# Medicines Information Services

**Information on drug therapy**
Information on any aspect of drug therapy can be obtained from Regional and District Medicines Information Services. Details regarding the local services provided within your Region can be obtained by telephoning the following numbers.

Access the BNF your way

The *British National Formulary* (BNF) and *BNF for Children* are updated monthly online via MedicinesComplete, ensuring healthcare professionals always have the latest prescribing advice.

You can be alerted to all the latest updates by signing up to the BNF eNewsletter at www.bnf.org/newsletter.

**ONLINE**

**BNF on MedicinesComplete**
Access BNF and *BNF for Children* on MedicinesComplete and receive the very latest drug information through monthly online updates.

**BNF on FormularyComplete**
Create, edit and manage your own local formulary content built upon the trusted prescribing advice of the BNF and *BNF for Children*.

**BNF on Evidence Search**
Search the BNF and *BNF for Children* alongside other authoritative clinical and non-clinical evidence and best practice at http://evidence.nhs.uk from NICE.

**MOBILE**

**BNF app** – Stay up to date anywhere with the BNF app available for iOS, Android and Blackberry.

**BNF eBook** – Available as an ePDF via a range of suppliers. See www.pharmpress.com/bnf.

**BNF on MedicinesComplete** – Now mobile responsive.

**PRINT**

**BNF subscription** – if you prefer to access BNF in print, take advantage of our subscription option. We will send you the new BNF as soon as the book is published. One or two year packages (including or excluding BNFC) are available. Discounted pricing is also available on bulk sales.
Eligible health professionals will now receive one print copy a year – the September issue – to supplement online access. If you are entitled to an NHS copy please refer to page ii for full details on distribution, call 01268 495 609 or email bnf@binleys.com.

**How to purchase**

**Purchase direct from Pharmaceutical Press** by visiting www.pharmpress.com/bnf

For enquiries about the BNF or BNFC in print, contact direct@macmillan.co.uk
Tel: +44 (0) 1256 302 699

For enquiries concerning MedicinesComplete, BNF on FormularyComplete, or bulk orders of the print edition, contact pharmpress@rpharms.com
Tel: +44 (0) 20 7572 2266

Download mobile apps by visiting your appropriate app store. Available for iOS, Android and Blackberry

For pricing information please visit the website at www.pharmpress.com/bnf

For international sales contact your local sales agent. Contact details at www.pharmpress.com/agents

Stay up to date – sign up to the BNF eNewsletter at www.bnf.org/newsletter
Distribution of printed BNFCs

In England, NICE purchases print editions of BNFC for distribution within the NHS. For details of who is eligible to receive a copy and further contact details, please refer to the NICE website: www.nice.org.uk/mpc/BritishNationalFormulary.jsp. If you are entitled to an NHS copy of BNFC, please call (0) 1268 495 609 or email: bnf@binleys.com.

In Scotland, email: nss.psd-tnf@nhs.net

In Wales, contact NHS Wales Shared Services Partnership—Contractor Services: Tel: 01792 567420

In Northern Ireland, email: ni.bnf@hsdni.net

About BNFC content

The BNFC for Children is for rapid reference by UK health professionals engaged in prescribing, dispensing, and administering medicines to children. BNFC for Children has been constructed using robust procedures for gathering, assessing and assimilating information on paediatric drug treatment, but may not always include all the information necessary for prescribing and dispensing. It is expected that the reader will be relying on appropriate professional knowledge and expertise to interpret the contents in the context of the circumstances of the individual child. BNFC for Children should be used in conjunction with other appropriate and up-to-date literature and, where necessary, supplemented by expert advice. Information is also available from Medicines Information Services. Special care is required in managing childhood conditions with unlicensed medicines or with licensed medicines for unlicensed uses. Responsibility for the appropriate use of medicines lies solely with the individual health professional. Please refer to digital versions of BNFC for Children for the most up-to-date content. BNFC for Children is published in print but interim updates are issued and published in the digital versions of BNFC for Children. The publishers work to ensure that the information is as accurate and up-to-date as possible at the date of publication, but knowledge and best practice in this field change regularly. BNFC for Children’s accuracy and currency cannot be guaranteed and neither the publishers nor the authors accept any responsibility for errors or omissions. While considerable efforts have been made to check the material in this publication, it should be treated as a guide only. Prescribers, pharmacists and other healthcare professionals are advised to check www.bnf.org for information about key updates and corrections.

Pharmaid

Numerous requests have been received from developing countries for BNFCs. The Pharmaid scheme of the Commonwealth Pharmacists Association will dispatch old BNFCs to certain Commonwealth countries. For more information on this scheme see www.commonwealthpharmacy.org/about/projects/pharmaid/. If you would like to donate your copy email: admin@commonwealthpharmacy.org
BNF for Children aims to provide prescribers, pharmacists, and other healthcare professionals with sound up-to-date information on the use of medicines for treating children.

A joint publication of the British Medical Association, the Royal Pharmaceutical Society, the Royal College of Paediatrics and Child Health, and the Neonatal and Paediatric Pharmacists Group, BNF for Children (‘BNFC’) is published under the authority of a Paediatric Formulary Committee which comprises representatives of these bodies, the Department of Health for England, and the Medicines and Healthcare products Regulatory Agency.

Many areas of paediatric practice have suffered from inadequate information on effective medicines. BNFC addresses this significant knowledge gap by providing practical information on the use of medicines in children of all ages from birth to adolescence. Information in BNFC has been validated against emerging evidence, best-practice guidelines, and crucially, advice from a network of clinical experts.

Drawing information from manufacturers’ literature where appropriate, BNFC also includes a great deal of advice that goes beyond marketing authorisations (product licences). This is necessary because licensed indications frequently do not cover the clinical needs of children; in some cases, products for use in children need to be specially manufactured or imported. Careful consideration has been given to establishing the clinical need for unlicensed interventions with respect to the evidence and experience of their safety and efficacy; local paediatric formularies, clinical literature and national information resources have been invaluable in this process.

BNFC has been designed for rapid reference and the information presented has been carefully selected to aid decisions on prescribing, dispensing and administration of medicines. Less detail is given on areas such as malignant disease and the very specialist use of medicines generally undertaken in tertiary centres. BNFC should be interpreted in the light of professional knowledge and it should be supplemented as necessary by specialised publications. Information is also available from Medicines Information Services (see inside front cover).

It is important to use the most recent BNFC information for making clinical decisions. The print edition of BNF for Children is updated in September each year. Monthly updates are provided online via the BNF Publications website www.bnf.org, MedicinesComplete and the NHS Evidence portal. The more important changes listed under Changes p. xix are cumulative (from one print edition to the next), and can be printed off each month to show the main changes since the last print edition as an aide memoire for those using print copies.

The website (www.bnf.org) includes additional information of relevance to healthcare professionals. Other digital formats of BNFC—including versions for mobile devices and integration into local formularies—are also available.

BNF Publications welcomes comments from healthcare professionals. Comments and constructive criticism should be sent to:

Acknowledgements

The Paediatric Formulary Committee is grateful to individuals and organisations that have provided advice and information to the BNF for Children (BNFC).

The principal contributors for this update were:

Members of the Advisory Committee on Malaria Prevention, R.H. Behrens, D. Bell, P.L. Chiodini, V. Field, F. Genasi, L. Goodyer, A. Green, J. Jones, G. Kassianos, D.G. Lalloo, D. Patel, H. Patel, M. Powell, D.V. Shingadia, N.O. Subair, C.J.M. Whitty, M. Blaze (Secretariat), and V. Smith (Secretariat) have provided valuable advice.

Members of the UK Ophthalmic Pharmacy Group have also provided valuable advice.

The MHRA have provided valuable assistance.

Correspondents in the pharmaceutical industry have provided information on new products and commented on products in BNFC.

Numerous doctors, pharmacists, nurses, and others have sent comments and suggestions.

BNFC interactions are provided by C.L. Preston, S.L. Jones, H.K. Sandhu, and S. Sutton.

The BNFC has valuable access to the Martindale data banks by courtesy of A. Brayfield and staff.

S. Frau, E. Laughton, P.D. Lee, J. Martin, L. Mistry, S. Sacranie, and A. Sparshatt provided considerable assistance during the production of this update of the BNFC.

How BNF Publications are constructed

Overview
The BNF for Children (BNFC) is an independent professional publication that addresses the day-to-day prescribing information needs of healthcare professionals involved in the care of children. Use of this resource throughout the health service helps to ensure that medicines are used safely, effectively, and appropriately.

Hundreds of changes are made between print editions, and are published monthly in some digital formats. The most clinically significant updates are listed under Changes p. xix.

BNFC is unique in bringing together authoritative, independent guidance on best practice with clinically validated drug information.

Information in BNFC has been validated against emerging evidence, best-practice guidelines, and advice from a network of clinical experts. BNFC includes a great deal of advice that goes beyond marketing authorisations (product licences or summaries of product characteristics). This is necessary because licensed indications frequently do not cover the clinical needs of children; in some cases, products for use in children need to be specially manufactured or imported. Careful consideration has been given to establishing the clinical need for unlicensed interventions with respect to the evidence and experience of their safety and efficacy.

Validation of information follows a standardised process. Where the evidence base is weak, further validation is undertaken through a process of peer review. The process and its governance are outlined in greater detail in the sections that follow.

Paediatric Formulary Committee
The Paediatric Formulary Committee (PFC) is responsible for the content of BNFC. The PFC comprises pharmacy, medical and nursing representatives with a paediatric background, and lay representatives who have worked with children or acted as a carer of a paediatric patient; there are also representatives from the Medicines and Healthcare products Regulatory Agency (MHRA) and the Department of Health for England. The PFC decides on matters of policy and reviews amendments to BNFC in the light of new evidence and expert advice.

Dental Advisory Group
The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the group includes representatives from the British Dental Association and a representative from the UK Health Departments.

Nurse Prescribers' Advisory Group
The Nurse Prescribers’ Advisory Group oversees the list of drugs approved for inclusion in the Nurse Prescribers' Formulary; the group includes representatives from a range of nursing disciplines and stakeholder organisations.

Expert advisers
BNFC uses about 80 expert clinical advisers (including doctors, pharmacists, nurses, and dentists) throughout the UK to help with the clinical content. The role of these expert advisers is to review existing text and to comment on amendments drafted by the clinical writers. These clinical experts help to ensure that BNFC remains reliable by:

- providing independent advice on drug interactions, prescribing in hepatic impairment, renal impairment, pregnancy, breast-feeding, neonatal care, palliative care, and the emergency treatment of poisoning.
- In addition to consulting with regular advisers, BNFC calls on other clinical specialists for specific developments when particular expertise is required.
- BNFC also works closely with a number of expert bodies that produce clinical guidelines. Drafts or pre-publication copies of guidelines are often received for comment and for assimilation into BNFC.

Editorial team
BNFC clinical writers have all worked as pharmacists or possess a pharmacy degree and further, relevant post-graduate qualification, and have a sound understanding of how drugs are used in clinical practice. A number of the clinical writers have specific experience of paediatric practice. As a team, the clinical writers are responsible for editing, maintaining, and updating BNFC content. They follow a systematic prioritisation process in response to updates to the evidence base in order to ensure the most clinically important topics are reviewed as quickly as possible. In parallel the team of clinical writers undertakes a process of rolling revalidation, aiming to review all of the content in the BNF over a 3- to 4-year period.

Amendments to the text are drafted when the clinical writers are satisfied that any new information is reliable and relevant. A set of standard criteria define when content is referred to expert advisers, the Joint Formulary Committee or other advisory groups, or submitted for peer review. Clinical writers prepare the text for publication and undertake a number of validation checks on the knowledge at various stages of the production.

Sources of BNFC information
BNFC uses a variety of sources for its information; the main ones are shown below.

Summaries of product characteristics
BNFC reviews the summaries of product characteristics (SPCs) of all new products as well as revised SPCs for existing products. The SPCs are a key source of product information and are carefully processed. Such processing involves:

- verifying the approved names of all relevant ingredients including 'non-active' ingredients (BNFC is committed to using approved names and descriptions as laid down by the Human Medicines Regulations 2012);
- comparing the indications, cautions, contra-indications, and side-effects with similar existing drugs. Where these are different from the expected pattern, justification is sought for their inclusion or exclusion;
- seeking independent data on the use of drugs in pregnancy and breast-feeding;
- incorporating the information into BNFC using established criteria for the presentation and inclusion of the data;
- checking interpretation of the information by a second clinical writer before submitting to a content manager; changes relating to doses receive a further check;
- identifying potential clinical problems or omissions and seeking further information from manufacturers or from expert advisers;
- constructing, with the help of expert advisers, a comment on the role of the drug in the context of similar drugs.

Much of this processing is applicable to the following sources as well.

Literature
Clinical writers monitor core medical, paediatric, and pharmaceutical journals. Research papers and reviews relating to drug therapy are carefully processed. When a
difference between the advice in BNFC and the paper is noted, the new information is assessed for reliability (using tools based on SIGN methodology) and relevance to UK clinical practice. If necessary, new text is drafted and discussed with expert advisers and the Paediatric Formulary Committee. BNFC enjoys a close working relationship with a number of national information providers.

In addition to the routine process, which is used to identify ‘triggers’ for changing the content, systematic literature searches are used to identify the best quality evidence available to inform an update. Clinical writers receive training in critical appraisal, literature evaluation, and search strategies.

Consensus guidelines

The advice in BNFC is checked against consensus guidelines produced by expert bodies. The quality of the guidelines is assessed using adapted versions of the AGREE II tool. A number of bodies make drafts or pre-publication copies of the guidelines available to BNFC; it is therefore possible to ensure that a consistent message is disseminated. BNFC routinely processes guidelines from the National Institute for Health and Care Excellence (NICE), the Scottish Medicines Consortium (SMC), and the Scottish Intercollegiate Guidelines Network (SIGN).

Reference sources

Paediatric formularies and reference sources are used to provide background information for the review of existing text or for the construction of new text. The BNFC team works closely with the editorial team that produces Martindale: The Complete Drug Reference. BNFC has access to Martindale information resources and each team keeps the other informed of significant developments and shifts in the trends of drug usage.

Peer review

Although every effort is made to identify the most robust data available, inevitably there are areas where the evidence base is weak or contradictory. While the BNF has the valuable support of expert advisers and the Paediatric Formulary Committee, the recommendations made may be subject to a further level of scrutiny through peer review to ensure they reflect best practice.

Content for peer review is posted on bnf.org and interested parties are notified via a number of channels, including the BNF e-newsletter.

Statutory information

BNFC routinely processes relevant information from various Government bodies including Statutory Instruments and regulations affecting the Prescription only Medicines Order. Official compendia such as the British Pharmacopoeia and its addenda are processed routinely to ensure that BNFC complies with the relevant sections of the Human Medicines Regulations 2012.

BNFC maintains close links with the Home Office (in relation to controlled drug regulations) and the Medicines and Healthcare products Regulatory Agency (including the British Pharmacopoeia Commission). Safety warnings issued by the Commission on Human Medicines (CHM) and guidelines on drug use issued by the UK health departments are processed as a matter of routine.

Relevant professional statements issued by the Royal Pharmaceutical Society are included in BNFC as are guidelines from bodies such as the Royal College of Paediatrics and Child Health.

Medicines and devices

NHS Prescription Services (from the NHS Business Services Authority) provides non-clinical, categorical information (including prices) on the medicines and devices included in BNFC.

Comments from readers

Readers of BNFC are invited to send in comments. Numerous letters and emails are received by the BNF team. Such feedback helps to ensure that BNFC provides practical and clinically relevant information. Many changes in the presentation and scope of BNFC have resulted from comments sent in by users.

Comments from industry

Close scrutiny of BNFC by the manufacturers provides an additional check and allows them an opportunity to raise issues about BNFC’s presentation of the role of various drugs; this is yet another check on the balance of BNFC advice. All comments are looked at with care and, where necessary, additional information and expert advice are sought.

Market research

Market research is conducted at regular intervals to gather feedback on specific areas of development.

Assessing the evidence

From January 2016, recommendations made in BNFC have been evidence graded to reflect the strength of the recommendation. The addition of evidence grading is to support clinical decision making based on the best available evidence.

The BNFC aims to revalidate all content over a rolling 3- to 4-year period and evidence grading will be applied to recommendations as content goes through the revalidation process. Therefore, initially, only a small number of recommendations will have been graded.

Grading system

The BNFC has adopted a five level grading system from A to E, based on the former SIGN grading system. This grade is displayed next to the recommendation within the text.

Evidence used to make a recommendation is assessed for validity using standardised methodology tools based on AGREE II and assigned a level of evidence. The recommendation is then given a grade that is extrapolated from the level of evidence, and an assessment of the body of evidence and its applicability.

Evidence assigned a level 1- or 2- score has an unacceptable level of bias or confounding and is not used to form recommendations.

Levels of evidence

- **Level 1++**
  - High quality meta-analyses, systematic reviews of randomised controlled trials (RCTs), or RCTs with a very low risk of bias.
- **Level 1+**
  - Well-conducted meta-analyses, systematic reviews, or RCTs with a low risk of bias.
- **Level 1**
  - Meta-analyses, systematic reviews, or RCTs with a high risk of bias.
- **Level 2++**
  - High quality systematic reviews of case control or cohort studies; or high quality case control or cohort studies with a very low risk of confounding or bias and a high probability that the relationship is causal.
- **Level 2+**
  - Well-conducted case control or cohort studies with a low risk of confounding or bias and a moderate probability that the relationship is causal.
- **Level 2**
  - Case control or cohort studies with a high risk of confounding or bias and a significant risk that the relationship is not causal.
- **Level 3**
  - Non-analytic studies, e.g. case reports, case series.
• **Level 4**
  Expert advice or clinical experience from respected authorities.

**Grades of recommendation**

• **Grade A: High strength**
  NICE-accredited guidelines; or guidelines that pass AGREE II assessment; or at least one meta-analysis, systematic review, or RCT rated as 1++, and directly applicable to the target population; or a body of evidence consisting principally of studies rated as 1+, directly applicable to the target population, and demonstrating overall consistency of results.

• **Grade B: Moderate strength**
  A body of evidence including studies rated as 2++, directly applicable to the target population, and demonstrating overall consistency of results; or extrapolated evidence from studies rated as 1++ or 1+.

• **Grade C: Low strength**
  A body of evidence including studies rated as 2+, directly applicable to the target population and demonstrating overall consistency of results; or extrapolated evidence from studies rated as 2++.

• **Grade D: Very low strength**
  Evidence level 3; or extrapolated evidence from studies rated as 2++; or tertiary reference source created by a transparent, defined methodology, where the basis for recommendation is clear.

• **Grade E: Practice point**
  Evidence level 4.
How to use BNF Publications in print

How to use the BNF for Children in print
This edition of the BNF for Children (BNFC) continues to display the fundamental change to the structure of the content that was first shown in BNFC 2015-2016. The changes were made to bring consistency and clarity to BNFC content, and to the way that the content is arranged within print and digital products, increasing the ease with which information can be found.

For reference, the most notable changes to the structure of the content include:

- Drug monographs – where possible, all information that relates to a single drug is contained within its drug monograph, moving information previously contained in the prescribing notes. Drug monographs have also changed structurally: additional sections have been added, ensuring greater regularity around where information is located within the publication.
- Drug class monographs – where substantial amounts of information are common to all drugs within a drug class (e.g. macrolides p. 308), a drug class monograph has been created to contain the common information.
- Medicinal forms – categorical information about marketed medicines, such as price and pack size, continues to be sourced directly from the Dictionary of Medicines and Devices provided by the NHS Business Services Authority. However, clinical information curated by the BNFC team has been clearly separated from the categorical pricing and pack size information and is included in the relevant section of the drug monograph.
- Section numbering – the BNFC and BNFC section numbering has been removed. This section numbering tied the content to a rigid structure and enforced the retention of defunct classifications, such as mercurial diuretics, and hindered the relocation of drugs where therapeutic use had altered. It also caused constraints between the BNFC and BNFC, where drugs had different therapeutic uses in children.
- Appendix 4 – the content has been moved to individual drug monographs. The introductory notes have been replaced with a new guidance section, Guidance on intravenous infusions p. 14.

Introduction
In order to achieve the safe, effective, and appropriate use of medicines, healthcare professionals must be able to use the BNFC effectively, and keep up to date with significant changes in the BNFC that are relevant to their clinical practice. This How to Use the BNF for Children is key in reinforcing the details of the new structure of the BNFC to all healthcare professionals involved with prescribing, monitoring, supplying, and administering medicines, as well as supporting the learning of students training to join these professions.

As with previous editions, the BNFC provides information on the use of medicines in children ranging from neonates (including preterm neonates) to adolescents. The terms infant, child, and adolescent are not used consistently in the literature; to avoid ambiguity actual ages are used in the dose statements in BNFC. The term neonate is used to describe a newborn infant aged 0–28 days. The terms child or children are used generically to describe the entire range from infant to adolescent in BNFC.

Structure of the BNFC
This BNFC edition continues to broadly follow the high level structure of earlier editions of the BNFC (i.e. those published before BNFC 2015-2016):

- Front matter, comprising information on how to use the BNFC, the significant content changes in each edition, and guidance on various prescribing matters (e.g. prescription writing, the use of intravenous drugs, particular considerations for special patient populations).

- Chapters, containing drug monographs describing the uses, doses, safety issues and other considerations involved in the use of drugs; drug class monographs; and treatment summaries, covering guidance on the selection of drugs. Monographs and treatment summaries are divided into chapters based on specific aspects of medical care, such as Chapter 5, Infections, or Chapter 16, Emergency treatment of poisoning; or drug use related to a particular system of the body, such as Chapter 2, Cardiovascular.

Within each chapter, content is organised alphabetically by therapeutic use (e.g. Airways disease, obstructive), with the treatment summaries first, (e.g. Asthma p. 138), followed by the monographs of the drugs used to manage the conditions discussed in the treatment summary. Within each therapeutic use, the drugs are organised alphabetically by classification (e.g. Antimuscarinics, Beta2-agonist bronchodilators) and then alphabetically within each classification (e.g. Formoterol fumarate, Salbutamol, Salmeterol, Terbutaline sulfate).

- Appendices, covering interactions, borderline substances, and cautionary and advisory labels.

- Back matter, covering the lists of medicines approved by the NHS for Dental and Nurse Practitioner prescribing, proprietary and specials manufacturers’ contact details, and the index. Yellow cards are also included, to facilitate the reporting of adverse events, as well as quick reference guides for life support and key drug doses in medical emergencies, for ease of access.

Navigating the BNFC for Children
The contents page provides the high-level layout of information within the BNFC; and in addition, each chapter begins with a small contents section, describing the therapeutic uses covered within that chapter. Once in a chapter, location is guided by the side of the page showing the chapter number (the ‘thumbnail’), alongside the chapter title. The top of the page includes the therapeutic use (the ‘running head’) alongside the page number.

Once on a page, visual cues aid navigation: treatment summary information is in black type, with therapeutic use titles similarly styled in black, whereas the use of colour indicates drug-related information, including drug classification titles, drug class monographs, and drug monographs.

Although navigation is possible by browsing, primarily access to the information is via the index, which covers the titles of drug class monographs, drug monographs and treatment summaries. The index also includes the names of branded medicines and other topics of relevance, such as abbreviations, guidance sections, tables, and images.

Content types
- Treatment summaries
  - Treatment summaries are of three main types;
  - an overview of delivering a drug to a particular body system (e.g. Skin conditions, management p. 665),
  - a comparison between a group or groups of drugs (e.g. beta-adrenoceptor blockers (systemic) p. 95),
  - an overview of the drug management or prophylaxis of common conditions intended to facilitate rapid appraisal of options (e.g. Hypertension p. 90, or Malaria, prophylaxis p. 364).

In order to select safe and effective medicines for individual children, information in the treatment summaries must be
used in conjunction with other prescribing details about the drugs and knowledge of the child’s medical and drug history.

**Monographs**

**Overview**

In earlier editions (i.e. before BNFC 2015–2016), a systemically administered drug with indications for use in different body systems was split across the chapters relating to those body systems. So, for example, codeine phosphate p. 259 was found in chapter 1, for its antimotility effects and chapter 4 for its analgesic effects. However, the monograph in chapter 1 contained only the dose and some selected safety precautions.

Now, all of the information for the systemic use of a drug is contained within one monograph, so codeine phosphate p. 259 is now included in chapter 4. This carries the advantage of providing all of the information in one place, so the user does not need to flick back and forth across several pages to find all of the relevant information for that drug. Cross references are included in chapter 1, where the management of diarrhoea is discussed, to the drug monograph to assist navigation.

Where drugs have systemic and local uses, for example, chloramphenicol, and the considerations around drug use are markedly different according to the route of administration, the monograph is split, as with earlier editions, into the relevant chapters.

This means that the majority of drugs are still placed in the same chapters and sections as earlier editions, and although there may be some variation in order, all of the relevant information will be easier to locate.

One of the most significant changes to the monograph structure is the increased granularity, with a move from around 9 sections to over 20 sections; sections are only included when relevant information has been identified. The following information describes these sections and their uses in more detail.

**Nomenclature**

Monograph titles follow the convention of recommended international non-proprietary names (rINNs), or, in the absence of a rINN, British Approved Names. Relevant synonyms are included below the title and, in some instances a brief description of the drug action is included. Over future editions these drug action statements will be rolled out for all drugs.

In some monographs, immediately below the nomenclature or drug action, there are a number of cross references used to signpost the user to any additional information they need to consider about a drug. This is most common for drugs formulated in combinations, where users will be signposted to the monographs for the individual ingredients (e.g. senna with ispaghula husk p. 42) or for drugs that are related to a drug class monograph (see Drug class monographs, below).

**Indication and dose**

User feedback has highlighted that one of the main uses of the BNFC is identifying indications and doses of drugs. Therefore, indication and dose information has been promoted to the top of the monograph and highlighted by a coloured panel to aid quick reference.

The indication and dose section is more highly structured than in earlier editions, giving greater clarity around which doses should be used for which indications and by which route. In addition, if the dose varies with a specific preparation or formulation that dosing information has been moved out of the preparations section and in to the indication and dose panel, under a heading of the preparation name.

Doses are either expressed in terms of a definite frequency (e.g. 1 g 4 times daily) or in the total daily dose format (e.g. 6 g daily in 3 divided doses); the total daily dose should be divided into individual doses (in the second example, the child should receive 2 g 3 times daily).

Doses for specific patient groups (e.g. neonates) may be included if they are different to the standard dose. Doses for children can be identified by the relevant age range and may vary according to their age or body-weight.

**Selecting the dose**

The dose of a drug may vary according to different indications, routes of administration, age, body-weight, and body surface area. The right dose should be selected for the right age and body-weight (or body surface area) of the child, as well as for the right indication, route of administration, and preparation.

In earlier editions of the BNFC, age ranges and weight ranges overlapped. For clarity and to aid selection of the correct dose, wherever possible these age and weight ranges now do not overlap. When interpreting age ranges it is important to understand that a child is considered to be 11 up until the point of their 12th birthday, meaning that an age range of child 12 to 17 years is applicable to a child from the day of their 12th birthday until the day before their 18th birthday. All age ranges should be interpreted in this way. Similarly, when interpreting weight ranges, it should be understood that a weight of up to 30 kg is applicable to a child up to, but not including, the point that they tip the scales at 30 kg and a weight range of 35 to 59 kg is applicable to a child as soon as they tip the scales at 35 kg right up until, but not including, the point that they tip the scales at 60 kg. All weight ranges should be interpreted in this way.

A pragmatic approach should be applied to these cut-off points depending on the child’s physiological development, condition, and if weight is appropriate for the child’s age. For some drugs (e.g. vancomycin p. 305) the neonatal dose varies according to the corrected gestational age of the neonate. Corrected gestational age is the neonate’s total age expressed in weeks from the start of the mother’s last menstrual period. For example, a 3 week old baby born at 27 weeks gestation is treated as having a corrected gestational age of 30 weeks. A term baby has a corrected gestational age of 37–42 weeks when born. For most other drugs, the dose can be based on the child’s actual date of birth irrespective of corrected gestational age. However, the degree of prematurity, the maturity of renal and hepatic function, and the clinical properties of the drug need to be considered on an individual basis.

Many children’s doses in BNFC are standardised by body-weight. To calculate the dose for a given child the weight-standardised dose is multiplied by the child’s weight (or occasionally by the child’s ideal weight for height). The calculated dose should not normally exceed the maximum recommended dose for an adult. For example, if the dose is 8 mg/kg (max. 300 mg), a child of 10 kg body-weight should receive 80 mg, but a child of 40 kg body-weight should receive 300 mg (rather than 320 mg). Calculation by body-weight in the overweight child may result in much higher doses being administered than necessary; in such cases, the dose should be calculated from an ideal weight for height.

Occasionally, some doses in BNFC are standardised by body surface area because many physiological phenomena correlate better with body surface area. In these cases, to calculate the dose for a given child, the body surface area-standardised dose is multiplied by the child’s body surface area. The child’s body surface area can be estimated from his or her weight using the tables for Body surface area in children, see inside back cover.

Wherever possible, doses are expressed in terms of a definite frequency (e.g. if the dose is 1 mg/kg twice daily, a child of body-weight 9 kg would receive 9 mg twice daily).
Occasionally, it is necessary to include doses in the total daily dose format (e.g. 10 mg/kg daily in 3 divided doses); in these cases the total daily dose should be divided into individual doses (in this example a child of body-weight 9 kg would receive 30 mg 3 times daily).

Most drugs can be administered at slightly irregular intervals during the day. Some drugs, e.g. antimicrobials, are best given at regular intervals. Some flexibility should be allowed in children to avoid waking them during the night. For example, the night-time dose may be given at the child’s bedtime.

Special care should be taken when converting doses from one metric unit to another, and when calculating infusion rates or the volume of a preparation to administer. Where possible, doses should be rounded to facilitate the administration of suitable volumes of liquid preparations, or an appropriate strength of tablet or capsule.

Other information relevant to indication and dose

The dose panel also contains, where known, an indication of pharmacokinetic considerations that may affect the choice of dose, and dose equivalence information, which may aid the selection of dose when switching between drugs or preparations.

The BNFC includes unlicensed use of medicines when the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience. When the BNFC recommends an unlicensed medicine or the ‘off-label’ use of a licensed medicine, this is shown below the indication and dose panel in the unlicensed use section.

Minimising harm and drug safety

The drug chosen to treat a particular condition should minimise the potential susceptibility to adverse effects and, where co-morbidities exist, have minimal detrimental effects on the patient’s other diseases. To achieve this, the Contra-indications, Cautions and Side-effects of the relevant drug should be reviewed.

The information under Cautions can be used to assess the risks of using a drug in a patient who has co-morbidities that are also included in the Cautions for that drug—if a safer alternative cannot be found, the drug may be prescribed while monitoring the patient for adverse-effects or deterioration in the co-morbidity. Contra-indications are far more restrictive than Cautions and mean that the drug should be avoided in a patient with a condition that is contra-indicated.

The impact that potential side-effects may have on a patient’s quality of life should also be assessed. For instance, in a child who has constipation, it may be preferable to avoid a drug that frequently causes constipation.

Clinically relevant Side-effects for drugs are included in the monographs or drug class monographs. Side-effects are listed in order of frequency, where known, and arranged alphabetically. The frequency of side-effects follows the regulatory standard:

- Very common — occurs more frequently than 1 in 10 administrations of a drug
- Common — occurs between 1 in 10 and 1 in 100 administrations of a drug
- Uncommon — between 1 in 100 and 1 in 1,000 administrations of a drug
- Rare — between 1 in 1,000 and 1 in 10,000 administrations of a drug
- Very rare — occurs less than 1 in 10,000 administrations of a drug
- Frequency not known

An exhaustive list of side-effects is not included, particularly for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). The BNFC also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes).

Recognising that hypersensitivity reactions can occur with virtually all medicines, this effect is generally not listed, unless the drug carries an increased risk of such reactions, when the information is included under Allergy and cross-sensitivity.

The Important safety advice section in the BNFC, delineated by a coloured outline box, highlights important safety concerns, often those raised by regulatory authorities or guideline producers. Safety warnings issued by the Commission on Human Medicines (CHM) or Medicines and Healthcare products Regulatory Agency (MHRA) are found here.

Drug selection should aim to minimise drug interactions. If it is necessary to prescribe a potentially serious combination of drugs, patients should be monitored appropriately. The mechanisms underlying drug interactions are explained in Appendix 1, followed by details of drug interactions.

Use of drugs in specific patient populations

Drug selection should aim to minimise the potential for drug accumulation, adverse drug reactions, and exacerbation of pre-existing hepatic or renal disease. If it is necessary to prescribe drugs whose effect is altered by hepatic or renal disease, appropriate drug dose adjustments should be made, and patients should be monitored adequately. The general principles for prescribing are outlined under Prescribing in hepatic impairment p. 15, and Prescribing in renal impairment p. 15. Information about drugs that should be avoided or used with caution in hepatic disease or renal impairment can be found in drug monographs under Hepatic impairment and Renal impairment (e.g. flucinzazole p. 352).

Similarly, drug selection should aim to minimise harm to the fetus, nursing infant, and mother. The infant should be monitored for potential side-effects of drugs used by the mother during pregnancy or breast-feeding. The general principles for prescribing are outlined under Prescribing in pregnancy p. 17 and Prescribing in breast-feeding p. 17. The Treatment Summaries provide guidance on the drug treatment of common conditions that can occur during pregnancy and breast-feeding (e.g. Asthma p. 138).

Information about the use of specific drugs during pregnancy and breast-feeding can be found in their drug monographs under Pregnancy, and Breast-feeding (e.g. flucinzazole p. 352).

A new section, Conception and contraception, containing information around considerations for females of childbearing potential or men who might father a child (e.g. isotretinoin p. 712) has been included.

Administration and monitoring

When selecting the most appropriate drug, it may be necessary to screen the patient for certain genetic markers or metabolic states. This information is included within a section called Pre-treatment screening (e.g. abacavir p. 390). This section covers one-off tests required to assess the suitability of a patient for a particular drug.

Once the drug has been selected, it needs to be given in the most appropriate manner. A Directions for administration section contains the information about intravenous administration previously located in Appendix 4. This provides practical information on the preparation of intravenous drug infusions, including compatibility of drugs with standard intravenous infusion fluids, method of dilution or reconstitution, and administration rates. In addition, general advice relevant to other routes of administration is provided within this section (e.g. fentanyl p. 262) and further details, such as masking the bitter taste of some medicines.

Whenever possible, intramuscular injections should be avoided in children because they are painful.
After selecting and administering the most appropriate drug by the most appropriate route, patients should be monitored to ensure they are achieving the expected benefits from drug treatment without any unwanted side-effects. The Monitoring section specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index (e.g. theophylline p. 159). Monitoring may, in certain cases, be affected by the impact of a drug on laboratory tests (e.g. hydroxocobalamin p. 534), and this information is included in Effects on laboratory tests.

In some cases, when a drug is withdrawn, further monitoring or precautions may be advised (e.g. clonidine hydrochloride p. 53); these are covered under Treatment cessation.

