrograms/kg, dose to be administered over 10 minutes, followed by 30–60 micrograms/kg/hour.
      - Child: Initially 50–100 micrograms/kg, dose to be administered over 10 minutes, followed by 30–120 micrograms/kg/hour, usual dose with intravenous anaesthetic, 60 micrograms/kg/hour.

- **Doses at extremes of body-weight**
  - To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

- **Pharmacokinetics**
  - Half-life is prolonged in neonates and accumulation is likely with prolonged use. Clearance may be increased in children 1 month–12 years and higher infusion doses might be needed.

- **Caution**
  - Repeated intra-operative doses. Repeated intra-operative doses of alfentanil should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

- **Side-effects**
  - Common or very common: Hypertension, myoclonic movements.
  - Uncommon: Arrhythmias, hiccup, laryngospasm.
  - Rare: Epistaxis.
  - Frequency not known: Cardiac arrest, convulsions, cough, muscle rigidity, pyrexia.

- **Side-effects, further information**
  - Muscle rigidity: Alfentanil can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

- **Breast feeding**
  - Present in milk—withdraw breast-feeding for 24 hours.

- **Renal impairment**
  - Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

- **Directions for administration**
  - 5 mg/mL injection to be diluted before use. For continuous or intermittent intravenous infusion dilute in Glucose 5% or Sodium Chloride 0.9%.

### Medicinal forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection.

- **Solution for injection**
  - Alfentanil (Non-proprietary)
    - Alfentanil (as Alfentanil hydrochloride) 500 microgram per 1 ml
      - Alfentanil 1mg/2ml solution for injection ampoules
        - 10 ampoule £0.00 (code)
        - 5 ampoule £16.00 (code)
      - Alfentanil (as Alfentanil hydrochloride) 5 mg per 1 ml
        - Alfentanil 5mg/1ml solution for injection ampoules
          - 10 ampoule £25.00 (code)
  - Rapifen (Janssen-Cilag Ltd)
    - Alfentanil (as Alfentanil hydrochloride) 500 microgram per 1 ml
      - Rapifen 5mg/10ml solution for injection ampoules
        - 5 ampoule £14.50 (code)
        - Rapifen 1mg/2ml solution for injection ampoules
          - 10 ampoule £6.34 (code)
  - Alfentanil (as Alfentanil hydrochloride) 5 mg per 1 ml
    - Rapifen Intensive Care 5mg/1ml solution for injection ampoules
      - 10 ampoule £23.19 (Hospital only) (code)

### Remifentanil

- **Indications and Dose**
  - Analgesia and enhancement of anaesthesia at induction (initial bolus injection)
    - By intravenous injection
      - Child 12-17 years: Initially 0.25–1 microgram/kg, dose to be administered over at least 30 seconds, if child is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary.
  - Analgesia and enhancement of anaesthesia at induction with or without initial bolus dose
    - Child 12-17 years: 30–60 micrograms/kg/hour, if child is to be intubated more than 8 minutes after start of intravenous infusion, initial bolus intravenous injection dose is not necessary.
  - Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia (initial bolus injection)
    - By intravenous injection
      - Child 1 month–11 years: Initially 0.1–1 microgram/kg, dose to be administered over at least 30 seconds (omitted if not required)
      - Child 12-17 years: Initially 0.1–1 microgram/kg, dose to be administered over at least 30 seconds (omitted if not required)
  - Assisted ventilation: analgesia and enhancement of anaesthesia during maintenance of anaesthesia with or without initial bolus dose
    - By intravenous infusion
      - Neonate: 24–60 micrograms/kg/hour, additional doses of 1 microgram/kg can be given by intravenous injection during the intravenous infusion.
      - Child 1 month–11 years: 3–78 micrograms/kg/hour, dose to be administered according to anaesthetic technique and adjusted according to response, additional doses can be given by intravenous injection during the intravenous infusion.
      - Child 12-17 years: 3–120 micrograms/kg/hour, dose to be administered according to anaesthetic technique and adjusted according to response, additional doses can be given by intravenous injection during the intravenous infusion.
1.4 Peri-operative sedation

Conscious sedation for clinical procedures

Overview
Sedation of children during diagnostic and therapeutic procedures is used to reduce fear and anxiety, to control pain, and to minimise excessive movement. The choice of sedative drug will depend upon the intended procedure and whether the child is cooperative; some procedures are safer and more successful under anaesthesia.

Midazolam p. 210 and chloral hydrate p. 275 are suitable for sedating children for painless procedures, such as imaging. For painful procedures, alternative choices include nitrous oxide p. 762, local anaesthesia, ketamine below, or concomitant use of sedation with opioid or non-opioid analgesia.

ANAESTHETICS, GENERAL > NMDA RECEPTOR ANTAGONISTS

Ketamine

- INDICATIONS AND DOSE
  Induction and maintenance of anaesthesia for short procedures
  > BY INTRAMUSCULAR INJECTION
    - Neonate: 4 mg/kg, adjusted according to response, a dose of 4 mg/kg usually produces 15 minutes of surgical anaesthesia.
  - Child: 4–13 mg/kg, adjusted according to response, a dose of 4 mg/kg sufficient for some diagnostic procedures, a dose of 10 mg/kg usually produces 12–25 minutes of surgical anaesthesia
  > BY INTRAVENOUS INJECTION
    - Neonate: 1–2 mg/kg, adjusted according to response, to be given over at least 60 seconds, a dose of 1–2 mg/kg produces 5–10 minutes of surgical anaesthesia.
    - Child 1 month–11 years: 1–2 mg/kg, adjusted according to response, to be given over at least 60 seconds, a dose of 1–2 mg/kg produces 5–10 minutes of surgical anaesthesia
    - Child 12–17 years: 1–4.5 mg/kg, adjusted according to response, to be given over at least 60 seconds, a dose of 2 mg/kg usually produces 5–10 minutes of surgical anaesthesia

Induction and maintenance of anaesthesia for long procedures

- INITIALLY BY INTRAVENOUS INJECTION
  - Neonate: Initially 0.5–2 mg/kg, followed by (by continuous intravenous infusion) 5 micrograms/kg/minute, adjusted according to response, doses up to 30 micrograms/kg/minute may be used to produce deep anaesthesia.
  - Child: Initially 0.5–2 mg/kg, followed by (by continuous intravenous infusion) 10–45 micrograms/kg/minute, adjusted according to response

Sedation prior to invasive or painful procedures

> BY INTRAVENOUS INJECTION
  - Child: 1–2 mg/kg for 1 dose
Ketamine should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

**CONTRA-INDICATIONS** Acute porphyrias p. 562 - eclampsia - head trauma - hypertension - pre-eclampsia - raised intracranial pressure - severe cardiac disease - stroke

**CAUTIONS** Acute circulatory failure (shock) - cardiovascular disease - dehydration - fixed cardiac output - hallucinations - head injury - hypertension - hypovolaemia - increased cerebrospinal fluid pressure - intracranial mass lesions - nightmares - predisposition to seizures - psychotic disorders - raised intra-ocular pressure - respiratory tract infection - thyroid dysfunction

**INTERACTIONS** Appendix 1 (anaesthetics, general).

**SIDE-EFFECTS**

- **Common or very common** Diplopia - hallucinations - hyperventilation - nausea - nightmares - nystagmus - rash - tachycardia - transient psychotic effects - vomiting
- **Uncommon** Arrhythmias - bradycardia - hypotension - laryngospasm - respiratory depression
- **Rare** Apnoea - cystitis - haemorrhagic cystitis - hypersalivation - insomnia
- **Frequency not known** Raised intra-ocular pressure

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Transient psychotic effects** Incidence of hallucinations, nightmares, and other transient psychotic effects can be reduced by a benzodiazepine such as diazepam or midazolam.
- **PREGNANCY** May depress neonatal respiration if used during delivery.
- **BREAST FEEDING** Avoid for at least 12 hours after last dose.
- **HEPATIC IMPAIRMENT** Consider dose reduction.

**DIRECTIONS FOR ADMINISTRATION** For intravenous injection, dilute 100 mg/mL strength to a concentration of not more than 50 mg/mL with Glucose 5% or Sodium Chloride 0.9%. For continuous intravenous infusion, dilute to a concentration of 1 mL/g with Glucose 5% or Sodium Chloride 0.9%; use microdrop infusion for maintenance of anaesthesia.

**PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised. For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including ketamine, see Drugs and driving under Guidance on prescribing p. 1.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, Solution for injection

- **Ketamine (Non-proprietary)**
  - Ketamine (as Ketamine hydrochloride) 10 mg per 1 mL
  - Curamed 50mg/5mL solution for injection ampoules | 10 ampoule (£8.77 [C])
  - Ketamine (as Ketamine hydrochloride) 50 mg per 1 mL
  - Ketamin 100mg/10ml solution for injection vials | 10 vial (£8.77 [C])
  - Ketamino 200mg/20ml solution for injection vials | 10 ampoule (£5.06 [C])

**HYPNOTICS, SEDATIVES AND ANXIOLYTICS > BENZODIAZEPINES**

**Temazepam**

**INDICATIONS AND DOSE**

Premedication before surgery or investigatory procedures

- **BY MOUTH**
  - Child 12-17 years: 10–20 mg, to be taken 1 hour before procedure
  - Adult: No dose limit

**UNLICENSED USE** Tablets not licensed for use in children.

**CONTRA-INDICATIONS** CNS depression - compromised airway - hyperkinesia - obsessional state - phobic states - respiratory depression

**CAUTIONS** Hypoalbuminaemia - muscle weakness - organic brain changes - personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive)—may increase risk of dependence

**CAUTIONS, FURTHER INFORMATION**

- **Paradoxical effects** A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

**SIDE-EFFECTS**

- **Common or very common** Amnesia - ataxia - confusion - dependence - drowsiness - hallucinations - hyperventilation - irritability - lightheadedness - nightmares - respiratory depression (may be marked when used for sedation; facilities for its treatment are essential) - restless sleep
  - **Uncommon** Dizziness - dystonia - gastro-intestinal disturbances - gynaecomastia - incontinence - salivation - tremor - visual disturbances
- **Rare** Apnoea - blood disorders - changes in libido - headache - hypotension - jaundice - skin reactions - urinary retention - vertigo
- **Frequency not known** Delusions - excitement - hallucinations - irritability - personality disorder - respiratory depression - suicidal ideas - thirst

**BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

**HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

**RENAL IMPAIRMENT** Start with small doses in severe impairment.

**PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. Responsible persons should be available to...
Malignant hyperthermia

MUSCLE RELAXANTS > DIRECTLY ACTING

Dantrium sodium

**Drug action** Acts on skeletal muscle cells by interfering with calcium efflux, thereby stopping the contractile process.