**Choice and supply**

The prescriber, the child’s carer, and the child (if appropriate) should agree on the health outcomes desired and on the strategy for achieving them (see Taking Medicines to Best Effect). Taking the time to explain to the child (and the child’s carer if appropriate) the rationale and the potential adverse effects of treatment may improve adherence. For some medicines there is a special need for counselling (e.g. appropriate posture during administration of doxycycline p. 332, or recognising signs of blood, liver, or skin disorders with carbamazepine p. 184); this is shown in Patient and carer advice.

Other information contained in the latter half of the monograph also helps prescribers and those dispensing medicines choose medicinal forms (by indicating information such as flavour or when branded products are not interchangeable e.g. modified-release theophylline p. 159), assess the suitability of a drug for prescribing, understand the NHS funding status for a drug (e.g. sildenafil p. 111), or assess when a patient may be able to purchase a drug without prescription (e.g. loperamide hydrochloride p. 44).

**Medicinal forms**

In the BNFC, preparations follow immediately after the monograph for the drug that is their main ingredient.

In earlier editions, when a particular preparation had safety information, dose advice or other clinical information specific to the product, it was contained within the preparations section. This information has been moved to the relevant section in the main body of the monograph under a heading of the name of the specific medicinal form (e.g. peppermint oil p. 32).

The medicinal forms (formerly preparations) section provides information on the type of formulation (e.g. tablet), the amount of active drug in a solid dosage form, and the concentration of active drug in a liquid dosage form. The legal status is shown for prescription-only medicines and controlled drugs, as well as pharmacy medicines and medicines on the general sales list. Practitioners are reminded, by a statement under the heading of ‘Medicinal Form’ that not all products containing a specific drug ingredient may be similarly licensed. To be clear on the precise licensing status of specific medicinal forms, practitioners should check the product literature for the particular product being prescribed or dispensed.

Details of all medicinal forms available on the dm+d for each drug in BNFC Publications appears online on MedicinesComplete. In print editions, due to space constraints, only certain branded products are included in detail. Where medicinal forms are listed they should not be inferred as equivalent to the other brands listed under the same form heading. For example, all the products listed under a heading of “Modified release capsule” will be available as modified release capsules, however, the brands listed under that form heading may have different release profiles, the available strengths may vary and/or the products may have different licensing information. As with earlier editions of the BNFC, practitioners must ensure that the particular product being prescribed or dispensed is appropriate.

As medicinal forms are derived from dm+d data, some drugs may appear under names derived from that data; this may vary slightly from those in earlier BNFC versions, e.g. sodium acid phosphate, is now sodium dihydrogen phosphate anhydrous.

Children should be prescribed a preparation that complements their daily routine, and that provides the right dose of drug for the right indication and route of administration. When dispensing liquid preparations, a sugar-free preparation should always be used in preference to one containing sugar. Patients receiving medicines containing carcinogenic sugars should be advised of appropriate dental hygiene measures to prevent caries.

Earlier editions of the BNFC only included excipients and electrolyte information for proprietary medicines. This information is now covered at the level of the dose form (e.g. tablet). It is not possible to keep abreast of all the generic products available on the UK market, and so this information serves as a reminder to the healthcare professional that, if the presence of a particular excipient is of concern, they should check the product literature for the particular product being prescribed or dispensed.

Cautions and advisory labels that pharmacists are recommended to add when dispensing are included in the medicinal forms section. Details of these labels can be found in Appendix 3, Guidance for cautionary and advisory labels p. 966. These labels have now been applied at the level of the dose form.

In the case of compound preparations, the prescribing information for all constituents should be taken into account.

**Prices in the BNFC**

Basic NHS net prices are given in the BNFC to provide an indication of relative cost. Where there is a choice of suitable preparations for a particular disease or condition the relative cost may be used in making a selection. Cost-effective prescribing must, however, take into account other factors (such as dose frequency and duration of treatment) that affect the total cost. The use of more expensive drugs is justified if it will result in better treatment of the patient, or a reduction of the length of an illness, or the time spent in hospital.

Prices are regularly updated using the Drug Tariff and proprietary price information published by the NHS dictionary of medicines and devices (dm+d, www.dmd.nhs.uk). The weekly updated dm+d data (including prices) can be accessed using the dm+d browser of the NHS Business Services Authority (https://apps.nhsbsa.nhs.uk/DMDBrowser/ DMDBrowser.do). Prices have been calculated from the net cost used in pricing NHS prescriptions and generally reflect whole dispensing packs. Prices for extemporaneously prepared preparations are not provided in the BNFC as prices vary between different manufacturers.

BNFC prices are not suitable for quoting to patients seeking private prescriptions or contemplating over-the-counter purchases because they do not take into account VAT, professional fees, and other overheads.

A fuller explanation of costs to the NHS may be obtained from the Drug Tariff. Separate drug tariffs are applicable to England and Wales (www.ppa.org.uk/ppa/edt_intro.htm), Scotland (www.sedscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-DrugTariff/), and Northern Ireland (www.hscbusiness.hscni.net/services/2034.htm); prices in the different tariffs may vary.
Typical layout of a monograph and associated medicinal forms

1. Class Monographs and drug monographs
   In most cases, all information that relates to an individual drug is contained in its drug monograph and there is no symbol. Class monographs have been created where substantial amounts of information are common to all drugs within a drug class, these are indicated by a flag symbol in a circle:

   Drug monographs with a corresponding class monograph are indicated by a tab with a flag symbol:

   The page number of the corresponding class monograph is indicated within the tab. For further information, see How to use BNF Publications

2. Drug classifications
   Used to inform users of the class of a drug and to assist in finding other drugs of the same class. May be based on pharmacological class (e.g. opioids) but can also be associated with the use of the drug (e.g. cough suppressants)

3. Review date
   The date of last review of the content

4. Specific preparation name
   If the dose varies with a specific preparation or formulation it appears under a heading of the preparation name

5. Evidence grading
   Evidence grading to reflect the strengths of recommendations will be applied as content goes through the revalidation process. A five level evidence grading system based on the former SIGN grading system has been adopted. The grades A, B, C, D, E are displayed next to the recommendations within the text, and are preceded by the symbol: ⚠️

   For further information, see How BNF Publications are constructed

---

**Class monograph**

**CLASSIFICATION**

**Drug monograph**

(Synonym) another name by which a drug may be known

- **DRUG ACTION** how a drug exerts its effect in the body

- **INDICATIONS AND DOSE**
  Indications are the clinical reasons a drug is used. The dose of a drug will often depend on the indications
  - **Indication**
    - **ROUTE**
      - Age groups: [Neonate/Child]
        - Dose and frequency of administration (max. dose)
  - **SPECIFIC PREPARATION NAME**
    - **Indication**
      - **ROUTE**
        - Age groups: [Neonate/Child]
          - Dose and frequency of administration (max. dose)

- **DOSE EQUIVALENCE AND CONVERSION** information around the bioequivalence between formulations of the same drug, or equivalent doses of drugs that are members of the same class

- **PHARMACOKINETICS** how the body affects a drug (absorption, distribution, metabolism, and excretion)

- **POTENCY** a measure of drug activity expressed in terms of the concentration required to produce an effect of given intensity

- **DOSES AT EXTREMES OF BODY-WEIGHT** dosing information for patients who are overweight or underweight

- **UNLICENSED USE** describes the use of medicines outside the terms of their UK licence (off-label use), or use of medicines that have no licence for use in the UK

---

**IMPORTANT SAFETY INFORMATION**

Information produced and disseminated by drug regulators often highlights serious risks associated with the use of a drug, and may include advice that is mandatory

- **CONTRA-INDICATIONS** circumstances when a drug should be avoided
- **CAUTIONS** details of precautions required
- **INTERACTIONS** when one drug changes the effects of another drug; the mechanisms underlying drug interactions are explained in Appendix 1
- **SIDE-EFFECTS** listed in order of frequency, where known, and arranged alphabetically
- **ALLERGY AND CROSS-SENSITIVITY** for drugs that carry an increased risk of hypersensitivity reactions
- **CONCEPTION AND CONTRACEPTION** potential for a drug to have harmful effects on an unborn child when prescribing for a woman of childbearing age or for a man trying to father a child; information on the effect of drugs on the efficacy of latex condoms or diaphragms
- **PREGNANCY** advice on the use of a drug during pregnancy
- **BREAST FEEDING** advice on the use of a drug during breast feeding
HEPATIC IMPAIRMENT advice on the use of a drug in hepatic impairment

RENAL IMPAIRMENT advice on the use of a drug in renal impairment

PRE-TREATMENT SCREENING covers one off tests required to assess the suitability of a patient for a particular drug

MONITORING REQUIREMENTS specifies any special monitoring requirements, including information on monitoring the plasma concentration of drugs with a narrow therapeutic index

EFFECTS ON LABORATORY TESTS for drugs that can interfere with the accuracy of seemingly unrelated laboratory tests

TREATMENT CESSATION specifies whether further monitoring or precautions are advised when the drug is withdrawn

DIRECTIONS FOR ADMINISTRATION practical information on the preparation of intravenous drug infusions; general advice relevant to other routes of administration

PRESCRIBING AND DISPENSING INFORMATION practical information around how a drug can be prescribed and dispensed including details of when brand prescribing is necessary

HANDLING AND STORAGE includes information on drugs that can cause adverse effects to those who handle them before they are taken by, or administered to, a patient; advice on storage conditions

PARENT AND CARER ADVICE for drugs with a special need for counselling

PROFESSION SPECIFIC INFORMATION provides details of the restrictions certain professions such as dental practitioners or nurse prescribers need to be aware of when prescribing on the NHS

NATIONAL FUNDING/ACCESS DECISIONS details of NICE Technology Appraisals and SMC advice

LESS SUITABLE FOR PRESCRIBING preparations that are considered by the Paediatric Formulary Committee to be less suitable for prescribing

EXCEPTION TO LEGAL CATEGORY advice and information on drugs which may be sold without a prescription under specific conditions

MEDICINAL FORMS

Form if applicable
CAUTIONARY AND ADVISORY LABELS if applicable
EXCIPIENTS clinically important but not comprehensive
ELECTROLYTES if clinically significant quantities occur
Preparation name (Manufacturer/Non-proprietary)
Drug name and strength pack sizes
Prices
Combinations available this indicates a combination preparation is available and a cross reference page number is provided to locate this preparation
Drug class monographs
In earlier editions of the BNFC, information relating to a
class of drug sharing the same properties (e.g. tetracyclines
p. 332), was contained within the prescribing notes. In the
updated structure, drug class monographs have been created
to contain the common information; this ensures such
information is easier to find, and has a more regularised
structure.

For consistency and ease of use, the class monograph follows
the same structure as a drug monograph. Class monographs
are indicated by the presence of a flag (e.g. beta-
adrenoceptor blockers (systemic) p. 95). If a drug monograph
has a corresponding class monograph, that needs to be
considered in tandem, in order to understand the full
information about a drug, the monograph is also indicated
by a flag (e.g. metoprolol tartrate p. 98). Within
this flag, the page number of the drug class monograph is
provided (e.g. 1234), to help navigate the user to this
information. This is particularly useful where occasionally,
due to differences in therapeutic use, the drug monograph
may not directly follow the drug class monograph (e.g.
sotalol hydrochloride p. 74).

Evidence grading
The BNF has adopted a five level evidence grading system
(see How BNF Publications are constructed p. ix).
Recommendations that are evidence graded can be identified
by a symbol appearing immediately before the
recommendation. The evidence grade is displayed at the end
of the recommendation.

Other content
Nutrition
Appendix 2 includes tables of ACBS-approved enteral feeds
and nutritional supplements based on their energy and
protein content. There are separate tables for specialised
formulae for specific clinical conditions. Classified sections
on foods for special diets and nutritional supplements for
metabolic diseases are also included.

Other useful information
Finding significant changes in the BNFC
• Changes, provides a list of significant changes, dose
changes, classification changes, new names, and new
preparations that have been incorporated into the BNFC,
as well as a list of preparations that have been
discontinued and removed from the BNFC. Changes listed
online are cumulative (from one print edition to the next),
and can be printed off each month to show the main
changes since the last print edition as an aide memoire for
those using print copies. So many changes are made for
each update of the BNFC, that not all of them can be
accommodated in the Changes section. We encourage
healthcare professionals to review regularly the
prescribing information on drugs that they encounter
frequently;
• Changes to the Dental Practitioners’ Formulary, are
located at the end of the Dental List;
• E-newsletter, the BNF & BNFC e-newsletter service is
available free of charge. It alerts healthcare professionals
to details of significant changes in the clinical content of
these publications and to the way that this information is
delivered. Newsletters also review clinical case studies,
provide tips on using these publications effectively, and
highlight forthcoming changes to the publications. To sign
up for e-newsletters go to www.bnf.org.
• An e-learning programme developed in collaboration with
the Centre for Pharmacy Postgraduate Education (CPPE),
enables pharmacists to identify and assess how significant
changes in the BNF affect their clinical practice. The
module can be found at www.cppe.ac.uk.

Using other sources for medicines information
The BNFC is designed as a digest for rapid reference. Less
detail is given on areas such as malignant disease and
anaesthesia since it is expected that those undertaking
treatment will have specialist knowledge and access to
specialist literature. The BNFC should be interpreted in the
light of professional knowledge and supplemented as
necessary by specialised publications and by reference to the
product literature. Information is also available from
medicines information services.
Changes

Monthly updates are provided online via MedicinesComplete and the NHS Evidence portal. The changes listed below are cumulative (from one print edition to the next).

**Significant changes**
Significant changes that will appear in the print edition of BNF for Children 2016–2017:
- Abatacept p. 598, adalimumab p. 598, etanercept p. 600 and tocilizumab p. 597 for treating juvenile idiopathic arthritis [NICE guidance]
- Asthma: updated guidance on management of chronic asthma and acute asthma.
- Adalimumab p. 598: new indications [enthesitis-related arthritis and chronic plaque psoriasis].
- Bisphosphonates: risk of osteonecrosis of the external auditory canal [MHRA/CHM advice].
- Drug allergy (suspected or confirmed): new guidance.
- Intravenous bisphosphonates: osteonecrosis of the jaw—further measures to minimise risk [MHRA advice].
- Isoflurane p. 761 is not recommended for induction of anaesthesia in infants and children of all ages [MHRA advice].
- Latanoprost (Xalatan®) p. 641 —increased reporting of eye irritation since reformulation [MHRA advice].
- Levonorgestrel releasing intra-uterine device p. 475: brand name prescribing [MHRA/CHM advice].
- Live attenuated vaccines [MHRA/CHM advice].
- Meningococcal group B vaccine, meningococcal groups A, C, W135 and Y vaccine, and influenza vaccine added to the childhood Immunisation Schedule (Summer 2015), see Vaccines p. 731.
- Obesity: updated guidance on management.
- Proton pump inhibitors: very low risk of subacute cutaneous lupus erythematosus [MHRA advice].
- Sodium valproate p. 195 and risk of abnormal pregnancy outcomes [updated MHRA/CHM advice].
- Valproic acid p. 200 and risk of abnormal pregnancy outcomes [updated MHRA/CHM advice].

**Dose changes**
Changes in dose statements that will appear in the print edition of BNF for Children 2016–2017:
- Ceftriaxone p. 302
- Colistimethate sodium p. 326 [Promixin®]
- Diamorphine hydrochloride p. 261 [licensed intranasal dose]
- Hydroxyzine hydrochloride p. 169
- Insulin degludec p. 424 [licensed in children over 1 year]
- Nystatin p. 663
- Oseltamivir p. 399

**Classification changes**
Classification changes that will appear in the print edition of BNF for Children 2016–2017:

**New preparations**
New preparations that will appear in the print edition of BNF for Children 2016–2017:
- Ayendi® [diamorphine hydrochloride p. 261]
- Intuniv® [guanfacine p. 217]
- Levosert® [levonorgestrel p. 475]
- Nuwiq® [simoctocog alfa (factor VIII fraction, dried p. 78)]
- Orphacol® [cholic acid p. 60]
- Tresiba® [insulin degludec p. 424]
Guidance on prescribing

General guidance
Medicines should be given to children only when they are necessary, and in all cases the potential benefit of administering the medicine should be considered in relation to the risk involved. This is particularly important during pregnancy, when the risk to both mother and fetus must be considered.

It is important to discuss treatment options carefully with the child and the child’s carer. In particular, the child and the child’s carer should be helped to distinguish the adverse effects of prescribed drugs from the effects of the medical disorder. When the beneficial effects of the medicine are likely to be delayed, this should be highlighted.

Taking medicines to best effect
Difficulties in adherence to drug treatment occur regardless of age. Factors that contribute to poor compliance with prescribed medicines include:
- difficulty in taking the medicine (e.g. inability to swallow the medicine);
- unattractive formulation (e.g. unpleasant taste);
- prescription not collected or not dispensed;
- purpose of medicine not clear;
- perceived lack of efficacy;
- real or perceived adverse effects;
- carers’ or child’s perception of the risk and severity of side-effects may differ from that of the prescriber;
- instructions for administration not clear.

The prescriber, the child’s carer, and the child (if appropriate) should agree on the health outcomes desired and on the strategy for achieving them (‘concordance’). The prescriber should be sensitive to religious, cultural, and personal beliefs of the child’s family that can affect acceptance of medicines.

Taking the time to explain to the child (and carers) the rationale and the potential adverse effects of treatment may improve adherence. Reinforcement and elaboration of the physician’s instructions by the pharmacist and other members of the healthcare team can be important. Giving advice on the management of adverse effects and the possibility of alternative treatments may encourage carers and children to seek advice rather than merely abandon unacceptable treatment.

Simplifying the drug regimen may help; the need for frequent administration may reduce adherence, although there appears to be little difference in adherence between once-daily and twice-daily administration. Combination products reduce the number of drugs taken but at the expense of the ability to titrate individual doses.

Drug treatment in children
Children, and particularly neonates, differ from adults in their response to drugs. Special care is needed in the neonatal period (first 28 days of life) and doses should always be calculated with care; the risk of toxicity is increased by a reduced rate of drug clearance and differing target organ sensitivity. The terms infant, child and adolescent are used inconsistently in the literature. However, for reference purposes only, the terms generally used to describe the paediatric stages of development are:

<table>
<thead>
<tr>
<th>Category</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preterm neonate</td>
<td>Born at &lt; 37 weeks gestation</td>
</tr>
<tr>
<td>Term neonate</td>
<td>Born at 37 to 42 weeks gestation</td>
</tr>
<tr>
<td>Post-term neonate</td>
<td>Born at &gt;42 weeks gestation</td>
</tr>
<tr>
<td>Neonate</td>
<td>From 0 up to 28 days of age (or first 4 weeks of life)</td>
</tr>
<tr>
<td>Infant</td>
<td>From 28 days up to 24 months of age</td>
</tr>
<tr>
<td>Child</td>
<td>From 2 years up to 12 years of age</td>
</tr>
<tr>
<td>Adolescent</td>
<td>From 12 years up to 18 years of age</td>
</tr>
</tbody>
</table>

In BNF for Children, the term neonate is used to describe a newborn infant aged 0–28 days. The terms child or children are used generically to describe the entire range from infant to adolescent (1 month–17 years). An age range is specified when the dose information applies to a narrower age range than a child from 1 month–17 years.

Administration of medicines to children
Children should be involved in decisions about taking medicines and encouraged to take responsibility for using them correctly. The degree of such involvement will depend on the child’s age, understanding, and personal circumstances.

Occasionally a medicine or its taste has to be disguised or masked with small quantities of food. However, unless specifically permitted (e.g. some formulations of pancreatin p. 66), a medicine should not be mixed with large quantities of food because the full dose might not be taken and the child might develop an aversion to food if the medicine imparts an unpleasant taste. Medicines should not be mixed or administered in a baby’s feeding bottle.

Children under 5 years (and some older children) find a liquid formulation more acceptable than tablets or capsules. However, for long-term treatment it may be possible for a child to be taught to take tablets or capsules.

An oral syringe should be used for accurate measurement and controlled administration of an oral liquid medicine. The unpleasant taste of an oral liquid can be disguised by flavouring it or by giving a favourite food or drink immediately afterwards, but the potential for food-drug interactions should be considered.

Advice should be given on dental hygiene to those receiving medicines containing cariogenic sugars for long-term treatment; sugar-free medicines should be provided whenever possible.

Children with nasal feeding tubes in place for prolonged periods should be encouraged to take medicines by mouth if possible; enteric feeding should generally be interrupted before the medicine is given (particularly if enteral feeds reduce the absorption of a particular drug). Oral liquids can be given through the tube provided that precautions are taken to guard against blockage; the dose should be washed down with warm water. When a medicine is given through a nasogastric tube to a neonate, sterile water must be used to accompany the medicine or to wash it down.

The intravenous route is generally chosen when a medicine cannot be given by mouth; reliable access, often a central vein, should be used for children whose treatment involves irritant or inotropic drugs or who need to receive the medicine over a long period or for home therapy. The subcutaneous route is used most commonly for insulin administration. Intramuscular injections should preferably be avoided in children, particularly neonates, infants, and young children. However, the intramuscular route may be advantageous for administration of single doses of medicines when intravenous cannulation would be more
problematic or painful to the child. Certain drugs, e.g. some vaccines, are only administered intramuscularly. The intrathecal, epidural and intraoesophageal routes should be used only by staff specially trained to administer medicines by these routes. Local protocols for the management of intrathecal injections must be in place.

Managing medicines in school
Administration of a medicine during schooltime should be avoided if possible; medicines should be prescribed for once or twice-daily administration whenever practicable. If the medicine needs to be taken in school, this should be discussed with parents or carers and the necessary arrangements made in advance; where appropriate, involvement of a school nurse should be sought. Managing Medicines in Schools and Early Years Settings produced by the Department of Health provides guidance on using medicines in schools (www.dh.gov.uk).

Patient information leaflets
Manufacturers’ patient information leaflets that accompany a medicine, cover only the licensed use of the medicine. Therefore, when a medicine is used outside its licence, it may be appropriate to advise the child and the child’s parent or carer that some of the information in the leaflet might not apply to the child’s treatment. Where necessary, inappropriate advice in the patient information leaflet should be identified and reassurance provided about the correct use in the context of the child’s condition.

Biosimilar medicines
A biosimilar medicine is a new biological product that is similar to a medicine that has already been authorised to be marketed (the biological reference medicine) in the European Union. The active substance of a biosimilar medicine is similar, but not identical, to the biological reference medicine. Biological products are different from standard chemical products in terms of their complexity and although theoretically there should be no important differences between the biosimilar and biological reference medicine in terms of safety or efficacy, when prescribing biological products, it is good practice to use the brand name. This will ensure that substitution of a biosimilar medicine does not occur when the medicine is dispensed. Biosimilar medicines have black triangle status at the time of initial marketing. It is important to report suspected adverse reactions to biosimilar medicines using the Yellow Card scheme. For biosimilar medicines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine.

The following biological medicines are available as biosimilar preparations and should therefore always be prescribed by brand name:
- Epoetin alfa p. 524
- Filgrastim p. 538
- Insulin glargine p. 424
- Somatropin p. 443

Complementary and alternative medicine
An increasing amount of information on complementary and alternative medicine is becoming available. Where appropriate, the child and the child’s carers should be asked about the use of their medicines, including dietary supplements and topical products. The scope of BNF for Children is restricted to the discussion of conventional medicines but reference is made to complementary treatments if they affect conventional therapy (e.g. interactions with St John’s wort). Further information on herbal medicines is available at www.mhra.gov.uk.

BNF for Children and marketing authorisation
Where appropriate the doses, indications, cautions, contra-indications, and side-effects in BNF for Children reflect those in the manufacturers’ Summaries of Product Characteristics (SPCs) which, in turn, reflect those in the corresponding marketing authorisations (formerly known as Product Licences). BNF for Children does not generally include proprietary medicines that are not supported by a valid Summary of Product Characteristics or when the marketing authorisation holder has not been able to supply essential information. When a preparation is available from more than one manufacturer, BNF for Children reflects advice that is the most clinically relevant regardless of any variation in the marketing authorisation. Unlicensed products can be obtained from ‘special-order’ manufacturers or specialist importing companies.

As far as possible, medicines should be prescribed within the terms of the marketing authorisation. However, many children require medicines not specifically licensed for paediatric use. Although a medicine cannot be promoted outside the limits of the licence, the Human Medicines Regulations 2012 do not prohibit the use of unlicensed medicines. BNF for Children includes advice involving the use of unlicensed medicines or of licensed medicines for unlicensed uses (‘off-label’ use). Such advice reflects careful consideration of the options available to manage a given condition and the weight of evidence and experience of the unlicensed intervention. Where the advice falls outside a drug’s marketing authorisation, BNF for Children shows the licensing status in the drug monograph. However, limitations of the marketing authorisation should not preclude unlicensed use where clinically appropriate.

Prescribing unlicensed medicines
Prescribing unlicensed medicines or medicines outside the recommendations of their marketing authorisation alters (and probably increases) the prescriber’s professional responsibility and potential liability. The prescriber should be able to justify and feel competent in using such medicines, and also inform the patient or the patient’s carer that the prescribed medicine is unlicensed.

Drugs and skilled tasks
Prescribers and other healthcare professionals should advise children and their carers if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

A new offence of driving, attempting to drive, or being in charge of a vehicle, with certain specified controlled drugs in excess of specified limits, came into force on 2nd March 2015. This offence is an addition to the existing rules on drug impaired driving and fitness to drive, and applies to two groups of drugs—commonly abused drugs, including amphetamines, cannabis, cocaine, and ketamine p. 773, and drugs used mainly for medical reasons, such as opioids and benzodiazepines. Anyone found to have any of the drugs (including related drugs, for example, apomorphine hydrochloride) above specified limits in their blood will be guilty of an offence, whether their driving was impaired or not. This also includes prescribed drugs which metabolise to those included in the offence, for example, selegiline hydrochloride. However, the legislation provides a statutory “medical defence” for patients taking drugs for medical reasons in accordance with instructions, if their driving was not impaired—it continues to be an offence to drive if actually impaired. Patients should therefore be advised to continue taking their medicines as prescribed, and when driving, to carry suitable evidence that the drug was
prescribed, or sold, to treat a medical or dental problem, and that it was taken according to the instructions given by the prescriber, or information provided with the medicine (e.g. a repeat prescription form or the medicine’s patient information leaflet). Further information is available from the Department for Transport at www.gov.uk/government/collections/drug-driving.

**Oral syringes**
An oral syringe is supplied when oral liquid medicines are prescribed in doses other than multiples of 5 mL. The oral syringe is marked in 0.5–5 mL divisions from 1 to 5 mL to measure doses of less than 5 mL (other sizes of oral syringe may also be available). It is provided with an adaptor and an instruction leaflet. The 5–mL spoon is used for doses of 5 mL (or multiples thereof).

**Excipients**
Branded oral liquid preparations that do not contain fructose, glucose, or sucrose are described as ‘sugar-free’ in BNF for Children. Preparations containing hydrogenated glucose syrup, mannitol, maltitol, sorbitol, or xylitol are also marked ‘sugar-free’ since they do not cause dental caries. Children receiving medicines containing cariogenic sugars, or their carers, should be advised of dental hygiene measures to prevent caries. Sugar-free preparations should be used whenever possible, particularly if treatment is required for a long period.

Where information on the presence of alcohol, aspartame, gluten, sulphites, tartrazine, arachis (peanut) oil or sesame oil is available, this is indicated in BNF for Children against the relevant preparation. Information is provided on selected excipients in skin preparations, in vaccines, and on selected preservatives and excipients in eye drops and injections.

The presence of benzyl alcohol and polyoxyl castor oil (polyethoxylated castor oil) in injections is indicated in BNF for Children. Benzyl alcohol has been associated with a fatal toxic syndrome in preterm neonates, and therefore, parenteral preparations containing the preservative should not be used in neonates. Polyoxyl castor oils, used as vehicles in intravenous injections, have been associated with severe anaphylactoid reactions. The presence of propylene glycol in oral or parenteral medicines is indicated in BNF for Children; it can cause adverse effects if its elimination is impaired, e.g. in renal failure, in neonates and young children, and in slow metabolisers of the substance. It may interact with metronidazole p. 313.

The lactose content in most medicines is too small to cause problems in most lactose-intolerant children. However, in severe lactose intolerance, the lactose content should be determined before prescribing. The amount of lactose varies according to manufacturer, product, formulation, and strength.

**Important** In the absence of information on excipients in BNF for Children and in the product literature (available at www.medicines.org.uk/emc/), contact the manufacturer if it is essential to check details.

**Health and safety**
When handling chemical or biological materials particular attention should be given to the possibility of allergy, fire, explosion, radiation, or poisoning. Care is required to avoid sources of heat (including hair dryers) when flammable substances are used on the skin or hair. Substances, such as corticosteroids, some antimicrobials, phenothiazines, and many cytotoxics, are irritant or very potent and should be handled with caution; contact with the skin and inhalation of dust should be avoided. Healthcare professionals and carers should guard against exposure to sensitising, toxic or irritant substances if it is necessary to crush tablets or open capsules.

**EEA and Swiss prescriptions**
Pharmacists can dispense prescriptions issued by doctors and dentists from the European Economic Area (EEA) or Switzerland (except prescriptions for controlled drugs in Schedules 1, 2, or 3, or for drugs without a UK marketing authorisation). Prescriptions should be written in ink or otherwise so as to be indelible, should be dated, should state the name of the patient, should state the address of the prescriber, should contain particulars indicating whether the prescriber is a doctor or dentist, and should be signed by the prescriber.

**Security and validity of prescriptions**
The Councils of the British Medical Association and the Royal Pharmaceutical Society have issued a joint statement on the security and validity of prescriptions. In particular, prescription forms should:
- not be left unattended at reception desks;
- not be left in a car where they may be visible;
- when not in use, be kept in a locked drawer within the surgery and at home.

Where there is any doubt about the authenticity of a prescription, the pharmacist should contact the prescriber. If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.

**Patient group direction (PGD)**
In most cases, the most appropriate clinical care will be provided on an individual basis by a prescriber to a specific child. However, a Patient Group Direction for supply and administration of medicines by other healthcare professionals can be used where it would benefit the child’s care without compromising safety. A Patient Group Direction is a written direction relating to the supply and administration (or administration only) of a licensed prescription-only medicine (including some Controlled Drugs in specific circumstances) by certain classes of healthcare professionals; the Direction is signed by a doctor (or dentist) and by a pharmacist. Further information on Patient Group Directions is available in Health Service Circular HSC 2000/026 (England), HDL (2001) 7 (Scotland), and WHC (2000) 116 (Wales); see also the Human Medicines Regulations 2012.

**NICE and Scottish Medicines Consortium**
Advice issued by the National Institute for Health and Care Excellence (NICE) is included in BNF for Children when relevant. BNF for Children also includes advice issued by the Scottish Medicines Consortium (SMC) when a medicine is restricted or not recommended for use within NHS Scotland.

If advice within a NICE Single Technology Appraisal differs from SMC advice, the Scottish Executive expects NHS Boards within NHS Scotland to comply with the SMC advice. Details of the advice together with updates can be obtained from www.nice.org.uk and from www.scottishmedicines.org.uk.
4 Prescription writing

Shared care
In its guidelines on responsibility for prescribing (circular EL (91) 127) between hospitals and general practitioners, the Department of Health has advised that legal responsibility for prescribing lies with the doctor who signs the prescription.

Requirements
Prescriptions should be written legibly in ink or otherwise so as to be indelible (it is permissible to issue carbon copies of NHS prescriptions as long as they are signed in ink), should be dated, should state the name and address of the patient, and should be signed in ink by the prescriber (computer-generated facsimile signatures do not meet the legal requirement). The age and the date of birth of the patient should preferably be stated, and it is a legal requirement in the case of prescription-only medicines to state the age for children under 12 years. These recommendations are acceptable for prescription-only medicines. Prescriptions for controlled drugs have additional legal requirements.

Wherever appropriate the prescriber should state the current weight of the child to enable the dose prescribed to be calculated. Consideration should also be given to including the surface area e.g. mg/m² body-surface area e.g. mg/m² where this would reduce error.

The following should be noted:
- The strength or quantity to be contained in capsules, lozenges, tablets etc. should be stated by the prescriber. In particular, strength of liquid preparations should be clearly stated (e.g. 125 mg/5 mL).
- The unnecessary use of decimal points should be avoided, e.g. 3 mg, not 3.0 mg. Quantities of 1 gram or more should be written as 1 g etc. Quantities less than 1 gram should be written in milligrams, e.g. 500 mg, not 0.5 g. Quantities less than 1 mg should be written in micrograms, e.g. 100 micrograms, not 0.1 mg. When decimals are unavoidable a zero should be written in front of the decimal point where there is no other figure, e.g. 0.5 mL, not .5 mL. Use of the decimal point is acceptable to express a range, e.g. 0.5 to 1 g.
- ‘Micrograms’ and ‘nanograms’ should not be abbreviated. Similarly ‘units’ should not be abbreviated.
- The term ‘millilitre’ (mL or mL) is used in medicine and pharmacy, and cubic centimetre, c.c., or cm³ should not be used. The use of capital ‘L’ in mL is a printing convention throughout the BNF; both ‘mL’ and ‘ml’ are recognised SI abbreviations.
- Dose and dose frequency should be stated; in the case of preparations to be taken ‘as required’ a minimum dose interval should be specified. Care should be taken to ensure children receive the correct dose of the active drug. Therefore, the dose should normally be stated in terms of the mass of the active drug (e.g. ‘125 mg 3 times daily’); terms such as ‘5 mL’ or ‘1 tablet’ should be avoided except for compound preparations. When doses other than multiples of 5 mL are prescribed for oral liquid preparations the dose-volume will be provided by means of an oral syringe, (except for preparations intended to be measured with a pipette). Suitable quantities:
  - Elixirs, Linctuses, and Paediatric Mixtures (5-mL dose), 50, 100, or 150 mL.
  - Adult Mixtures (10 mL dose), 200 or 300 mL.
  - Ear Drops, Eye drops, and Nasal Drops, 10 mL (or the manufacturer’s pack).
  - Eye Lotions, Gargles, and Mouthwashes, 200 mL.
- The names of drugs and preparations should be written clearly and not abbreviated, using approved titles only; avoid creating generic titles for modified-release preparations.
- The quantity to be supplied may be stated by indicating the number of days of treatment required in the box provided on NHS forms. In most cases the exact amount will be supplied. This does not apply to items directed to be used as required—if the dose and frequency are not given then the quantity to be supplied needs to be stated. When several items are ordered on one form the box can be marked with the number of days of treatment provided the quantity is added for any item for which the amount cannot be calculated.
- Although directions should preferably be in English without abbreviation, it is recognised that some Latin abbreviations are used.

Abbreviation of titles In general, titles of drugs and preparations should be written in full. Unofficial abbreviations should not be used as they may be misinterpreted.

Non-proprietary titles Where non-proprietary (‘generic’) titles are given, they should be used for prescribing. This will enable any suitable product to be dispensed, thereby saving delay to the patient and sometimes expense to the health service. The only exception is where there is a demonstrable difference in clinical effect between each manufacturer’s version of the formulation, making it important that the child should always receive the same brand; in such cases, the brand name or the manufacturer should be stated.

Non-proprietary names of compound preparations Non-proprietary names of compound preparations which
appear in BNF for Children are those that have been compiled by the British Pharmacopoeia Commission or another recognised body; whenever possible they reflect the names of the active ingredients. Prescribers should avoid creating their own compound names for the purposes of generic prescribing; such names do not have an approved definition and can be misinterpreted.

Special care should be taken to avoid errors when prescribing compound preparations; in particular the hyphen in the prefix ‘co-’ should be retained. Special care should also be taken to avoid creating generic names for modified-release preparations where the use of these names could lead to confusion between formulations with different duration of action.
Supply of medicines

Overview
When supplying a medicine for a child, the pharmacist should ensure that the child and the child’s carer understand the nature and identity of the medicine and how it should be used. The child and the carer should be provided with appropriate information (e.g. how long the medicine should be taken for and what to do if a dose is missed or the child vomits soon after the dose is given).

Safety in the home
Carers and relatives of children must be warned to keep all medicines out of the reach and sight of children. Tablets, capsules and oral and external liquid preparations must be dispensed in a reclosable child-resistant container unless:
- the medicine is in an original pack or patient pack such as to make this inadvisable;
- the child’s carer will have difficulty in opening a child-resistant container;
- a specific request is made that the product shall not be dispensed in a child-resistant container;
- no suitable child-resistant container exists for a particular liquid preparation.

All patients should be advised to dispose of unwanted medicines by returning them to a pharmacy for destruction.

Labelling of prescribed medicines
There is a legal requirement for the following to appear on the label of any prescribed medicine:
- name of the patient;
- name and address of the supplying pharmacy;
- date of dispensing;
- name of the medicine;
- precautions relating to the use of the medicine.

The Royal Pharmaceutical Society recommends that the following also appears on the label:
- the words ‘Keep out of the sight and reach of children’;
- where applicable, the words ‘Use this medicine only on your skin’.

A pharmacist can exercise professional skill and judgement to amend or include more appropriate wording for the name of the medicine, the directions for use, or the precautions relating to the use of the medicine.

Unlicensed medicines
A drug or formulation that is not covered by a marketing authorisation may be obtained from a pharmaceutical company, imported by a specialist importer, manufactured by a commercial or hospital licensed manufacturing unit, or prepared extemporaneously against a prescription. The safeguards that apply to products with marketing authorisation should be extended, as far as possible, to the use of unlicensed medicines. The safety, efficacy, and quality (including labelling) of unlicensed medicines should be assured by means of clear policies on their prescribing, purchase, supply, and administration. Extra care is required with unlicensed medicines because less information may be available on the drug and any formulation of the drug. The following should be agreed with the supplier when ordering an unlicensed or extemporaneously prepared medicine:
- the specification of the formulation;
- documentation confirming the specification and quality of the product supplied (e.g. a certificate of conformity or of analysis);
- for imported preparations product and licensing information should be supplied in English.

Extemporaneous preparations
A product should be dispensed extemporaneously only when no product with a marketing authorisation is available. Every effort should be made to ensure that an extemporaneously prepared product is stable and that it delivers the requisite dose reliably; the child should be provided with a consistent formulation regardless of where the medicine is supplied to minimise variations in quality. Where there is doubt about the formulation, advice should be sought from a medicines information centre, the pharmacy at a children’s hospital, a hospital production unit, a hospital quality control department, or the manufacturer.

In many cases it is preferable to give a licensed product by an unlicensed route (e.g. an injection solution given by mouth) than to prepare a special formulation. When tablets or capsules are cut, dispersed, or used for preparing liquids immediately before administration, it is important to confirm uniform dispersal of the active ingredient, especially if only a portion of the solid content (e.g. a tablet segment) is used or if only an aliquot of the liquid is to be administered. In some cases the child’s clinical condition may require a dose to be administered in the absence of full information on the method of administration. It is important to ensure that the appropriate supporting information is available at the earliest opportunity.

Preparation of products that produce harmful dust (e.g. cytotoxic drugs, hormones, or potentially sensitising drugs such as neomycin sulfate p. 675) should be avoided or undertaken with appropriate precautions to protect staff and carers.

The BP direction that a preparation must be freshly prepared indicates that it must be made not more than 24 hours before it is issued for use. The direction that a preparation should be recently prepared indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15–25°C.

The term water used without qualification means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled purified water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation.
Emergency supply of medicines

Emergency supply requested by member of the public
Pharmacists are sometimes called upon by members of the public to make an emergency supply of medicines. The Human Medicines Regulations 2012 allows exemptions from the Prescription Only requirements for emergency supply to be made by a person lawfully conducting a retail pharmacy business provided:

a) that the pharmacist has interviewed the person requesting the prescription-only medicine and is satisfied:
   i) that there is immediate need for the prescription-only medicine and that it is impracticable in the circumstances to obtain a prescription without undue delay;
   ii) that treatment with the prescription-only medicine has on a previous occasion been prescribed for the person requesting it;
   iii) as to the dose that it would be appropriate for the person to take;
b) that no greater quantity shall be supplied than will provide 5 days’ treatment of phenobarbital p. 205, phenobarbital sodium, or Controlled Drugs in Schedules 4 or 5 (doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation) or 30 days’ treatment for other prescription-only medicines, except when the prescription-only medicine is:
   i) insulin, an ointment or cream, or a preparation for the relief of asthma in an aerosol dispenser when the smallest pack can be supplied;
   ii) an oral contraceptive when a full cycle may be supplied;
   iii) an antibiotic in liquid form for oral administration when the smallest quantity that will provide a full course of treatment can be supplied;

c) that an entry shall be made in the prescription book stating:
   i) the date of supply;
   ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   iii) the name and address of the patient;

d) that the container or package must be labelled to show:
   i) the date of supply;
   ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   iii) the name of the patient;
   iv) the name and address of the pharmacy;
   v) the words 'Emergency supply';
   vi) the words 'Keep out of the reach of children' (or similar warning);

e) that the prescription-only medicine is not a substance specifically excluded from the emergency supply provision, and does not contain a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 205 or phenobarbital sodium for the treatment of epilepsy: for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition); (Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation).

Emergency supply requested by prescriber
Emergency supply of a prescription-only medicine may also be made at the request of a doctor, a dentist, a supplementary prescriber, a community practitioner nurse prescriber, a nurse, pharmacist, or optometrist independent prescriber, or a doctor or dentist from the European Economic Area or Switzerland, provided:

a) that the pharmacist is satisfied that the prescriber by reason of some emergency is unable to furnish a prescription immediately;

b) that the prescriber has undertaken to furnish a prescription within 72 hours;

c) that the medicine is supplied in accordance with the directions of the prescriber requesting it;

d) that the medicine is not a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital p. 205 or phenobarbital sodium for the treatment of epilepsy: for details see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition); (Doctors or dentists from the European Economic Area and Switzerland, or their patients, cannot request an emergency supply of Controlled Drugs in Schedules 1, 2, or 3, or drugs that do not have a UK marketing authorisation).

e) that an entry shall be made in the prescription book stating:
   i) the date of supply;
   ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   iii) the name and address of the practitioner requesting the emergency supply;
   iv) the name and address of the patient;
   v) the date on the prescription;
   vi) when the prescription is received the entry should be amended to include the date on which it is received.

Royal Pharmaceutical Society’s guidelines
1. The pharmacist should consider the medical consequences of not supplying a medicine in an emergency.
2. If the pharmacist is unable to make an emergency supply of a medicine the pharmacist should advise the patient how to obtain essential medical care.
For conditions that apply to supplies made at the request of a patient see Medicines, Ethics and Practice, London, Pharmaceutical Press, (always consult latest edition).
Controlled drugs and drug dependence

Regulations and classification

The Misuse of Drugs Act, 1971 prohibits certain activities in relation to ‘Controlled Drugs’, in particular their manufacture, supply, and possession. The penalties applicable to offences involving the different drugs are graded broadly according to the harmfulness attributable to a drug when it is misused and for this purpose the drugs are defined in the following three classes:

- **Class A** includes: alfentanil p. 772, cocaine, diamorphine hydrochloride (heroin) p. 261, dipipanone hydrochloride, lysergide (LSD), methadone hydrochloride p. 270, methylenedioxymethamphetamine (MDMA, ‘ecstasy’), morphine, opium, pethidine hydrochloride p. 269, phencyclidine, remifentanil p. 772, and class B substances when prepared for injection.
- **Class C** includes: certain drugs related to the amfetamines such as benzphetamine and chlorphentermine, buprenorphine p. 257, mazindol, meprobamate, pemoline, pipradrol, most benzodiazepines, tramadol hydrochloride p. 270, zaleplon, zolpidem tartrate, zopiclone, and androgenic anabolic steroids, clenbuterol, chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatropin, somatrem, and somatropin p. 443. Controlled drug prescription requirements do not apply and Schedule 4 Controlled Drugs are not subject to safe custody requirements.

- **Schedule 5** includes those preparations which, because of their strength, are exempt from virtually all Controlled Drug requirements other than retention of invoices for two years.

Prescriptions

Preparations in Schedules 2, 3, and 4 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are identified throughout BNF for children using the following symbols:

- (20) for preparations in Schedule 2
- (21) for preparations in Schedule 3
- (24-1) for preparations in Schedule 4 (Part I)
- (24-2) for preparations in Schedule 4 (Part II)

The principal legal requirements relating to medical prescriptions are listed below (see also Department of Health Guidance).

Prescription requirements

Prescriptions for Controlled Drugs that are subject to prescription requirements (all preparations in Schedules 2 and 3) must be indelible and must be signed by the prescriber, be dated, and specify the prescriber’s address. A machine-written prescription is acceptable, but the prescriber’s signature must be handwritten. Advanced electronic signatures can be accepted for Schedule 2 and 3 Controlled Drugs where the Electronic Prescribing Service (EPS) is used. All prescriptions for Controlled Drugs that are subject to prescription requirements must always state:

- the name and address of the patient;
- in the case of a preparation, the form (The dosage form e.g. tablets must be included on a Controlled Drugs prescription irrespective of whether it is implicit in the proprietary name e.g. MST Continus or whether only one form is available) and where appropriate the strength (when more than one strength of a preparation exists the strength required must be specified) of the preparation;
- for liquids, the total volume in millilitres (in both words and figures) of the preparation to be supplied; for dosage units, the number (in both words and figures) of dosage units to be supplied; in any other case, the total quantity (in both words and figures) of the Controlled Drug to be supplied;
- the dose (the instruction ‘one as directed’ constitutes a dose but ‘as directed’ does not);
- the words ‘for dental treatment only’ if issued by a dentist.

A pharmacist is not allowed to dispense a Controlled Drug unless all the information required by law is given on the prescription. In the case of a prescription for a Controlled Drug in Schedule 2 or 3, a pharmacist can amend the prescription if it specifies the total quantity only in words or in figures or if it contains minor typographical errors, provided that such amendments are indelible and clearly attributable to the pharmacist (implementation date for N. Ireland not confirmed). Failure to comply with the regulations concerning the writing of prescriptions will result in inconvenience to patients and delay in supplying the necessary medicine. A prescription for a Controlled Drug in Schedules 2, 3, or 4 is valid for 28 days from the date stated thereon (the prescriber may forward-date the
prescription; the start date may also be specified in the body of the prescription).

**Instalments and ‘repeats’**

A prescription may order a Controlled Drug to be dispensed by instalments; the amount of instalments and the intervals to be observed must be specified (a total of 14 days’ treatment by instalment of any drug listed in Schedule 2 of the Misuse of Drugs Regulations, buprenorphine p. 257, and diazepam p. 207 may be prescribed in England. In England, forms FP10(MDA) (blue) and FP10H (MDA) (blue) should be used. In Scotland, forms GP10 (peach), HBP (blue), or HBPA (pink) should be used. In Wales a total of 14 days’ treatment by instalment of any drug listed in Schedules 2–5 of the Misuse of Drugs Regulations may be prescribed. In Wales, form WP10(MDA) or form WP10HP(AD) should be used.

Instalment prescriptions must be dispensed in accordance with the directions in the prescription. However, the Home Office has approved specific wording which may be included in an instalment prescription to cover certain situations; for example, if a pharmacy is closed on the day when an instalment is due. For details, see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition) or see Drug Misuse and Dependence: UK Guidelines on Clinical Management (2007), available at [www.nita.nhs.uk/uploads/clinical_guidelines_2007.pdf](http://www.nita.nhs.uk/uploads/clinical_guidelines_2007.pdf). Prescriptions ordering ‘repeats’ on the same form are not permitted for Controlled Drugs in Schedules 2 or 3.

**Private prescriptions**

Private prescriptions for Controlled Drugs in Schedules 2 and 3 must be written on specially designated forms provided by Primary Care Trusts in England, Health Boards in Scotland, Local Health Boards in Wales, or the Northern Ireland Central Services Agency; in addition, prescriptions must specify the prescriber’s identification number. Prescriptions to be supplied by a pharmacist in hospital are exempt from the requirements for private prescriptions.

**Department of Health guidance**

Guidance (June 2006) issued by the Department of Health in England on prescribing and dispensing of Controlled Drugs requires:

- in general, prescriptions for Controlled Drugs in Schedules 2, 3, and 4 to be limited to a supply of up to 30 days’ treatment; exceptionally, to cover a justifiable clinical need and after consideration of any risk, a prescription can be issued for a longer period, but the reasons for the decision should be recorded on the patient’s notes;
- the patient’s identifier to be shown on NHS and private prescriptions for Controlled Drugs in Schedules 2 and 3.

Further information is available at [www.gov.uk/dh](http://www.gov.uk/dh).

### Dependence and misuse

The most serious drugs of addiction are *cocaine*, diamorphine hydrochloride (heroin) p. 261, morphine p. 265, and the *synthetic opioids*.

Despite marked reduction in the prescribing of amphetamines, there is concern that abuse of illicit amphetamine and related compounds is widespread. Benzodiazepines are commonly misused. However, the misuse of barbiturates is now uncommon, in line with declining medicinal use and consequent availability.

Cannabis (Indian hemp) has no approved medicinal use and cannot be prescribed by doctors. Its use is illegal but widespread. Cannabis is a mild hallucinogen seldom accompanied by a desire to increase the dose; withdrawal symptoms are unusual. However, cannabis extract is licensed as a medicinal product. *Lysergide* (lysergic acid diethylamide, LSD) is a much more potent hallucinogen; its use can lead to severe psychotic states which can be life-threatening.

There are concerns over increases in the availability and misuse of other drugs with variously combined hallucinogenic, anaesthetic, or sedative properties. These include ketamine p. 773 and gamma-hydroxybutyrate (sodium oxybate, GHB).

### Prescribing drugs likely to cause dependence or misuse

The prescriber has three main responsibilities:

- To avoid creating dependence by introducing drugs to patients without sufficient reason. In this context, the proper use of the morphine-like drugs is well understood. The dangers of other Controlled Drugs are
Controlled drugs and drug dependence

BNFC 2016–2017

less clear because recognition of dependence is not easy and its effects, and those of withdrawal, are less obvious.

- To see that the patient does not gradually increase the dose of a drug, given for good medical reasons, to the point where dependence becomes more likely. This tendency is seen especially with hypnotics and anxiolytics. The prescriber should keep a close eye on the amount prescribed to prevent patients from accumulating stocks. A minimal amount should be prescribed in the first instance, or when seeing a new patient for the first time.

- To avoid being used as an unwitting source of supply for addicts and being vigilant to methods for obtaining medicines. Methods include visiting more than one doctor, fabricating stories, and forging prescriptions. Patients under temporary care should be given only small supplies of drugs unless they present an unequivocal letter from their own doctor. It is sensible to reduce dosages steadily or to issue weekly or even daily prescriptions for small amounts if dependence is suspected. The stealing and misuse of prescription forms could be minimised by the following precautions:
  - do not leave unattended if called away from the consulting room or at reception desks; do not leave in a car where they may be visible; when not in use, keep in a locked drawer within the surgery and at home;
  - draw a diagonal line across the blank part of the form under the prescription;
  - the quantity should be shown in words and figures when prescribing drugs prone to abuse; this is obligatory for controlled drugs;
  - alterations are best avoided but if any are made they should be clear and unambiguous; add initials against altered items;
  - if prescriptions are left for collection they should be left in a safe place in a sealed envelope.

Travelling abroad

Prescribed drugs listed in Schedule 4 Part II (CD Anab) and Schedule 5 of the Misuse of Drugs Regulations 2001 are not subject to export or import licensing. However, patients intending to travel abroad for more than 3 months carrying any amount of drugs listed in Schedules 2, 3, or 4 Part I (CD Benz) will require a personal export/import licence. Further details can be obtained at www.gsi.gov.uk/publish/controlled-drugs-licences-fees-and-returns or from the Home Office by contacting licensing.enquiry.aadu@homeoffice.gsi.gov.uk (in cases of emergency, telephone (020) 7035 6330).

Applications must be supported by a covering letter from the prescriber and should give details of:
  - the patient’s name and address;
  - the quantities of drugs to be carried;
  - the strength and form in which the drugs will be dispensed;
  - the country or countries of destination;
  - the dates of travel to and from the United Kingdom.

Applications for licences should be sent to the Home Office, Drugs Licensing & Compliance Unit, Fry Building, 2 Marsham Street, London, SW1P 4DF. Alternatively, completed application forms can be emailed to dlccommsofficer@homeoffice.gsi.gov.uk with a copy of the covering letter from the prescriber as a pdf. A minimum of two weeks should be allowed for processing the application. Patients travelling for less than 3 months do not require a personal export/import licence for carrying Controlled Drugs, but are advised to carry a letter from the prescribing doctor. Those travelling for more than 3 months are advised to make arrangements to have their medication prescribed by a practitioner in the country they are visiting.

Doctors who want to take Controlled Drugs abroad while accompanying patients may similarly be issued with licences. Licences are not normally issued to doctors who want to take Controlled Drugs abroad solely in case a family emergency should arise.

Personal export/import licences do not have any legal status outside the UK and are issued only to comply with the Misuse of Drugs Act and to facilitate passage through UK Customs and Excise control. For clearance in the country to be visited it is necessary to approach that country’s consulate in the UK.

Notification of drug misusers

Doctors should report cases of drug misuse to their regional or national drug misuse database or centre. In England, doctors should report cases where they are providing structured drug treatment for substance dependence to their local National Drug Treatment Monitoring System (NDTMS) Team. General information about NDTMS can be found at www.nta.nhs.uk/ndtms.aspx. Enquiries about NDTMS, and how to submit data, should initially be directed to: EvidenceApplicationTeam@phe.gov.uk

In Scotland, doctors should report cases to the Substance Misuse Programme (SMP).

Tel: (0131) 275 6348

In Northern Ireland, the Misuse of Drugs (Notification of and Supply to Addicts) (Northern Ireland) Regulations 1973 require doctors to send particulars of persons whom they consider to be addicted to certain controlled drugs to the Chief Medical Officer of the Department of Health and Social Services. The Northern Ireland contacts are:

- Medical contact:
  - Dr Ian McMaster, C3 Castle Buildings, Belfast, BT4 3FQ
  - Tel: (028) 9052 2421, Fax: (028) 9052 0718
  - ian.mcmaster@dhsspsni.gov.uk

- Administrative contact:
  - Public Health Information & Research Branch, Annex 2, Castle Building, Belfast, BT4 3SQ
  - Tel: (028) 9052 2520

Public Health Information & Research Branch also maintains the Northern Ireland Drug Misuse Database (NIDMD) which collects detailed information on those presenting for treatment, on drugs misused and injecting behaviour; participation is not a statutory requirement. In Wales, doctors should report cases where they are providing structured drug treatment for substance dependence on the Welsh National Database for Substance Misuse; enquiries should be directed to: substance.misuse-queries@wales.nhs.uk.
Adverse reactions to drugs

Yellow card scheme
Any drug may produce unwanted or unexpected adverse reactions. Rapid detection and recording of adverse drug reactions is of vital importance so that unrecognised hazards are identified promptly and appropriate regulatory action is taken to ensure that medicines are used safely. Healthcare professionals and coroners are urged to report suspected adverse drug reactions directly to the Medicines and Healthcare products Regulatory Agency (MHRA) through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard. Alternatively, prepayd Yellow Cards for reporting are available from the address below and are also bound in the inside back cover of BNF for Children. Send Yellow Cards to:
FREEPOST YELLOW CARD
(No other address details required).
Tel: 0800 731 6789

Suspected adverse drug reactions to any therapeutic agent should be reported, including drugs (self-medication as well as those prescribed), blood products, vaccines, radiographic contrast media, complementary and herbal products. For biosimilar medicines and vaccines, adverse reaction reports should clearly state the brand name and the batch number of the suspected medicine or vaccine.

Suspected adverse drug reactions should be reported through the Yellow Card Scheme at www.mhra.gov.uk/yellowcard. Yellow Cards can be used for reporting suspected adverse drug reactions to medicines, vaccines, herbal or complementary products, whether self-medicated or prescribed. This includes suspected adverse drug reactions associated with misuse, overdose, medication errors or from use of unlicensed and off-label medicines. Yellow Cards can also be used to report medical device incidents, defective medicines, and suspected fake medicines.

Report all suspected adverse drug reactions that are:
- serious, medically significant or result in harm;
- associated with newer drugs and vaccines; the most up to date list of black triangle medicines is available at: www.mhra.gov.uk/blacktrangle

If in doubt whether to report a suspected adverse drug reaction, please complete a Yellow Card. The identification and reporting of adverse reactions to drugs in children and neonates is particularly important because:
- the action of the drug and its pharmacokinetics in children (especially in the very young) may be different from that in adults;
- drugs may not have been extensively tested in children;
- many drugs are not specifically licensed for use in children and are used either ‘off-label’ or as unlicensed products;
- drugs may affect the way a child grows and develops or may cause delayed adverse reactions which do not occur in adults;
- suitable formulations may not be available to allow precise dosing in children or they may contain excipients that should be used with caution in children;
- the nature and course of illnesses and adverse drug reactions may differ between adults and children.

Even if reported through the British Paediatric Surveillance Unit’s Orange Card Scheme, any identified suspected adverse drug reactions should also be submitted to the Yellow Card Scheme. Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised, or if other drugs have been given at the same time. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.

A freephone service is available to all parts of the UK for advice and information on suspected adverse drug reactions; contact the National Yellow Card Information Service at the MHRA on 0800 731 6789. Outside office hours a telephone-answering machine will take messages.

The following Yellow Card Centres can be contacted for further information:

**Yellow Card Centre Northwest**
2nd Floor, 70 Pembroke Place, Liverpool, L69 3GF
Tel: (0151) 794 8122

**Yellow Card Centre Wales**
Cardiff University, Department of Pharmacology, Therapeutics and Toxicology, Heath Park, Cardiff, CF14 4XN
Tel: (029) 2074 4181

**Yellow Card Centre Northern & Yorkshire**
Regional Drug and Therapeutics Centre, 16/17 Framlington Place, Newcastle upon Tyne, NE2 4AB
Tel: (0191) 213 7855

**Yellow Card Centre West Midlands**
City Hospital, Dudley Road, Birmingham, B18 7QH
Tel: (0121) 507 5672

**Yellow Card Centre Scotland**
CARDs, Royal Infirmary of Edinburgh, 51 Little France Crescent, Old Dalkeith Road, Edinburgh, EH16 4SA
Tel: (0131) 242 2919
YCCScotland@luht.scot.nhs.uk

The MHRA’s database facilitates the monitoring of adverse drug reactions. More detailed information on reporting and a list of products currently under additional monitoring can be found on the MHRA website: www.mhra.gov.uk.

**MHRA Drug Safety Update**
*Drug Safety Update* is a monthly newsletter from the MHRA and the Commission on Human Medicines (CHM); it is available at www.mhra.gov.uk/drugsafetyupdate.

**Self-reporting**
Patients and their carers can also report suspected adverse drug reactions to the MHRA. Reports can be submitted directly to the MHRA through the Yellow Card Scheme using the electronic form at www.mhra.gov.uk/yellowcard, by telephone on 0808 100 3352, or by downloading the Yellow Card form from www.mhra.gov.uk. Alternatively, patient Yellow Cards are available from pharmacies and GP surgeries. Information for patients about the Yellow Card Scheme is available in other languages at www.mhra.gov.uk/yellowcard.

**Prescription-event monitoring**
In addition to the MHRA’s Yellow Card Scheme, an independent scheme monitors the safety of new medicines using a different approach. The Drug Safety Research Unit identifies patients who have been prescribed selected new medicines and collects data on clinical events in these patients. The data are submitted on a voluntary basis by general practitioners on green forms. More information about the scheme and the Unit’s educational material is available from www.drsu.org.

**Newer drugs and vaccines**
Only limited information is available from clinical trials on the safety of new medicines. Further understanding about
the safety of medicines depends on the availability of information from routine clinical practice. The black triangle symbol identifies newly licensed medicines that require additional monitoring by the European Medicines Agency. Such medicines include new active substances, biosimilar medicines, and medicines that the European Medicines Agency consider require additional monitoring. The black triangle symbol also appears in the Patient Information Leaflets for relevant medicines, with a brief explanation of what it means. Products usually retain a black triangle for 5 years, but this can be extended if required.

Medication errors
Adverse drug reactions where harm occurs as a result of a medication error are reportable as a Yellow Card or through the local risk management systems into the National Reporting and Learning System (NRLS). If reported to the NRLS, these will be shared with the MHRA. If the NRLS is not available and harm occurs, report using a Yellow Card.

Adverse reactions to medical devices
Suspected adverse reactions to medical devices including dental or surgical materials, intra-uterine devices, and contact lens fluids should be reported. Information on reporting these can be found at: www.mhra.gov.uk.

Side-effects in the BNF for Children
The BNF for Children includes clinically relevant side-effects for most drugs; an exhaustive list is not included for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). Where causality has not been established, side-effects in the manufacturers’ literature may be omitted from the BNF for Children.

Special problems

**Symptoms** Children may be poor at expressing the symptoms of an adverse drug reaction and parental opinion may be required.

**Delayed drug effects** Some reactions (e.g. cancers and effects on development) may become manifest months or years after exposure. Any suspicion of such an association should be reported directly to the MHRA through the Yellow Card Scheme.

**Congenital abnormalities** When an infant is born with a congenital abnormality or there is a malformed aborted fetus doctors are asked to consider whether this might be an adverse reaction to a drug and to report all drugs (including self-medication) taken during pregnancy.

**Prevention of adverse reactions** Adverse reactions may be prevented as follows:

- whenever possible use a familiar drug; with a new drug be particularly alert for adverse reactions or unexpected events;
- consider if excipients (e.g. colouring agents) may be contributing to the adverse reaction. If the reaction is minor, a trial of an alternative formulation of the same drug may be considered before abandoning the drug;
- obtain a full drug history including asking if the child is already taking other drugs including over-the-counter medicines; interactions may occur;
- age and hepatic or renal disease may alter the metabolism or excretion of drugs, particularly in neonates, which can affect the potential for adverse effects. Genetic factors may also be responsible for variations in metabolism, and therefore for the adverse effects of the drug;
- warn the child, parent, or carer if serious adverse reactions are liable to occur.

**Drug allergy (suspected or confirmed)** Suspected drug allergy is any reaction caused by a drug with clinical features compatible with an immunological mechanism. All drugs have the potential to cause adverse drug reactions, but not all of these are allergic in nature. A reaction is more likely to be caused by drug allergy if:

- The reaction occurred while the child was being treated with the drug, or
- The drug is known to cause this pattern of reaction, or
- The child has had a similar reaction to the same drug or drug-class previously.

A suspected reaction is less likely to be caused by a drug allergy if there is a possible non-drug cause or if there are only gastro-intestinal symptoms present. The following signs, allergic patterns and timing of onset can be used to help decide whether to suspect drug allergy:

**Immediate, rapidly-evolving reactions** (onset usually less than 1 hour after drug exposure)

- Anaphylaxis, with erythema, urticaria or angioedema, and hypotension and/or bronchospasm. See also antihistamines, allergen immunotherapy and allergic emergencies p. 162
- Urticaria or angioedema without systemic features
- Exacerbation of asthma e.g. with non-steroidal anti-inflammatory drugs (NSAIDs)

**Non-immediate reactions, without systemic involvement** (onset usually 6–10 days after first drug exposure or 3 days after second exposure)

- Cutaneous reactions, e.g. widespread red macules and/or papules, or, fixed drug eruption (localised inflamed skin)

**Non-immediate reactions, with systemic involvement** (onset may be variable, usually 3 days to 6 weeks after first drug exposure, depending on features, or 3 days after second exposure)

- Cutaneous reactions with systemic features, e.g. drug reaction with eosinophilia and systemic signs (DRESS) or drug hypersensitivity syndrome (DHS), characterised by widespread red macules, papules or erythroderma, fever, lymphadenopathy, liver dysfunction or eosinophilia
- Toxic epidermal necrolysis or Stevens–Johnson syndrome
- Acute generalised exanthematous pustulosis (AGEP)

Suspected drug allergy information should be clearly and accurately documented in clinical notes and prescriptions, and shared among all healthcare professionals. Children and parents or carers should be given information about which drugs and drug-classes to avoid and encouraged to share the drug allergy status.

*BNFC 2016–2017*
If a drug allergy is suspected, consider stopping the suspected drug and advising the child and parent or carer to avoid this drug in future. Symptoms of the acute reaction should be treated, in hospital if severe. Children presenting with a suspected anaphylactic reaction, or a severe or non-immediate cutaneous reaction, should be referred to a specialist drug allergy service. Children presenting with a suspected drug allergic reaction or anaphylaxis to NSAIDs, and local and general anaesthetics may also need to be referred to a specialist drug allergy service, e.g. in cases of anaphylactoid reactions or to determine future treatment options. Children presenting with a suspected drug allergic reaction or anaphylaxis associated with beta-lactam antibiotics should be referred to a specialist drug allergy service if their disease or condition can only be treated by a beta-lactam antibiotic or they are likely to need beta-lactam antibiotics frequently in the future (e.g. immunodeficient children). For further information see Drug allergy: diagnosis and management. NICE Clinical Guideline 183 (September 2014) www.nice.org.uk/guidance/cg183.

Defective medicines
During the manufacture or distribution of a medicine an error or accident may occur whereby the finished product does not conform to its specification. While such a defect may impair the therapeutic effect of the product and could adversely affect the health of a patient, it should not be confused with an Adverse Drug Reaction where the product conforms to its specification.

The Defective Medicines Report Centre assists with the investigation of problems arising from licensed medicinal products thought to be defective and co-ordinates any necessary protective action. Reports on suspect defective medicinal products should include the brand or the non-proprietary name, the name of the manufacturer or supplier, the strength and dosage form of the product, the product licence number, the batch number or numbers of the product, the nature of the defect, and an account of any action already taken in consequence. The Centre can be contacted at:

The Defective Medicines Report Centre
Medicines and Healthcare products Regulatory Agency, 151 Buckingham Palace Road, London, SW1W 9SZ

Guidance on intravenous infusions

Intravenous infusions for neonatal intensive care

Intravenous policy
A local policy on the dilution of drugs with intravenous fluids should be drawn up by a multi-disciplinary team and issued as a document to the members of staff concerned. Centralised additive services are provided in a number of hospital pharmacy departments and should be used in preference to making additions on wards. The information that follows should be read in conjunction with local policy documents.

Guidelines

- Drugs should only be diluted with infusion fluid when constant plasma concentrations are needed or when the administration of a more concentrated solution would be harmful.
- In general, only one drug should be mixed with an infusion fluid in a syringe and the components should be compatible. Ready-prepared solutions should be used whenever possible. Drugs should not normally be added to blood products, mannitol, or sodium bicarbonate. Only specially formulated additives should be used with fat emulsions or amino-acid solutions.
- Solutions should be thoroughly mixed by shaking and checked for absence of particulate matter before use.
- Strict asepsis should be maintained throughout and in general the giving set should not be used for more than 24 hours (for drug admixtures).
- The infusion syringe should be labelled with the name and hospital number, the name and quantity of drug, the infusion fluid, and the expiry date and time. If a problem occurs during administration, containers should be retained for a period after use in case they are needed for investigation.
- Administration using a suitable motorised syringe driver is advocated for preparations where strict control over administration is required.
- It is good practice to examine intravenous infusions from time to time while they are running. If cloudiness, crystallisation, change of colour, or any other sign of interaction or contamination is observed the infusion should be discontinued.

Problems

Microbial contamination
The accidental entry and subsequent growth of micro-organisms converts the infusion fluid pathway into a potential vehicle for infection with micro-organisms, particularly species of Candida, Enterobacter, and Klebsiella. Ready-prepared infusions containing the additional drugs, or infusions prepared by an additive service (when available) should therefore be used in preference to making extemporaneous additions to infusion containers on wards etc. However, when this is necessary strict aseptic procedure should be followed.

Incompatibility
Physical and chemical incompatibilities may occur with loss of potency, increase in toxicity, or other adverse effect. The solutions may become opalescent or precipitate at any point in the infusion fluid pathway, and the potential for incompatibility is increased when more than one substance is added to the infusion fluid.

Common incompatibilities
Precipitation reactions are numerous and varied and may occur as a result of pH, concentration changes, ‘salting-out’ effects, complexation or other chemical changes. Precipitation or other particle formation must be avoided since, apart from lack of control of dosage on administration, it may initiate or exacerbate adverse effects. This is particularly important in the case of drugs which have been implicated in either thrombophlebitis (e.g. diazepam) or in skin sloughing or necrosis caused by extravasation (e.g. sodium bicarbonate and parenteral nutrition). It is also especially important to effect solution of colloidal drugs and to prevent their subsequent precipitation in order to avoid a pyrogenic reaction (e.g. amphotericin). It is considered undesirable to mix beta-lactam antibiotics, such as semi-synthetic penicillins and cephalosporins, with proteinaceous materials on the grounds that immunogenic and allergenic conjugates could be formed. A number of preparations undergo significant loss of potency when added singly or in combination to large volume infusions. Examples include ampicillin in infusions that contain glucose or lactates.

Blood
Because of the large number of incompatibilities, drugs should not be added to blood and blood products for infusion purposes. Examples of incompatibility with blood include hypertonic mannitol solutions (irreversible crenation of red cells), dextrans (rouleaux formation and interference with cross-matching), glucose (clumping of red cells), and oxytocin (inactivated).

If the giving set is not changed after the administration of blood, but used for other infusion fluids, a fibrin clot may form which, apart from blocking the set, increases the likelihood of microbial growth.

Intravenous fat emulsion
These may break down with coalescence of fat globules and separation of phases when additions such as antibiotics or electrolytes are made, thus increasing the possibility of embolism. Only specially formulated products such as Vitlipid N® may be added to appropriate intravenous fat emulsions.

Other infusions
Infusions that frequently give rise to incompatibility include amino acids, mannitol, and sodium bicarbonate.

Method
Ready-prepared infusions should be used whenever available. When dilution of drugs is required to be made extemporaneously, any product reconstitution instructions such as those relating to concentration, vehicle, mixing, and handling precautions should be strictly followed using an aseptic technique throughout. Once the product has been reconstituted, further dilution with the infusion fluid should be made immediately in order to minimise microbial contamination and, with certain products, to prevent degradation or other formulation change which may occur; e.g. reconstituted ampicillin injection degrades rapidly on standing, and also may form polymers which could cause sensitivity reactions.