**Indications and Dose**

- **Malignant hyperthermia**
  - Child: Initially 2–3 mg/kg, then 1 mg/kg, repeated if necessary; maximum 10 mg/kg per course

- **Chronic severe spasticity of voluntary muscle**
  - **By mouth**
    - Child 5–11 years: Initially 500 micrograms/kg once daily for 7 days, then increased to 500 micrograms/kg/dose 3 times a day, then increased in steps of 500 micrograms/kg/dose every 7 days (max. per dose 2 mg/kg 3–4 times a day) until satisfactory response; maximum 400 mg per day
    - Child 12–17 years: Initially 25 mg once daily for 7 days, then increased to 25 mg 3 times a day, then increased in steps of 500 micrograms/kg/dose every 7 days (max. per dose 2 mg/kg 3–4 times a day) until satisfactory response; maximum 400 mg per day

**Unlicensed Use** Not licensed for use in children.

**Important Safety Information**

- Only be administered by, or under the direct supervision of, personnel experienced in the use of dantrium when used for malignant hyperthermia.

**Contra-Indications**

- With oral use Acute muscle spasm • avoid when spasticity is useful, for example, locomotion

**Cautions**

- With intravenous use Avoid extravasation (risk of tissue necrosis)
- With oral use Females (hepatotoxicity) • history of liver disorders (hepatotoxicity) • if doses greater than 400 mg daily (hepatotoxicity) • impaired cardiac function • impaired pulmonary function • therapeutic effect may take a few weeks to develop • discontinue if no response within 6–8 weeks

**Interactions**

- **Appendix 1 (muscle relaxants).**
- With oral use Caution if concomitant use of hepatotoxic drugs.

**Side-Effects**

- **Common or very common**
  - With oral use Abdominal pain • anorexia • asthenia • chills • diarrhoea (withdraw if severe, discontinue treatment if recurs on re-introduction) • dizziness • drowsiness • fatigue • fever • headache • hepatotoxicity • nausea • pericarditis • pleural effusion • rash • respiratory depression • seizures • speech disturbances • visual disturbances • vomiting
- **Uncommon**
  - With oral use Confusion • constipation • crystalluria • depression • dysphagia • dyspepsia • erratic blood pressure • exacerbation of cardiac insufficiency • haematurnia • increased sweating • increased urinary frequency • insomnia • nervousness • tachycardia • urinary incontinence • urinary retention
- **Frequency not known**
  - With intravenous use Dizziness • erythema • hepatotoxicity • injection-site reactions • pulmonary oedema • rash • swelling • thrombophlebitis • weakness

**Side-Effects, Further Information**

- Hepatotoxicity Potentially life-threatening hepatotoxicity reported—discontinue if abnormal liver function tests or symptoms of liver disorder; re-introduce only if complete reversal of hepatotoxicity.

**Pregnancy**

- With intravenous use Use only if potential benefit outweighs risk.
- With oral use Avoid use in chronic spasticity—embryotoxic in animal studies.

**Breast Feeding**

- With intravenous use Present in milk—use only if potential benefit outweighs risk.
- With oral use Present in milk—manufacturer advises avoid use in chronic spasticity.

**Hepatic Impairment** Avoid—may cause severe liver damage (injection may be used in an emergency for malignant hyperthermia).

**Monitoring Requirements**

- With oral use Test liver function before and at intervals during therapy.

**Patient and Carer Advice**

- Driving and skilled tasks
  - With oral use Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
  - Hepatotoxicity
  - With oral use Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop.

**Medicinal Forms**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Capsule**

Local anaesthesia

Local anaesthetic drugs

The use of local anaesthetics by injection or by application to mucous membranes to produce local analgesia is discussed in this section.

Local anaesthetic drugs act by causing a reversible block to conduction along nerve fibres. They vary widely in their potency, toxicity, duration of action, stability, solubility in water, and ability to penetrate mucous membranes. These factors determine their application, e.g. topical (surface), infiltration, peripheral nerve block, intravenous regional anaesthesia (Bier’s block), plexus, epidural (extradural), or spinal (intrathecal or subarachnoid) block. Local anaesthetics may also be used for postoperative pain relief, thereby reducing the need for analgesics such as opioids.

Bupivacaine hydrochloride p. 778 has a longer duration of action than other local anaesthetics. It has a slow onset of action, taking up to 30 minutes for full effect. It is often used in lumbar epidural blockade and is particularly suitable for continuous epidural analgesia in labour, or for postoperative pain relief. It is the principal drug used for spinal anaesthesia. Hyperbaric solutions containing glucose may be used for spinal block.

Lidocaine hydrochloride p. 779, an isomer of bupivacaine hydrochloride, has anaesthetic and analgesic properties similar to bupivacaine hydrochloride, but is thought to have fewer adverse effects.

Lidocaine hydrochloride p. 780 is effectively absorbed from mucous membranes and is a useful surface anaesthetic in concentrations up to 10%. Except for surface anaesthesia and dental anaesthesia, solutions should not usually exceed 1% in strength. The duration of the block (with adrenaline/epinephrine p. 128) is about 90 minutes.

Application of a mixture of lidocaine and prilocaine (EMLA®) under an occlusive dressing provides surface anaesthesia for 1–2 hours. EMLA® does not appear to be effective in providing local anaesthesia for heel lancing in neonates.

Prilocaine hydrochloride p. 783 is a local anaesthetic of low toxicity which is similar to lidocaine hydrochloride.

Ropivacaine hydrochloride p. 784 is an amide-type local anaesthetic agent similar to bupivacaine hydrochloride. It is less cardiotoxic than bupivacaine hydrochloride, but also less potent.

Tetracaine p. 785, a para-aminobenzoic acid ester, is an effective local anaesthetic for topical application; a 4% gel is indicated for anaesthesia before venepuncture or venous cannulation. Tetracaine is effective for 4–6 hours after a single application in most children. It is not recommended prior to neonatal heel lancing.

Tetracaine is rapidly absorbed from mucous membranes and should not be applied to inflamed, traumatised, or highly vascular surfaces. It should never be used to provide anaesthesia for bronchoscopy or cystoscopy because lidocaine hydrochloride is a safer alternative.

Administration

The dose of local anaesthetic depends on the injection site and the procedure used. In determining the safe dosage, it is important to take account of the rate of absorption and excretion, and of the potency. The child’s age, weight, physique, and clinical condition, and the vascularity of the administration site and the duration of administration, must also be considered.

Uptake of local anaesthetics into the systemic circulation determines their duration of action and produces toxicity. Great care must be taken to avoid accidental intravascular injection; local anaesthetic injections should be given slowly in order to detect inadvertent intravascular administration. When prolonged analgesia is required, a long-acting local anaesthetic is preferred to minimise the likelihood of cumulative systemic toxicity. Local anaesthesia around the oral cavity may impair swallowing and therefore increases the risk of aspiration.

Epidural anaesthesia is combined with general anaesthesia for certain surgical procedures in children.

Use of vasoconstrictors

Local anaesthetics cause dilatation of blood vessels. The addition of a vasoconstrictor such as adrenaline/epinephrine to the local anaesthetic preparation diminishes local blood flow, slowing the rate of absorption and thereby prolonging the anaesthetic effect. Great care should be taken to avoid inadvertent intravenous administration of a preparation containing adrenaline/epinephrine, and it is not advisable to give adrenaline/epinephrine with a local anaesthetic injection in digits or appendages because of the risk of ischaemic necrosis.

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. Care must also be taken to calculate a safe maximum dose of local anaesthetic when using combination products.

In children with severe hypertension or unstable cardiac rhythm, the use of adrenaline/epinephrine with a local anaesthetic may be hazardous. For these children an anaesthetic without adrenaline/epinephrine should be used.

Dental anaesthesia

Lidocaine hydrochloride is widely used in dental procedures; it is most often used in combination with adrenaline/epinephrine. Lidocaine hydrochloride 2% combined with adrenaline/epinephrine 1 in 80 000 (12.5 micrograms/mL) is a safe and effective preparation; there is no justification for using higher concentrations of adrenaline/epinephrine. The amide-type local anaesthetics articaine and mepivacaine hydrochloride p. 782 are also used in dentistry; they are available in cartridges suitable for dental use. Mepivacaine hydrochloride is available with or without adrenaline/epinephrine, and articaine is available with adrenaline/epinephrine. In children with severe hypertension or unstable cardiac rhythm, mepivacaine hydrochloride without adrenaline/epinephrine may be used. Alternatively, prilocaine hydrochloride with or without felypressin can be used but there is no evidence that it is any safer. Felypressin can cause coronary vasoconstriction when used at high doses; limit dose in children with coronary artery disease.

Toxicity

For management of toxicity see Severe local anaesthetic-induced cardiovascular toxicity below.