It is also important in certain instances that an infusion fluid of specific pH be used (e.g. furosemide injection requires dilution in infusions of pH greater than 5.5). When drug dilutions are made it is important to mix thoroughly; additions should not be made to an infusion container that has been connected to a giving set, as mixing is hampered. If the solutions are not thoroughly mixed, a concentrated layer of the drug may form owing to differences in density. Potassium chloride is particularly prone to this ‘layering’ effect when added without adequate mixing to infusions; if such a mixture is administered it may have a serious effect on the heart.

A time limit between dilution and completion of administration must be imposed for certain admixtures to guarantee satisfactory drug potency and compatibility. For admixtures in which degradation occurs without the
Prescribing in hepatic impairment

Overview
Children have a large reserve of hepatic metabolic capacity and modification of the choice and dosage of drugs is usually unnecessary even in apparently severe liver disease. However, special consideration is required in the following situations:

- liver failure characterised by severe derangement of liver enzymes and profound jaundice; the use of sedative drugs, opioids, and drugs such as diuretics and amphotericin p. 351 which produce hypokalaemia may precipitate hepatic encephalopathy;
- impaired coagulation, which can affect response to oral anticoagulants;
- in cholestatic jaundice elimination may be impaired of drugs such as fusidic acid p. 336 and rifampicin p. 342 which are excreted in the bile;
- in hypoproteinaemia, the effect of highly protein-bound drugs such as phenytoin p. 193, prednisolone p. 413, warfarin sodium p. 89, and benzodiazepines may be increased;
- use of hepatotoxic drugs is more likely to cause toxicity in children with liver disease; such drugs should be avoided if possible;
- in neonates, particularly preterm neonates, and also in infants metabolic pathways may differ from older children and adults because liver enzyme pathways may be immature.

Where care is needed when prescribing in hepatic impairment, this is indicated under the relevant drug in BNF for Children.

Prescribing in renal impairment

Issues encountered in renal impairment
The use of drugs in children with reduced renal function can give rise to problems for several reasons:

- reduced renal excretion of a drug or its metabolites may produce toxicity;
- sensitivity to some drugs is increased even if elimination is unimpaired;
- many side-effects are tolerated poorly by children with renal impairment;
- some drugs are not effective when renal function is reduced;
- neonates, particularly preterm, may have immature renal function.

Many of these problems can be avoided by reducing the dose or by using alternative drugs.

Principles of dose adjustment in renal impairment
The level of renal function below which the dose of a drug must be reduced depends on the proportion of the drug eliminated by renal excretion and its toxicity.

For many drugs with only minor or no dose-related side-effects, very precise modification of the dose regimen is unnecessary and a simple scheme for dose reduction is sufficient.

For more toxic drugs with a small safety margin dose regimens based on glomerular filtration rate should be used.

When both efficacy and toxicity are closely related to plasma-drug concentration, recommended regimens should be regarded only as a guide to initial treatment; subsequent doses must be adjusted according to clinical response and plasma-drug concentration.

The total daily maintenance dose of a drug can be reduced either by reducing the size of the individual doses or by increasing the interval between doses. For some drugs, although the size of the maintenance dose is reduced it is important to give a loading dose if an immediate effect is required. This is because it takes about five times the half-life of the drug to achieve steady-state plasma concentration. Because the plasma half-life of drugs excreted by the kidney is prolonged in renal impairment, it can take many doses at the reduced dosage to achieve a therapeutic plasma concentration. The loading dose should usually be the same as the initial dose for a child with normal renal function.

Nephrotoxic drugs should, if possible, be avoided in children with renal disease because the consequences of nephrotoxicity are likely to be more serious when the renal reserve is already reduced.

Glomerular filtration rate is low at birth and increases rapidly during the first 6 months. Thereafter, glomerular filtration rate increases gradually to reach adult levels by 1–2 years of age, when standardised to a typical adult body surface area (1.73 m²). In the first weeks after birth, serum creatinine falls; a single measure of serum creatinine provides only a
crude estimate of renal function and observing the change over days is of more use. In the neonate, a sustained rise in serum creatinine or a lack of the expected postnatal decline, is indicative of a reduced glomerular filtration rate. Dose recommendations are based on the severity of renal impairment. This is expressed in terms of **glomerular filtration rate** (mL/minute/1.73 m²). The following equations provide a guide to glomerular filtration rate.

Child over 1 year:
Estimated glomerular filtration rate (mL/minute/1.73 m²) = 40 × height (cm)/serum creatinine (micromol/litre)

Neonate:
Estimated glomerular filtration rate (mL/minute/1.73 m²) = 30 × height (cm)/serum creatinine (micromol/litre)

The values used in these formulas may differ according to locality or laboratory.
The serum-creatinine concentration is sometimes used as a measure of renal function but is only a rough guide even when corrected for age, weight, and sex.

**Important** The information on dose adjustment in *BNF for Children* is expressed in terms of estimated glomerular filtration rate. Renal function in adults is increasingly being reported as estimated glomerular filtration rate (eGFR) normalised to a body surface area of 1.73 m²; however, eGFR is derived from the MDRD (Modification of Diet in Renal Disease) formula which is not validated for use in children. eGFR derived from the MDRD formula should not be used to adjust drug doses in children with renal impairment.

In *BNF for Children*, values for measures of renal function are included where possible. However, where such values are not available, the *BNF for Children* reflects the terms used in the published information.

**Degrees of renal impairment defined using estimated glomerular filtration rate (eGFR)**

<table>
<thead>
<tr>
<th>Degree of impairment</th>
<th>eGFR * mL/minute/1.73 m²</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal: Stage 1</td>
<td>More than 90 (with other evidence of kidney damage)</td>
</tr>
<tr>
<td>Mild: Stage 2</td>
<td>60–89 (with other evidence of kidney damage)</td>
</tr>
<tr>
<td>Moderate*: Stage 3</td>
<td>30–59</td>
</tr>
<tr>
<td>Severe: Stage 4</td>
<td>15–29</td>
</tr>
<tr>
<td>Established renal failure: Stage 5</td>
<td>Less than 15</td>
</tr>
</tbody>
</table>

1. Estimated glomerular filtration rate (eGFR) derived from the Modification of Diet in Renal Disease (MDRD) formula for use in patients over 18 years
2. NICE clinical guideline 73 (September 2008)-Chronic kidney disease: Stage 3A eGFR = 45–59, Stage 3B eGFR = 30–44

Drug prescribing should be kept to the minimum in all children with severe renal disease. If even mild renal impairment is considered likely on clinical grounds, renal function should be checked before prescribing any drug which requires dose modification. Where care is needed when prescribing in renal impairment, this is indicated under the relevant drug in *BNF for Children*.

**Dialysis**
For prescribing in children on renal replacement therapy consult specialist literature.
Prescribing in pregnancy

Overview
Drugs can have harmful effects on the embryo or fetus at any time during pregnancy. It is important to bear this in mind when prescribing for a woman of childbearing age or for men trying to father a child.

During the first trimester drugs can produce congenital malformations (teratogenesis), and the period of greatest risk is from the third to the eleventh week of pregnancy.

During the second and third trimesters drugs can affect the growth or functional development of the fetus, or they can have toxic effects on fetal tissues.

Drugs given shortly before term or during labour can have adverse effects on labour or on the neonate after delivery.

Not all the damaging effects of intra-uterine exposure to drugs are obvious at birth, some may only manifest later in life. Such late-onset effects include malignancy, e.g. adenocarcinoma of the vagina after puberty in females exposed to diethylstilbestrol in the womb, and adverse effects on intellectual, social, and functional development.

The BNF and BNF for Children identifies drugs which:
- may have harmful effects in pregnancy and indicates the trimester of risk
- are not known to be harmful in pregnancy

The information is based on human data, but information from animal studies has been included for some drugs when its omission might be misleading. Maternal drug doses may require adjustment during pregnancy due to changes in maternal physiology but this is beyond the scope of the BNF and BNF for Children.

Important
Drugs should be prescribed in pregnancy only if the expected benefit to the mother is thought to be greater than the risk to the fetus, and all drugs should be avoided if possible during the first trimester. Drugs which have been extensively used in pregnancy and appear to be usually safe should be prescribed in preference to new or untried drugs; and the smallest effective dose should be used. Few drugs have been shown conclusively to be teratogenic in humans, but no drug is safe beyond all doubt in early pregnancy. Screening procedures are available when there is a known risk of certain defects.

Absence of information does not imply safety. It should be noted that the BNF and BNF for Children provide independent advice and may not always agree with the product literature.

Information on drugs and pregnancy is also available from the UK Teratology Information Service. www.uktis.org. Tel: 0344 892 0909 (09.00–17.00 Monday to Friday; urgent enquiries only outside these hours).

Prescribing in breast-feeding

Overview
Breast-feeding is beneficial; the immunological and nutritional value of breast milk to the infant is greater than that of formula feeds.

Although there is concern that drugs taken by the mother might affect the infant, there is very little information on this. In the absence of evidence of an effect, the potential for harm to the infant can be inferred from:
- the amount of drug or active metabolite of the drug delivered to the infant (dependent on the pharmacokinetic characteristics of the drug in the mother);
- the efficiency of absorption, distribution, and elimination of the drug by the infant (dependent on the pharmacokinetics);
- the nature of the effect of the drug on the infant (pharmacodynamic properties of the drug in the infant).

Most medicines given to a mother cause no harm to breast-fed infants and there are few contra-indications to breast-feeding when maternal medicines are necessary. However, administration of some drugs to nursing mothers can harm the infant. In the first week of life, some such as preterm or jaundiced infants are at a slightly higher risk of toxicity.

Toxicity to the infant can occur if the drug enters the milk in pharmacologically significant quantities. The concentration in milk of some drugs (e.g. fluvastatin p. 124) may exceed the concentration in maternal plasma so that therapeutic doses in the mother can cause toxicity to the infant. Some drugs inhibit the infant’s sucking reflex (e.g. phenobarbital p. 203) while others can affect lactation (e.g. bromocriptine). Drugs in breast milk may, at least theoretically, cause hypersensitivity in the infant even when concentration is too low for a pharmacological effect.

BNF for Children identifies drugs:
- which should be used with caution or which are contra-indicated in breast-feeding for the reasons given above;
- which, on present evidence, may be given to the mother during breast-feeding, because they appear in milk in amounts which are too small to be harmful to the infant;
- which are not known to be harmful to the infant although they are present in milk in significant amounts.

Where care is needed when prescribing in breast-feeding, this is indicated under the relevant drug in the BNF for Children.

Important
For many drugs insufficient evidence is available to provide guidance and it is advisable to administer only essential drugs to a mother during breast-feeding. Because of the inadequacy of information on drugs in breast-feeding, absence of information does not imply safety.
Prescribing in palliative care

Overview
Palliative care is the active and total approach to the care of children and young adults with life-limiting and life-threatening conditions, embracing physical, emotional, social, and spiritual elements of their care. It focuses on enhancing the quality of life for the child and support for their family, and includes the management of distressing symptoms, provision of respite, and care following death and bereavement.

Effective palliative care requires a broad multidisciplinary approach that includes the whole family, and ideally should start as soon as possible after diagnosis or recognition of a life-threatening condition.

Drug treatment
The number of drugs should be as few as possible. Oral medication is usually appropriate unless there is severe nausea and vomiting, dysphagia, weakness, or coma, when parenteral medication may be necessary.

Pain
Pain management in palliative care is focused on achieving control of pain by administering the right drug in the right dose at the right time. Analgesics can be divided into three broad classes: non-opioid (paracetamol p. 254, NSAID), opioid (e.g. codeine phosphate p. 259 ‘weak’, morphine p. 265 ‘strong’) and adjuvant (e.g. antidepressants, antiepileptics). Drugs from the different classes are used alone or in combination according to the type of pain and response to treatment. Analgesics are more effective in preventing pain than in the relief of established pain; it is important that they are given regularly.

Paracetamol or a NSAID given regularly will often be sufficient to manage mild pain. If non-opioid analgesics alone are not sufficient, then an opioid analgesic alone or in combination with a non-opioid analgesic at an adequate dosage, may be helpful in the control of moderate pain.

Codeine phosphate or tramadol hydrochloride p. 270 can be considered for moderate pain. If these preparations do not control the pain then morphine is the most useful opioid analgesic. Alternatives to morphine, including transdermal buprenorphine p. 257, transdermal fentanyl p. 262, hydromorphone hydrochloride p. 265, methadone hydrochloride p. 279, or oxycodone hydrochloride p. 267, should be initiated by those with experience in palliative care. Initiation of an opioid analgesic should not be delayed by concern over a theoretical likelihood of psychological dependence (addiction).

Bone metastases
In addition to the above approach, radiotherapy and bisphosphonates, may be useful for pain due to bone metastases.

Neuropathic pain
Patients with neuropathic pain may benefit from a trial of a tricyclic antidepressant, most commonly amitriptyline hydrochloride p. 224, for several weeks. An antiepileptic such as carbamazepine p. 184, may be added or substituted if pain persists. Ketamine p. 773 is sometimes used under specialist supervision for neuropathic pain that responds poorly to opioid analgesics. Pain due to nerve compression may be reduced by a corticosteroid such as dexamethasone p. 410, which reduces oedema around the tumour, thus reducing compression. Nerve blocks can be considered when pain is localised to a specific area.

Transcutaneous electrical nerve stimulation (TENS) may also help.

Pain management with opioids
Oral route
Treatment with morphine p. 265 is given by mouth as immediate-release or modified-release preparations. During the titration phase the initial dose is based on the previous medication used, the severity of the pain, and other factors such as presence of renal impairment or frailty. The dose is given either as an immediate-release preparation 4-hourly (for starting doses, see Morphine p. 265), or as a 12-hourly modified-release preparation, in addition to rescue doses. If replacing a weaker opioid analgesic (such as codeine phosphate p. 259), starting doses are usually higher.

If pain occurs between regular doses of morphine (‘breakthrough pain’), an additional dose (‘rescue dose’) of immediate-release morphine should be given. An additional dose should also be given 30 minutes before an activity that causes pain, such as wound dressing. The standard dose of a strong opioid for breakthrough pain is usually one-tenth to one-sixth of the regular 24-hour dose, repeated every 2–4 hours as required (up to hourly may be needed if pain is severe or in the last days of life). Review pain management if rescue analgesic is required frequently (twice daily or more). Each child should be assessed on an individual basis.

Formulations of fentanyl p. 262 that are administered nasally, buccally or sublingually are not licensed for use in children; their usefulness in children is also limited by dose availability.

Children often require a higher dose of morphine in proportion to their body-weight compared to adults. Children are more susceptible to certain adverse effects of opioids such as urinary retention (which can be eased by benzamethan chloride), and opioid-induced pruritus.

When adjusting the dose of morphine, the number of rescue doses required and the response to them should be taken into account; increments of morphine should not exceed one-third to one-half of the total daily dose every 24 hours. Thereafter, the dose should be adjusted with careful assessment of the pain, and the use of adjuvant analgesics should also be considered. Upward titration of the dose of morphine stops when either the pain is relieved or unacceptable adverse effects occur, after which it is necessary to consider alternative measures.

Once their pain is controlled, children started on 4-hourly immediate-release morphine p. 265 can be transferred to the same total 24-hour dose of morphine given as the modified-release preparation for 12-hourly or 24-hourly administration. The first dose of the modified-release preparation is given with, or within 4 hours of the last dose of the immediate-release preparation. For preparations suitable for 12-hourly or 24-hourly administration see modified-release preparations under morphine. Increments should be made to the dose, not to the frequency of administration. The patient must be monitored closely for efficacy and side-effects, particularly constipation, and nausea and vomiting. A suitable laxative should be prescribed routinely.

Oxycodone hydrochloride p. 267 can be used in children who require an opioid but cannot tolerate morphine. If the child is already receiving an opioid, oxycodone hydrochloride should be started at a dose equivalent to the current analgesic. Oxycodone hydrochloride immediate-release preparations can be given for breakthrough pain.
### Equivalent doses of opioid analgesics

This table is only an approximate guide (doses may not correspond with those given in clinical practice); children should be carefully monitored after any change in medication and dose titration may be required.

</tr>
</tbody>
</table>

### Parenteral route

Diamorphine hydrochloride p. 261 is preferred for injection because, being more soluble, it can be given in a smaller volume. The equivalent subcutaneous dose is approximately a third of the oral dose of morphine p. 265. Subcutaneous infusion of diamorphine hydrochloride via a continuous infusion device can be useful (for details, see Continuous Subcutaneous Infusions).

If the child can resume taking medicines by mouth, then oral morphine may be substituted for subcutaneous infusion of diamorphine hydrochloride. See the table Approximate Equivalent doses of Morphine and Diamorphine.

### Rectal route

Morphine p. 265 is also available for rectal administration as suppositories.

### Transdermal route

Transdermal preparations of fentanyl p. 262 and buprenorphine p. 257 [not licensed for use in children] are available; they are not suitable for acute pain or in those children whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Prescribers should ensure that they are familiar with the correct use of transdermal preparations (see under fentanyl p. 262) because inappropriate use has caused fatalities.

The following 24-hour oral doses of morphine are considered to be approximately equivalent to the buprenorphine and fentanyl patches shown, however when switching due to possible opioid-induced hyperalgesia, reduce the calculated equivalent dose of the new opioid by one-quarter to one-half.

### Symptom control

#### Unlicensed indications or routes

Several recommendations in this section involve unlicensed indications or routes.

- **Anorexia** Anorexia may be helped by prednisolone p. 413 or dexamethasone p. 410.

- **Anxiety** Anxiety can be treated with a long-acting benzodiazepine such as diazepam p. 207, or by continuous infusion of the short-acting benzodiazepine midazolam p. 210. Interventions for more acute episodes of anxiety (such as panic attacks) include short-acting benzodiazepines such as lorazepam p. 209 given sublingually or midazolam given subcutaneously. Temazepam p. 774 provides useful night-time sedation in some children.

- **Capillary bleeding** Capillary bleeding can be treated with tranexamic acid p. 76 by mouth; treatment is usually continued for one week after the bleeding has stopped but it can be continued at a reduced dose if bleeding persists. Alternatively, gauze soaked in tranexamic acid 100 mg/mL p. 76 or adrenaline/epinephrine solution 1 mg/mL (1 in 1000) p. 128 can be applied to the affected area.

- **Constipation** Constipation is a common cause of distress and is almost invariable after administration of an opioid analgesic. It should be prevented if possible by the regular administration of laxatives. Suitable laxatives include

### Buprenorphine patches are approximately equivalent to the following 24-hour doses of oral morphine

| Morphine salt 12 mg daily | = BuTrans® '5' patch: 7-day patches |
| morphine salt 24 mg daily | = BuTrans® '10' patch: 7-day patches |
| morphine salt 48 mg daily | = BuTrans® '20' patch: 7-day patches |
| morphine salt 84 mg daily | = Transtec® '35' patch: 4-day patches |
| morphine salt 126 mg daily | = Transtec® '52.5' patch: 4-day patches |
| morphine salt 168 mg daily | = Transtec® '70' patch: 4-day patches |

Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral morphine.

### 72-hour Fentanyl patches are approximately equivalent to the following 24-hour doses of oral morphine

| Morphine salt 30 mg daily | = fentanyl '12' patch |
| morphine salt 60 mg daily | = fentanyl '25' patch |
| morphine salt 120 mg daily | = fentanyl '50' patch |
| morphine salt 180 mg daily | = fentanyl '75' patch |
| morphine salt 240 mg daily | = fentanyl '100' patch |

Fentanyl equivalences in this table are for children on well-tolerated opioid therapy for long periods; fentanyl patches should not be used in opioid naive children. Conversion ratios vary and these figures are a guide only. Morphine equivalences for transdermal opioid preparations have been approximated to allow comparison with available preparations of oral morphine.
osmotic laxatives (such as lactulose p. 37 or macrogols), stimulant laxatives (such as co-danthramer p. 40 and senna p. 42) or the combination of lactulose and a senna preparation. Naloxone hydrochloride p. 796 given by mouth may help relieve opioid-induced constipation; it is poorly absorbed but opioid withdrawal reactions have been reported.

**Convulsions** Intractable seizures are relatively common in children dying from non-malignant conditions. Phenobarbital p. 203 by mouth or as a continuous subcutaneous infusion may be beneficial; continuous infusion of midazolam p. 210 is an alternative. Both cause drowsiness, but this is rarely a concern in the context of intractable seizures. For breakthrough convulsions diazepam p. 207 given rectally (as a solution), buccal midazolam p. 210, or paraldehyde p. 208 as an enema may be appropriate. See *Continuous subcutaneous infusions*, below, for the use of midazolam by subcutaneous infusion using a continuous infusion device.

**Dry mouth** Dry mouth may be caused by certain medications including opioid analgesics, antimuscarinic drugs (e.g. hyoscine), antidepressants and some antiemetics; if possible, an alternative preparation should be considered. Dry mouth may be relieved by good mouth care and measures such as chewing sugar-free gum, sucking ice or pineapple chunks, or the use of artificial saliva, dry mouth associated with candidiasis can be treated by oral preparations of nystatin p. 159.

**Dysphagia** A corticosteroid such as dexamethasone p. 410 may help, temporarily, if there is an obstruction due to tumour. See also *Dry mouth*, above.

**Dyspnoea** Breathlessness at rest may be relieved by regular oral morphine p. 265 in carefully titrated doses. Diazepam p. 207 may be helpful for dyspnoea associated with anxiety. Sublingual lorazepam p. 209 or subcutaneous or buccal midazolam p. 210 are alternatives. A nebulised short-acting beta agonist or a corticosteroid, such as dexamethasone p. 410 or prednisolone p. 413, may also be helpful for bronchospasm or partial obstruction.

**Excessive respiratory secretion** Excessive respiratory secretion (death rattle) may be reduced by hyoscine hydrobromide patches or by subcutaneous or intravenous injection of hyoscine hydrobromide p. 250, however, care must be taken to avoid the discomfort of dry mouth. Alternatively, glycopyrronium bromide p. 765 may be given. Hyoscine hydrobromide can be administered by subcutaneous or intravenous infusion using a continuous infusion device.

**Fungating tumours** Fungating tumours can be treated by regular dressing and antibacterial drugs; systemic treatment with metronidazole p. 313 is often required to reduce malodour, but topical metronidazole is also used.

**Gastro-intestinal pain** The pain of bowel colic may be reduced by loperamide hydrochloride p. 44. Hyoscine hydrobromide p. 250 may also be helpful in reducing the frequency of spasms; it is given sublingually as *Kwells* tablets and also by subcutaneous infusion. Gastric distension pain due to pressure on the stomach may be helped by a preparation incorporating an antacid with an antiflatulent and a prokinetic such as domperidone before meals.

**Hiccups** Hiccups due to gastric distension may be helped by a preparation incorporating an antacid with an antiflatulent.

**Insomnia** Children with advanced cancer may not sleep because of discomfort, cramps, night sweats, joint stiffness, or fear. There should be appropriate treatment of these problems before hypnotics are used. Benzodiazepines, such as temazepam p. 774, may be useful.

**Intractable cough** Intractable cough may be relieved by moist inhalations or by regular administration of oral morphine p. 265 every 4 hours. Methadone hydrochloride linctus p. 279 should be avoided because it has a long duration of action and tends to accumulate.

**Mucosal bleeding** Mucosal bleeding from the mouth and nose occurs commonly in the terminal phase, particularly in a child suffering from haemopoietic malignancy. Bleeding from the nose caused by a single bleeding point can be arrested by cautery or by dressing it. Tranexamic acid p. 76 may be effective applied topically or given systemically.

**Muscle spasm** The pain of muscle spasm can be helped by a muscle relaxant such as diazepam p. 207 or baclofen p. 603.

**Nausea and vomiting** Nausea and vomiting are common in children with advanced cancer. Ideally, the cause should be determined before treatment with an antiemetic is started. Nausea and vomiting with opioid therapy are less common in children than in adults but may occur particularly in the initial stages and can be prevented by giving an antiemetic. An antiemetic is usually necessary only for the first 4 or 5 days and therefore combined preparations containing an opioid with an antiemetic are not recommended because they lead to unnecessary antiemetic therapy (and associated side-effects when used long-term). Metoclopramide hydrochloride p. 246 has a prokinetic action and is used by mouth for nausea and vomiting associated with gastritis, gastric stasis, and functional bowel obstruction. Drugs with antimuscarinic effects antagonise prokinetic drugs and, if possible, should not therefore be used concurrently. Haloperidol p. 231 is used by mouth or by continuous intravenous or subcutaneous infusion for most metabolic causes of vomiting (e.g. hypercalcaemia, renal failure). Cyclizine p. 244 is used for nausea and vomiting due to mechanical bowel obstruction, raised intracranial pressure, and motion sickness.

**Pruritus** Pruritus, even when associated with obstructive jaundice, often responds to simple measures such as application of emollients. Ondansetron p. 248 may be effective in some children. Where opioid analgesics cause pruritus it may be appropriate to review the dose or to switch to an alternative opioid analgesic. In the case of obstructive jaundice, further measures include administration of ursodeoxycholic acid.

**Rapid intracranial pressure** Headache due to raised intracranial pressure often responds to a high dose of a corticosteroid, such as dexamethasone p. 410, for 4 to 5 days, subsequently reduced if possible; dexamethasone should be given before 6 p.m. to reduce the risk of insomnia. Treatment of headache and of associated nausea and vomiting should also be considered.

**Restlessness and confusion** Restlessness and confusion may require treatment with haloperidol p. 231. Levomepromazine p. 251 is also used occasionally for restlessness.
Continuous subcutaneous infusions

Although drugs can usually be administered by mouth to control symptoms in palliative care, the parenteral route may sometimes be necessary. Repeated administration of intramuscular injections should be avoided in children, particularly if cachectic. This has led to the use of portable continuous infusion devices such as syringe drivers to give a continuous subcutaneous infusion, which can provide good control of symptoms with little discomfort or inconvenience to the patient. Indications for the parenteral route are:

- inability to take medicines by mouth owing to nausea and vomiting, dysphagia, severe weakness, or coma;
- malignant bowel obstruction for which surgery is inappropriate (avoiding the need for an intravenous infusion or for insertion of a nasogastric tube);
- refusal by the child to take regular medication by mouth.

Syringe driver rate settings Staff using syringe drivers should be adequately trained and different rate settings should be clearly identified and differentiated; incorrect use of syringe drivers is a common cause of medication errors.

Bowel colic and excessive respiratory secretions Hyoscine butylbromide p. 270 effectively reduces respiratory secretions and is sedative (but occasionally causes paradoxical agitation); it is given in a subcutaneous or intravenous infusion. Glycopyrronium bromide p.765 may also be used. Hyoscine butylbromide p. 57 is effective in bowel colic, is less sedative than hyoscine hydrobromide, but is not always adequate for the control of respiratory secretions; it is given by subcutaneous infusion (important: hyoscine butylbromide must not be confused with hyoscine hydrobromide, above).

Confusion and restlessness Haloperidol p. 231 has little sedative effect. Levomepromazine p.251 has a sedative effect. Midazolam p. 210 is a sedative and an antiepileptic that may be suitable for a very restless patient.

Convulsions If a child has previously been receiving an antiepileptic drug or has a primary or secondary cerebral tumour or is at risk of convolution (e.g. owing to uraemia) antiepileptic medication should not be stopped. Midazolam p. 210 is the benzodiazepine antiepileptic of choice for continuous subcutaneous infusion.

Nausea and vomiting Levomepromazine p. 251 causes sedation in about 50% of patients. Haloperidol p. 231 has little sedative effect. Cyclizine p. 244 is particularly likely to precipitate if mixed with diamorphine hydrochloride p. 261 or other drugs (see under Mixing and compatibility); it is given by subcutaneous infusion.

In theory injections dissolved in water for injections are more likely to be associated with pain (possibly owing to their hypotonicity). The use of physiological saline (sodium chloride 0.9% p. 547) however increases the likelihood of precipitation when more than one drug is used; moreover subcutaneous infusion rates are so slow (0.1 – 0.3 mL/hour) that pain is not usually a problem when water is used as a diluent.

Compatibility with diamorphine Diamorphine can be given by subcutaneous infusion in a strength of up to 250 mg/mL; up to a strength of 40 mg/mL either water for injections or physiological saline (sodium chloride 0.9%) is a suitable diluent—above that strength only water for injections is used (to avoid precipitation).

The following can be mixed with diamorphine:

- Cyclizine, may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
- Dexamethasone, special care is needed to avoid precipitation of dexamethasone when preparing it.
- Haloperidol, mixtures of haloperidol and diamorphine are likely to precipitate after 24 hours if haloperidol concentration is above 2 mg/mL.
- Hyoscine butylbromide
- Hyoscine hydrobromide
- Levomepromazine
- Metoclopramide, under some conditions infusions containing metoclopramide become discoloured; such solutions should be discarded.
- Midazolam

Subcutaneous infusion solution should be monitored regularly both to check for precipitation (and discolouration) and to ensure that the infusion is running at the correct rate.

Problems encountered with syringe drivers The following are problems that may be encountered with syringe drivers and the action that should be taken:

- if the subcutaneous infusion runs too quickly check the rate setting and the calculation;
- if the subcutaneous infusion runs too slowly check the start button, the battery, the syringe driver, the cannula, and make sure that the injection site is not inflamed;
- if there is an injection site reaction make sure that the site does not need to be changed—firmness or swelling at the site of injection is not in itself an indication for change, but pain or obvious inflammation is.

Prescribing in palliative care
**Equivalent doses of morphine sulfate and diamorphine hydrochloride given over 24 hours**

These equivalences are *approximate only* and should be adjusted according to response.

If breakthrough pain occurs give a subcutaneous injection equivalent to one-tenth to one-sixth of the total 24-hour subcutaneous infusion dose. With an intermittent subcutaneous injection absorption is smoother so that the risk of adverse effects at peak absorption is avoided (an even better method is to use a subcutaneous butterfly needle). To minimise the risk of infection no individual subcutaneous infusion solution should be used for longer than 24 hours.

**General Medical Council’s advice**

Doctors who prescribe or collude in the provision of drugs or treatment with the intention of improperly enhancing an individual’s performance in sport contravene the GMC’s guidance, and such actions would usually raise a question of a doctor’s continued registration. This does not preclude the provision of any care or treatment where the doctor’s intention is to protect or improve the patient’s health.
Prescribing in dental practice

General guidance
Advice on the drug management of dental and oral conditions has been integrated into the main text. For ease of access, guidance on such conditions is usually identified by means of a relevant heading (e.g. Dental and Orofacial Pain) in the appropriate sections.
The following is a list of topics of particular relevance to dentists.
- Prescribing by dentists, see Prescription writing p. 4
- Oral side-effects of drugs, see Adverse reactions to drugs p. 11
- Medical emergencies in dental practice, see BNF
- Medical problems in dental practice, see BNF

Chapter 1
Gastro-intestinal system

1 Chronic bowel disorders

Overview
Individual symptoms of chronic bowel disorders need specific treatment including dietary manipulation as well as drug treatment and the maintenance of a liberal fluid intake.

Irritable bowel syndrome
Irritable bowel syndrome can present with pain, constipation, or diarrhoea. Some children have important psychological aggravating factors which respond to reassurance. The fibre intake of children with irritable bowel syndrome should be reviewed. If an increase in dietary fibre is required, soluble fibre (e.g. oats, ispaghula husk p. 36, or sterculia p. 36) is recommended; insoluble fibre (e.g. bran) should be avoided. A laxative can be used to treat constipation. An osmotic laxative, such as a macrogol, is preferred; lactulose p. 37 may cause bloating. Loperamide hydrochloride p. 44 may relieve diarrhoea and antispasmodic drugs may relieve pain. Opioids with a central action, such as codeine phosphate p. 259, are better avoided because of the risk of dependence.

Clostridium difficile infection
Clostridium difficile infection is caused by colonisation of the colon with Clostridium difficile and production of toxin. It often follows antibiotic therapy and is usually of acute onset, but may become chronic. It is a particular hazard of ampicillin p. 321, amoxicillin p. 320, co-amoxiclav p. 323, second- and third-generation cephalosporins, clindamycin p. 307, and quinolones, but few antibacterials are free of this side-effect. Oral metronidazole p. 313 or oral vancomycin p. 305 are used as specific treatment; vancomycin may be preferred for very sick patients. Metronidazole can be given by intravenous infusion if oral treatment is inappropriate.

Malabsorption syndromes
Individual conditions need specific management and also general nutritional consideration. Coeliac disease (gluten enteropathy) usually needs a gluten-free diet and pancreatic insufficiency needs pancreatin supplements.

For further information on foods for special diets (ACBS), see Borderline substances.

1.1 Inflammatory bowel disease

Inflammatory bowel disease
Management of acute ulcerative colitis and Crohn’s disease
Chronic inflammatory bowel diseases include ulcerative colitis and Crohn’s disease. The treatment of inflammatory bowel disease in children should be initiated and supervised by a paediatric gastroenterologist. Effective management requires drug therapy, attention to nutrition, and in severe or chronic active disease, surgery.

Aminosalicylates (balsalazide sodium p. 26, mesalazine p. 26, olsalazine sodium p. 28, and sulfasalazine p. 29), corticosteroids (hydrocortisone p. 411, budesonide p. 30, and prednisolone p. 413), and drugs that affect the immune response are used in the treatment of inflammatory bowel disease.

Treatment of acute ulcerative colitis and Crohn’s disease
Acute mild to moderate disease affecting the rectum (proctitis) or the recto-sigmoid (distal colitis) is treated initially with local application of an aminosalicylate; alternatively a local corticosteroid can be used but it is less effective. Foam preparations and suppositories are useful for children who have difficulty retaining liquid enemas.

Diffuse inflammatory bowel disease or disease that does not respond to local therapy requires oral treatment. Mild disease affecting the proximal colon can be treated with an oral aminosalicylate alone; a combination of a local and an oral aminosalicylate can be used in proctitis or distal colitis. Refractory or moderate inflammatory bowel disease usually requires adjunctive use of an oral corticosteroid such as prednisolone for 4–8 weeks. Modified-release budesonide is used for children with Crohn’s disease affecting the ileum and the ascending colon; it causes fewer systemic side effects than oral prednisolone, but may be less effective. As an alternative to an oral corticosteroid, enteral nutrition may be used for 6–8 weeks in children with active Crohn’s disease.
Severe inflammatory bowel disease or disease that is not responding to an oral corticosteroid requires hospital admission and treatment with an intravenous corticosteroid such as hydrocortisone or methylprednisolone p. 412; other therapy may include intravenous fluid and electrolyte replacement, and possibly parenteral nutrition. Children with ulcerative colitis that fails to respond adequately to these measures may benefit from a short course of ciclosporin p. 486. Children with unresponsive or chronically active Crohn’s disease may benefit from azathioprine p. 485, mercaptopurine p. 505, or once-weekly methotrexate p. 506; these drugs have a slow onset of action. Infliximab p. 30 is used in specialist centres for children with severe active Crohn’s disease or severe active ulcerative colitis whose condition has not responded adequately to treatment with a corticosteroid and a conventional drug that affects the immune response, or who are intolerant of them. Adalimumab p. 598 is licensed for children with severe active Crohn’s disease whose condition has not responded adequately to conventional therapy (including corticosteroids, other drugs that affect the immune response, and primary nutrition therapy) or who are intolerant of it. There are concerns about the long-term safety of infliximab and adalimumab in children; hepatoportal T-cell lymphoma has been reported.