Severe local anaesthetic-induced cardiovascular toxicity

Overview

After injection of a bolus of local anaesthetic, toxicity may develop at any time in the following hour. In the event of signs of toxicity during injection, the administration of the local anaesthetic must be stopped immediately.

Cardiovascular status must be assessed and cardiopulmonary resuscitation procedures must be followed. In the event of local anaesthetic-induced cardiac arrest, standard cardiopulmonary resuscitation should be initiated immediately. Lidocaine must not be used as anti-arrhythmic therapy.
If the patient does not respond rapidly to standard procedures, 20% lipid emulsion such as Intralipid® (unlicensed indication) should be given intravenously at an initial bolus dose of 1.5 mL/kg over 1 minute, followed by an infusion of 15 mL/kg/hour. After 5 minutes, if cardiovascular stability has not been restored or circulation deteriorates, give a maximum of two further bolus doses of 1.5 mL/kg over 1 minute, 5 minutes apart, and increase the infusion rate to 30 mL/kg/hour. Continue infusion until cardiovascular stability has not been restored or circulation deteriorates, or maximum cumulative dose of 12 mL/kg is given.

Standard cardiopulmonary resuscitation must be maintained throughout lipid emulsion treatment.

Propofol is not a suitable alternative to lipid emulsion.

Further advice on ongoing treatment should be obtained from the National Poisons Information Service. Detailed treatment algorithms and accompanying notes are available at www.toxbase.org or can be found in the Association of Anaesthetists of Great Britain and Ireland safety guideline, Management of Severe Local Anaesthetic Toxicity and Management of Severe Local Anaesthetic Toxicity – Accompanying notes.

ANAESTHETICS, LOCAL

Adrenaline with articaine hydrochloride
(Carticaine hydrochloride with epinephrine)

**INDICATIONS AND DOSE**

Infiltration anaesthesia in dentistry
- **BY REGIONAL ADMINISTRATION**
- Child 4-17 years: Consult expert dental sources

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 5 micrograms/kg (1 mL/kg of a 1 in 200 000 solution) and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

**CONTRA-INDICATIONS**

Application to damaged skin - application to the middle ear (may cause ototoxicity) - complete heart block - injection into infected tissues - injection into inflamed tissues - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block)

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

**CAUTIONS**

**CAUTIONS, FURTHER INFORMATION**

- Use of vasoconstrictors In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

**INTERACTIONS**

- **APPENDIX 1 (sympathomimetics).**

**SIDE-EFFECTS**

Angina - angle-closure glaucoma - anorexia - anxiety - arrhythmias - blurred vision - cardiac arrest - cold extremities - confusion - convulsions - difficulty in micturition - dizziness - drowsiness - dry mouth - dyspnoea - feeling of inebriation - headache - hyperglycaemia - hypersalivation - hypertension (risk of cerebral haemorrhage) - hypokalaemia - insomnia - lightheadedness - metabolic acidosis - methaemoglobinemia - muscle twitching - mydriasis - myocardial depression (resulting in hypotension and bradycardia) - myoccardial infarction - nausea - numbness of the tongue and perioral region - pallor - palpitation - paraesthesia (including sensations of hot and cold) - peripheral vasodilatation (resulting in hypotension and bradycardia) - psychosis - pulmonary oedema (on excessive dosage or extreme sensitivity) - restlessness - sweating - tachycardia - tinnitus - tissue necrosis at injection site and of extremities, bowel, liver and kidneys - transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) - tremor - urinary retention - vomiting - weakness

**SIDE-EFFECTS, FURTHER INFORMATION**

- Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.

Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- **ALLERGY AND CROSS-SENSITIVITY**

- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Use only if potential benefit outweighs risk — no information available.

- **BREAST FEEDING** Avoid breast-feeding for 48 hours after administration.

- **HEPATIC IMPAIRMENT** Use with caution; increased risk of side-effects in severe impairment.

- **RENAL IMPAIRMENT** Manufacturers advise use with caution in severe impairment.

- **MONITORING REQUIREMENTS** Consider monitoring blood pressure and ECG (advised with systemic adrenaline/epinephrine).
### Local anaesthesia

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **EXCipients**: May contain Sulphites
- **Septanest (Septodont Ltd)**
  - Adrenaline (as Adrenaline acid tartrate) 10 microgram per 1 ml
  - Articaine hydrochloride 40 mg per 1 ml Septanest 1 in 100,000 solution for injection cartridges | 50 cartridge no price available
  - Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 ml, Articaine hydrochloride 40 mg per 1 ml Septanest 1 in 200,000 solution for injection cartridges | 50 cartridge no price available

**DOSES AT EXTREMES OF BODY-WEIGHT**
To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**IMPORTANT SAFETY INFORMATION**
The licensed doses stated may not be appropriate in some settings and expert advice should be sought.

- Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

**CONTRA-INDICATIONS**
Application to the middle ear (can cause ototoxicity). Avoid injection into infected tissues. Avoid injection into inflamed tissues. Complete heart block. Preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) - should not be applied to damaged skin.

**CONTRA-INDICATIONS, FURTHER INFORMATION**
Injection site: Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

**CAUTIONS**
Cardiovascular disease - cerebral atheroma - children (consider dose reduction) - debilitated patients (consider dose reduction) - epilepsy - hypertention - hypotention - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - myocardial depression may be more severe and more resistant to treatment - shock.

**INTERACTIONS**
- Appendix 1 (bupivacaine).

**SIDE-EFFECTS**
- Arrhythmias - blurred vision - cardiac arrest - convulsions - dizziness - drowsiness - feeling of inebriation - headache - lightheadedness - muscle twitching - myocardial depression (resulting in hypotension and bradycardia) - nausea - numbness of the tongue and perioral region - paraesthesia (including sensations of hot and cold) - peripheral vasodilatation (resulting in hypotension and bradycardia) - restlessness - tinnitus - transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) - tremors - vomiting.

**SIDE-EFFECTS, FURTHER INFORMATION**
- **Toxic effects**: Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.
- Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

- The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

**ALLERGY AND CROSS-SENSITIVITY**
- Hypersensitivity and cross-sensitivity
- Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

**PREGNANCY**
Use lower doses for intrathecal use during late pregnancy. Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidual block.

**BREAST FEEDING**
Amount too small to be harmful.

**HEPATIC IMPAIRMENT**
Use with caution in severe impairment.

**RENAL IMPAIRMENT**
Use with caution in severe impairment.

Bupivacaine with adrenaline

The properties listed below are those particular to the combination only. For the properties of the components please consider, bupivacaine hydrochloride p. 778, adrenaline/epinephrine p. 128.

● INDICATIONS AND DOSE

Surgical anaesthesia

▶ BY LUMBAR EPIDURAL, OR BY LOCAL INFILTRATION, OR BY CAUDAL EPIDURAL

▶ Child 12-17 years: (consult product literature)

Acute pain management

▶ BY LUMBAR EPIDURAL, OR BY LOCAL INFILTRATION

▶ Child 1-17 years: (consult product literature)

• IMPORTANT SAFETY INFORMATION

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 5 micrograms/kg (1 mL/kg of a 1 in 200 000 solution) and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

● CAUTIONS

In patients with severe hypertension or unstable cardiac rhythm, the use of adrenaline with a local anaesthetic may be hazardous. For these patients an anaesthetic without adrenaline should be used.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

Bupivacaine with adrenaline (Non-proprietary)

Adrenaline (as Adrenaline acid tartrate) 5 microgram per 1 mL
Bupivacaine hydrochloride 2.5 mg per 1 mL
Bupivacaine hydrochloride anhydrous 2.5 mg per 1 mL
Carbostesin-adrenaline 0.25% / 100 micrograms/20 mL (1 in 200,000) solution for injection ampoules| 1 ampoule (PSt) £40.00
Carbostesin-adrenaline 0.25% / 25 micrograms/mL (1 in 200,000) solution for injection ampoules| 1 ampoule (PSt) no price available
Carbostesin-adrenaline 5 micrograms/mL (1 in 200,000) solution for injection ampoules| 10 ampoules (PSt) £65.00
Carbostesin-adrenaline 0.5% / 10 micrograms/20 mL (1 in 200,000) solution for injection ampoules| 1 ampoule (PSt) no price available

Levobupivacaine

● INDICATIONS AND DOSE

Surgical anaesthesia | Acute pain

▶ BY REGIONAL ADMINISTRATION

▶ Child: Doses adjusted according to child’s physical status and nature of procedure, seek expert advice (consult product literature or local protocols)

DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

• IMPORTANT SAFETY INFORMATION

The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

• CONTRA-INDICATIONS

Application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues - complete heart block - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) - should not be applied to damaged skin

CONTRA-INDICATIONS, FURTHER INFORMATION

Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

● CAUTIONS

Cardiovascular disease - children (consider dose reduction) - debilitated patients (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - shock

● INTERACTIONS

Appendix 1 (levobupivacaine)

● SIDE-EFFECTS

Anæmia - arthralgia - blurred vision - cardiac arrest - convulsions - dizziness - drowsiness - feeling of inebriation - headache - lightheadedness - muscle twitching - myocardial depression (resulting in hypotension and bradycardia) - nausea - numbness of the tongue and perioral region - paraesthesia (including sensations of hot and cold) - peripheral vasodilatation (resulting in hypotension and bradycardia) - pyrexia - restlessness - sweating - tinnitus - transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) - tremors - vomiting

• SIDE-EFFECTS, FURTHER INFORMATION

Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection.

Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

• ALLERGY AND CROSS-SENSITIVITY

Cross-sensitivity reactions may be avoided by using the alternative chemical type.

• PREGNANCY

Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidual block. Avoid if possible in the first trimester—toxicity in animal studies. May cause fetal distress syndrome. Do not use for paracervical block in obstetrics. Do not use 7.5 mg/mL strength in obstetrics.

• BREAST FEEDING

Amount too small to be harmful.
**Hepatic Impairment** Use with caution.

**Directions for Administration** For 1.25 mg/mL concentration dilute standard solutions with sodium chloride 0.9%.

**Prescribing and Dispensing Information** Levobupivacaine is an isomer of bupivacaine.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for Injection**

- **Chirocaine (AbbVie Ltd)**
  - Levobupivacaine (as Levobupivacaine hydrochloride) 2.5 mg per 1 ml Chirocaine 25mg/10ml solution for injection ampoules
  - 10 ampoule (POD) £14.11 (Hospital only)

- **Levobupivacaine (as Levobupivacaine hydrochloride) 5 mg per 1 ml** Chirocaine 50mg/10ml solution for injection ampoules
  - 10 ampoule (POD) £16.15 (Hospital only)

- **Levobupivacaine (as Levobupivacaine hydrochloride) 7.5 mg per 1 ml** Chirocaine 75mg/10ml solution for injection ampoules
  - 10 ampoule (POD) £24.23 (Hospital only)

**Infusion**

- **Chirocaine (AbbVie Ltd)**
  - Levobupivacaine (as Levobupivacaine hydrochloride) 1.25 mg per 1 ml Chirocaine 125mg/100ml infusion bags
    - 24 bag (POD) £174.22
  - Chirocaine 250mg/200ml infusion bags
    - 12 bag (POD) no price available

**Indications and dose**

**Infiltration anaesthesia**

- **By Local Infiltration**
  - Neonate: Up to 3 mg/kg, dose to be given according to patient’s weight and nature of procedure, dose may be repeated not more often than every 4 hours, 3 mg/kg equivalent to 0.2 mL/kg of 1% solution.
  - Child 1-month–11 years: Up to 3 mg/kg, dose to be given according to patient’s weight and nature of procedure, dose may be repeated not more often than every 4 hours, 3 mg/kg equivalent to 0.3 mL/kg of 1% solution.
  - Child 12-17 years: (max. per dose 200 mg), dose to be given according to child’s weight and nature of procedure, dose may be repeated not more often than every 4 hours.

**Dosages at extremes of body-weight**

- When used by local infiltration To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight.

**Intravenous regional anaesthesia and nerve block**

- **By Regional Administration**
  - Child: Seek expert advice

**Dental Anaesthesia**

- **By Regional Administration**
  - Child: Seek expert advice

**Pain relief (in anal fissures, haemorrhoids, pruritus ani, pruritus vulvae, herpes zoster, or herpes labialis)**

- **Lubricant in Cystoscopy / Lubricant in Proctoscopy**
  - **TO THE SKIN**
    - Child: Apply 1–2 mL as required, avoid long-term use
  - **LMX 4®**

**Anaesthesia before venous cannulation or venepuncture**

- **TO THE SKIN**
  - Child 1-2 months: Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 60 minutes, remove cream with gauze and perform procedure after approximately 5 minutes

**Frequency Not Known**

- **When used by Regional Administration**
  - Transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) - arrhythmias - blurred vision - cardiac arrest - feeling of inebriation - headache - hypoglycaemia (following intrathecal or extradural administration) - methaemoglobinaemia - muscle twitching - myocardial depression (resulting in hypotension and bradycardia) - nausea - numbness of the tongue and perioral region - nyctagmus - peripheral vasodilatation (resulting in hypotension and bradycardia) - rash - restlessness - tinnitus - tremors - vomiting

**Contra-Indications, Further Information**

- **When used by regional administration**
  - Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

**Cautions**

- **When used by regional administration**
  - Acute porphyria (consider infusion with glucose for its antiporphyrinogenic effects) - children (consider dose reduction) - congestive cardiac failure (consider lower dose) - debilitated patients (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - post cardiac surgery (consider lower dose) - shock

**Interactions**

- Appendix 1 (lidocaine). Interactions less likely when lidocaine used topically.

**Side-Effects**

- **Common or very common**
  - When used by regional administration
  - Bradydysrhythmias (may lead to cardiac arrest) - confusion - convulsions - hypotension (may lead to cardiac arrest) - respiratory depression

**Rare**

- When used by regional administration
  - Anaphylaxis

**Contra-Indications**

- When used by regional administration
  - All grades of atrioventricular block - application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissue - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia.

**Further Information**

- **Indications and dose**
  - **By Local Infiltration**
    - Neonate: Up to 3 mg/kg, dose to be given according to patient’s weight and nature of procedure, dose may be repeated not more often than every 4 hours, 3 mg/kg equivalent to 0.2 mL/kg of 1% solution.
    - Child 1-month–11 years: Up to 3 mg/kg, dose to be given according to patient’s weight and nature of procedure, dose may be repeated not more often than every 4 hours, 3 mg/kg equivalent to 0.3 mL/kg of 1% solution.
    - Child 12-17 years: (max. per dose 200 mg), dose to be given according to child’s weight and nature of procedure, dose may be repeated not more often than every 4 hours.

**Dosages at extremes of body-weight**

- When used by local infiltration To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal body-weight.

**Intravenous regional anaesthesia and nerve block**

- **By Regional Administration**
  - Child: Seek expert advice

**Dental Anaesthesia**

- **By Regional Administration**
  - Child: Seek expert advice

**Pain Relief (in Anal Fissures, Haemorrhoids, Pruritus Ani, Pruritus Vulvae, Herpes Zoster, or Herpes Labialis)**

- **Lubricant in Cystoscopy / Lubricant in Proctoscopy**
  - **To the Skin**
    - Child: Apply 1–2 mL as required, avoid long-term use

**LMX 4®**

**Anaesthesia Before Venous Cannulation or Venepuncture**

- **To the Skin**
  - Child 1-2 months: Apply up to 1 g, apply thick layer to small area (2.5 cm × 2.5 cm) of non-irritated skin at least 30 minutes before procedure; may be applied under an occlusive dressing; max. application time 60 minutes, remove cream with gauze and perform procedure after approximately 5 minutes

**Important Safety Information**

- The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

**Contra-Indications**

- When used by regional administration
  - Acute porphyria (consider infusion with glucose for its antiporphyrinogenic effects) - children (consider dose reduction) - congestive cardiac failure (consider lower dose) - debilitated patients (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - post cardiac surgery (consider lower dose) - shock

**Interactions**

- Appendix 1 (lidocaine). Interactions less likely when lidocaine used topically.

**Side-Effects**

- **Common or very common**
  - When used by regional administration
  - Bradydysrhythmias (may lead to cardiac arrest) - confusion - convulsions - hypotension (may lead to cardiac arrest) - respiratory depression

**Rare**

- When used by regional administration
  - Anaphylaxis

**Frequency Not Known**

- When used by regional administration
  - Transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) - arrhythmias - blurred vision - cardiac arrest - feeling of inebriation - headache - hypoglycaemia (following intrathecal or extradural administration) - methaemoglobinaemia - muscle twitching - myocardial depression (resulting in hypotension and bradycardia) - nausea - numbness of the tongue and perioral region - nyctagmus - peripheral vasodilatation (resulting in hypotension and bradycardia) - rash - restlessness - tinnitus - tremors - vomiting

**IMPORTANT SAFETY INFORMATION**

- The licensed doses stated may not be appropriate in some settings and expert advice should be sought. Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

**Contra-Indications**

- When used by regional administration
  - Acute porphyria (consider infusion with glucose for its antiporphyrinogenic effects) - children (consider dose reduction) - congestive cardiac failure (consider lower dose) - debilitated patients (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - post cardiac surgery (consider lower dose) - shock

**Interactions**

- Appendix 1 (lidocaine). Interactions less likely when lidocaine used topically.

**Side-Effects**

- **Common or very common**
  - When used by regional administration
  - Bradydysrhythmias (may lead to cardiac arrest) - confusion - convulsions - hypotension (may lead to cardiac arrest) - respiratory depression

**Rare**

- When used by regional administration
  - Anaphylaxis

**Frequency Not Known**

- When used by regional administration
  - Transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) - arrhythmias - blurred vision - cardiac arrest - feeling of inebriation - headache - hypoglycaemia (following intrathecal or extradural administration) - methaemoglobinaemia - muscle twitching - myocardial depression (resulting in hypotension and bradycardia) - nausea - numbness of the tongue and perioral region - nyctagmus - peripheral vasodilatation (resulting in hypotension and bradycardia) - rash - restlessness - tinnitus - tremors - vomiting
SIDE-EFFECTS, FURTHER INFORMATION

- **Topical application** A single application of a topical lidocaine preparation does not generally cause systemic side-effects.
- **Toxic effects** When used by regional administration Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from inadvertent intravascular injection or too rapid injection. Following most regional anaesthetic procedures, maximum arterial plasma concentration of 0.1 mg/l is reached 15 minutes after injection. The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.
- **Methaemoglobinaemia** When used by regional administration Methaemoglobinaemia can be treated with an intravenous injection of methylthioninium chloride; neonates and infants under 6 months are particularly susceptible to methaemoglobinaemia.