Crohn’s disease of the mouth or of the perineum is more common in children than in adults and it is difficult to treat; elimination diets and the use of a topical corticosteroid may be beneficial, but a systemic corticosteroid and occasionally azathioprine may be required in severe cases.

**Maintenance of remission of acute ulcerative colitis and Crohn’s disease**

Children should be advised not to smoke because smoking increases the risk of relapse in Crohn’s disease. Smoking cessation should be encouraged when necessary.

**Aminosalicylates** are efficacious in the maintenance of remission of ulcerative colitis, but there is no evidence of efficacy in the maintenance of remission of Crohn’s disease. Corticosteroids are not suitable for maintenance treatment because of their side-effects. In resistant or frequently relapsing cases either azathioprine or mercaptopurine may be helpful. Methotrexate is used in Crohn’s disease when azathioprine or mercaptopurine are ineffective or not tolerated. Infliximab can be used for maintenance therapy in Crohn’s disease or ulcerative colitis in children who respond to the initial induction course of this drug. Adalimumab is also licensed for maintenance therapy in Crohn’s disease.

There are concerns about the long-term safety of infliximab and adalimumab in children.

**Fistulating Crohn’s disease**

Treatment may not be necessary for simple, asymptomatic perianal fistulas. Metronidazole p. 313 or ciprofloxacin p. 328 may be beneficial for the treatment of fistulating Crohn’s disease [both unlicensed for this indication].

Metronidazole by mouth is usually given for 1 month but no longer than 3 months because of concerns about peripheral neuropathy. Ciprofloxacin by mouth is given twice daily. Other antibacterials should be given if specifically indicated (e.g., sepsis associated with fistulas and perianal disease) and for managing bacterial overgrowth in the small bowel. Fistulas may also require surgical exploration and local drainage.

Either azathioprine or mercaptopurine is used as a second-line treatment for fistulating Crohn’s disease and continued for maintenance. Infliximab is used for fistulating Crohn’s disease refractory to conventional treatments; maintenance therapy with infliximab should be considered for patients who respond to the initial induction course.

**Adjunctive treatment of inflammatory bowel disease**

Due attention should be paid to diet; high-fibre or low-residue diets should be used as appropriate.

Antimotility drugs such as codeine phosphate p. 259 and loperamide hydrochloride p. 44, and antispasmodic drugs may precipitate paralytic ileus and megacolon in active ulcerative colitis; treatment of the inflammation is more logical. Laxatives may be required in proctitis. Diarrhoea resulting from the loss of bile-salt absorption (e.g. in terminal ileal disease or bowel resection) may improve with colestyramine p. 120, which binds bile salts.

**Drugs used in inflammatory bowel disease**

**Aminosalicylates**

Sulfasalazine is a combination of 5-aminosalicylic acid (5-ASA) and sulfapyridine; sulfapyridine acts only as a carrier to the colonic site of action but still causes side-effects. In the newer aminosalicylates, mesalazine (5-aminosalicylic acid), balsalazide sodium (a prodrug of 5-aminosalicylic acid) and olsalazine sodium (a dimer of 5-aminosalicylic acid which cleaves in the lower bowel), the sulfonamide-related side-effects of sulfasalazine are avoided, but 5-aminosalicylic acid alone can still cause side-effects including blood disorders and lupus-like syndrome also seen with sulfasalazine.

**Drugs affecting the immune response**

Azathioprine, mercaptopurine, or once weekly methotrexate are used to induce remission in unresponsive or chronically active Crohn’s disease. Azathioprine or mercaptopurine may also be helpful for retaining remission in frequently relapsing inflammatory bowel disease; once weekly methotrexate is used in Crohn’s disease when azathioprine or mercaptopurine are ineffective or not tolerated. Response to azathioprine or mercaptopurine may not become apparent for several months. Folic acid p. 533 should be given to reduce the possibility of methotrexate toxicity. Folic acid is usually given once weekly on a different day to the methotrexate; alternative regimens may be used in some settings. Ciclosporin (cyclosporin) p. 486 is a potent immunosuppressant and is markedly nephrotoxic. In children with severe ulcerative colitis unresponsive to other treatment, ciclosporin may reduce the need for urgent colorectal surgery.

**Cytokine modulators**

Infliximab p. 30 and adalimumab p. 598 are monoclonal antibodies which inhibit the pro-inflammatory cytokine, tumour necrosis factor alpha. They are used in the treatment of severe refractory Crohn’s disease. Infliximab is also used in the treatment of severe refractory ulcerative colitis. They should be used only when treatment with other immunomodulating drugs has failed or is not tolerated and for children in whom surgery is inappropriate. Cytokine modulators should be used under specialist supervision. Adequate resuscitation facilities must be available when infliximab is used.

**AMINOSALICYLATES**

 лечения на язвенно-язвенно болезнь 25

**Aminosalicylates**

**SIDE-EFFECTS**

- Rare: Acute pancreatitis, agranulocytosis, alopecia, aplastic anaemia, arthralgia, blood disorders, eosinophilia, fibrosing alveolitis, hepatitis, interstitial nephritis, leucopenia, lung disorders, lupus erythematosus-like syndrome, methaemoglobinemia, myalgia, myocardiitis, nephrotic syndrome, neutropenia, pericarditis, peripheral neuropathy, renal dysfunction, skin reactions, Stevens-Johnson syndrome, thrombocytopenia

- Frequency not known: Abdominal pain, diarrhoea, exacerbation of symptoms of colitis, headache, hypersensitivity reactions, nausea, rash, urticaria, vomiting

- **Gastro-intestinal system**
Balsalazide sodium

**INDICATIONS AND DOSE**

Treatment of mild to moderate ulcerative colitis, acute attack

- **BY MOUTH**
  - Child 12-17 years: 2.25 g 3 times a day until remission occurs or for up to maximum of 12 weeks

Maintenance of remission of ulcerative colitis

- **BY MOUTH**
  - Child 12-17 years: 1.5 g twice daily (max. per dose 3 g), adjusted according to response; maximum 6 g per day

**UNLICENSED USE** Not licensed for use in children under 18 years.

**CAUTIONS** History of asthma

**SIDE-EFFECTS** Cholelithiasis

**PREGNANCY** Manufacturer advises avoid.

**BREAST FEEDING** Diarrhoea may develop in the infant.

Monitor breast-fed infants for diarrhoea.

**HEPATIC IMPAIRMENT** Avoid in severe impairment.

**RENAL IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Capsule

**CAUTIONARY AND ADVISORY LABELS** 21, 25

- Colazide (Almirall Ltd)
- Balsalazide disodium 750 mg Colazide 750mg capsules | 130 capsule £30.42 DT price = £30.42

Mesalazine

**INDICATIONS AND DOSE**

**ASACOL® MR 400MG TABLETS**

Treatment of mild to moderate ulcerative colitis, acute attack

- **BY MOUTH**
  - Child 12-17 years: 800 mg 3 times a day

Maintenance of remission of ulcerative colitis and Crohn’s ileo-colitis

- **BY MOUTH**
  - Child 12-17 years: 400–800 mg 2–3 times a day

**ASACOL® FOAM ENEMA**

Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region

- **BY RECTUM**
  - Child 12-17 years: 1 g daily for 4–6 weeks, to be administered into the rectum

Treatment of acute attack of mild to moderate ulcerative colitis, affecting the descending colon

- **BY RECTUM**
  - Child 12-17 years: 2 g once daily for 4–6 weeks, to be administered into the rectum

**ASACOL® SUPPOSITORIES**

Treatment and maintenance of remission of ulcerative colitis affecting the rectosigmoid region

- **BY RECTUM**
  - Child 12-17 years: 250–500 mg 3 times a day, last dose to be administered at bedtime

**IPOCOL®**

Treatment of mild to moderate ulcerative colitis, acute attack

- **BY MOUTH**
  - Child 6-17 years (body-weight 40 kg and above): 800 mg 3 times a day

Maintenance of remission of ulcerative colitis

- **BY MOUTH**
  - Child 6-17 years (body-weight 40 kg and above): 1.2–2 g daily in divided doses

**OCTASA®**

Treatment of mild to moderate ulcerative colitis, acute attack

- **BY MOUTH**
  - Child 6-17 years (body-weight 40 kg and above): 2.4–4 g daily in divided doses

Maintenance of remission of ulcerative colitis and Crohn’s ileo-colitis

- **BY MOUTH**
  - Child 6-17 years (body-weight 40 kg and above): 1.2–2 g once daily, alternatively daily in divided doses

**PENTASA® GRANULES**

Treatment of mild to moderate ulcerative colitis, acute attack

- **BY MOUTH**
  - Child 5-17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
  - Child 5-17 years (body-weight 40 kg and above): 1–2 g twice daily, total daily dose may alternatively be given in 3–4 divided doses

Maintenance of remission of ulcerative colitis

- **BY MOUTH**
  - Child 5-17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
  - Child 5-17 years (body-weight 40 kg and above): 2 g once daily

**PENTASA® RETENTION ENEMA**

Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectosigmoid region

- **BY RECTUM**
  - Child 12-17 years: 1 g once daily, dose to be administered at bedtime
**PENTASA® SUPPOSITORIES**
*Treatment of acute attack, ulcerative proctitis*
- **BY RECTUM**
  - Child 12-14 years: 1 g daily for 2–4 weeks
  - Child 15-17 years: 1 g daily for 2–4 weeks

**Maintenance, ulcerative proctitis**
- **BY RECTUM**
  - Child 12-14 years: 1 g daily
  - Child 15-17 years: 1 g daily

**PENTASA® TABLETS**
*Treatment of mild to moderate ulcerative colitis, acute attack*
- **BY MOUTH**
  - Child 5-17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
  - Child 5-17 years (body-weight 40 kg and above): 1–2 g twice daily, total daily dose may alternatively be given in 3 divided doses

**Maintenance of remission of ulcerative colitis**
- **BY MOUTH**
  - Child 5-17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
  - Child 5-17 years (body-weight 40 kg and above): 2 g once daily

**SALOFALK® ENEMA**
*Treatment of acute attack of mild to moderate ulcerative colitis or maintenance of remission*
- **BY RECTUM**
  - Child 12-17 years: 2 g once daily, dose to be administered at bedtime

**SALOFALK® GRANULES**
*Treatment of mild to moderate ulcerative colitis, acute attack*
- **BY MOUTH**
  - Child 5-17 years (body-weight up to 40 kg): 30–50 mg/kg once daily, dose preferably given in the morning, alternatively 10–20 mg/kg 3 times a day
  - Child 5-17 years (body-weight 40 kg and above): 1.5–3 g once daily, dose preferably given in the morning, alternatively 0.5–1.5 g 3 times a day

**Maintenance of remission of ulcerative colitis**
- **BY MOUTH**
  - Child 5-17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
  - Child 5-17 years (body-weight 40 kg and above): 500 mg 3 times a day

**SALOFALK® RECTAL FOAM**
*Treatment of mild ulcerative colitis affecting sigmoid colon and rectum*
- **BY RECTUM**
  - Child 12-17 years: 2 g once daily, dose to be administered into the rectum at bedtime, alternatively 2 g daily in 2 divided doses

**SALOFALK® SUPPOSITORIES**
*Treatment of acute attack of mild to moderate ulcerative colitis affecting the rectum, sigmoid colon and descending colon*
- **BY RECTUM**
  - Child 12-17 years: 0.5–1 g 2–3 times a day, adjusted according to response, dose to be given using 500 mg suppositories

**SALOFALK® TABLETS**
*Treatment of mild to moderate ulcerative colitis, acute attack*
- **BY MOUTH**
  - Child 5-17 years (body-weight up to 40 kg): 10–20 mg/kg 3 times a day
  - Child 5-17 years (body-weight 40 kg and above): 0.5–1 g 3 times a day

**Maintenance of remission of ulcerative colitis**
- **BY MOUTH**
  - Child 5-17 years (body-weight up to 40 kg): 7.5–15 mg/kg twice daily, total daily dose may alternatively be given in 3 divided doses
  - Child 5-17 years (body-weight 40 kg and above): 500 mg 3 times a day

**DOSE EQUIVALENCE AND CONVERSION**
There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.

- **UNLICENSED USE**
  - With oral use Asacol® (all preparations) not licensed for use in children under 18 years. Pentasa® tablets not licensed for use in children under 15 years. Pentasa® granules and Salofalk® tablets and granules not licensed for use in children under 6 years.

- **With rectal use** Asacol® (all preparations) and Salofalk® enema not licensed for use in children under 18 years. Salofalk® suppositories and Pentasa® suppositories not licensed for use in children under 15 years. Salofalk® rectal foam no dose recommendations for children (age range not specified by manufacturer). Pentasa® enema not licensed for use in children.

- **CONTRA-INDICATIONS** Blood clotting abnormalities
- **CAUTIONS** Pulmonary disease
- **INTERACTIONS** The manufacturers of some mesalazine gastro-resistant and modified-release medicines (Asacol®, Pentasa®, Salofalk®) suggest that preparations that lower stool pH (e.g. lactulose) may prevent the release of mesalazine.

- **SIDE-EFFECTS**
  - Rare Dizziness
  - Very rare Oligospermia (reversible)

- **PREGNANCY** Negligible quantities cross placenta.

- **BREAST FEEDING** Diarrhoea reported in breast-fed infants, but negligible amounts of mesalazine detected in breast milk.

  Monitor breast-fed infant for diarrhoea.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

- **RENAL IMPAIRMENT** Use with caution. Avoid if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

- **DIRECTIONS FOR ADMINISTRATION**
  - **PENTASA® TABLETS** Tablets may be halved, quartered, or dispersed in water, but should not be chewed.
  - **SALOFALK® GRANULES** Granules should be placed on tongue and washed down with water without chewing.
  - **SALOFALK® GRANULES** Granules should be placed on tongue and washed down with water or orange juice without chewing.

  Contents of one sachet should be weighed and divided immediately before use; discard any remaining granules.

- **PRESCRIBING AND DISPENSING INFORMATION** There is no evidence to show that any one oral preparation of mesalazine is more effective than another; however, the delivery characteristics of oral mesalazine preparations may vary.

  Flavours of granule formulations of Salofalk® may include vanilla.
PATIENT AND CARER ADVICE
If it is necessary to switch a patient to a different brand of mesalazine, the patient should be advised to report any changes in symptoms.

Some products may require special administration advice; patients and carers should be informed.

Medicines for Children leaflet: Mesalazine (oral) for inflammatory bowel disease www.medicinesforchildren.org.uk/mesalazine-oral-for-inflammatory-bowel-disease

Delivered by P
carcinoid syndrome.

Olsalazine sodium

INDICATIONS AND DOSE

Treatment of acute attack of mild ulcerative colitis

BY MOUTH

Child 2–7 years: 500 mg twice daily, dose to be taken after food, then increased if necessary up to 1 g 3 times a day, dose to be increased over 1 week

Maintenance of remission of mild ulcerative colitis

BY MOUTH

Child 2–7 years: Maintenance 250–500 mg twice daily, dose to be taken after food

UNLICENSED USE

Not licensed for use in children under 12 years.

SIDE-EFFECTS

Common or very common Watery diarrhoea

Frequency not known Blurred vision • palpitation • photosensitivity • pyrexia • tachycardia

PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk.

BREAST FEEDING

Monitoring

Monitor breast-fed infants for diarrhoea.

RENAL IMPAIRMENT

Use with caution; manufacturer advises avoid in significant impairment.

DIRECTIONS FOR ADMINISTRATION

Capsules can be opened and contents sprinkled on food.

MENICIAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 21 (does not apply to Pentasa® tablets), 25 (does not apply to Pentasa® tablets)

Pentasa (Ferring Pharmaceuticals Ltd)

Mesalazine 400 mg | 84 tablet (Pentasa®) £27.45 DT price = £27.45 | 168 tablet (Pentasa®) £54.90

Mesalazine 800 mg | 84 tablet (Pentasa®) £45.90 DT price = £45.90

Ipocol (Sandoz Ltd)

Mesalazine 400 mg | 120 tablet (Ipocol®) £17.68

Olsalazine 400 mg | 120 tablet (Olsalazine®) £17.68

Octasa MR (Tillotson Pharma Ltd)

Mesalazine 400 mg | 90 tablet (Octasa®) £15.50 DT price = £15.50 | 120 tablet (Octasa®) £26.00

Mesalazine 800 mg | 90 tablet (Octasa®) £47.50 | 180 tablet (Octasa®) £95.00 DT price = £95.00

Salofalk (Dr. Falk Pharma UK Ltd)

Mesalazine 250 mg | 100 tablet (Salofalk®) £16.19

Mesalazine 500 mg | 100 tablet (Salofalk®) £32.38

Modified-release granules

CAUTIONARY AND ADVISORY LABELS 25 (does not apply to Pentasa® granules)

EXCIPIENTS: May contain Aspartame

Pentasa (Ferring Pharmaceuticals Ltd)

Mesalazine 1 gram | Pentasa gastro-resistant modified-release granules 500mg | 50 sachet (Pentasa®) £30.74 DT price = £30.74

Mesalazine 2 gram | Pentasa gastro-resistant modified-release granules 1000mg | 50 sachet (Pentasa®) £73.78 DT price = £73.78

Mesalazine 4 gram | Pentasa gastro-resistant modified-release granules 2000mg | 50 sachet (Pentasa®) £73.78

Salofalk (Dr. Falk Pharma UK Ltd)

Mesalazine 500 mg | Salofalk gastro-resistant modified-release granules 500mg | 100 sachet (Pentasa®) £28.74

Mesalazine 1 gram | Salofalk gastro-resistant modified-release granules 1000mg | 50 sachet (Pentasa®) £48.85 DT price = £48.85

Mesalazine 1.5 gram | Salofalk gastro-resistant modified-release granules 1500mg | 50 sachet (Pentasa®) £97.70 DT price = £97.70

FOAM

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), disodium edetate, hydrogenbenzoates (parabens), polysorbates, propylene glycol, sodium metabolisulfate
Sulfasalazine (Salazopyrin, Sulfasalazine, Sulfasalazine)

- **INDICATIONS AND DOSE**
  - Treatment of acute attack of mild to moderate and severe ulcerative colitis: Active Crohn's disease
    - **BY MOUTH**
      - Child 2-11 years: 10–15 mg/kg 4–6 times a day (max. per dose 1 g) until remission occurs; increased if necessary up to 60 mg/kg daily in divided doses
      - Child 12-17 years: 1–2 g 4 times a day until remission occurs
    - **BY RECTUM**
      - Child 5-7 years: 500 mg twice daily
      - Child 8-11 years: 500 mg, dose to be administered in the morning and 1 g, dose to be administered at night
      - Child 12-17 years: 0.5–1 g twice daily
  - Maintenance of remission of mild to moderate and severe ulcerative colitis
    - **BY MOUTH**
      - Child 2-11 years: 5–7.5 mg/kg 4 times a day (max. per dose 500 mg)
      - Child 12-17 years: 500 mg 4 times a day
    - **BY RECTUM**
      - Child 5-7 years: 500 mg twice daily
      - Child 8-11 years: 500 mg, dose to be administered in the morning and 1 g, dose to be administered at night
      - Child 12-17 years: 0.5–1 g twice daily

- **Juvenile idiopathic arthritis**
  - **BY MOUTH**
    - Child 2-11 years: Initially 5 mg/kg twice daily for 1 week, then 10 mg/kg twice daily for 1 week, then 20 mg/kg twice daily for 1 week; maintenance 20–25 mg/kg twice daily; maximum 2 g per day
    - Child 12-17 years: Initially 5 mg/kg twice daily for 1 week, then 10 mg/kg twice daily for 1 week, then 20 mg/kg twice daily for 1 week; maintenance 20–25 mg/kg twice daily; maximum 3 g per day

- **UNLICENSED USE** Not licensed for use in children for juvenile idiopathic arthritis.
- **CONTRA-INDICATIONS** Child under 2 years of age
- **CAUTIONS** Acute porphyria p. 562 - G6PD deficiency - history of allergy - history of anemia - maintain adequate fluid intake - risk of haematological toxicity - risk of hepatic toxicity - slow acetylator status
- **INTERACTIONS** → Appendix 1 (aminosalicylates).
- **SIDE-EFFECTS**
  - Common or very common Blood disorders - cough - dizziness - fever - Heinz body anaemia - insomnia - megaloblastic anaemia - proteinuria - pruritus - stomatitis - taste disturbances - tinnitus
  - Uncommon Alopecia - convulsions - depression - dyspnoea - vasculitis
  - Frequency not known Anaphylaxis - aseptic meningitis - ataxia - crystalluria - disturbances of smell - epidermal necrolysis - exfoliative dermatitis - gastro-intestinal intolerance - hallucinations - hypersensitivity reactions - leucopenia (especially in patients with rheumatoid arthritis) - loss of appetite - neutropenia (especially in patients with rheumatoid arthritis) - oligospermia - parotitis - photosensitivity - rash - serum sickness - some soft contact lenses may be stained - thrombocytopenia (especially in patients with rheumatoid arthritis) - yellow-orange discoloration of blood fluids - yellow-orange discoloration of skin - yellow-orange discoloration of urine

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Gastro-intestinal side effects Upper gastro-intestinal side-effects common over 4 g daily.
  - Blood disorders Haematological abnormalities occur usually in the first 3 to 6 months of treatment and are reversible on cessation of treatment.
  - **PREGNANCY** Theoretical risk of neonatal haemolysis in third trimester; adequate folate supplements should be given to mother.
  - **BREAST FEEDING** Small amounts in milk (1 report of bloody diarrhoea); theoretical risk of neonatal haemolysis especially in G6PD-deficient infants.
  - **HEPATIC IMPAIRMENT** Use with caution.
  - **RENAI IMPAIRMENT** Risk of toxicity, including crystalluria, in moderate impairment—ensure high fluid intake. Avoid in severe impairment.
  - **MONITORING REQUIREMENTS**
    - Blood disorders Close monitoring of full blood counts (including differential white cell count and platelet count) is necessary initially, and at monthly intervals during the first 3 months.
    - Renal function Although the manufacturer recommends renal function tests in rheumatic diseases, evidence of practical value is unsatisfactory.
    - Liver function Liver function tests should be performed at monthly intervals for first 3 months.
  - **PATIENT AND CARER ADVICE**
    - Contact lenses Some soft contact lenses may be stained.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension
  - **Tablet**
    - **CAUTIONARY AND ADVISORY LABELS** 14
      - Sulfasalazine (Non-proprietary)
      - **Sulfasalazine 500 mg** Salazopyrin 500mg tablets | 112 tablet | £18.00 DT price = £6.13
      - Salazopyrin (Pfizer Ltd)
      - **Sulfasalazine 500 mg** Salazopyrin 500mg tablets | 112 tablet | £6.97 DT price = £6.13
  - **Gastro-resistant tablet**
    - **CAUTIONARY AND ADVISORY LABELS** 5, 14, 25
      - Sulfasalazine (Non-proprietary)
      - **Sulfasalazine 500 mg** Sulfasalazine 500mg gastro-resistant tablets | 100 tablet | no price available | 112 tablet | £27.00 DT price = £8.63
      - Salazopyrin (Pfizer Ltd)
      - **Sulfasalazine 500 mg** Salazopyrin EN-Tabs 500mg | 112 tablet | £8.43 DT price = £8.63
      - Sulazine EC (Genesis Pharmaceuticals Ltd, Teva UK Ltd)
      - **Sulfasalazine 500 mg** Sulazine EC 500mg tablets | 112 tablet | £8.00 DT price = £8.63
  - **Oral suspension**
    - **CAUTIONARY AND ADVISORY LABELS** 14
      - **EXCIPIENTS:** May contain Alcohol
      - Sulfasalazine (Non-proprietary)
      - **Sulfasalazine 50 mg per 1 ml** Sulfasalazine 250mg/5ml oral suspension sugar free sugar-free | 500 ml | £44.09 DT price = £43.42
  - **Suppository**
    - **CAUTIONARY AND ADVISORY LABELS** 14
      - Salazopyrin (Pfizer Ltd)
      - **Sulfasalazine 500 mg** Salazopyrin 500mg suppositories | 10 suppository | £3.30
CORTICOSTEROIDS

Budesonide

- **INDICATIONS AND DOSE**
  **BUDENOFALK® CAPSULES**
  Mild to moderate Crohn’s disease affecting the ileum or ascending colon | Chronic diarrhea due to collagenous colitis
  - **BY MOUTH**
  - Child 12-17 years: 3 mg 3 times a day for up to 8 weeks, reduce dose for the last 2 weeks of treatment
  **ENTOCORT® CAPSULES**
  Mild to moderate Crohn’s disease affecting the ileum or ascending colon
  - **BY MOUTH**
  - Child 12-17 years: 9 mg once daily for up to 8 weeks; reduce dose for the last 2–4 weeks of treatment, to be taken in the morning
  **ENTOCORT® ENEMA**
  Ulcerative colitis involving rectal and recto-sigmoid disease
  - **BY RECTUM**
  - Child 12-17 years: 1 enema daily for 4 weeks, to be administered at bedtime

- **UNLICENSED USE** Not licensed for use in children.
- **DIRECTIONS FOR ADMINISTRATION** Capsules can be opened and the contents mixed with apple or orange juice.
- **PRESCRIBING AND DISPENSING INFORMATION**
  **ENTOCORT® CAPSULES** Dispense modified-release capsules in original container (contains desiccant).

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  **Modified-release capsule**
  CAUTIONARY AND ADVISORY LABELS 5, 10, 25
  - Entocort CR (Tillotts Pharma Ltd)
  **Budesonide 3 mg** Entocort CR 3mg capsules | 100 capsule (BNFC £99.00 DT price = £99.00)
  **Gastro-resistant capsule**
  CAUTIONARY AND ADVISORY LABELS 5, 10, 22, 25
  - Budesofalk (Dr. Falk Pharma UK Ltd)
  Budesonide 3 mg Budenofalk 3mg gastro-resistant capsules | 100 capsule (BNFC £75.05 DT price = £75.05)
  **Enema**
  - Entocort (Tillotts Pharma Ltd)
  **Budesonide 20 microgram per 1 ml** Entocort 2mg/100ml enema | 7 enema (BNFC £39.60)

IMMUNOSUPPRESSANTS > TUMOR NECROSIS FACTOR ALPHA (TNF-α) INHIBITORS

Infliximab

- **INDICATIONS AND DOSE**
  **Severe active Crohn’s disease**
  - **BY INTRAVENOUS INFUSION**
  - Child 6-17 years: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, then 5 mg/kg every 8 weeks, discontinue if no response within 8 weeks of initial dose
  **Fistulating Crohn’s disease**
  - **BY INTRAVENOUS INFUSION**
  - Child 6-17 years: Initially 5 mg/kg, then 5 mg/kg after 2 weeks, followed by 5 mg/kg after 4 weeks, if condition has responded consult product literature for guidance on further doses

- **UNLICENSED USE** Not licensed for fistulating Crohn’s disease in children.

- **PRESCRIBING AND DISPENSING INFORMATION**
  Adequate resuscitation facilities must be available when infliximab is used.

- **CONTRA-INDICATIONS** Moderate or severe heart failure - severe infections
- **CAUTIONS** Demyelinating disorders (risk of exacerbation) - dermatomyositis - development of malignancy - hepatitis B virus—monitor for active infection - history of malignancy - history of prolonged immunosuppressant or PUVA treatment in patients with psoriasis - mild heart failure (discontinue if symptoms develop or worsen) - predisposition to infection (discontinue if new serious infection develops) - risk of delayed hypersensitivity reactions if drug-free interval exceeds 16 weeks (re-administration after interval exceeding 16 weeks not recommended)
- **CAUTIONS, FURTHER INFORMATION**
  - Tuberculosis Manufacturer advises to evaluate patients for active and latent tuberculosis before treatment. Active tuberculosis should be treated with standard treatment for at least 2 months before starting infliximab. If latent tuberculosis is diagnosed, treatment should be started before commencing treatment with infliximab. Patients who have previously received adequate treatment for tuberculosis can start infliximab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting infliximab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with infliximab. Patients should be advised to seek medical attention if symptoms suggestive of tuberculosis develop (e.g. persistent cough, weight loss and fever).
  - Hypersensitivity reactions
    - Hypersensitivity reactions (including fever, chest pain, hypotension, hypertension, dyspnoea, transient visual loss, pruritus, urticaria, serum sickness-like reactions, angioedema, anaphylaxis) reported during or within 1–2 hours after infusion (risk greatest during first or second infusion or in patients who discontinue other immunosuppressants). Manufacturer advises prophylactic antipyretics, antihistamines, or hydrocortisone may be administered.
- **INTERACTIONS** Appendix 1 (infliximab).
- **SIDE-EFFECTS**
  - Common or very common
  - Uncommon
**Rare** Demyelinating disorders · interstitial lung disease · leukaemia · lymphoma · melanoma · pericardial effusion · Stevens-Johnson syndrome · toxic epidermal necrolysis · vasospasm

**Frequency not known** Abdominal pain · anaemia · antibody formation · aplastic anaemia · blood disorders · depression · fever · headache · hepatic failure · hepatosplenic T-cell lymphoma (more likely in inflammatory bowel disease) · hypersensitivity reactions · injection-site reactions · leucopenia · lupus erythematosus-like syndrome · Merkel cell carcinoma · nausea · pancytopenia · pruritus · thrombocytopenia · worsening heart failure · worsening symptoms of dermatomyositis

SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during and for at least 6 months after last dose.

**PREGNANCY** Use only if essential.

**BREAST FEEDING** Amount probably too small to be harmful.

**PRE-TREATMENT SCREENING** Tuberculosis Patients should be evaluated for tuberculosis before treatment.

**MONITORING REQUIREMENTS**

Monitor for infection before, during, and for 6 months after treatment.

All patients should be observed carefully for 1–2 hours after infusion and resuscitation equipment should be available for immediate use (risk of hypersensitivity reactions).

Monitor for symptoms of delayed hypersensitivity if re-administered after a prolonged period.

Manufacturer advises periodic skin examination for non-melanoma skin cancer, particularly in patients with risk factors.

**DIRECTIONS FOR ADMINISTRATION**

With intravenous use For intravenous infusion reconstitute each 100–mg vial of powder with 10 mL Water for Injections; to dissolve, gently swirl vial without shaking; allow to stand for 5 minutes; dilute required dose with Sodium Chloride 0.9% to a final volume of 250 mL and give through a low protein-binding filter (1.2 micron or less) over at least 2 hours; start infusion within 3 hours of reconstitution.

**PRESCRIBING AND DISPENSING INFORMATION** Products containing infliximab are not identical and although there should be no important differences in terms of safety and efficacy, when prescribing biological products it is good practice to use the brand name, see Biosimilar medicines, under Guidance on prescribing p. 1.

**PATIENT AND CARER ADVICE** An alert card should be provided.

Tuberculosis Patients and carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop. Blood disorders Patients and carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Hypersensitivity reactions Patients and carers should be advised to keep Alert card with them at all times and seek medical advice if symptoms of delayed hypersensitivity develop.

**NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

Infliximab for Crohn’s disease (May 2010) NICE TA187

In children over 6 years of age, infliximab is recommended for the treatment of severe active Crohn’s disease that has not responded to conventional therapy (including corticosteroids and other drugs affecting the immune response, and primary nutrition therapy) or when conventional therapy cannot be used because of intolerance or contra-indications.

Infliximab should be given as a planned course of treatment for 12 months or until treatment failure, whichever is shorter. Treatment should be continued beyond 12 months only if there is evidence of active disease—in these cases the need for treatment should be reviewed at least annually. If the disease relapses after stopping treatment, infliximab can be restarted.

www.nice.org.uk/TA187

**Infliximab, adalimumab and golimumab for treating moderately to severely active ulcerative colitis after the failure of conventional therapy (February 2015) NICE TA329**

Infliximab is an option for treating severely active ulcerative colitis in children whose disease has responded inadequately to conventional therapy including corticosteroids and mercaptopurine or azathioprine.

Infliximab should be given as a planned course of treatment until treatment fails (including the need for surgery) or until 12 months after starting treatment, whichever is shorter. Treatment should be continued only if there is clear evidence of a response. Patients who continue treatment should be reassessed every 12 months to determine whether ongoing treatment is still clinically appropriate.

www.nice.org.uk/TA329

**MEDICINES FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

**CAUTIONARY AND ADVISORY LABELS 10**

Remsima (Napp Pharmaceuticals Ltd)

Infliximab 100 mg Remsima 100mg powder for concentrate for solution for infusion vials | 1 vial | £377.66 (Hospital only)

**1.2 Irritable bowel syndrome**

**Drugs used for Irritable bowel syndrome not listed below**

Alverine citrate, p. 58 · Mebeverine hydrochloride, p. 58

**ANTISPASMODICS**

**Mebeverine with ispaghula husk**

4.2.2016

**The properties listed below are those particular to the combination only. For the properties of the components please consider, mebeverine hydrochloride p. 58, ispaghula husk p. 36.**

**INDICATIONS AND DOSE**

**Irritable bowel syndrome**

**BY MOUTH**

Child 12–17 years: 1 sachet twice daily, in water, morning and evening, 30 minutes before food and 1 sachet daily if required, taken 30 minutes before midday meal

**DIRECTIONS FOR ADMINISTRATION** Contents of one sachet should be stirred into a glass (approx. 150 mL) of cold water and drunk immediately.
32 Constipation and bowel cleansing

**Peppermint oil**

- **INDICATIONS AND DOSE**

  **COLPERMIN®**

  Relief of abdominal colic and distension, particularly in irritable bowel syndrome

  - **BY MOUTH**
  - Child 15-17 years: 1–2 capsules 3 times a day for up to 3 months if necessary, capsule to be swallowed whole with water

- **CAUTIONS**
  - Sensitivity to menthol

- **SIDE-EFFECTS**
  - Rare: Allergic reactions - ataxia - bradycardia - headache - muscle tremor - rash
  - Frequency not known: Heartburn - perianal irritation
  - PREGNANCY: Not known to be harmful.
  - BREAST FEEDING: Significant levels of menthol in breast milk unlikely.

- **DIRECTIONS FOR ADMINISTRATION**
  - Capsules should not be broken or chewed because peppermint oil may irritate mouth or oesophagus.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Modified-release capsule**

- **EXCipients**: May contain Arachis (peanut) oil
  - Colpermin (McNeil Products Ltd)
  - Peppermint oil 200 microg: Colpermin gastro-resistant modified-release capsules: 20 capsule (£3.33) 100 capsule (£5.10)
  - £12.18 DT price = £12.18

2 Constipation and bowel cleansing

2.1 Bowel cleansing

**Drugs used for Bowel cleansing not listed below**

- Bisacodyl, p. 40
- Docusate sodium, p. 43

**DIAGNOSTIC AGENTS > RADIOGRAPHIC CONTRAST MEDIA**

- **Meglumine amidotrizoate with sodium amidotrizoate**

  (Diatrizoates)

  - **DRUG ACTION**
    - Meglumine amidotrizoate with sodium amidotrizoate is a radiological contrast medium with high osmolality.