**ALLERGY AND CROSS-SENSITIVITY**

- Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, meptivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- **PREGNANCY** Crosses the placenta but not known to be harmful in animal studies—use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.
- **BREAST FEEDING** Present in milk but amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Caution—increased risk of side-effects.
- **RENAL IMPAIRMENT** Possible accumulation of lidocaine and active metabolite; caution in severe impairment.
- **MONITORING REQUIREMENTS** With systemic use Monitor ECG and have resuscitation facilities available.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

**Lidocaine hydrochloride (Non-proprietary)**

- Lidocaine hydrochloride 5 mg per 1 ml
  - Lidocaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule | £0.50
  - Lidocaine hydrochloride 10 mg per 1 ml
    - Lidocaine 100mg/10ml (1%) solution for injection Mini-Plasco ampoules | 20 ampoule | £10.85
    - Lidocaine 100mg/10ml (1%) solution for injection ampoules | 10 ampoule | £4.50 DT price = £4.01
    - Lidocaine 100mg/10ml (1%) solution for injection Sure-Amp ampoules | 20 ampoule | £18.00
    - Lidocaine 200mg/20ml (1%) solution for injection vials | 10 vial | £8.80
    - Lidocaine 200mg/20ml (1%) solution for injection ampoules | 10 ampoule | £7.00
    - Lidocaine 500mg/5ml (2%) solution for injection ampoules | 10 ampoule | £2.35–£3.10 DT price = £2.36
    - Lidocaine 20mg/2ml (1%) solution for injection ampoules | 10 ampoule | £3.50 DT price = £1.98
    - Lidocaine 50mg/5ml (1%) solution for injection Sure-Amp ampoules | 20 ampoule | £6.00

**Lidocaine hydrochloride 20 mg per 1 ml**

- Lidocaine 100mg/5ml (2%) solution for injection ampoules | 10 ampoule | £2.40–£3.80 DT price = £2.41
- Lidocaine 400mg/20ml (2%) solution for injection vials | 10 vial | £18.50–£19.50
- Lidocaine 200mg/10ml (2%) solution for injection Mini-Plasco ampoules | 20 ampoule | £14.52
- Lidocaine 40mg/ml (2%) solution for injection ampoules | 10 ampoule | £4.00 DT price = £2.11
- Lidocaine 100mg/5ml (2%) solution for injection Sure-Amp ampoules | 20 ampoule | £6.00
- Lidocaine 40mg/ml (2%) solution for injection vials | 10 ampoule | £8.00–£9.00 DT price = £9.00

**Cream**

- **Lidocaine hydrochloride (Non-proprietary)**
  - Lidocaine hydrochloride 50 mg per 1 gram | 15 gram | £6.50 DT price = £6.18

**Lidocaine with adrenaline**

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 780, adrenaline/epinephrine p. 128.

### Indications and Dose

#### Local anaesthesia

- **By local infiltration**
  - Child 12–17 years: Dosed according to the type of nerve block required (consult product literature)

#### Profession Specific Information

**Dental information**

A variety of lidocaine injections with adrenaline is available in dental cartridges.

Consult expert dental sources for specific advice in relation to dose of lidocaine for dental anaesthesia.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection.

### Solution for injection

**EXCIPENTS:** May contain Benzyl alcohol, propylene glycol

- LMX 4 (Ferndale Pharmaceuticals Ltd)
  - Lidocaine 40 mg per 1 gram | LMX 4 cream | 5 gram | £2.98 DT price = £2.98
  - 30 mL cartridges | £14.90

- **Ointment**
  - Lidocaine hydrochloride (Non-proprietary)
    - Lidocaine hydrochloride 50 mg per 1 gram | Lidocaine 9% ointment | 15 gram | £6.50 DT price = £6.18

### Important safety information

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 5 micrograms/kg (1 mL/kg of a 1 in 200 000 solution) and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.
Lidocaine with phenylephrine

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 780, phenylephrine hydrochloride p. 116.

**INDICATIONS AND DOSE**

Anæsthesia before nasal surgery, endoscopy, laryngoscopy, or removal of foreign bodies from the nose
- **BY INTRANAVAL ADMINISTRATION**
  - Child 12-17 years: Up to 8 sprays

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Spray**
- Lidocaine with phenylephrine (Non-proprietary)
  - Phenylephrine hydrochloride 5 mg per 1 ml, Lidocaine hydrochloride 50 mg per 1 ml: Lidocaine 5% / Phenylephrine 0.5% nasal spray | 2.5 ml (Ped) £11.48 DT price = £11.48

Lidocaine with prilocaine

The properties listed below are those particular to the combination only. For the properties of the components please consider, lidocaine hydrochloride p. 780, prilocaine hydrochloride p. 783.

**INDICATIONS AND DOSE**

Anæsthesia before minor skin procedures including venepuncture
- **TO THE SKIN**

  - Neonate: Apply up to 1 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mullusca); maximum 1 dose per day.
  - Child 1–2 months: Apply up to 1 g for maximum 1 hour before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mullusca); maximum 1 dose per day
  - Child 3–11 months: Apply up to 2 g for maximum 4 hours before procedure, to be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mullusca); maximum 2 doses per day
  - Child 1–11 years: Apply 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mullusca);
  - Child 12–17 years: Apply 1–5 hours before procedure (2–5 hours before procedures on large areas e.g. split skin grafting), a thick layer should be applied under occlusive dressing, shorter application time of 15–30 minutes is recommended for children with atopic dermatitis (30 minutes before removal of mullusca)

**CONTRA-INDICATIONS**

Use in child less than 37 weeks corrected gestational age

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Toxic effects** Toxic effects after administration of local anaesthetics are a result of excessively high plasma

Mepivacaine hydrochloride

**INDICATIONS AND DOSE**

Infiltration anaesthesia and nerve block in dentistry
- Child 3–17 years: Consult expert dental sources

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal body-weight.

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

**CONTRA-INDICATIONS**

Application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues - complete heart block - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) - should not be applied to damaged skin

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Toxic effects** Toxic effects after administration of local anaesthetics are a result of excessively high plasma
Local anaesthesia

Prilocaine hydrochloride

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

**CONTRA-INDICATIONS**

Acquired methaemoglobinaemia - anaemia - application to the middle ear (can cause ototoxicity) - avoid injection into infected tissues - avoid injection into inflamed tissues - complete heart block - congenital methaemoglobinaemia - preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) - should not be applied to damaged skin

**CONTRA-INDICATIONS, FURTHER INFORMATION**

Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

**CAUTIONS**

Acute porphyrias p. 562 - cardiovascular disease - children (consider dose reduction) - debilitated patients (consider dose reduction) - epilepsy - hypovolaemia - impaired cardiac conduction - impaired respiratory function - myasthenia gravis - neonates and infants under 6 months are particularly susceptible to methaemoglobinaemia - severe or untreated hypertension - shock

**INTERACTIONS**

→ Appendix 1 (prilocaine).

Caution with concomitant use of drugs that cause methaemoglobinaemia.

**SIDE-EFFECTS**

Arrhythmias - blurred vision - cardiac arrest - convulsions - dizziness - drowsiness - feeling of inebriation - headache - hypertension - lightheadedness - methaemoglobinaemia (with high doses) - muscle twitching - myocardial depression (resulting in hypotension and bradycardia) - nausea - numbness of the tongue and perioral region - paraesthesia (including sensations of hot and cold) - peripheral vasodilatation (resulting in hypotension and bradycardia) - restlessness - tinnitus - transient excitation (followed by depression with drowsiness, respiratory failure, unconsciousness, and coma) - tremors - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Toxic effects Toxic effects after administration of local anaesthetics are a result of excessively high plasma concentrations; severe toxicity usually results from

**Mepivacaine with adrenaline**

The properties listed below are those particular to the combination only. For the properties of the components please consider, mepivacaine hydrochloride p. 782, adrenaline/epinephrine p. 128.

**INDICATIONS AND DOSE**

Infiltration anaesthesia and nerve block in dentistry

▶ BY LOCAL INFILTRATION

Child: consult product literature

### IMPORTANT SAFETY INFORMATION

Adrenaline/epinephrine must be used in a low concentration when administered with a local anaesthetic. The total dose of adrenaline should not exceed 5 micrograms/kg (1 mL/kg of a 1 in 200 000 solution) and it is essential not to exceed a concentration of 1 in 200 000 (5 micrograms/mL) if more than 50 mL of the mixture is to be injected.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

**EXCIPIENTS:** May contain Sulfites

| Scandonest plain (Deproco UK Ltd) |
| Adrenaline 10 microgram per 1 ml, Mepivacaine hydrochloride 20 mg per 1 ml | Scandonest special 2% solution for injection 2.2ml cartridges | 50 cartridge list | no price available |

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

**EXCIPIENTS:** May contain Sulfites

| Scandonest plain (Deproco UK Ltd) |
| Adrenaline 10 microgram per 1 ml, Mepivacaine hydrochloride 20 mg per 1 ml | Scandonest special 2% solution for injection 2.2ml cartridges | 50 cartridge list | no price available |
inadvertent intravascular injection or too rapid injection.

Following most regional anaesthetic procedures, maximum arterial plasma concentration of anaesthetic develops within about 10 to 25 minutes, so careful surveillance for toxic effects is necessary during the first 30 minutes after injection.

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems.

- **Methaemoglobinemia** Methaemoglobinemia can be treated with an intravenous injection of methylene blue.
- **ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity and cross-sensitivity. Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.
- **PREGNANCY** Use lower doses for intrathecal use during late pregnancy. Large doses during delivery can cause neonatal respiratory depression, hypotonia, and bradycardia after epidural block. Avoid paracervical or pudendal block in obstetrics (neonatal methaemoglobinemia reported).
- **BREAST FEEDING** Present in milk but not known to be harmful.
- **HEPATIC IMPAIRMENT** Lower doses may be required for intrathecal anaesthesia. Use with caution.
- **RENAL IMPAIRMENT** Lower doses may be required for intrathecal anaesthesia. Use with caution.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Citanest (AstraZeneca Ltd)
- Prilocaine hydrochloride 10 mg per 1 ml
- Citanest 1% solution for injection 50ml vials | 1 vial £5.06

**Indications and Dose**

**Dental anaesthesia**

- **BY REGIONAL ADMINISTRATION**
- **Child:** Consult expert dental sources for specific advice

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- Citanest with Octapressin (Dentsply Ltd)
- Felypressin 0.3 unit per 1 ml Prilocaine hydrochloride 30 mg per 1 ml

Citanest 3% with Octapressin Dental 0.054 units/1.8 ml solution for injection self aspitating cartridges | 100 cartridge £0.53 no price available

Citanest 3% with Octapressin Dental 0.066 units/2.2 ml solution for injection self aspitating cartridges | 100 cartridge £0.53 no price available

**Ropivacaine hydrochloride**

- **INDICATIONS AND DOSE**
  - **Acute pain** | **Surgical anaesthesia**
  - **BY REGIONAL ADMINISTRATION**
  - **Child:** Adjust according to child’s physical status and nature of procedure, seek expert advice

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose may need to be calculated on the basis of ideal bodyweight.

**UNLICENSED USE** 2 mg/mL strength not licensed for use in children under 12 years except for acute pain management by caudal epidural block and continuous epidural infusion. 7.5 mg/mL and 10 mg/mL strengths not licensed for use in children under 12 years.

**IMPORTANT SAFETY INFORMATION**

Should only be administered by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management, and should not be administered parenterally unless adequate resuscitation equipment is available.

**CONTRA-INDICATIONS** Application to the middle ear (can cause ototoxicity) • avoid injection into infected tissues • avoid injection into inflamed tissues • complete heart block • preparations containing preservatives should not be used for caudal, epidural, or spinal block, or for intravenous regional anaesthesia (Bier’s block) • should not be applied to damaged skin

**CONTRA-INDICATIONS, FURTHER INFORMATION**

Injection site Local anaesthetics should not be injected into inflamed or infected tissues nor should they be applied to damaged skin. Increased absorption into the blood increases the possibility of systemic side-effects, and the local anaesthetic effect may also be reduced by altered local pH.

      - Ropivacaine hydrochloride 2 mg per 1 ml Ropivacaine 400mg/200ml infusion bags | 5 bag (POM) £72.25 | 10 bag (POM) £137.00 (Hospital only)
    - **Naropin** (AstraZeneca UK Ltd)
      - Ropivacaine hydrochloride 2 mg per 1 ml Naropin 400mg/200ml infusion Polybags | 5 bag (POM) £86.70

- **UNLICENSED USE**
  - Not licensed for use in neonates.

- **CONTRA-INDICATIONS**
  - Should not be applied to damaged skin.

- **SIDE-EFFECTS**
  - Local skin reactions

**SIDE-EFFECTS, FURTHER INFORMATION**

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems; systemic side effects unlikely as minimal absorption following topical application.

- **ALLERGY AND CROSS-SENSITIVITY**
  - Hypersensitivity and cross-sensitivity. Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **BREAST FEEDING**
  - Not known to be harmful.

- **Gel**
  - **EXCIPIENTS:** May contain Hydroxybenzoates (parabens)
  - **Ametop** (Smith & Nephew Healthcare Ltd)
    - Tetracaine 40 mg per 1 gram Ametop 4% gel | 1.5 gram (P) £1.08
    - 18 gram (P) no price available

**Tetracaine**

*(Amethocaine)*

- **INDICATIONS AND DOSE**
  - **Anaesthesia before venepuncture or venous cannulation**
    - **TO THE SKIN**
      - **Neonate:** Apply contents of tube (or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation.
      - **Child 1 month-4 years:** Apply contents of up to 1 tube (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation.
      - **Child 5-17 years:** Apply contents of up to 5 tubes (applied at separate sites at a single time or appropriate proportion) to site of venepuncture or venous cannulation and cover with occlusive dressing; remove gel and dressing after 30 minutes for venepuncture and after 45 minutes for venous cannulation.
Emergency treatment of poisoning

Overview
These notes provide only an overview of the treatment of poisoning, and it is strongly recommended that either TOXBASE or the UK National Poisons Information Service be consulted when there is doubt about the degree of risk or about management.

Most childhood poisoning is accidental. Other causes include intentional overdose, drug abuse, iatrogenic and deliberate poisoning. The drugs most commonly involved in childhood poisoning are paracetamol p. 254, ibuprofen p. 608, orally ingested creams, aspirin p. 83, iron preparations, cough medicines, and the contraceptive pill.

Hospital admission
Children who have features of poisoning should generally be admitted to hospital. Children who have taken poisons with delayed actions should also be admitted, even if they appear well. Delayed-action poisons include aspirin, iron, paracetamol, tricyclic antidepressants, and co-phenotrope (diphenoxylate with atropine, Lomotil®). The effects of modified-release preparations are also delayed. A note of all relevant information, including what treatment has been given, should accompany the patient to hospital.

Further information
TOXBASE, the primary clinical toxicology database of the National Poisons Information Service, is available on the internet to registered users at www.toxbase.org (a backup site is available at www.toxbasebackup.org if the main site cannot be accessed). It provides information about routine diagnosis, treatment, and management of patients exposed to drugs, household products, and industrial and agricultural chemicals.

Specialist information and advice on the treatment of poisoning is available day and night from the UK National Poisons Information Service on the following number: Tel: 0344 892 0111.

Advice on laboratory analytical services can be obtained from TOXBASE or from the National Poisons Information Service. Help with identifying capsules or tablets may be obtained from TOXBASE or from the National Poisons Information Service. Help with identifying capsules or tablets may be obtained from TOXBASE.

General care
It is often impossible to establish with certainty the identity of the poison and the size of the dose. This is not usually important because only a few poisons (such as opioids, paracetamol, and iron) have specific antidotes; few patients require active removal of the poison. In most patients, treatment is directed at managing symptoms as they arise. Nevertheless, knowledge of the type and timing of poisoning can help in anticipating the course of events. All relevant information should be sought from the poisoned individual and from carers or parents. However, such information should be interpreted with care because it may not be complete or entirely reliable. Sometimes symptoms arise from other illnesses and patients should be assessed carefully. Accidents may involve domestic and industrial products (the contents of which are not generally known). The National Poisons Information Service should be consulted when there is doubt about any aspect of suspected poisoning.

Respiration
Respiration is often impaired in unconscious patients. An obstructed airway requires immediate attention. In the absence of trauma, the airway should be opened with simple measures such as chin lift or jaw thrust. An oropharyngeal or nasopharyngeal airway may be useful in patients with reduced consciousness to prevent obstruction, provided ventilation is adequate. Intubation and ventilation should be considered in patients whose airway cannot be protected or who have respiratory acidosis because of inadequate ventilation; such patients should be monitored in a critical care area.

Most poisons that impair consciousness also depress respiration. Assisted ventilation (either mouth-to-mouth or using a bag-valve-mask device) may be needed. Oxygen is not a substitute for adequate ventilation, although it should be given in the highest concentration possible in poisoning with carbon monoxide and irritant gases. The potential for pulmonary aspiration of gastric contents should be considered.

Blood pressure
Hypotension is common in severe poisoning with central nervous system depressants; if severe, this may lead to irreversible brain damage or renal tubular necrosis. Hypotension should be corrected initially by raising the foot of the bed and administration of an infusion of either sodium chloride p. 547 or a colloid. Vasopressor sympathomimetics are rarely required and their use may be discussed with the National Poisons Information Service or a paediatric intensive care unit.

Fluid depletion without hypotension is common after prolonged coma and after aspirin poisoning due to vomiting, sweating, and hyperpyrexia. Hypertension, often transient, occurs less frequently than hypotension in poisoning; it may be associated with sympathomimetic drugs such as amphetamines, phencyclidine, and cocaine.
Heart
Cardiac conduction defects and arrhythmias can occur in acute poisoning, notably with tricyclic antidepressants, some antipsychotics, and some antihistamines. Arrhythmias often respond to correction of underlying hypoxia, acidosis, or other biochemical abnormalities, but ventricular arrhythmias that cause serious hypotension require treatment. If the QT interval is prolonged, specialist advice should be sought because the use of some anti-arrhythmic drugs may be inappropriate. Supraventricular arrhythmias are seldom life-threatening and drug treatment is best withheld until the patient reaches hospital.

Body temperature
Hypothermia may develop in patients of any age who have been deeply unconscious for some hours, particularly following overdose with barbiturates or phenothiazines. It may be missed unless core temperature is measured using a low-reading rectal thermometer or by some other means. Hypothermia should be managed by prevention of further heat loss and appropriate rewarming as clinically indicated.

Hyperthermia can develop in patients taking CNS stimulants; children are also at risk when taking therapeutic doses of drugs with antimuscarinic properties. Hyperthermia is initially managed by removing all unnecessary clothing and using a fan. Sponging with tepid water will promote evaporation. Advice should be sought from the National Poisons Information Service on the management of severe hyperthermia resulting from conditions such as the serotonin syndrome.

Both hypothermia and hyperthermia require urgent hospitalisation for assessment and supportive treatment.

Convolusions
Single short-lived convulsions (lasting less than 5 minutes) do not require treatment. If convulsions are protracted or recur frequently, lorazepam p. 209 or diazepam p. 207 (preferably as emulsion) should be given by slow intravenous injection into a large vein. Benzodiazepines should not be given by the intramuscular route for convulsions. If the intravenous route is not readily available, midazolam can be given by the buccal route or diazepam can be administered as a rectal solution.

Methaemoglobinaemia
Drug- or chemical-induced methaemoglobinaemia should be treated with methylene blue solution (by means of an intravenous injection); also sodium 20% or higher, or if symptoms of tissue hypoxia are present despite oxygen therapy. Methylene blue solution p. 798 reduces the ferric iron of methaemoglobin back to the ferrous iron of haemoglobin; in high doses, methylene blue solution can itself cause methaemoglobinaemia.