  - **INDICATIONS AND DOSE**

    **Uncomplicated meconium ileus**
    - **BY RECTUM**
    - Neonate: 15–30 mL for 1 dose.

    **Distal intestinal obstruction syndrome in children with cystic fibrosis**
    - **BY MOUTH, OR BY RECTUM**
    - Child 1–23 months: 15–30 mL for 1 dose
    - Child (body-weight 15–25 kg): 50 mL for 1 dose
    - Child (body-weight 25 kg and above): 100 mL for 1 dose

    **Radiological investigations**
    - Child: Dose to be recommended by radiologist

- **UNLICENSED USE**
  - Not licensed for use in distal intestinal obstruction syndrome.

- **CONTRA-INDICATIONS**
  - Hyperthyroidism

- **CAUTIONS**
  - Asthma - benign nodular goitre - dehydration - electrolyte disturbance (correct first) - enteritis - history of allergy - in children with oesophageal fistulae (aspiration may lead to pulmonary oedema) - latent hyperthyroidism - risk of anaphylactoid reactions increased by concomitant administration of beta-blockers

- **SIDE-EFFECTS**
  - Common or very common: Diarrhoea - nausea - vomiting
  - Frequency not known: Abdominal pain - bowel necrosis - disturbances in consciousness - dizziness - electrolyte disturbances - headache - hypersensitivity reactions - hyperthyroidism - intestinal perforation - oral mucosal blistering - pyrexia - skin reactions - toxic epidermal necrolysis

- **ALLERGY AND CROSS-SENSITIVITY**
  - Hypersensitivity to iodine.

- **PREGNANCY**
  - Manufacturer advises caution.

- **BREAST FEEDING**
  - Amount probably too small to be harmful.

- **DIRECTIONS FOR ADMINISTRATION**
  - Intravenous prehydration is essential in neonates and infants. Fluid intake should be encouraged for 3 hours after administration. **By mouth**, for child bodyweight under 25 kg, dilute Gastrografin® with 3 times its volume of water or fruit juice; for child bodyweight over 25 kg, dilute Gastrografin® with twice its volume of water or fruit juice. **By rectum**, administration must be carried out slowly under radiological supervision to ensure required site is reached. For child under 5 years, dilute Gastrografin® with 5 times its volume of water; for child over 5 years dilute Gastrografin® with 4 times its volume of water.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Oral solution**
    - EXCipients: May contain Diodium edetate
    - Gastrografin (Bayer Plc)
    - Sodium amidotrizoate 100 mg per 1 mL, Meglumine amidotrizoate 660 mg per 1 mL Gastrografin oral solution sugar-free 1000 ml (£175.00 Hospital only)

---
**LAXATIVES** > OSMOTIC LAXATIVES

Citrlic acid with magnesium carbonate (Formulated as a bowel cleansing preparation)

- **INDICATIONS AND DOSE**
  Bowel evacuation for surgery, colonoscopy or radiological examination
  - **BY MOUTH**
    - Child 5-9 years: One-third of a sachet to be given at 8 a.m. the day before the procedure and, one-third of a sachet to be given between 2 and 4 p.m. the day before the procedure
    - Child 10-17 years: 0.5–1 sachet, given at 8 a.m. the day before the procedure and 0.5–1 sachet, given between 2 and 4 p.m. the day before the procedure

- **CONTRA-INDICATIONS**
  Acute severe colitis, gastric retention, gastro-intestinal obstruction, gastro-intestinal perforation, toxic megacolon

- **CAUTIONS**
  Children: colitis (avoid if acute severe colitis) - debilitated - hypovolaemia (should be corrected before administration of bowel cleansing preparations) - impaired gag reflex or possibility of regurgitation or aspiration - patients with fluid and electrolyte disturbances

- **SIDE-EFFECTS**
  Common or very common - Abdominal distention, abdominal pain, nausea, vomiting
  Uncommon - Dehydration, dizziness, electrolyte disturbances, headache

- **INTERACTIONS**
  Other oral drugs should not be taken one hour before or after administration of bowel cleansing preparations because absorption may be impaired.

- **PREGNANCY**
  Use with caution.

- **BREAST FEEDING**
  Use with caution.

- **HEPATIC IMPAIRMENT**
  Avoid in hepatic coma if risk of hypovolaemia (should be corrected before administration of bowel cleansing preparations) - impaired gag reflex or possibility of regurgitation or aspiration - patients with fluid and electrolyte disturbances

- **RENAL IMPAIRMENT**
  Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m² — risk of hypermagnesaemia.

- **MONITORING REQUIREMENTS**
  Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.

- **DIRECTIONS FOR ADMINISTRATION**
  One sachet should be reconstituted with 200 mL of hot water; the solution should be allowed to cool for approx. 30 minutes before drinking.

- **PRESCRIBING AND DISPENSING INFORMATION**
  Reconstitution of one sachet containing 11.57 g magnesium carbonate and 17.79 g anhydrous citric acid produces a solution containing magnesium citrate with 118 mmol Mg²⁺. Flavours of oral powders may include lemon and lime.

- **PATIENT AND CARER ADVICE**
  Low residue or fluid only diet (e.g. water, fruit squash, clear soup, black tea or coffee) recommended before procedure (according to prescriber’s advice) and copious intake of clear fluids recommended until procedure. Patient or carers should be given advice on how to administer oral powder.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Effervescent powder**
  **CAUTIONARY AND ADVISORY LABELS**
  13, 10 ELECTROLYTES: May contain Magnesium
  - **Citramag** (Sanochemia Diagnostics UK Ltd)
    - Magnesium carbonate heavy 11.57 gram, Citric acid anhydrous 17.79 gram
    - Citramag effervescent powder sachets sugar-free | 10 sachet £18.92

---

**Macrogol 3350 with anhydrous sodium sulfate, potassium chloride, sodium bicarbonate and sodium chloride**

(Formulated as a bowel cleansing preparation)

- **INDICATIONS AND DOSE**
  Bowel cleansing before radiological examination, colonoscopy, or surgery
  - **BY MOUTH**
    - Child 12-17 years: Initially 2 litres daily for 2 doses: first dose of reconstituted solution taken on the evening before procedure and the second dose on the morning of procedure, alternatively (by mouth) initially 250 mL every 10–15 minutes, reconstituted solution to be administered, alternatively (by nasogastric tube) initially 20–30 mL/minute, starting on the day before procedure until 4 litres have been consumed
  - **DISTAL INTESTINAL OBSTRUCTION SYNDROME**
    - **BY MOUTH, OR BY NASOGASTRIC TUBE, OR BY GASTROSTOMY TUBE**
      - Child 1-7 years: 10 mL/kg/hour for 30 minutes, then increased to 20 mL/kg/hour for 30 minutes, then increased if tolerated to 25 mL/kg/hour, max. 100 mL/kg (or 4 litres) over 4 hours, repeat 4 hour treatment if necessary

- **UNLICENSED USE**
  Klean-Prep® not licensed for use in children.

- **CONTRA-INDICATIONS**
  Acute severe colitis, gastric retention, gastro-intestinal obstruction, gastro-intestinal perforation, gastro-intestinal ulceration, toxic megacolon

- **CAUTIONS**
  Children: colitis (avoid if acute severe colitis) - debilitated patients - fluid and electrolyte disturbances - heart failure - hypovolaemia (should be corrected before administration of bowel cleansing preparations) - impaired gag reflex or possibility of regurgitation or aspiration

- **SIDE-EFFECTS**
  Common or very common - Abdominal distention, abdominal pain, nausea, vomiting
  Uncommon - Anal discomfort, dizziness, electrolyte disturbances, headache

- **INTERACTIONS**
  Other oral drugs should not be taken one hour before or after administration of bowel cleansing preparations because absorption may be impaired.

- **PREGNANCY**
  Manufacturers advise use only if essential — no information available.

- **BREAST FEEDING**
  Manufacturers advise use only if essential — no information available.

- **MONITORING REQUIREMENTS**
  Renal function should be measured before starting treatment in patients at risk of fluid and electrolyte disturbances.

- **DIRECTIONS FOR ADMINISTRATION**
  1 sachet should be reconstituted with 1 litre of water. Flavouring such as clear fruit cordials may be added if required. After reconstitution the solution should be kept in a refrigerator and discarded if unused after 24 hours.
**Constipation and bowel cleansing**

**34**

**LAXATIVES > STIMULANT LAXATIVES**

**Magnesium citrate with sodium picosulfate**

(Formulated as a bowel cleansing preparation)

**INDICATIONS AND DOSE**

**PICOLAX® SACHETS**

Bowel evacuation on day before radiological procedure, endoscopy, or surgery

- **By mouth**
  - Child 1 year: 0.25 sachet taken before 8 a.m., then 0.25 sachet after 6–8 hours
  - Child 2–3 years: 0.5 sachet taken before 8 a.m., then 0.5 sachet after 6–8 hours
  - Child 4–8 years: 1 sachet taken before 8 a.m., then 0.5 sachet after 6–8 hours
  - Child 9–17 years: 1 sachet taken before 8 a.m., then 1 sachet after 6–8 hours

**PHARMACOKINETICS**

Acts within 3 hours of first dose.

**CONTRA-INDICATIONS**

Acute severe colitis - ascites - congestive cardiac failure - gastric retention - gastrointestinal obstruction - gastrointestinal perforation - gastrointestinal ulceration - toxic megacolon

**CAUTIONS**

Cardiac disease (avoid in congestive cardiac failure) - children - colitis (avoid if acute severe colitis) - debilitated patients - fluid and electrolyte disturbances - hypovolaemia (should be corrected before administration) - impaired gag reflex or possibility of regurgitation or aspiration - recent gastro-intestinal surgery

**SIDE-EFFECTS**

- Common or very common: Abdominal distention - abdominal pain (usually transient—reduced by taking more slowly) - nausea - vomiting
- Uncommon: Dehydration - dizziness - electrolyte disturbances - headache
- Frequency not known: Anal discomfort - fatigue - rash - sleep disturbances

**PREGNANCY** Caution.

**BREAST FEEDING** Caution.

**HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.

**PRESCRIBING AND DISPENSING INFORMATION**

Each Klean-Prep® sachet provides Na⁺ 125 mmol, K⁺ 10 mmol, Cl⁻ 35 mmol and HCO₃⁻ 20 mmol when reconstituted with 1 litre of water.

**PATIENT AND CARER ADVICE**

Solid food should not be taken for 2 hours before starting treatment. Adequate hydration should be maintained during treatment. Treatment can be stopped if bowel motions become watery and clear.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder**

CAUTIONARY AND ADVISORY LABELS 10, 13

EXECRIPENTS: May contain Aspartame

ELECTROLYTES: May contain Bicarbonate, chloride, potassium, sodium

- **Klean-Prep** (Norgine Pharmaceuticals Ltd)
  - Potassium chloride 742.5 mg, Sodium chloride 1.465 gram, Sodium sulfate anhydrous 5.685 gram, Polyethylene glycol 3350 59 gram Klean-Prep oral powder 69g sachets sugar-free £ 3.98

**Renal Impairment**

Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—risk of hypermagnesaemia.

**DIRECTIONS FOR ADMINISTRATION**

One sachet of sodium picosulfate with magnesium citrate powder should be reconstituted with 150 mL (approx. half a glass) of cold water; patients should be warned that heat is generated during reconstitution and that the solution should be allowed to cool before drinking.

**PICOLAX® SACHETS**

One sachet should be reconstituted with 150 mL (approx. half a glass) of cold water.

**PRESCRIBING AND DISPENSING INFORMATION**

Flavours of oral powder formulations may include lemon.

**PICOLAX® SACHETS**

One reconstituted sachet contains K⁺ 5 mmol and Mg²⁺ 87 mmol.

**PATIENT AND CARER ADVICE**

Low residue diet recommended on the day before procedure and copious intake of water or other clear fluids recommended during treatment. Patients or carers should be given advice on how to administer sodium picosulfate with magnesium citrate oral powder.

**PICOLAX® SACHETS**

Low residue diet recommended on the day before procedure and copious intake of water or other clear fluids recommended during treatment. Patients and carers should be given advice on how to administer oral powder; they should be warned that heat is generated during reconstitution and that the solution should be allowed to cool before drinking.

**MEDICINAL FORMS**

**2.2 Constipation**

**Constipation**

**Overview**

Before prescribing laxatives it is important to be sure that the child is constipated and that the constipation is not secondary to an underlying undiagnosed complaint. Laxatives should be prescribed by a healthcare professional experienced in the management of constipation in children. Delays of greater than 3 days between stools may increase the likelihood of pain on passing hard stools leading to anal fissure, anal spasm and eventually to a learned response to avoid defaecation.

In infants, increased intake of fluids, particularly fruit juice containing sorbitol (e.g. prune, pear, or apple), may be sufficient to soften the stool. In infants under 1 year of age with mild constipation, lactulose p. 37 can be used to soften the stool; either an oral preparation containing macrogols or, rarely, glycerol suppositories p. 41 can be used to clear faecal impaction. The infant should be referred to a hospital paediatric specialist if these measures fail.

The diet of children over 1 year of age should be reviewed to ensure that it includes an adequate intake of fibre and fluid. An osmotic laxative containing macrogols can also be used, particularly in children with chronic constipation; lactulose is an alternative in children who cannot tolerate a macrogol. If there is an inadequate response to the osmotic laxative, a stimulant laxative can be added.
Treatment of faecal impaction may initially increase symptoms of soiling and abdominal pain. In children over 1 year of age with faecal impaction, an oral preparation containing macrogol is used to clear faecal mass and to establish and maintain soft well-formed stools. If disimpaction does not occur after 2 weeks, a stimulant laxative can be added. If the impacted mass is not expelled following treatment with macrogol and a stimulant laxative, a sodium citrate enema can be administered. Although rectal administration of laxatives may be effective, this route is frequently distressing for the child and may lead to persistence of withholding. A phosphate enema may be administered under specialist supervision if disimpaction does not occur after a sodium citrate enema; a bowel cleansing preparation is an alternative. Manual evacuation under anaesthetic may be necessary if disimpaction does not occur after oral and rectal treatment, or if the child is afraid. Long-term regular use of laxatives is essential to maintain well-formed stools and prevent recurrence of faecal impaction; intermittent use may provoke relapses. In children with chronic constipation, laxatives should be continued for several weeks after a regular pattern of bowel movements or toilet training is established. The dose of laxatives should then be tapered gradually, over a period of months, according to response. Some children may require laxative therapy for several years.

Laxatives are also of value in drug-induced constipation, in distal intestinal obstruction syndrome in children with cystic fibrosis, for the expulsion of parasites after anthelminthic treatment, and to clear the alimentary tract before surgery and radiological procedures.

Laxatives also have a role in the treatment of irritable bowel syndrome. Also see the prevention of opioid-induced constipation in palliative care.

**Chronic constipation**

For children with chronic constipation, it may be necessary to exceed the licensed doses of some laxatives. Parents and carers of children should be advised to adjust the dose of laxative in order to establish a regular pattern of bowel movements in which stools are soft, well-formed, and passed without discomfort.

Laxatives should be administered at a time that produces an effect that is likely to fit in with the child’s toilet routine.

**Pregnancy**

If dietary and lifestyle changes fail to control constipation in pregnancy, moderate doses of poorly absorbed laxatives may be used. A bulk-forming laxative should be tried first. An osmotic laxative, such as lactulose, can also be used. Bisacodyl p. 40 or senna p. 42 may be suitable, if a stimulant effect is necessary.

**Laxatives drugs**

The laxatives that follow have been divided into 5 main groups. This simple classification disguises the fact that some laxatives have a complex action.

**Bulk-forming laxatives**

Bulk-forming laxatives are of value if the diet is deficient in fibre. During treatment with bulk-forming laxatives, adequate fluid intake must be maintained to avoid intestinal obstruction. Proprietary preparations containing a bulking agent such as ispaghula husk p. 36 are often difficult to administer to children.

Proprietary preparations containing a bulking agent such as ispaghula husk are often difficult to administer to children. Bulk-forming laxatives may be used in the management of children with haemorrhoids, anal fissure, and irritable bowel syndrome.

**Stimulant laxatives**

Stimulant laxatives include bisacodyl, sodium picosulfate p. 42, and members of the anthraquinone group, senna, co-
danthramer p. 40 and co-danthrusate p. 41. The indications for co-danthramer and co-danthrusate are limited by its potential carcinogenicity (based on rodent carcinogenicity studies) and evidence of genotoxicity. Powerful stimulants such as cascara (an anthraquinone) and castor oil are obsolete. Docusate sodium p. 43 probably acts both as a stimulant and as a softening agent.

Stimulant laxatives increase intestinal motility and often cause abdominal cramp; they should be avoided in intestinal obstruction. Stools should be softened by increasing dietary fibre and liquid or with an osmotic laxative before giving a stimulant laxative. In chronic constipation, especially where withholding of stool occurs, additional doses of a stimulant laxative may be required. Long-term use of stimulant laxatives is sometimes necessary, but excessive use can cause diarrhoea and related effects such as hypokalaemia.

Glycerol suppositories act as a lubricant and as a rectal stimulant by virtue of the mildly irritant action of glycerol.

**Faecal softeners**

Enemas containing arachis oil p. 43 (ground-nut oil, peanut oil) lubricate and soften impacted faeces and promote a bowel movement.

Bulk laxatives and non-ionic surfactant ‘wetting’ agents e.g. docusate sodium also have softening properties. Such drugs are useful for oral administration in the management of anal fissure; glycerol suppositories are useful for rectal use.

**Osmotic laxatives**

Osmotic laxatives increase the amount of water in the large bowel, either by drawing fluid from the body into the bowel or by retaining the fluid they were administered with.

Lactulose is a semi-synthetic disaccharide which is not absorbed from the gastro-intestinal tract. It produces an osmotic diarrhoea of low faecal pH, and discourages the proliferation of ammonia-producing organisms. It is therefore useful in the treatment of hepatic encephalopathy.

Macrogols are inert polymers of ethylene glycol which sequester fluid in the bowel; giving fluid with macrogols may reduce the dehydrating effect sometimes seen with osmotic laxatives. Macrogols are an effective non-traumatic means of evacuation in children with faecal impaction and can be used in the long-term management of chronic constipation.

Saline purgatives such as magnesium hydroxide are commonly abused but are satisfactory for occasional use; adequate fluid intake should be maintained. Magnesium salts are useful where rapid bowel evacuation is required. Sodium salts should be avoided as they may give rise to sodium and water retention in susceptible individuals.

Phosphate enemas are useful in bowel clearance before radiology, endoscopy, and surgery. Enemas containing phosphate or sodium citrate, and oral bowel cleansing preparations should only be used on the advice of a specialist practitioner.

**Bowel cleansing preparations**

Bowel cleansing preparations are used before colonic surgery, colonoscopy, or radiological examination to ensure the bowel is free of solid contents. They are not treatments for constipation.
LAXATIVES > BULK-FORMING LAXATIVES

Ispaghula husk 24.2.2016

- **DRUG ACTION** Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

- **INDICATIONS AND DOSE** Constipation
  - **BY MOUTH**
    - Child 1 month–5 years: 2.5–5 mL twice daily, dose to be taken only when prescribed by a doctor, as half or whole level spoonful in water, preferably after meals, morning and evening
    - Child 6–11 years: 2.5–5 mL twice daily, dose to be given as a half or whole level spoonful in water, preferably after meals, morning and evening
    - Child 12–17 years: 1 sachet twice daily, dose to be given in water preferably after meals, morning and evening

- **DOSE EQUIVALENCE AND CONVERSION** 1 sachet equivalent to 2 level 5 mL spoonful.

- **CONTRA-INDICATIONS** Colonic atony · faecal impaction · intestinal obstruction · reduced gut motility

- **CAUTIONS** Adequate fluid intake should be maintained to avoid intestinal obstruction

- **SIDE-EFFECTS** Abdominal distension · flatulence · gastro-intestinal impaction · gastro-intestinal obstruction · hypersensitivity

- **DIRECTIONS FOR ADMINISTRATION** Dose to be taken with at least 150 mL liquid.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of soluble granules formulations may include plain, lemon, or orange.

- **HANDLING AND STORAGE** Ispaghula husk contains potent allergens. Individuals exposed to the product (including those handling the product) can develop hypersensitivity reactions such as rhinitis, conjunctivitis, bronchospasm and in some cases, anaphylaxis.

- **PATIENT AND CARER ADVICE** Manufacturer advises that preparations that swell in contact with liquid should not be taken immediately before going to bed. Patients and their carers should be advised that the full effect may take some days to develop and should be given advice on how to administer ispaghula husk.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Granules**
  - CAUTIONARY AND ADVISORY LABELS 13
  - **EXCIPIENTS**: May contain Aspartame

          - Combinations available: Senna with ispaghula husk, p. 42

Methycellulose

- **DRUG ACTION** Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis.

- **INDICATIONS AND DOSE** Constipation | Diarrhoea
  - BY MOUTH USING TABLETS
    - Child 6–11 years: 2 tablets twice daily
    - Child 12–17 years: 3–6 tablets twice daily

- **UNLICENSED USE** No age limit specified by manufacturer.

- **CONTRA-INDICATIONS** Colonic atony · difficulty in swallowing · faecal impaction · infective bowel disease · intestinal obstruction

- **CAUTIONS** Adequate fluid intake should be maintained to avoid intestinal obstruction

- **SIDE-EFFECTS** Abdominal distension (especially during the first few days of treatment) · flatulence (especially during the first few days of treatment) · gastro-intestinal impaction · gastro-intestinal obstruction · hypersensitivity

- **DIRECTIONS FOR ADMINISTRATION** In constipation the dose should be taken with at least 300 mL liquid. In diarrhoea, ileostomy, and colostomy control, avoid liquid intake for 30 minutes before and after dose.

- **PATIENT AND CARER ADVICE** Patients and their carers should be advised that the full effect may take some days to develop. Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

  **Tablet**
  - Celevac (AMCo)
    - Methycellulose *450* 500 mg Celevac 500mg tablets | 112 tablet (GSS) £4.64 DT price = £4.64

Sterculia

- **DRUG ACTION** Sterculia is a bulk-forming laxative. It relieves constipation by increasing faecal mass which stimulates peristalsis.

- **INDICATIONS AND DOSE** Constipation
  - **BY MOUTH**
    - Child 6–11 years: 0.5–1 sachet 1–2 times a day, alternatively, half to one heaped 5–5 mL spoonful once or twice a day; washed down without chewing with plenty of liquid after meals
    - Child 12–17 years: 1–2 sachets 1–2 times a day, alternatively, one to two heaped 5–5 mL spoonfuls once or twice a day; washed down without chewing with plenty of liquid after meals

- **CONTRA-INDICATIONS** Colonic atony · difficulty in swallowing · faecal impaction · intestinal obstruction

- **CAUTIONS** Adequate fluid intake should be maintained to avoid intestinal obstruction

- **SIDE-EFFECTS** Abdominal distension (especially during the first few days of treatment) · flatulence (especially...
during the first few days of treatment) • gastro-intestinal impaction • gastro-intestinal obstruction • hypersensitivity

**DIRECTIONS FOR ADMINISTRATION** May be mixed with soft food (e.g. yoghurt) before swallowing, followed by plenty of liquid.

**PATIENT AND CARER ADVICE** Patients and their carers should be advised that the full effect may take some days to develop. Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**LAXATIVES** > OSMOTIC LAXATIVES

**Lactulose**

**INDICATIONS AND DOSE**

**Constipation**

- **BY MOUTH**
  - Child 1-11 months: 2.5 mL twice daily, adjusted according to response
  - Child 1-4 years: 2.5–10 mL twice daily, adjusted according to response
  - Child 5-17 years: 5–20 mL twice daily, adjusted according to response

**Lactugal**

- **Indications**
  - Hepatic encephalopathy (portal systemic encephalopathy)
    - **BY MOUTH**
      - Child 12-17 years: Adjusted according to response to 30–50 mL 3 times a day, subsequently adjusted to produce 2–3 soft stools per day

**Pharmacokinetics**

Lactulose may take up to 48 hours to act.

**UNLICENSED USE** Not licensed for use in children for hepatic encephalopathy.

**CONTRA-INDICATIONS**

Galactosaemia • intestinal obstruction

**CAUTIONS**

Lactose intolerance

**INTERACTIONS** → Appendix 1 (lactulose).

**SIDE-EFFECTS**

- **Common or very common**
  - Abdominal discomfort • cramps • flatulence • nausea • vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Nausea**
  - Nausea can be reduced by administration with water, fruit juice or meals.

**PREGNANCY**

Not known to be harmful.

**PATIENT AND CARER ADVICE**

MOVICOL-PAEDIATRIC®

Impaired consciousness (with high doses) - impaired gag reflex (with high doses) - reflux oesophagitis (with high doses)

INTERACTIONS → Appendix 1 (macrogols).
SIDE-EFFECTS Abdominal distention - abdominal pain - flatulence - nausea
PREGNANCY Limited data, but manufacturer advises that it can be used.

BRUST FEEDING Manufacturer advises that it can be used.
RENAL IMPAIRMENT MOVICOL-PAEDIATRIC® Contra-indicated in renal impairment.

DIRECTIONS FOR ADMINISTRATION Contents of each ‘full strength’ sachet of oral powder to be dissolved in half a glass (approx. 125 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours.

MOVICOL® LIQUID 25 mL of oral concentrate to be diluted with half a glass (approx. 100 mL) of water. After dilution the solution should be discarded if unused after 24 hours.

MOVICOL-PAEDIATRIC® Contents of each sachet to be dissolved in quarter of a glass (approx. 60–65 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 24 hours.

MOVICOL® ORAL POWDER Contents of each sachet to be dissolved in half a glass (approx. 125 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours.

MOVICOL-HALF® Contents of each sachet to be dissolved in quarter of a glass (approx. 60–65 mL) of water; after reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours.

PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include orange. Flavours of oral powder formulations may include chocolate, lime and lemon, or plain.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Oral solution

CAUTIONARY AND ADVISORY LABELS 13

ELECTROLYTES: May contain Bicarbonate, chloride, potassium, sodium
- Macrogl 3350 with potassium chloride, sodium bicarbonate and sodium chloride (Non-proprietary)

Sodium acid phosphate with sodium phosphate
INDICATIONS AND DOSE
Constipation (using Phosphates Enema BP Formula B) | Bowel evacuation before abdominal radiological procedures, endoscopy, and surgery (using Phosphates Enema BP Formula B)
BY RECTUM
Child 3–6 years: 45–65 ml once daily
Child 7–11 years: 65–100 ml once daily
Child 12–17 years: 100–120 ml once daily
FLEET® READY-TO-USE ENEMA
Constipation | Bowel evacuation before abdominal radiological procedures | Bowel evacuation before endoscopy | Bowel evacuation before surgery
BY RECTUM
Child 3–6 years: 40–60 ml once daily
Child 7–11 years: 60–90 ml once daily
Child 12–17 years: 90–118 ml once daily
CONTRA-INDICATIONS Conditions associated with increased colonic absorption - gastro-intestinal obstruction - inflammatory bowel disease
CAUTIONS Aspects - congestive heart failure - electrolyte disturbances - uncontrolled hypertension
SIDE-EFFECTS Electrolyte disturbances - local irritation
HEPATIC IMPAIRMENT Use with caution in cirrhosis.
RENAI IMPAIRMENT Use with caution.
PRESCRIBING AND DISPENSING INFORMATION When prepared extemporaneously, the BP states Phosphates Enema BP Formula B consists of sodium dihydrogen phosphate dihydrate 12.8 g, disodium phosphate
**Gastro-intestinal system**

**LAXATIVES**

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Enema**
  - Sodium acid phosphate with sodium phosphate (Non-proprietary)
  - Disodium hydrogen phosphate dodecahydrate 80 mg per 1 ml
  - Sodium dihydrogen phosphate dihydrate 100 mg per 1 ml
  - Phosphates enema (Formula B) 128 ml long tube | 1 enema £2.95 DT price = £2.79
  - Phosphates enema (Formula B) 128 ml standard tube | 1 enema £3.98 DT price = £3.98
  - Fleet Ready-to-use (Casen Recordati S.L.)

- **Bisacodyl**
  - Disodium hydrogen phosphate dodecahydrate 181 mg per 1 ml
  - Sodium citrate 90 mg per 1 ml
  - Sodium acid phosphate with sodium phosphate (Non-proprietary)

**CAUTIONS**

- Sodium and water retention in susceptible individuals
- There can be variation in the licensing of different medicines containing the same drug.

**CONTRA-INDICATIONS**

- Acute abdominal conditions
- Acute inflammatory bowel disease
- Intestinal obstruction
- Severe dehydration

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- Abdominal cramp
- Colitis
- Nausea
- Vomiting

**SPECIFIC SIDE-EFFECTS**

- With rectal use
- Local irritation

**PREGNANCY**

- May be suitable for constipation in pregnancy, if a stimulant effect is necessary.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, suppository, enema and injectable and injectable.

**Bowel clearance before radiological procedures and surgery**

- **INITIALLY BY MOUTH**
  - Child 4–9 years: 5 mg once daily for 2 days before procedure, dose to be taken at bedtime and (by rectum) 5 mg if required, dose to be administered 1 hour before procedure
  - Child 10–17 years: 10 mg once daily for 2 days before procedure, dose to be taken at bedtime and (by rectum) 10 mg if required, dose to be administered 1 hour before procedure

**PHARMACOKINETICS**

- Tablets act in 10–12 hours; suppositories act in 20–60 minutes.

- **CONTRA-INDICATIONS**
  - Acute abdominal conditions
  - Acute inflammatory bowel disease
  - Intestinal obstruction
  - Severe dehydration

- **CAUTIONS**
  - Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia - risk of electrolyte imbalance with prolonged use

**LAXATIVES**

**STIMULANT LAXATIVES**

**Bisacodyl**

**INDICATIONS AND DOSE**

- **Constipation**
  - Child 4–17 years: 5–20 mg once daily, adjusted according to response, dose to be taken at night
  - Child 2–17 years: 5–10 mg once daily, adjusted according to response

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Enema**
  - Micolette Micro-enema (Pinewood Healthcare)
  - Sodium citrate 90 mg per 1 ml Micolette Micro-enema 5 ml | 12 enema £3.40
  - Micralax Micro-enema (Focus Pharmaceuticals Ltd)
  - Sodium citrate 90 mg per 1 ml Micralax Micro-enema 5 ml | 12 enema £4.87
  - Relaxit (Supra Enterprises Ltd)
  - Sodium citrate 90 mg per 1 ml Relaxit Micro-enema 5 ml | 12 enema £5.21

- **Suppository**
  - Bisacodyl 10 mg Bisacodyl 10 mg gastro-resistant tablets | 12 suppository £3.53 DT price = £3.53

- **Enema**
  - Bisacodyl (Non-proprietary)
  - Bisacodyl 333.333 microgram per 1 ml Fleet Bisacodyl 10 mg/30ml enema | 1 enema no price available

**Co-danthramer**

**INDICATIONS AND DOSE**

- **Constipation in terminally ill patients (standard strength capsules)**
  - **BY MOUTH USING CAPSULES**
  - Child 6–11 years: 1 capsule once daily, dose should be taken at night
  - Child 12–17 years: 1–2 capsules once daily, dose should be taken at night

- **Constipation in terminally ill patients (strong capsules)**
  - **BY MOUTH USING CAPSULES**
  - Child 12–17 years: 1–2 capsules once daily, dose should be given at night

- **Constipation in terminally ill patients (standard strength suspension)**
  - **BY MOUTH USING ORAL SUSPENSION**
  - Child 6–11 years: 2.5–5 ml once daily, dose should be taken at night
  - Child 12–17 years: 5–10 ml once daily, dose should be taken at night
CONTRA-INDICATIONS

BREAST FEEDING

SIDE-EFFECTS

CAUTION

CONTRA-INDICATIONS

Acute abdominal conditions • acute inflammatory bowel disease • intestinal obstruction • severe dehydration

CAUTIONS

Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia • may cause local irritation • rodent studies indicate potential carcinogenic risk

CAUTIONS, FURTHER INFORMATION

Local irritation • Avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies — risk of irritation and excoriation).

SIDE-EFFECTS

Abdominal cramp • urine may be coloured red

PREGNANCY

Manufacturers advise avoid — limited information available.

BREAST FEEDING

Manufacturers advise avoid — no information available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 14 (urine red)

INDICATIONS AND DOSE

Constipation
**Senna**

**13.6.2016**

- **DRUG ACTION** Senna is a stimulant laxative. After metabolism of sennosides in the gut the anthrone component stimulates peristalsis thereby increasing the motility of the large intestine.

- **INDICATIONS AND DOSE**
  - **Constitution**
    - **BY MOUTH USING TABLETS**
    - Child 4–5 years: 3.75–15 mg once daily, adjusted according to response
    - Child 6–17 years: 7.5–30 mg once daily, adjusted according to response
    - **BY MOUTH USING SYRUP**
    - Child 1 month–3 years: 3.75–15 mg once daily, adjusted according to response
    - Child 4–17 years: 3.75–30 mg once daily, adjusted according to response

- **PHARMACOKINETICS**
  - Onset of action 8–12 hours.

- **UNLICENSED USE** Tablets not licensed for use in children under 6 years. Syrup not licensed for use in children under 2 years.
  - **CONTRA-INDICATIONS** Intestinal obstruction - undiagnosed abdominal pain
  - **SIDE-EFFECTS** Abdominal spasm - discoloration of urine - pruritus

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Prolonged or excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia.

- **PREGNANCY** Specialist sources indicate suitable for use in pregnancy.

- **BREAST FEEDING** Specialist sources indicate suitable for use in breast-feeding in infants over 6 months.

- **PATIENT AND CARER ADVICE**

- **MEDICATION FORMS**
  - **Tablet**
    - Senna (Non-proprietary) Senna B (as Sennosides) 7.5 mg Senko 7.5mg tablets  
      20 tablet $0.99 | 60 tablet $2.10 | 100 tablet $3.01 | 1000 tablet $24.71 no price available
    - Senna B (as Sennosides) 1.5 mg per 1 ml Senko 7.5mg/5ml Syrup Pharmacy sugar free sugar-free | 500 ml $3.99 DT price = £3.99
      150 ml $3.49

- **NATIONAL FUNDING/ACCESS DECISIONS**

- **EXCEPTIONS TO LEGAL CATEGORY** Senna is on sale to the public for use in children over 12 years, doses on packs may vary from those in BNF Publications.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Senna with ispaghula husk**

24.2.2016

- **INDICATIONS AND DOSE**
  - **Constitution**
    - Child 2–3 years: 3.75–15 mg once daily, adjusted according to response
  - **Constitution**
    - Child 4–17 years: 7.5–30 mg once daily, adjusted according to response
  - **BY MOUTH USING SYRUP**
    - Child 1 month–3 years: 3.75–15 mg once daily, adjusted according to response
    - Child 4–17 years: 3.75–30 mg once daily, adjusted according to response

- **SIDE-EFFECTS** Urine coloured yellow or red-brown

- **PREGNANCY** Manufacturer advises avoid during first trimester. To be used only intermittently and only if dietary and lifestyle changes fail.