Removal and elimination
Prevention of absorption
Given by mouth, charcoal, activated p. 793 can adsorb many poisons in the gastrointestinal system, thereby reducing their absorption. The sooner it is given the more effective it is, but it may still be effective up to 1 hour after ingestion of the poison—longer in the case of modified-release preparations or of drugs with antimuscarinic (anticholinergic) properties. It is particularly useful for the prevention of absorption of poisons that are toxic in small amounts, such as antidepressants.

A second dose may occasionally be required when blood-Drug, or chemical-induced methaemoglobinaemia should be treated with charcoal, activated p. 793 if the methaemoglobin concentration is 30% or higher, or if symptoms of tissue hypoxia are present despite oxygen therapy. Methylene blue solution p. 798 reduces the ferric iron of methaemoglobin back to the ferrous iron of haemoglobin; in high doses, methylene blue solution can itself cause methaemoglobinaemia.

Removal and elimination
Prevention of absorption
Given by mouth, charcoal, activated p. 793 can adsorb many poisons in the gastrointestinal system, thereby reducing their absorption. The sooner it is given the more effective it is, but it may still be effective up to 1 hour after ingestion of the poison—longer in the case of modified-release preparations or of drugs with antimuscarinic (anticholinergic) properties. It is particularly useful for the prevention of absorption of poisons that are toxic in small amounts, such as antidepressants.

A second dose may occasionally be required when blood-drug concentration continues to rise suggesting delayed drug release or delayed gastric emptying.

Active elimination techniques
Repeated doses of charcoal, activated by mouth may enhance the elimination of some drugs after they have been absorbed; repeated doses are given after overdosage with:

- Carbamazepine
- Dapsone
- Phenobarbital
- Quinine
- Theophylline

If vomiting occurs after dosing, it should be treated (e.g. with an antiemetic drug) since it may reduce the efficacy of charcoal treatment. In cases of intolerance, the dose may be reduced and the frequency increased but this may compromise efficacy.

Charcoal, activated should not be used for poisoning with petroleum distillates, corrosive substances, alcohols, malathion, cyanides and metal salts including iron and lithium salts.

Other techniques intended to enhance the elimination of poisons after absorption are only practicable in hospital and are only suitable for a small number of severely poisoned patients. Moreover, they only apply to a limited number of poisons. Examples include:

- haemodialysis for ethylene glycol, lithium, methanol, phenobarbital, salicylates, and sodium valproate;
- alkalisation of the urine for salicylates.

Removal from the gastro-intestinal tract
Gastric lavage is rarely required as benefit rarely outweighs risk; advice should be sought from the National Poisons Information Service if a significant quantity of iron or lithium has been ingested within the previous hour. Whole bowel irrigation (by means of a bowel cleansing preparation) has been used in poisoning with certain modified-release or enteric-coated formulations, in severe poisoning with lithium salts, and if illicit drugs are carried in the gastro-intestinal tract (‘body-packing’). However, it is not clear that the procedure improves outcome and advice should be sought from the National Poisons Information Service.

The administration of laxatives alone has no role in the management of the poisoned child and is not a recommended method of gut decontamination. The routine use of a laxative in combination with charcoal, activated has mostly been abandoned. Laxatives should not be administered to young children because of the likelihood of fluid and electrolyte imbalance.

Alcohol
Acute intoxication with alcohol (ethanol) is common in adults but also occurs in children. The features include ataxia, dysarthria, nystagmus, and drowsiness, which may progress to coma, with hypotension and acidosis. Aspiration of vomit is a special hazard and hypoglycaemia may occur. Patients are managed supportively, with particular attention to maintaining a clear airway and measures to reduce the risk of aspiration of gastric contents. The blood glucose is measured and glucose given if indicated.

Aspirin
The main features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning. The associated acid-base disturbances are complex.

Treatment must be in hospital, where plasma salicylate, pH, and electrolytes can be measured; absorption of aspirin may be slow and the plasma-salicylate concentration may continue to rise for several hours, requiring repeated measurement. Plasma-salicylate concentration may not correlate with clinical severity in the young, and clinical and biochemical assessment is necessary. Generally, the clinical
Emergency treatment of poisoning

788

BNFC 2016–2017

severity of poisoning is less than a plasma-salicylate concentration of 500 mg/litre (3.6 mmol/litre), unless there is evidence of metabolic acidosis. Activated charcoal can be given within 1 hour of ingesting more than 125 mg/kg of aspirin. Fluid losses should be replaced and intravenous sodium bicarbonate may be given (ensuring plasma-potassium concentration is within the reference range) to enhance urinary salicylate excretion (optimum urinary pH 7.5–8.5).

Plasma-potassium concentration should be corrected before giving sodium bicarbonate as hypokalaemia may complicate alkalinisation of the urine.

Haemodialysis is the treatment of choice for severe salicylate poisoning and should be considered when the plasma-salicylate concentration exceeds 700 mg/litre (5.1 mmol/litre) or in the presence of severe metabolic acidosis, convulsions, respiratory failure, pulmonary oedema or persistently high plasma-salicylate concentrations unresponsive to urinary alkalinisation.

Opioids

Opioids (narcotic analgesics) cause varying degrees of coma, respiratory depression, and pinpoint pupils. The specific antidote naltrexone hydrochloride p. 796 is indicated if there is coma or bradypnoea. Since naltrexone has a shorter duration of action than many opioids, close monitoring and repeated injections are necessary according to the respiratory rate and depth of coma. When repeated administration of naltrexone is required, it can be given by continuous intravenous infusion instead and the rate of infusion adjusted according to vital signs. All children should be observed for at least 6 hours after the last dose of naltrexone. The effects of some opioids, such as buprenorphine, are only partially reversed by naltrexone.

Dextropropoxyphene and methadone have very long durations of action; patients may need to be monitored for days after the last dose. Naloxone reverses the opioid effects of dextropropoxyphene. The long duration of action of dextropropoxyphene and methadone have very long durations of action; patients may need to be monitored for long periods following large overdoses.

Naloxone reverses the opioid effects of dextropropoxyphene. The long duration of action of dextropropoxyphene calls for prolonged monitoring and further doses of naloxone may be required. Nalorphine, a metabolite of dextropropoxyphene, also has cardiovascular effects which may require treatment with sodium bicarbonate p. 544 or magnesium sulfate p. 556, or both. Arrhythmias may occur for up to 12 hours.

Paracetamol

In cases of intravenous paracetamol poisoning contact the National Poisons Information Service for advice on risk assessment and management.

Toxic doses of paracetamol may cause severe hepatocellular necrosis and, much less frequently, renal tubular necrosis. Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis. Liver damage is maximal 3–4 days after paracetamol overdose and may lead to encephalopathy, haemorrhage, hypoglycaemia, cerebral oedema, and death. Therefore, despite a lack of significant early symptoms, children who have taken an overdose of paracetamol should be transferred to hospital urgently.

To avoid underestimating the potentially toxic paracetamol dose ingested by obese children who weigh more than 110 kg, use a body-weight of 110 kg (rather than their actual body-weight) when calculating the total dose of paracetamol ingested (in mg/kg).

Acetylcysteine p. 797 protects the liver if infused up to, and possibly beyond, 24 hours of ingesting paracetamol. It is most effective if given within 8 hours of ingestion, after which effectiveness declines. Very rarely, giving acetylcysteine by mouth [unlicensed route] is an alternative if intravenous access is not possible—contact the National Poisons Information Service for advice.

Neonates less than 45 weeks corrected gestational age may be more susceptible to paracetamol-induced liver toxicity, therefore, treatment with acetylcysteine should be considered in all paracetamol overdoses, and advice should be sought from the National Poisons Information Service.

Acute overdose

Hepatotoxicity may occur after a single ingestion of more than 150 mg/kg paracetamol taken in less than 1 hour. Rarely, hepatotoxicity may develop with single ingestions as low as 75 mg/kg of paracetamol taken in less than 1 hour.

Children who have ingested 75 mg/kg or more of paracetamol in less than 1 hour should be referred to hospital. Administration of charcoal, activated p. 793 should be considered if paracetamol in excess of 150 mg/kg is thought to have been ingested within the previous hour.

Children at risk of liver damage and, therefore, requiring acetylcysteine, can be identified from a single measurement of the plasma-paracetamol concentration, related to the time from ingestion, provided this time interval is not less than 4 hours; earlier samples may be misleading. The concentration is plotted on a paracetamol treatment graph, with a reference line (‘treatment line’) joining plots of 100 mg/litre (0.66 mmol/litre) at 4 hours and 3.13 mg/litre (0.02 mmol/litre) at 24 hours. Acetylcysteine treatment should commence immediately in children:

- whose plasma-paracetamol concentration falls on or above the treatment line on the paracetamol treatment graph;
- who present 8–24 hours after taking an acute overdose of more than 150 mg/kg of paracetamol, even if the plasma-paracetamol concentration is not yet available; acetylcysteine can be discontinued if the plasma-paracetamol concentration is later reported to be below the treatment line on the paracetamol treatment graph, provided that the child is asymptomatic and liver function tests, serum creatinine and INR are normal.

The prognostic accuracy of a plasma-paracetamol concentration taken after 15 hours is uncertain, but a concentration on or above the treatment line on the paracetamol treatment graph should be regarded as carrying a serious risk of liver damage. If more than 15 hours have elapsed since ingestion, or there is doubt about appropriate management, advice should be sought from the National Poisons Information Service.

‘Staggered’ overdose, uncertain time of overdose, or therapeutic excess

A ‘staggered’ overdose involves ingestion of a potentially toxic dose of paracetamol over more than one hour, with the possible intention of causing self-harm. Therapeutic excess is the inadvertent ingestion of a potentially toxic dose of paracetamol during its clinical use. The paracetamol treatment graph is unreliable if a ‘staggered’ overdose is taken, if there is uncertainty about the time of the overdose, or if there is therapeutic excess. In these cases, children who have taken more than 150 mg/kg of paracetamol in any 24-hour period are at risk of toxicity and should be commenced on acetylcysteine immediately, unless it is more than 24 hours since the last ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal.

Rarely, toxicity can occur with paracetamol doses between 75–150 mg/kg in any 24-hour period; for some children this may be within the licensed dose, but ingestion of a licensed dose of paracetamol is not considered an overdose. Clinical judgement of the individual case is necessary to determine whether to treat those who have ingested this amount of paracetamol.
Although there is some evidence suggesting that factors such as the use of liver enzyme-inducing drugs (e.g., carbamazepine p. 184, efavirenz p. 388, nevirapine p. 389, phenobarbital p. 203, phenytoin p. 193, rifabutin p. 341, rifampicin p. 342, St John’s wort), chronic alcoholism, and starvation may increase the risk of hepatotoxicity, the CHM has advised that these should no longer be used in the assessment of paracetamol toxicity.

Significant toxicity is unlikely if, 24 hours or longer after the last paracetamol ingestion, the patient is asymptomatic, the plasma-paracetamol concentration is undetectable, and liver function tests, serum creatinine and INR are normal. Children with clinical features of hepatic injury such as jaundice or hepatic tenderness should be treated urgently with acetylcysteine. If there is uncertainty about a patient’s risk of toxicity after paracetamol overdose, treatment with acetylcysteine should be commenced. Advice should be sought from the National Poisons Information Service whenever necessary.

**Antidepressants**

**Tricyclic and related antidepressants**

Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Metabolic acidosis may complicate severe poisoning; delirium with confusion, agitation, and visual and auditory hallucinations are common during recovery.

Assessment in hospital is strongly advised in case of poisoning by tricyclic and related antidepressants but symptomatic treatment can be given before transfer. Supportive measures to ensure a clear airway and adequate ventilation during transfer are mandatory. Intravenous lorazepam or intravenous diazepam (preferably in emulsion form) may be required to treat convulsions. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Although arrhythmias are worrying, some will respond to correction of hypoxia and acidosis. The use of anti-arrhythmic drugs is best avoided, but intravenous infusion of sodium bicarbonate can arrest arrhythmias or prevent them in those with an extended QRS duration. Diazepam p. 207 given by mouth is usually adequate to sedate delirious patients but large doses may be required.

**Selective serotonin re-uptake inhibitors (SSRIs)**

Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.

Management of SSRI poisoning is supportive. Activated charcoal given within 1 hour of the overdose reduces absorption of the drug. Convulsions can be treated with lorazepam p. 209, diazepam p. 207, or buccal midazolam p. 210 (see Convulsions). Contact the National Poisons Information Service for the management of hyperthermia or the serotonin syndrome.
Antimalarials
Overdosage with quinine, chloroquine, or hydroxychloroquine is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

Antipsychotics
Phenothiazines and related drugs
Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. Dystonic reactions can occur with therapeutic doses (particularly with prochlorperazine and trifluoperazine), and convulsions may occur in severe cases. Arrhythmias may require correction of hypoxia, acidosis, and other biochemical abnormalities, but specialist advice should be sought. If arrhythmias result from a prolonged QT interval; the use of some anti-arrhythmic drugs can worsen such arrhythmias. Dystonic reactions are rapidly abolished by injection of drugs such as procyclidine hydrochloride p. 241 or diazepam (emulsion preferred).

Second-generation antipsychotic drugs
Features of poisoning by second-generation antipsychotic drugs include drowsiness, convulsions, extrapyramidal symptoms, hypotension, and ECG abnormalities (including prolongation of the QT interval). Management is supportive. Charcoal, activated p. 793 can be given within 1 hour of ingesting a significant quantity of a second-generation antipsychotic drug.

Benzodiazepines
Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. Charcoal, activated can be given within 1 hour of ingesting a significant quantity of benzodiazepine, provided the patient is awake and the airway is protected. Benzodiazepines potentiate the effects of other central nervous system depressants taken concomitantly. Use of the benzodiazepine antagonist flumazenil p. 794 [unlicensed indication] can be hazardous, particularly in mixed overdoses involving tricyclic antidepressants or in benzodiazepine-dependent patients. Flumazenil may prevent the need for ventilation, particularly in patients with severe respiratory disorders; it should be used on expert advice only and not as a diagnostic test in children with a reduced level of consciousness.

Beta blockers
Therapeutic overdosages with beta-blockers may cause light-headedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. These complications are most likely in children with conduction system disorders or impaired myocardial function. Bradycardia is the most common arrhythmia caused by beta-blockers, but sotalol may induce ventricular tachyarrhythmias (sometimes of the torsade de points type). The effects of massive overdosage can vary from one beta-blocker to another; propranolol overdosage in particular may cause coma and convulsions. Acute massive overdosage must be managed in hospital and expert advice should be obtained. Maintenance of a clear airway and adequate ventilation is mandatory. An intravenous injection of atropine sulfate is required to treat bradycardia. Cardiogenic shock unresponsive to atropine is best treated with an intravenous injection of glucose p. 433 [unlicensed] in glucose 5% (with precautions to protect the airway in case of vomiting) followed by an intravenous infusion. If glucose is not available, intravenous isoprenaline (available from 'special-order' manufacturers or specialist importing companies) is an alternative. A cardiac pacemaker can be used to increase the heart rate.

Calcium-channel blockers
Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. Verapamil and diltiazem have a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole. The dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

Charcoal, activated should be considered if the patient presents within 1 hour of overdosage with a calcium-channel blocker; repeated doses of activated charcoal are considered if a modified-release preparation is involved. In patients with significant features of poisoning, calcium chloride p. 553 or calcium gluconate p. 553 is given by injection; atropine sulfate is given to correct symptomatic bradycardia. In severe cases, an insulin and glucose infusion may be required in the management of hypotension and myocardial failure. For the management of hypotension, the choice of isotropic sympathomimetic depends on whether hypotension is secondary to vasodilatation or to myocardial depression—advice should be sought from the National Poisons Information Service.

Iron salts
Iron poisoning in childhood is usually accidental. The symptoms are nausea, vomiting, abdominal pain, diarrhoea, haematemesis, and rectal bleeding. Hypotension and hepatocellular necrosis can occur later. Coma, shock, and metabolic acidosis indicate severe poisoning. Advice should be sought from the National Poisons Information Service if a significant quantity of iron has been ingested within the previous hour.

Mortality is reduced by intensive and specific therapy with desferrioxamine mesilate p. 536, which chelates iron. The serum-iron concentration is measured as an emergency and intravenous desferrioxamine mesilate given to chelate absorbed iron in excess of the expected iron binding capacity. In severe toxicity intravenous desferrioxamine mesilate should be given immediately without waiting for the result of the serum-iron measurement.

Lithium
Most cases of lithium intoxication occur as a complication of long-term therapy and are caused by reduced excretion of the drug because of a variety of factors including dehydration, deterioration of renal function, infections, and co-administration of diuretics or NSAIDs (or other drugs that interact). Acute deliberate overdoses may also occur with delayed onset of symptoms (12 hours or more) owing to slow entry of lithium into the tissues and continuing absorption from modified-release formulations.

The early clinical features are non-specific and may include apathy and restlessness which could be confused with mental changes arising from the child’s depressive illness. Vomiting, diarrhoea, ataxia, weakness, dysarthria, muscle twitching, and tremor may follow. Severe poisoning is associated with convulsions, coma, renal failure, electrolyte imbalance, dehydration, and hypotension.

Therapeutic serum-lithium concentrations are within the range of 0.4–1 mmol/litre; concentrations in excess of 2 mmol/litre are usually associated with serious toxicity and such cases may need treatment with haemodialysis if neurological symptoms or renal failure are present. In acute overdose much higher serum-lithium concentrations may be present without features of toxicity and all that is usually
necessary is to take measures to increase urine output (e.g. by increasing fluid intake but avoiding diuretics). Otherwise, treatment is supportive with special regard to electrolyte balance, renal function, and control of convulsions. Whole-bowel irrigation should be considered for significant ingestion, but advice should be sought from the National Poisons Information Service.

**Stimulants**

**Amphetamines**

Amphetamines cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. The early stages can be controlled by diazepam p. 207 or lorazepam p. 209; advice should be sought from the National Poisons Information Service on the management of hypertension. Later, tepid sponging, anticonvulsants, and artificial respiration may be needed.

**Cocaine**

Cocaine stimulates the central nervous system, causing agitation, dilated pupils, tachycardia, hypertension, hallucinations, hyperthermia, hypertonia, and hyperreflexia; cardiac effects include chest pain, myocardial infarction, and arrhythmias.

Initial treatment of cocaine poisoning involves cooling measures for hyperthermia (see Body temperature); agitation, hypertension and cardiac effects require specific treatment and expert advice should be sought.

**Ecstasy**

Ecstasy (methyleneoxyethylamphetamines, MDMA) may cause severe reactions, even at doses that were previously tolerated. The most serious effects are delirium, coma, convulsions, ventricular arrhythmias, hyperthermia, rhabdomyolysis, acute renal failure, acute hepatitis, disseminated intravascular coagulation, adult respiratory distress syndrome, hyperreflexia, hypotension and intracerebral haemorrhage; hyponatraemia has also been associated with ecstasy use and syndrome of inappropriate antidiuretic hormone secretion (SIADH) can occur.

Treatment of methylenedioxyethylamphetamines poisoning is supportive, with diazepam to control persistent convulsions and close monitoring including ECG. For the management of agitation, seek specialist advice. Self-induced water intoxication should be considered in patients with ecstasy poisoning.

‘Liquid ecstasy’ is a term used for sodium oxybate (gamma-hydroxybutryate, GHB), which is a sedative.

**Theophylline**