- **DIRECTIONS FOR ADMINISTRATION** Take at night with at least 150 ml liquid.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Sodium picosulfate**

(1) 6.5.2016

- **DRUG ACTION** Sodium picosulfate is a stimulant laxative. After metabolism in the colon it stimulates the mucosa thereby increasing the motility of the large intestine.

- **INDICATIONS AND DOSE**
  - **Constitution**
    - **BY MOUTH**
    - Child 2–3 years: 2.5–10 mg once daily, adjusted according to response
    - Child 4–17 years: 2.5–20 mg once daily, adjusted according to response

- **PHARMACOKINETICS**
  - Onset of action 6–12 hours.

- **UNLICENSED USE** Sodium picosulfate doses in BNF Publications adhere to national guidelines and may differ from those in product literature.

- **CONTRA-INDICATIONS** Intestinal obstruction - undiagnosed abdominal pain

- **SIDE-EFFECTS**
  - Common or very common Abdominal cramp
  - Uncommon Dizziness - nausea - vomiting
  - Frequency not known Angioedema - pruritus - rash - syncope

- **PREGNANCY** Manufacturer states evidence limited but not known to be harmful.

- **BREAST FEEDING** Specialist sources indicate suitable for use in breast-feeding in infants over 1 month— not known to be present in milk.

- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Sodium picosulfate for constipation www.medicinesforchildren.org.uk/sodium-picosulfate-for-constipation
### Diarrhoea

#### Acute diarrhoea

**Management of acute diarrhoea**

The priority in acute diarrhoea, as in gastro-enteritis, is the prevention or reversal of fluid and electrolyte depletion—this is particularly important in infants. **Oral rehydration preparations** are used in the prevention or reversal of fluid and electrolyte depletion. Severe dehydration requires immediate admission to hospital and urgent replacement of fluid and electrolytes.

**Adsorbents and bulk-forming drugs**

Adsorbents such as kaolin are **not** recommended for **acute diarrhoea**. Bulk-forming drugs, such as ispaghula husk p. 36, methylcellulose p. 36, and sterculia p. 36 are rarely effective in controlling faecal consistency in ileostomy and colostomy. Colestyramine p. 120 binds unabsorbed bile salts and provides symptomatic relief of diarrhoea following ileal disease or resection.

**Antibacterial drugs**

Antibacterial drugs are generally unnecessary in **simple diarrhoeas**. Antibacterial drugs are only indicated if a *Systemic bacterial infection* provides symptomatic relief of diarrhoea following ileal disease or resection.

**Antimotility drugs**

Antimotility drugs relieve symptoms of diarrhoea. They prolong the duration of intestinal transit by binding to opioid receptors in the gastrointestinal tract. Loperamide
Diarrhoea

ANTIDIARRHOEALS  
ANTIPROPULSIVES

Loperamide hydrochloride

**INDICATIONS AND DOSE**

Symptomatic treatment of acute diarrhoea

- **BY MOUTH**
  - Child 4–7 years: 1 mg 3–4 times a day for up to 3 days only
  - Child 8–11 years: 2 mg 4 times a day for up to 5 days
  - Child 12–17 years: Initially 4 mg, followed by 2 mg for up to 5 days, dose to be taken after each loose stool; usual dose 6–8 mg daily; maximum 16 mg per day

Chronic diarrhoea

- **BY MOUTH**
  - Child 1–11 months: 100–200 micrograms/kg twice daily, to be given 30 minutes before feeds; increased if necessary up to 2 mg/kg daily in divided doses
  - Child 1–11 years: 100–200 micrograms/kg 3–4 times a day (max. per dose 2 mg), increased if necessary up to 1.25 mg/kg daily in divided doses; maximum 16 mg per day
  - Child 12–17 years: 2–4 mg 2–4 times a day; maximum 16 mg per day

**CONTRA-INDICATIONS** Active ulcerative colitis - antibiotic-associated colitis - conditions where abdominal distension develops - conditions where inhibition of peristalsis should be avoided

**CAUTIONS** Not recommended for children under 12 years

**INTERACTIONS** → Appendix 1 (atropine). **SIDE-EFFECTS**

- **Common or very common** Dizziness - flatulence - headache - nausea
- **Uncommon** Abdominal pain - drowsiness - dry mouth - dyspepsia - rash - vomiting

- **Frequency not known** Abdominal pain - anorexia - constipation - dilation of the pupils with loss of accommodation - dry mouth - dryness of the skin - fever - flushing - giddiness - nausea - photophobia - reduced bronchial secretions - transient bradycardia (followed by tachycardia, palpitation and arrhythmias) - urinary retention - urinary urgency - vomiting

- **PREGNANCY** Manufacturer advises caution.

- **BREAST FEEDING** May be present in milk.

- **HEPATIC IMPAIRMENT** Avoid in jaundice.

**PRESCRIBING AND DISPENSING INFORMATION** A mixture of diphenoxylate hydrochloride and atropine sulfate in the mass proportions 100 parts to 1 part respectively.

**EXCEPTIONS TO LEGAL CATEGORY** Co-phenotrope 2.5/0.025 can be sold to the public for children over 16 years (provided packs do not contain more than 20 tablets) as an adjunct to rehydration in acute diarrhoea (max. daily dose 10 tablets).

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Co-phenotrope (Non-proprietary)

  - Atropine sulfate 25 microgram, Diphenoxylate hydrochloride 2.5 mg  
  - Lomotil 2.5mg/25microgram tablets  
  - no price available Schedule 5 (CD Inv)

**Co-phenotrope**

**INDICATIONS AND DOSE**

Adjuunct to rehydration in acute diarrhoea

- **BY MOUTH**
  - Child 2–3 years: 0.5 tablet 3 times a day
  - Child 4–8 years: 1 tablet 3 times a day
  - Child 9–11 years: 1 tablet 4 times a day
  - Child 12–15 years: 2 tablets 3 times a day
  - Child 16–17 years: Initially 4 tablets, followed by 2 tablets every 6 hours until diarrhoea controlled

Control of faecal consistency after colostomy or ileostomy

- **BY MOUTH**
  - Child 2–3 years: 0.5 tablet 3 times a day
  - Child 4–8 years: 1 tablet 3 times a day
  - Child 9–11 years: 1 tablet 4 times a day
  - Child 12–15 years: 2 tablets 3 times a day
  - Child 16–17 years: Initially 4 tablets, then 2 tablets 4 times a day

**UNLICENSED USE** Not licensed for use in children under 4 years.

**CONTRA-INDICATIONS** Gastro-intestinal obstruction - intestinal atony - myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) - paralytic ileus - pyloric stenosis - severe ulcerative colitis - significant bladder outflow obstruction - toxic megacolon - urinary retention

**CAUTIONS** Presence of subclinical doses of atropine may give rise to atropine side-effects in susceptible individuals or in overdosage; young children are particularly susceptible to overdosage; symptoms may be delayed and observation is needed for at least 48 hours after ingestion

**INTERACTIONS** → Appendix 1 (antimuscarinics, opioid analgesics).

**SIDE-EFFECTS**

- **Very rare** Angle-closure glaucoma

**Drugs used for Diarrhoea not listed below** Codeine phosphate, p. 259

hydrochloride below is used due to its action on opioid receptors in the gastrointestinal tract and because it does not cross the blood-brain barrier readily. Antimotility drugs have a role in the management of uncomplicated acute diarrhoea in adults but not in children under 12 years. Antimotility drugs have a role in Inflammatory bowel disease p. 24 and are also used in Stoma care p. 67.

Antispasmodics

Antispasmodics are occasionally of value in treating abdominal cramp associated with diarrhoea but they should not be used for primary treatment. Antispasmodics and antiemetics should be avoided in young children with gastro-enteritis since they are rarely effective and have troublesome side-effects.

Enkephalinase inhibitors

Racecadotril p. 45 is a pro-drug of thiophan. Thiophan is an enkephalinase inhibitor that inhibits the breakdown of endogenous opioids, thereby reducing intestinal secretions. Racecadotril is licensed, as an adjunct to rehydration, for the symptomatic treatment of uncomplicated acute diarrhoea; it should only be used in children over 3 months of age when usual supportive measures, including oral rehydration, are insufficient to control the condition. Racecadotril does not affect the duration of intestinal transit.

Co-phenotrope (Non-proprietary)

Atropine sulfate 25 microgram, Diphenoxylate hydrochloride 2.5 mg  
Lomotil 2.5mg/25microgram tablets  
no price available Schedule 5 (CD Inv)

**BNFC 2016–2017**
Loperamide hydrochloride p. 44, simeticone p. 48.

- **RARE** Fatigue • Hypertonia • Paralytic ileus • Stevens-Johnson syndrome • Toxic epidermal necrolysis • Urinary retention
- **PREGNANCY** Manufacturers advise avoid—no information available.
- **BREAST FEEDING** Amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Risk of accumulation—manufacturer advises caution.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Loperamide for diarrhoea www.medicinesforchildren.org.uk/loperamide-for-diarrhoea
- **EXCEPTIONS TO LEGAL CATEGORY** Loperamide can be sold to the public, for use in children over 12 years, provided it is licensed and labelled for the treatment of acute diarrhoea.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, capsules, tablets, soft capsules, liquid capsules, granules, orodispersible tablets, liquid orosuspension, orodispersible tablets, syrup, infusion.

**MEDICINAL FORMS**

**Tablet**
- Loperamide hydrochloride (Non-proprietary) 2 mg: Loperamide 2 mg tablets | 30 tablet | £2.25 DT price = £2.15
- Norimode (Tilitomed Laboratories Ltd) 2 mg: Norimode 2 mg tablets | 30 tablet | £2.15 DT price = £2.15
- Normaloe (Tilitomed Laboratories Ltd) 2 mg: Normaloe 2 mg tablets | 12 tablet | £1.70

**Orodispersible tablet**
- Imodium (McNeil Products Ltd) 2 mg Loperamide hydrochloride orodispersible tablets sugar-free | 6 tablet | £2.45 sugar-free | 12 tablet | £3.76 Imodium Instant Melts 2 mg orodispersible tablets sugar-free | 12 tablet | £3.75 sugar-free | 18 tablet | £5.02 DT price = £5.02

**Capsule**
- Loperamide hydrochloride (Non-proprietary) 2 mg: Loperamide 2 mg capsules | 6 capsule | £0.42 | 12 capsule | £1.94 | 30 capsule | £2.99 DT price = £3.39
- Imodium (McNeil Products Ltd) 2 mg: Imodium 2 mg capsules | 6 capsule | £0.42 | 12 capsule | £1.94 | 30 capsule | £2.99 DT price = £3.39

**IMMEDIATELY DIRECTIONS FOR ADMINISTRATION**

**Racecadotril**

**INDICATIONS AND DOSE**

Adjunct to rehydration, for the symptomatic treatment of uncomplicated acute diarrhoea

- By mouth using granules
  - Child 3 months–17 years (body-weight up to 9 kg): 10 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
  - Child 3 months–17 years (body-weight 9–12 kg): 20 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
  - Child 3 months–17 years (body-weight 13–27 kg): 30 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days
  - Child 3 months–17 years (body-weight 28 kg and above): 60 mg 3 times a day until diarrhoea stops; maximum duration of treatment 7 days

**CONTRA-INDICATIONS** Antibiotic-associated diarrhoea

**SIDE-EFFECTS**

- Uncommon Erythema • Rash
- Frequency not known Angioedema • Pruritus • Urticaria

**SIDE-EFFECTS, FURTHER INFORMATION**

Skin reactions Severe skin reactions have been reported—discontinue treatment immediately.

**PREGNANCY** Manufacturer advises avoid—no information available.

**BREAST FEEDING** Manufacturer advises avoid—no information available.

**HEPATIC IMPAIRMENT** Manufacturer advises avoid.

**RENAL IMPAIRMENT** Manufacturer advises avoid.

**DIRECTIONS FOR ADMINISTRATION** Granules may be added to food or mixed with water or bottle feeds and then taken immediately.

**PATIENT AND CARER ADVICE** Patients and carers should be given advice on how to administer racecadotril granules.

**NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium, has advised (July 2014) that racecadotril (Hidrasec®) is not recommended for use within NHS Scotland for the treatment of acute diarrhoea in children because there is insufficient evidence that it improves the recovery rate.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Granules**
- Excipients: May contain Sucrose
- Hidrasec (Lincoln Medical Ltd) 10 mg: Hidrasec Infants 10 mg granules sachets | 20 sachet | £8.42
- Hidrasec Children 30 mg granules sachets | 20 sachet | £8.42

**Loperamide with simeticone**

The properties listed below are those particular to the combination only. For the properties of the components please consider, loperamide hydrochloride p. 44, simeticone p. 48.

**INDICATIONS AND DOSE**

Acute diarrhoea with abdominal colic

- By mouth
  - Child 12–17 years: Initially 1 tablet, then 1 tablet, after each loose stool, for up to 2 days; maximum 4 tablets per day

**Antidiarrhoeals > Enkephalinase inhibitors**

**Broadsheet**

**11.2.2016**

**Racecadotril (Hidrasec)**

**Medications for children in the treatment of acute diarrhoea**

**Patents and carers should be given advice on how to administer racecadotril granules.**

**National Funding/Access Decisions**

Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium, has advised (July 2014) that racecadotril (Hidrasec®) is not recommended for use within NHS Scotland for the treatment of acute diarrhoea in children because there is insufficient evidence that it improves the recovery rate.

**Loperamide with simeticone**

The properties listed below are those particular to the combination only. For the properties of the components please consider, loperamide hydrochloride p. 44, simeticone p. 48.

**Indications and Dose**

Acute diarrhoea with abdominal colic

- By mouth
  - Child 12–17 years: Initially 1 tablet, then 1 tablet, after each loose stool, for up to 2 days; maximum 4 tablets per day
4 Disorders of gastric acid and ulceration

4.1 Dyspepsia

### Dyspepsia

**Overview**

Dyspepsia covers upper abdominal pain, fullness, early satiety, bloating, and nausea. It can occur with gastric and duodenal ulceration, gastro-oesophageal reflex disease, gastritis, and upper gastro-intestinal motility disorders, but most commonly it is of uncertain origin.

Patients with dyspepsia should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, smoking cessation, and raising the head of the bed. Some medications may cause dyspepsia—these should be stopped, if possible.

A compound alginate preparation may provide relief from dyspepsia; persistent dyspepsia requires investigation. Treatment with a H₂-receptor antagonist or a proton pump inhibitor should be initiated only on the advice of a hospital specialist.

*Helicobacter pylori* may be present in children with dyspepsia. *H. pylori* eradication therapy should be considered for persistent dyspepsia if it is ulcer-like. However, most children with functional (investigated, non-ulcer) dyspepsia do not benefit symptomatically from *H. pylori* eradication.

### ANTACIDS

#### Alginic acid

**Indications and dose**

**Gaviscon Infant® Powder Sachets**

Management of gastro-oesophageal reflux disease

- **By mouth**
  - Neonate (body-weight up to 4.5 kg): 1 dose as required, to be mixed with feeds (or water, for breast-fed infants); maximum 6 doses per day.
  - Neonate (body-weight 4.5 kg and above): 2 doses as required, to be mixed with feeds (or water, for breast-fed infants); maximum 12 doses per day.
  - Child 1-23 months (body-weight up to 4.5 kg): 1 dose as required, to be mixed with feeds (or water, for breast-fed infants); maximum 6 doses per day.
  - Child 1-23 months (body-weight 4.5 kg and above): 2 doses as required, to be mixed with feeds (or water, for breast-fed infants); maximum 12 doses per day.

**Contra-indications**

Intestinal obstruction - preterm neonates - where excessive water loss likely (e.g. fever, diarrhoea, vomiting, high room temperature)

**Interactions**

Not to be used with other preparations containing thickening agents.

Antacids should preferably not be taken at the same time as other drugs since they may impair absorption. Antacids may damage enteric coatings designed to prevent dissolution in the stomach.

**Hepatic impairment**

In patients with fluid retention, avoid antacids containing large amounts of sodium. Avoid antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.

**Renal impairment**

In patients with fluid retention, avoid antacids containing large amounts of sodium.

**Prescribing and dispensing information**

Each half of the dual-sachet is identified as ‘one dose’.

To avoid errors prescribe with directions in terms of ‘dose’.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**Powder**

**Electrolytes:** May contain Sodium

- **Gaviscon Infant®** (Forum Health Products Ltd)
  - Magnesium alginate 87.5 mg, Sodium alginate 225 mg
  - Gaviscon Infant oral powder sachets sugar-free | 15 dual dose sachets £5.49

**Alginates** taken in combination with an antacid increases the viscosity of stomach contents and can protect the oesophageal mucosa from acid reflux. Some alginate-containing preparations form a viscous gel (‘raft’) that floats on the surface of the stomach contents, thereby reducing symptoms of reflux. Alginate-containing preparations are used in the management of mild symptoms of dyspepsia and gastro-oesophageal reflux disease.

The amount of additional ingredient or antacid in individual preparations varies widely, as does their sodium content, so that preparations may not be freely interchangeable.

Sodium alginate with potassium bicarbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, alginic acid p. 46.

- **INDICATIONS AND DOSE**
  - **Management of mild symptoms of dyspepsia and gastro-oesophageal reflux disease**
    - **BY MOUTH USING CHEWABLE TABLETS**
      - Child 6–11 years (under medical advice only): 1 tablet, to be chewed after meals and at bedtime
      - Child 12–17 years: 1–2 tablets, to be chewed after meals and at bedtime
    - **BY MOUTH USING ORAL SUSPENSION**
      - Child 2–11 years (under medical advice only): 2.5–5 mL, to be taken after meals and at bedtime
      - Child 12–17 years: 5–10 mL, to be taken after meals and at bedtime

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include aniseed or peppermint.

- **MEDICINAL FORMS**
  - **INFORMATION** There can be variation in the licensing of different medicines containing the same drug.
  - **Chewable tablet**
    - **EXCipients**: May contain Aspartame
    - **ELECTROLYTES**: May contain Potassium, sodium
  - **Sodium alginate with potassium bicarbonate (Non-proprietary)**
    - Potassium bicarbonate 100 mg, Sodium alginate 500 mg
    - Sodium alginate 500 mg / Potassium bicarbonate 100 mg chewable tablets sugar free sugar-free | 60 tablet [SSL] no price available DT price = £3.07
    - Brands may include Gaviscon Advance

- **Oral suspension**
  - **ELECTROLYTES**: May contain Potassium, sodium
  - **Gaviscon Advance** (Reckitt Benckiser Healthcare (UK) Ltd)
    - Potassium bicarbonate 20 mg per 1 ml, Sodium alginate 100 mg per 1 ml Gaviscon Advance oral suspension aniseed sugar-free
    - 150 ml P £3.23 sugar-free | 300 ml P £5.82
  - **Gaviscon Advance oral suspension peppermint sugar-free**
    - 150 ml P £3.23 sugar-free | 300 ml P £5.82

- **ANTACIDS > ALUMINIUM AND MAGNESIUM**

- **Co-magaldrox**
  - The properties listed below are those particular to the combination only. For the properties of the components please consider, aluminium hydroxide p. 558, magnesium hydroxide p. 39.
  - **INDICATIONS AND DOSE**
    - **MAALOX®**
      - **Dyspepsia**
        - **BY MOUTH**
          - Child 14–17 years: 10–20 mL, to be taken 20–60 minutes after meals, and at bedtime or when required
    - **MUCOGEL®**
      - **Dyspepsia**
        - **BY MOUTH**
          - Child 12–17 years: 10–20 mL 3 times a day, to be taken 20–60 minutes after meals, and at bedtime, or when required
  - **PRESCRIBING AND DISPENSING INFORMATION** Co-magaldrox is a mixture of aluminium hydroxide and magnesium hydroxide; the proportions are expressed in the form x/y where x and y are the strengths in milligrams per unit dose of magnesium hydroxide and aluminium hydroxide respectively.

- **MEDICINAL FORMS**
  - **INFORMATION** There can be variation in the licensing of different medicines containing the same drug.
  - **Oral suspension**
    - **MAALOX®**
      - Magnesium hydroxide 39 mg per 1 mL, Aluminium hydroxide gel dried 44 mg per 1 mL Mucogel oral suspension sugar-free
      - 500 ml [SSL] £3.35
    - **MUCOGEL®** (Chemidex Pharma Ltd)
      - Magnesium hydroxide 39 mg per 1 mL, Aluminium hydroxide gel dried 44 mg per 1 mL Mucogel oral suspension sugar-free
      - 500 ml [SSL] £2.99

- **Dyspepsia**
  - **INDICATIONS AND DOSE**
    - **BY MOUTH**
      - Child 8–11 years: 5 mL 4 times a day as required, to be taken between meals and at bedtime
      - Child 12–17 years: 10 mL 4 times a day as required, to be taken between meals and at bedtime
  - **CONTRA-INDICATIONS** Hypophosphataemia - infants - neonates
    - **CONTRA-INDICATIONS, FURTHER INFORMATION**
      - Aluminium-containing antacids
      - Aluminium-containing antacids should not be used in neonates and infants because accumulation may lead to increased plasma-aluminium concentrations.
  - **INTERACTIONS** → Appendix 1 (antacids).
    - Antacids should preferably not be taken at the same time as other drugs since they may impair absorption.
    - Antacids may damage enteric coating designed to prevent dissolution in the stomach.
  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Constipation and diarrhoea
    - Magnesium-containing antacids tend to be laxative whereas aluminium-containing antacids may be constipating; antacids containing both magnesium and aluminium may reduce these colonic side-effects.
  - **HEPATIC IMPAIRMENT** Avoid; can cause constipation which can precipitate coma. Avoid in hepatic coma; risk of renal failure.
  - **RENAL IMPAIRMENT** Antacids containing magnesium salts should be avoided or used at a reduced dose because there is an increased risk of toxicity. Aluminium-containing antacids should not be used in children with renal impairment, because accumulation may lead to increased plasma-aluminium concentrations.
  - **PRESCRIBING AND DISPENSING INFORMATION** Altacite Plus® is low in Na+.
48 Disorders of gastric acid and ulceration

Simeticone with aluminium hydroxide and magnesium hydroxide

The properties listed below are those particular to the combination only. For the properties of the components please consider, simeticone below, aluminium hydroxide p. 558.

- **INDICATIONS AND DOSE**
  - **Dyspepsia**
    - **BY MOUTH**
      - Child 2–4 years: 5 mL 3 times a day
      - Child 5–11 years: 5–10 mL 3–4 times a day
      - Child 12–17 years: 5–10 mL 3–4 times a day, to be taken after meals and at bedtime, or when required

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  - **Oral suspension**
    - Maalox Plus (Sanofi)
      - Simeticone 5 mg per 1 ml, Magnesium hydroxide 39 mg per 1 ml, Aluminium hydroxide gel dried 44 mg per 1 ml
    - Maalox Plus oral suspension sugar-free | 500 ml [GL] £3.90

**ANTACIDS > MAGNESIUM**

Magnesium trisilicate with magnesium carbonate and sodium bicarbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, simeticone below, aluminium hydroxide p. 554.

- **INDICATIONS AND DOSE**
  - **Dyspepsia**
    - **BY MOUTH**
      - Child 2–4 years: 5 mL 3 times a day
      - Child 5–11 years: 5–10 mL 3–4 times a day, alternatively as required, dose to be made up with water
      - Child 12–17 years: 10–20 mL 3 times a day, alternatively as required, dose to be made up with water

- **CONTRA-INDICATIONS**
  - Hypophosphataemia • Severe renal failure
- **CAUTIONS**
  - Heart failure • Hyperventilation • hypertension • metabolic alkalosis • respiratory alkalosis
- **INTERACTIONS**
  - Appendix 1 (antacids).

Antacids should preferably not be taken at the same time as other drugs since they may impair absorption. Antacids may damage enteric coatings designed to prevent dissolution in the stomach.

- **SIDE-EFFECTS**
  - Belching due to liberated carbon dioxide • diarrhoea
- **HEPATIC IMPAIRMENT**
  - In patients with fluid retention avoid antacids containing large amounts of sodium. Avoid antacids containing magnesium salts in hepatic coma if there is a risk of renal failure.
- **RENAL IMPAIRMENT**
  - Magnesium trisilicate and magnesium carbonate mixtures have high sodium content; avoid in patients with fluid retention.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - When prepared extemporaneously, the BP states Magnesium Trisilicate Mixture, BP consists of 5% each of Magnesium trisilicate, light magnesium carbonate, and sodium bicarbonate in a suitable vehicle with a peppermint flavour.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Oral suspension**
    - Magnesium trisilicate with magnesium carbonate and sodium bicarbonate (Non-proprietary)
      - Magnesium carbonate light 50 mg per 1 ml, Magnesium trisilicate 50 mg per 1 ml, Sodium bicarbonate 50 mg per 1 ml
    - Magnesium trisilicate oral suspension | 200 ml [GL] £1.50 DT price + £1.50

- **ANTIFOAMING DRUGS**
  - **Simeticone**
    - (Activated dimeticone)
    - **DRUG ACTION**
      - Simeticone (activated dimeticone) is an antifoaming agent.

- **INDICATIONS AND DOSE**
  - **DENTINOX®**
    - Colic | Wind pains
      - **BY MOUTH**
      - Neonate: 2.5 mL, to be taken with or after each feed; may be added to bottle feed; maximum 6 doses per day.
      - Child 1 month–1 year: 2.5 mL, to be taken with or after each feed; may be added to bottle feed; maximum 6 doses per day
    - **INFACOL®**
      - Colic | Wind pains
      - **BY MOUTH**
      - Neonate: 0.5–1 mL, to be taken before feeds.
      - Child 1 month–1 year: 0.5–1 mL, to be taken before feeds

- **PRESCRIBING AND DISPENSING INFORMATION**
  - **DENTINOX®**
    - The brand name Dentinox® is also used for other preparations including teething gel.
  - **PATIENT AND CARER ADVICE**
    - Infacol® Patients or carers should be given advice on use of the Infacol® dropper.
  - **LESS SUITABLE FOR PRESCRIBING**
    - Infacol® Infacol® is less suitable for prescribing (evidence of benefit in infantile colic uncertain).
  - **DENTINOX®**
    - Dentinox® colic drops are less suitable for prescribing (evidence of benefit in infantile colic uncertain).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Oral suspension**
    - Infacol (Forest Laboratories UK Ltd)
      - Simeticone 40 mg per 1 ml Infacol 40mg/ml oral suspension sugar-free | 50 ml [GL] £2.71 DT price + £2.71
    - **Oral drops**
      - Dentinox Infant (Dendron Ltd)
        - Simeticone 8.4 mg per 1 ml Dentinox Infant colic drops | 100 ml [GL] £1.73
  - **Combinations available:** Simeticone with aluminium hydroxide and magnesium hydroxide, above
4.2 Gastric and duodenal ulceration

Peptic ulceration

Overview

Peptic ulceration commonly involves the stomach, duodenum, and lower oesophagus; after gastric surgery it involves the gastro-enterostomy stoma. Healing can be promoted by general measures, stopping smoking and taking antacids and by antisecretory drug treatment, but relapse is common when treatment ceases. Nearly all duodenal ulcers and most gastric ulcers not associated with NSAIDs are caused by Helicobacter pylori.

Helicobacter pylori infection

Eradication of Helicobacter pylori reduces the recurrence of gastric and duodenal ulcers and the risk of rebleeding. The presence of H. pylori should be confirmed before starting eradication treatment. If possible, the antibacterial sensitivity of the organism should be established at the time of endoscopy and biopsies. Acid inhibition combined with antibacterial treatment is highly effective in the eradication of H. pylori; reinfection is rare. Antibiotic-associated colitis is an uncommon risk.

Treatment to eradicate H. pylori infection in children should be initiated under specialist supervision. One-week triple-therapy regimens that comprise omeprazole p. 54, amoxicillin p. 320, and either clarithromycin p. 309 or metronidazole p. 313 are recommended, see table above. Resistance to clarithromycin or to metronidazole is much more common than to amoxicillin and can develop during treatment. A regimen containing amoxicillin and clarithromycin is therefore recommended for initial therapy and one containing amoxicillin and metronidazole is recommended for eradication failure or for a child who has been treated with a macrolide for other infections. There is usually no need to continue antisecretory treatment (with a proton pump inhibitor or H₂-receptor antagonist); however, if the ulcer is large, or complicated by haemorrhage or perforation then antisecretory treatment is continued for a further 3 weeks. Lansoprazole p. 53 may be considered if omeprazole is unsuitable. Treatment failure usually indicates antibacterial resistance or poor compliance.

Two-week triple-therapy regimens offer the possibility of higher eradication rates compared to one-week regimens, but adverse effects are common and poor compliance is likely to offset any possible gain.

Recommended regimens for Helicobacter pylori eradication

Two-week dual-therapy regimens using a proton pump inhibitor and a single antibacterial produce low rates of H. pylori eradication and are not recommended. See under NSAID-associated ulcers for the role of H. pylori eradication therapy in children starting or taking NSAIDs.

Test for Helicobacter pylori

¹³C-Urea breath test kits are available for confirming the presence of gastric-duodenal infection with Helicobacter pylori. The test involves collection of breath samples before and after ingestion of an oral solution of ¹³C-urea; the samples are sent for analysis by an appropriate laboratory. The test should not be performed within 4 weeks of treatment with an antibacterial or within 2 weeks of treatment with an antisecretory drug. A specific ¹³C-Urea breath test kit for children is available (Helicobacter Test INFAI for children of the age 3–11). However, the appropriateness of testing for H. pylori infection in children has not been established. Breath, saliva, faecal, and urine tests for H. pylori are frequently unreliable in children; the most accurate method of diagnosis is endoscopy with biopsy.

NSAID-associated ulcers

Gastro-intestinal bleeding and ulceration can occur with NSAID use. Whenever possible, NSAIDs should be withdrawn if an ulcer occurs. Children at high risk of developing gastro-intestinal complications with a NSAID include those with a history of peptic ulcer disease or serious upper gastro-intestinal complication, those taking other medicines that increase the risk of upper gastro-intestinal side-effects, or those with serious co-morbidity. In children at risk of ulceration, a proton pump inhibitor can be considered for protection against gastric and duodenal ulcers associated with non-selective NSAIDs; high dose ranitidine p. 50 is an alternative. NSAID use and H. pylori infection are independent risk factors for gastro-intestinal bleeding and ulceration. In children already taking a NSAID, eradication of H. pylori is unlikely to reduce the risk of NSAID-induced bleeding or ulceration. However, in children about to start long-term NSAID treatment who are H. pylori positive and have dyspepsia or a history of gastric or duodenal ulcer, eradication of H. pylori may reduce the overall risk of ulceration.

If the NSAID can be discontinued in a child who has developed an ulcer, a proton pump inhibitor usually produces the most rapid healing; alternatively the ulcer can be treated with an H₂-receptor antagonist.

If NSAID treatment needs to continue, the ulcer is treated with a proton pump inhibitor.
GASTROPROTECTIVE COMPLEXES AND CHELATORS

Chelates and complexes

Succralfate

Succralfate below is a complex of aluminium hydroxide and sulfated sucrose that appears to act by protecting the mucosa from acid-pepsin attack; it has minimal antacid properties.

INDICATIONS AND DOSE

Benign gastric ulceration | Benign duodenal ulceration

- BY MOUTH
  - Child 1 month–1 year: 250 mg 4–6 times a day
  - Child 2–11 years: 500 mg 4–6 times a day
  - Child 12–14 years: 1 g 4–6 times a day
  - Child 15–17 years: 2 g twice daily, dose to be taken on rising and at bedtime, alternatively 1 g 4 times a day for 4–6 weeks, or in resistant cases up to 12 weeks, dose to be taken 1 hour before meals and at bedtime; maximum 8 g per day

Prophylaxis of stress ulceration in child under intensive care

- BY MOUTH
  - Child 1 month–1 year: 250 mg 4–6 times a day
  - Child 2–11 years: 500 mg 4–6 times a day
  - Child 12–14 years: 1 g 4–6 times a day
  - Child 15–17 years: 2 g 6 times a day; maximum 8 g per day

INDICATIONS AND DOSE

Benign gastric ulceration | Duodenal ulceration

- BY MOUTH
  - Neonate: 2 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day), oral absorption is unreliable.
  - Child 1–5 months: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
  - Child 6 months–2 years: 2–4 mg/kg twice daily
  - Child 3–11 years: 2–4 mg/kg twice daily (max. per dose 150 mg)
  - Child 12–17 years: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night

INDICATIONS AND DOSE

H₂-receptor antagonists

Overview

Histamine H₂-receptor antagonists heal gastric and duodenal ulcers by reducing gastric acid output as a result of histamine H₂-receptor blockade; they are also used to relieve symptoms of dyspepsia and gastro-œsophageal reflux disease. H₂-receptor antagonists should not normally be used for Zollinger–Ellison syndrome because proton pump inhibitors are more effective.

Maintenance treatment with low doses has largely been replaced in Helicobacter pylori positive children by eradication regimens.

H₂-receptor antagonist therapy can promote healing of NSAID-associated ulcers.

Treatment with a H₂-receptor antagonist has not been shown to be beneficial in haematemesis and melena, but prophylactic use reduces the frequency of bleeding from gastroduodenal erosions in hepatic coma, and possibly in other conditions requiring intensive care. Treatment also reduces the risk of acid aspiration in obstetric patients at delivery (Mendelson’s syndrome).

H₂-receptor antagonists are also used to reduce the degradation of pancreatic enzyme supplements in children with cystic fibrosis.

H₂-receptor antagonists

- SIDE-EFFECTS
  - Common or very common Diarrhoea · dizziness · headache
  - Uncommon Erythema multiforme · rash · toxic epidermal necrolysis
  - Rare Arthralgia · blood disorders · bradycardia · cholestatic jaundice · confusion · depression · hallucinations · hepatitis · leucopenia · myalgia · pancytopenia · psychiatric reactions · thrombocytopenia
  - Frequency not known Gynaecomastia · impotence

SIDE-EFFECTS, FURTHER INFORMATION

Psychiatric reactions: Psychiatric reactions, including confusion, depression, and hallucinations occur particularly in the very ill.

Ranitidine

- INDICATIONS AND DOSE
  - Benign gastric ulceration | Duodenal ulceration
    - BY MOUTH
      - Neonate: 2 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day), oral absorption is unreliable.
      - Child 1–5 months: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
      - Child 6 months–2 years: 2–4 mg/kg twice daily
      - Child 3–11 years: 2–4 mg/kg twice daily (max. per dose 150 mg)
      - Child 12–17 years: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night
Gastric and duodenal ulceration

### Prophylaxis of stress ulceration

- **INITIALLY BY SLOW INTRAVENOUS INJECTION**
- **Neonate**: 0.5–1 mg/kg every 6–8 hours.
- **Child 1 month-11 years**: 1 mg/kg every 6–8 hours (max. per dose 50 mg), may be given as an intermittent infusion at a rate of 25 mg/hour
- **Child 12-17 years**: 50 mg every 8 hours, dose to be diluted to 20 mL and given over at least 2 minutes, then (by mouth) 150 mg twice daily, may be given when oral feeding commences

### Reflux oesophagitis and other conditions where gastric acid reduction is beneficial

- **BY MOUTH**
- **Neonate**: 2 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day), oral absorption is unreliable.
- **Child 1-5 months**: 1 mg/kg 3 times a day (max. per dose 3 mg/kg 3 times a day)
- **Child 6 months-2 years**: 2–4 mg/kg twice daily
- **Child 3-11 years**: 2–4 mg/kg twice daily (max. per dose 150 mg), increased to up to 5 mg/kg twice daily (max. per dose 300 mg), dose increase for severe gastro-oesophageal disease
- **Child 12-17 years**: 150 mg twice daily, alternatively 300 mg once daily, dose to be taken at night, then increased if necessary to 300 mg twice daily for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease, alternatively increased if necessary to 150 mg 4 times a day for up to 12 weeks in moderate to severe gastro-oesophageal reflux disease
- **BY SLOW INTRAVENOUS INJECTION**
- **Neonate**: 0.5–1 mg/kg every 6–8 hours.
- **Child**: 1 mg/kg every 6–8 hours (max. per dose 50 mg), may be given as an intermittent infusion at a rate of 25 mg/hour

#### UNLICENSED USE

Oral preparations not licensed for use in children under 3 years. Injection not licensed for use in children under 6 months.

#### INTERACTIONS

- Appendix 1 (histamine H₂-antagonists).

#### SIDE-EFFECTS

- **Uncommon** Blurred vision
- **Frequency not known** Alopecia · interstitial nephritis · involuntary movement disorders · pancreatitis

#### PREGNANCY

Manufacturer advises avoid unless essential, but not known to be harmful.

#### BREAST FEEDING

Significant amount present in milk, but not known to be harmful.

#### RENAL IMPAIRMENT

Use half normal dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

#### DIRECTIONS FOR ADMINISTRATION

- With intravenous use For slow intravenous injection dilute to a concentration of 2.5 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over at least 3 minutes.

#### PATIENT AND CARER ADVICE

Medicines for Children leaflet: Ranitidine for acid reflux www.medicinesforchildren.org.uk/ranitidine-for-acid-reflux

In fat malabsorption syndrome, give oral doses 1–2 hours before food to enhance effects of pancreatic enzyme replacement.

#### EXCEPTIONS TO LEGAL CATEGORY

Ranitidine can be sold to the public for children over 16 years (provided packs do not contain more than 2 weeks’ supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink (max. single dose 75 mg, max. daily dose 300 mg).

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, infusion

#### TABLET

- **Ranitidine (Non-proprietary)**
- Ranitidine (as Ranitidine hydrochloride) 75 mg
- Ranitidine (as Ranitidine hydrochloride) 150 mg
- Ranitidine (as Ranitidine hydrochloride) 300 mg
- Ranitidine (as Ranitidine hydrochloride) 600 mg

#### INJECTION

- Ranitidine (as Ranitidine hydrochloride) 50 mg
- Ranitidine (as Ranitidine hydrochloride) 100 mg
- Ranitidine (as Ranitidine hydrochloride) 200 mg
- Ranitidine (as Ranitidine hydrochloride) 300 mg

#### ORAL SOLUTION

- Ranitidine (as Ranitidine hydrochloride) 15 mg
- Ranitidine (as Ranitidine hydrochloride) 30 mg

#### EFFERVESCENT TABLET

- Ranitidine (as Ranitidine hydrochloride) 150 mg

#### NEONATE:

- 0.3 mg/kg

#### CHILD 1 MONTH

- 3 mg/kg

#### CHILD 3–6 MONTHS

- 15 mg/kg

#### CHILD 6–12 MONTHS

- 30 mg/kg

#### CHILD 1–2 YEARS

- 60 mg/kg

#### CHILD 2–5 YEARS

- 150 mg/kg

#### CHILD 5–12 YEARS

- 300 mg/kg

#### CHILD 12 YEARS+

- 600 mg/kg

#### CHILD 50 kg+

- 1200 mg/kg

#### ADULTS

- 300 mg/kg

#### Statistical data

- **DT price = £1.06**
- **DT price = £1.17**
- **DT price = £1.19**
- **DT price = £1.20**
- **DT price = £1.35**
- **DT price = £1.50**

### PROTON PUMP INHIBITORS

#### Proton pump inhibitors

**Overview**

Omeprazole p. 54 is an effective short-term treatment for gastric and duodenal ulcers; it is also used in combination with antibacterials for the eradication of Helicobacter pylori. An initial short course of omeprazole is the treatment of choice in gastro-oesophageal reflux disease with severe symptoms; children with endoscopically confirmed erosive, ulcerative, or stricturing oesophagitis usually need to be maintained on omeprazole.

Omeprazole is also used for the prevention and treatment of NSAID-associated ulcers. In children who need to continue NSAID treatment after an ulcer has healed, the dose of omeprazole should not normally be reduced because asymptomatic ulcer deterioration may occur.

Omeprazole is effective in the treatment of the Zollinger-Ellison syndrome (including cases resistant to other treatment). It is also used to reduce the degradation of
pancreatic enzyme supplements in children with cystic fibrosis. Lansoprazole p. 53 is not licensed for use in children, but may be considered when the available formulations of omeprazole are unsuitable. Esomeprazole below can be used for the management of gastro-oesophageal reflux disease when the available formulations of omeprazole and lansoprazole are unsuitable.

**Proton pump inhibitors**

- **DRUG ACTION** Proton pump inhibitors inhibit gastric acid secretion by blocking the hydrogen-potassium adenosine triphosphatase enzyme system (the ‘proton pump’) of the gastric parietal cell.

**IMPORTANT SAFETY INFORMATION**

**MHRA ADVICE: PROTON PUMP INHIBITORS (PPIs): VERY LOW RISK OF SUBACUTE CUTANEOUS LUPUS ERYTHEMATOSUS (SCLE) (SEPTEMBER 2015)**

Very infrequent cases of subacute cutaneous lupus erythematosus (SCLE) have been reported in patients taking PPIs. Drug-induced SCLE can occur weeks, months or even years after exposure to the drug. If a patient treated with a PPI develops lesions—especially in sun-exposed areas of the skin—and it is accompanied by arthralgia:

- advise them to avoid exposing the skin to sunlight;
- consider SCLE as a possible diagnosis;
- consider discontinuing PPI treatment unless it is imperative for a serious acid-related condition; a patient who develops SCLE with a particular PPI may be at risk of the same reaction with another;
- in most cases, symptoms resolve on PPI withdrawal; topical or systemic steroids might be necessary for treatment of SCLE only if there are no signs of remission after a few weeks or months.

- **CAUTIONS** May increase the risk of gastro-intestinal infections (including *Clostridium difficile* infection) in patients at risk of osteoporosis

**CAUTIONS, FURTHER INFORMATION**

- Risk of osteoporosis Patients at risk of osteoporosis should maintain an adequate intake of calcium and vitamin D, and if necessary, receive other preventative therapy.

- **SIDE-EFFECTS**
  - Common or very common Abdominal pain - constipation - diarrhoea - flatulence - gastro-intestinal disturbances - headache - nausea - vomiting
  - Uncommon Arthralgia - dizziness - dry mouth - fatigue - myalgia - paraesthesia - peripheral oedema - pruritus - rash - sleep disturbances
  - Rare Alopecia - anaphylaxis - blood disorders - bronchospasm - confusion - depression - fever - gynaecomastia - hallucinations - hepatitis - hypersensitivity reactions - hypomagnesaemia (usually after 1 year of treatment, but sometimes after 3 months of treatment) - hypoteniasaemia - interstitial nephritis - jaundice - leucocytosis - leucopenia - pancytopenia - photosensitivity - Stevens-Johnson syndrome - stomatitis - sweated - taste disturbance - thrombocytopenia - toxic epidermal necrolysis - visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

Rebound acid hypersecretion and protracted dyspepsia may occur after stopping prolonged treatment with a proton pump inhibitor.

- **MONITORING REQUIREMENTS** Measurement of serum-magnesium concentrations should be considered before and during prolonged treatment with a proton pump inhibitor, especially when used with other drugs that cause hypomagnesaemia or with digoxin.

- **PRESCRIBING AND DISPENSING INFORMATION** A proton pump inhibitor should be prescribed for appropriate indications at the lowest effective dose for the shortest period; the need for long-term treatment should be reviewed periodically.

**Esomeprazole**

- **INDICATIONS AND DOSE**

  **Gastro-oesophageal reflux disease (in the presence of erosive reflux oesophagitis)**
  - **BY MOUTH**
    - Child 1–11 years (body-weight 10–19 kg): 10 mg once daily for 8 weeks
    - Child 1–11 years (body-weight 20 kg and above): 10–20 mg once daily for 8 weeks
    - Child 12–17 years: Initially 40 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed or symptoms persist; maintenance 20 mg daily
    - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - Child 11 years (body-weight up to 20 kg): 10 mg once daily, injection to be given over at least 3 minutes
      - Child 11 years (body-weight 20 kg and above): 10–20 mg once daily, injection to be given over at least 3 minutes
    - Child 12–17 years: 40 mg daily, injection to be given over at least 3 minutes

  **Symptomatic treatment of gastro-oesophageal reflux disease (in the absence of oesophagitis)**
  - **BY MOUTH**
    - Child 11 years (body-weight 10 kg and above): 10 mg once daily for up to 8 weeks
    - Child 12–17 years: 20 mg once daily for up to 4 weeks
    - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
      - Child 11 years: 10 mg once daily, injection to be given over at least 3 minutes
    - Child 12–17 years: 20 mg once daily, injection to be given over at least 3 minutes

- **UNLICENSED USE**

  Tablets and capsules not licensed for use in children 1–11 years.

- **INTERACTIONS** → Appendix 1 (proton pump inhibitors).

- **PREGNANCY** Manufacturer advises caution—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** 1–11 years max. 10 mg daily in severe impairment. 12–17 years max. 20 mg daily in severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe renal insufficiency.

- **DIRECTIONS FOR ADMINISTRATION**

  - With intravenous use For intravenous infusion, dilute reconstituted solution to a concentration not exceeding 800 micrograms/mL with Sodium Chloride 0.9%: give over 10–30 minutes.
  - With oral use Do not chew or crush capsules; swallow whole or mix capsule contents in water and drink within 30 minutes. Do not crush or chew tablets; swallow whole or disperse in water and drink within 30 minutes. Disperse the contents of each sachet of gastro-resistant granules in approx. 15 mL water. Stir and leave to thicken for a few minutes; stir again before administration and use within 30 minutes; rinse container with 15 mL water to obtain full dose. For administration through a gastric tube, consult product literature.

- **PATIENT AND CARER ADVICE**

  - With oral use Counselling on administration of gastro-resistant capsules, tablets, and granules advised.
**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Gastro-resistant tablet**
- Esomeprazole (Non-proprietary)
- Esomeprazole (as Esomeprazole magnesium trihydrate)
  - 20 mg: Esomeprazole 20 mg gastro-resistant tablets | 28 tablet [POM] £18.50 DT price = £3.31
  - 40 mg: Esomeprazole 40 mg gastro-resistant tablets | 28 tablet [POM] £25.19 DT price = £4.18
- Nexium (AstraZeneca UK Ltd, Pfizer Consumer Healthcare Ltd)
- Esomeprazole (as Esomeprazole magnesium trihydrate)
  - 40 mg: Nexium 40 mg gastro-resistant tablets | 28 tablet [POM] £25.19 DT price = £4.18

**Gastro-resistant capsule**
- Esomeprazole (Non-proprietary)
- Esomeprazole (as Esomeprazole magnesium trihydrate)
  - 20 mg: Esomeprazole 20 mg gastro-resistant capsules | 28 capsule [POM] £12.95 DT price = £3.40
  - 40 mg: Esomeprazole 40 mg gastro-resistant capsules | 28 capsule [POM] £17.63 DT price = £3.96
- Emozul (Consilient Health Ltd)
- Esomeprazole (as Esomeprazole magnesium trihydrate)
  - 40 mg: Emozul 40 mg gastro-resistant capsules | 28 capsule [POM] £3.40 DT price = £3.96

**Gastro-resistant granules**
- Nexium (AstraZeneca UK Ltd)
- Esomeprazole (as Esomeprazole magnesium trihydrate)
  - 10 mg: Nexium 10 mg gastro-resistant granules sachets | 28 sachet [POM] £25.19 DT price = £5.19

**Powder for solution for injection**
- Esomeprazole (Non-proprietary)
- Esomeprazole (as Esomeprazole sodium)
  - 40 mg: Esomeprazole 40 mg powder for solution for injection vials | 1 vial [POM] £3.07–£3.13 (Hospital only)
- Nexium (AstraZeneca UK Ltd)
- Esomeprazole (as Esomeprazole sodium)
  - 40 mg: Nexium LV 40 mg powder for solution for injection vials | 1 vial [POM] £4.25 (Hospital only)

**Indications and dose**

**Benign gastric ulcer**
- BY MOUTH
  - Child (body-weight up to 30 kg): 0.5–1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning
  - Child (body-weight 30 kg and above): 15–30 mg once daily, doses to be taken in the morning

**Duodenal ulcer**
- BY MOUTH
  - Child (body-weight up to 30 kg): 0.5–1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning
  - Child (body-weight 30 kg and above): 15–30 mg once daily, doses to be taken in the morning

**NSAID-associated duodenal ulcer / NSAID-associated gastric ulcer**
- BY MOUTH
  - Child (body-weight up to 30 kg): 0.5–1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning

**Gastro-oesophageal reflux disease**
- BY MOUTH
  - Child (body-weight up to 30 kg): 0.5–1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning
  - Child (body-weight 30 kg and above): 15–30 mg once daily, doses to be taken in the morning

**Acid-related dyspepsia**
- BY MOUTH
  - Child (body-weight up to 30 kg): 0.5–1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning
  - Child (body-weight 30 kg and above): 15–30 mg once daily, doses to be taken in the morning

**Fat malabsorption despite pancreatic enzyme replacement therapy in cystic fibrosis**
- BY MOUTH
  - Child (body-weight up to 30 kg): 0.5–1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning
  - Child (body-weight 30 kg and above): 15–30 mg once daily, doses to be taken in the morning

**Unlicensed use**
- Not licensed for use in children.

**Interactions**
- → Appendix 1 (proton pump inhibitors).

**Side-effects**
- Very rare: Colitis - raised serum cholesterol - raised triglycerides
- Frequency not known: Anorexia - glossitis - impotence - pancreatitis - petechiae - purpura - restlessness - tremor

**Pregnancy**
- Manufacturer advises avoid.

**Breastfeeding**
- Avoid — present in milk in animal studies.

**Hepatic impairment**
- Use half normal dose in moderate to severe liver disease.

**Directions for administration**
- Oros dispersible tablets should be placed on the tongue, allowed to disperse and swallowed, or may be swallowed whole with a glass of water. Alternatively, tablets can be dispersed in a small amount of water and administered by an oral syringe or nasogastric tube.

**Patient and carer advice**
- Medicines for Children leaflet: Lansoprazole for gastro-oesophageal reflux disease (GORD) and ulcers www.medicinesforchildren.org.uk/lansoprazole-for-gord-and-ulcers
- Counselling on administration of orodispersible tablet advised.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Orodispersible tablet**
- CAUTIONARY AND ADVISORY LABELS 5, 22
- EXCIPIENTS: May contain Aspartame
- Lansoprazole (Non-proprietary)
  - Lansoprazole 15 mg: Lansoprazole 15 mg orodispersible tablets | 28 tablet [POM] £3.99 DT price = £2.42
  - Lansoprazole 30 mg: Lansoprazole 30 mg orodispersible tablets | 28 tablet [POM] £6.99 DT price = £4.18
- Zoton Fastab (Pfizer Ltd)
  - Lansoprazole 15 mg: Zoton Fastab 15 mg | 28 tablet [POM] £2.99 DT price = £2.42
  - Lansoprazole 30 mg: Zoton Fastab 30 mg | 28 tablet [POM] £5.50 DT price = £4.18

**Gastro-resistant capsule**
- CAUTIONARY AND ADVISORY LABELS 5, 22
- Lansoprazole (Non-proprietary)
  - Lansoprazole 15 mg: Lansoprazole 15 mg gastro-resistant capsules | 28 capsule [POM] £12.92 DT price = £0.97
  - Lansoprazole 30 mg: Lansoprazole 30 mg gastro-resistant capsules | 28 capsule [POM] £23.63 DT price = £1.37

---

**Lansoprazole**

**Indications and dose**

**Benign gastric ulcer**
- BY MOUTH
  - Child (body-weight up to 30 kg): 0.5–1 mg/kg once daily (max. per dose 15 mg once daily), doses to be taken in the morning

**Gastro-intestinal system**
Omeprazole

**INDICATIONS AND DOSE**

**Helicobacter pylori** eradication in combination with amoxicillin and clarithromycin; or in combination with amoxicillin and metronidazole; or in combination with clarithromycin and metronidazole

**BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**

- Child 1-11 years: 1–2 mg/kg once daily (max. per dose 40 mg)
- Child 12-17 years: 40 mg once daily

**Treatment of duodenal ulcers including those complicating NSAID therapy**

**TREATMENT OF BENIGN GASTRIC ULCERS INCLUDING THOSE COMPLICATING NSAID THERAPY**

**BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**

- Neonate: 700 micrograms/kg once daily for 7–14 days, then increased if necessary to 1.4–2.8 mg/kg once daily.
- Child 1 month-1 year: 700 micrograms/kg once daily, increased if necessary to 3 mg/kg once daily (max. per dose 20 mg)
- Child 2-17 years (body-weight 10-19 kg): 10 mg once daily, increased if necessary to 20 mg once daily
- Child 2-17 years (body-weight 20 kg and above): 20 mg once daily, increased if necessary to 40 mg once daily

**BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**

- Child 1 month-11 years: Initially 500 micrograms/kg once daily (max. per dose 20 mg), increased if necessary to 2 mg/kg once daily (max. per dose 40 mg), injection to be given over 5 minutes
- Child 12-17 years: 40 mg once daily, injection to be given over 5 minutes

**Zollinger-Ellison syndrome**

**BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**

- Neonate: 700 micrograms/kg once daily for 7–14 days, then increased if necessary to 1.4–2.8 mg/kg once daily.
- Child 1 month-1 year: 700 micrograms/kg once daily, increased if necessary to 3 mg/kg once daily (max. per dose 20 mg)
- Child 2-17 years (body-weight 10-19 kg): 10 mg once daily, increased if necessary to 20 mg once daily
- Child 2-17 years (body-weight 20 kg and above): 20 mg once daily, increased if necessary to 40 mg once daily

**BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**

- Child 1 month-11 years: Initially 500 micrograms/kg once daily, increased if necessary to 2 mg/kg once daily (max. per dose 40 mg), injection to be given over 5 minutes
- Child 12-17 years: 40 mg once daily, injection to be given over 5 minutes

**Gastro-oesophageal reflux disease**

**BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**

- Neonate: 700 micrograms/kg once daily for 7–14 days, then increased if necessary to 1.4–2.8 mg/kg once daily.
- Child 1 month-1 year: 700 micrograms/kg once daily, increased if necessary to 3 mg/kg once daily (max. per dose 20 mg)
- Child 2-17 years (body-weight 10-19 kg): 10 mg once daily, increased if necessary to 20 mg once daily
- Child 2-17 years (body-weight 20 kg and above): 20 mg once daily, increased if necessary to 40 mg once daily

**BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**

- Child 1 month-11 years: Initially 500 micrograms/kg once daily (max. per dose 20 mg), increased if necessary to 2 mg/kg once daily (max. per dose 40 mg), injection to be given over 5 minutes
- Child 12-17 years: 40 mg once daily, injection to be given over 5 minutes

**Acid-related dyspepsia**

**BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**

- Neonate: 700 micrograms/kg once daily for 7–14 days, then increased if necessary to 1.4–2.8 mg/kg once daily.
- Child 1 month-1 year: 700 micrograms/kg once daily, increased if necessary to 3 mg/kg once daily (max. per dose 20 mg)
- Child 2-17 years (body-weight 10-19 kg): 10 mg once daily, increased if necessary to 20 mg once daily
- Child 2-17 years (body-weight 20 kg and above): 20 mg once daily, increased if necessary to 40 mg once daily

**Fat malabsorption despite pancreatic enzyme replacement therapy in cystic fibrosis**

**BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**

- Neonate: 700 micrograms/kg once daily for 7–14 days, then increased if necessary to 1.4–2.8 mg/kg once daily.
- Child 1 month-1 year: 700 micrograms/kg once daily, increased if necessary to 3 mg/kg once daily (max. per dose 20 mg)
- Child 2-17 years (body-weight 10-19 kg): 10 mg once daily, increased if necessary to 20 mg once daily
- Child 2-17 years (body-weight 20 kg and above): 20 mg once daily, increased if necessary to 40 mg once daily

**UNLICENSED USE**

- Capsules and tablets not licensed for use in children except for severe ulcerating reflux oesophagitis in children over 1 year. Injection not licensed for use in children under 12 years.

**INTERACTIONS**

- Appendix 1 (proton pump inhibitors).

**SIDE-EFFECTS**

- Agitation, impotence

**PREGNANCY**

- Not known to be harmful.

**BREAST FEEDING**

- Present in milk but not known to be harmful.

**HEPATIC IMPAIRMENT**

- No more than 700 micrograms/kg (max. 20 mg) once daily.

**DIRECTIONS FOR ADMINISTRATION**

- For administration by mouth, swallow whole, or disperse Losec MUPS® tablets in water, or mix capsule contents or Losec MUPS® tablets with fruit juice or yoghurt. Preparations consisting of an e/c tablet within a capsule should not be opened.

- For administration through an enteral feeding tube, use Losec MUPS® or the contents of a capsule containing omeprazole dispersed in a large volume of water, or in 10 mL Sodium Bicarbonate 8.4% (1 mmol Na+/mL). Allow to stand for 10 minutes before administration.

- With intravenous use For intermittent intravenous infusion, dilute reconstituted solution to a concentration of 400 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; give over 20–30 minutes.
4.3 Gastro-oesophageal reflux disease

Gastro-oesophageal reflux disease

Management

Gastro-oesophageal reflux disease includes non-erosive gastro-oesophageal reflux and erosive oesophagitis. Uncomplicated gastro-oesophageal reflux is common in infancy and most symptoms, such as intermittent vomiting or repeated, effortless regurgitation, resolve without treatment between 12 and 18 months of age. Older children with gastro-oesophageal reflux disease may have heartburn, acid regurgitation and dysphagia. Gastro-oesophageal inflammation (oesophagitis), ulceration or stricture formation may develop in early childhood; gastro-oesophageal reflux disease may also be associated with chronic respiratory disorders including asthma.

Parents and carers of neonates and infants should be reassured that most symptoms of uncomplicated gastro-oesophageal reflux resolve without treatment. An increase in the frequency and a decrease in the volume of feeds may reduce symptoms. A feed thickener or pre-thickened formula feed can be used on the advice of a dietician. If necessary, a suitable alginate-containing preparation can be used instead of thickened feeds. A thickening agent should be tried for up to 2 weeks before considering other treatment. Older children should be advised about life-style changes such as weight reduction if overweight, and the avoidance of alcohol and smoking. An alginate-containing antacid can be used to relieve symptoms.

Children who do not respond to these measures or who have problems such as respiratory disorders or suspected oesophagitis need to be referred to hospital. On the advice of a paediatrician, a histamine H₂-receptor antagonist can be used to relieve symptoms of gastro-oesophageal reflux disease, promote mucosal healing and permit reduction in antacid consumption. A proton pump inhibitor can be used for the treatment of moderate, non-erosive oesophagitis that is unresponsive to an H₂-receptor antagonist.

Endoscopically confirmed erosive, ulcerative, or strictureturing disease in children is usually treated with a proton pump inhibitor. Reassessment is necessary if symptoms persist despite 4–6 weeks of treatment; long-term use of an H₂-receptor antagonist or proton pump inhibitor should not be undertaken without full assessment of the underlying condition. For endoscopically confirmed erosive, ulcerative, or strictureturing disease, the proton pump inhibitor usually needs to be maintained at the minimum effective dose. Motility stimulants, such as erythromycin p. 310 may improve gastro-oesophageal sphincter contraction and accelerate gastric emptying. Evidence for the long-term efficacy of motility stimulants in the management of gastro-oesophageal reflux in children is unconvincing.

For advice on specialised formula feeds, see Enteral feeds.

Pregnancy

If dietary and lifestyle changes fail to control gastro-oesophageal reflux disease in pregnancy, an antacid or an alginate can be used. If this is ineffective, ranitidine p. 50 can be tried. Omeprazole p. 54 is reserved for women with severe or complicated reflux disease.

Drugs used for Gastro-oesophageal reflux disease not listed below
Esomeprazole, p. 52 - Lansoprazole, p. 53
**Food allergy**

**Management**

Allergy with classical symptoms of vomiting, colic and diarrhoea caused by specific foods such as cow’s milk or shellfish should be managed by strict avoidance. The condition should be distinguished from symptoms of occasional food intolerance in those with irritable bowel syndrome. Sodium cromoglicate p. 157 may be helpful as an adjunct to dietary avoidance.

Other drugs used for Food allergy Chlorphenamine maleate, p. 168

---

**4.4 Helicobacter pylori diagnosis**

**Urea (13C)**

**indications and dose**

Diagnosis of gastro-duodenal *Helicobacter pylori* infection

- **by mouth**
- **child**: (consult product literature)

**medicinal forms**

There can be variation in the licensing of different medicines containing the same drug.

**oral suspension**

**electrolytes**: May contain Sodium

- Sodium alginate with calcium carbonate and sodium bicarbonate (Non-proprietary)
  - Sodium carbonate: 16 mg per 1 ml, Sodium bicarbonate: 26.7 mg per 1 ml
  - Sodium alginate: 50 mg per 1 ml
  - Alginite raft-forming oral suspension sugar-free peppermint sugar-free
  - 500 ml [SSL]: no price available DT price = £1.95
  - 500 ml [SSL]: no price available DT price = £1.95
  - Brands may include Acidex, Entrocalm Heartburn and Indigestion Relief, Gaviscon, Gaviscon Cool, Gaviscon Liquid Relief, Peptac

---

**56 Food allergy**

**Antacids > Alginate**

Sodium alginate with calcium carbonate and sodium bicarbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, alginic acid p. 46, sodium bicarbonate p. 544, calcium carbonate p. 552.

- **indications and dose**
  - **Mild symptoms of gastro-oesophageal reflux disease**
    - **by mouth**: 5–10 mL, to be taken after meals and at bedtime
    - **Child 6-11 years**: 10–20 mL, to be taken after meals and at bedtime

- **prescribing and dispensing information**
  - Flavours of oral liquid formulations may include aniseed or peppermint.

- **patient and carer advice**
  - Medicines for Children leaflet: Gaviscon for gastro-oesophageal reflux disease www.medicinesforchildren.org.uk/gaviscon

**6 Gastro-intestinal smooth muscle spasm**

**Antispasmodics**

**Antimuscarinics**

The intestinal smooth muscle relaxant properties of antimuscarinic and other antispasmodic drugs may be useful in irritable bowel syndrome.

Antimuscarinics (formerly termed ‘anticholinergics’) reduce intestinal motility. They are occasionally used for the management of irritable bowel syndrome. However, evidence of their value has not been established and response varies.

Antimuscarinics that are used for gastro-intestinal smooth muscle spasm includes the tertiary amine dicyclomine hydrochloride p. 57 and the quaternary ammonium compounds propantheline bromide p. 58 and hyoscine butylbromide p. 57. The quaternary ammonium compounds are less lipid soluble than atropine and are less likely to cross the blood–brain barrier; they are also less well absorbed from the gastro-intestinal tract.

Dicyclomine hydrochloride, may also have some direct action on smooth muscle. Hyoscine butylbromide is advocated as a gastro-intestinal antispasmodic, but it is poorly absorbed; the injection may be useful in endoscopy and radiology.

Other indications for antimuscarinic drugs include asthma and airways disease, motion sickness, urinary frequency and enuresis, mydriasis and cycloplegia, premedication, palliative care and as an antidote to organophosphorus poisoning.

Other antispasmodics

Alverine citrate p. 58, mebeverine hydrochloride p. 58, and peppermint oil p. 52 are believed to be direct relaxants of intestinal smooth muscle and may relieve pain in irritable bowel syndrome, and primary dysmenorrhoea. They have no serious adverse effects but, like all antispasmodics, should be avoided in paralytic ileus.

**Motility stimulants**

Domperidone is a dopamine receptor antagonist which stimulates gastric emptying and small intestinal transit, and enhances the strength of oesophageal sphincter contraction. The MHRA/CHM has issued restrictions on its use because domperidone is associated with a small increased risk of serious cardiac side effects.

A low dose of erythromycin p. 310 stimulates gastro-intestinal motility and may be used on the advice of a paediatric gastroenterologist to promote tolerance of enteral
feeds; erythromycin may be less effective as a prokinetic drug in preterm neonates than in older children.

### Antimuscarinics

#### Dicycloverine hydrochloride

**(Dicyclomine hydrochloride)**

**Indications and Dose**

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

- **By Mouth**
  - Child 6–23 months: 5–10 mg 3–4 times a day, dose to be taken 15 minutes before feeds
  - Child 2–11 years: 10 mg 3 times a day
  - Child 12–17 years: 10–20 mg 3 times a day

- **Contra-Indications**
  - Child under 6 months

- **Pregnancy**
  - Not known to be harmful; manufacturer advises use only if essential.

- **Breast Feeding**
  - Avoid—present in milk; apnoea reported in infant.

- **Exceptions to Legal Category**
  - Dicycloverine hydrochloride can be sold to the public provided that max. single dose is 10 mg and max. daily dose is 60 mg.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

#### Dicycloverine hydrochloride with aluminium hydroxide, magnesium oxide and simeticone

The properties listed below are those particular to the combination only. For the properties of the components please consider, dicycloverine hydrochloride above, aluminium hydroxide p. 558, simeticone p. 48.

**Indications and Dose**

Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm

- **By Mouth**
  - Child 12–17 years: 10–20 mL every 4 hours as required

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

### Hyoscine butylbromide

**Indications and Dose**

Symptomatic relief of gastro-intestinal or genito-urinary disorders characterised by smooth muscle spasm

- **By Mouth**
  - Child 6–11 years: 10 mg 3 times a day
  - Child 12–17 years: 20 mg 4 times a day

**Acute spasm: Spasm in diagnostic procedures**

- **Initially by Intramuscular Injection, or by Slow Intravenous Injection**
  - Child 2–5 years: 5 mg, then (by intramuscular injection or by slow intravenous injection) 5 mg after 30 minutes if required, dose may be repeated more frequently in endoscopy; maximum 15 mg per day
  - Child 6–11 years: 5–10 mg, then (by intramuscular injection or by intravenous injection) 5–10 mg after 30 minutes if required, dose may be repeated more frequently in endoscopy; maximum 30 mg per day
  - Child 12–17 years: 20 mg, then (by intramuscular injection or by slow intravenous injection) 20 mg after 30 minutes if required, dose may be repeated more frequently in endoscopy; maximum 80 mg per day

**Excessive respiratory secretions in palliative care**

- **By Mouth**
  - Child 1 month–1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
  - Child 2–4 years: 5 mg 3–4 times a day
  - Child 5–11 years: 10 mg 3–4 times a day
  - Child 12–17 years: 10–20 mg 3–4 times a day

- **By Intramuscular Injection, or by Intravenous Injection**
  - Child 1 month–4 years: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
  - Child 5–11 years: 5–10 mg 3–4 times a day
  - Child 12–17 years: 10–20 mg 3–4 times a day

**Bowel colic (in palliative care)**

- **By Mouth**
  - Child 1 month–1 year: 300–500 micrograms/kg 3–4 times a day (max. per dose 5 mg)
  - Child 2–4 years: 5 mg 3–4 times a day
  - Child 5–11 years: 10 mg 3–4 times a day
  - Child 12–17 years: 10–20 mg 3–4 times a day

**Spasm in diagnostic procedures**

- **Over at least 15 minutes before feeds**
  - Excessive respiratory secretions in palliative care
  - Bowel colic (in palliative care)
  - Spasm in diagnostic procedures

**Pharmacokinetics**

Administration by mouth is associated with poor absorption.

**Unlicensed Use**

Tables not licensed for use in children under 6 years. **Injection** not licensed for use in children (age range not specified by manufacturer).

**Pregnancy**

Manufacturer advises avoid.

**Breast Feeding**

Amount too small to be harmful.

**Directions for Administration**

- **With oral use** For administration by mouth, injection solution may be used; content of ampoule may be stored in a refrigerator for up to 24 hours after opening.
- **With intravenous use** For intravenous injection, may be diluted with Glucose 5% or Sodium Chloride 0.9%; give over at least 1 minute.
Propantheline bromide

- **INDICATIONS AND DOSE**
  Symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm
  - **BY MOUTH**
    - Child 1 month-11 years: 300 micrograms/kg 3–4 times a day (max. per dose 15 mg), dose to be taken at least one hour before food.
    - Child 12-17 years: 15 mg 3 times a day, dose to be taken at least one hour before food and 30 mg, dose to be taken at night; maximum 120 mg per day.

- **UNLICENSED USE** Tablets not licensed for use in children under 12 years.
- **SIDE-EFFECTS** Facial flushing
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** May suppress lactation.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises caution.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  - **Tablet**
    - Buscopan (Boehringer Ingelheim Ltd)
    - Hyoscine butylbromide 10 mg Buscopan 10mg tablets |
      56 tablet (PS) £3.00 DT price = £3.00
    - Solution for injection
      - Buscopan (Boehringer Ingelheim Ltd)

7 Liver disorders and related conditions

7.1 Biliary disorders

**Biliary disorders**

**Drugs affecting biliary composition and flow**

Bile acids (ursodeoxycholic acid p. 60, chenodeoxycholic acid below and cholic acid p. 60) may be used as dietary supplements in children with inborn errors of bile acid synthesis. Ursodeoxycholic acid is used to improve the flow of bile in children with cholestatic conditions such as familial intrahepatic cholestasis, biliary atresia in infants, cystic-fibrosis related liver disease, and cholestasis caused by total parenteral nutrition or following liver transplantation. Ursodeoxycholic acid may also relieve the severe itching associated with cholestasis.

In sclerosing cholangitis, ursodeoxycholic acid is used to improve fat digestion and absorption.

Chenodeoxycholic acid and Ursodeoxycholic acid have been associated with the development of progressive fibrosing colonopathy (FPC) in children with cystic fibrosis aged between 2 and 13 years. The following is recommended:

- Pancrease Hi®, Nutrizym 22® should not be used in children under 16 years with cystic fibrosis;
- the total dose of pancreatic enzyme supplements used in patients with cystic fibrosis should not usually exceed 10 000 units of lipase per kg body-weight daily;
- if a patient on any pancreatin preparation develops new abdominal symptoms (or any change in existing abdominal symptoms) the patient should be reviewed to exclude the possibility of colonic damage.

Possible risk factors are gender (boys at greater risk than girls), more severe cystic fibrosis, and concomitant use of laxatives. The peak age for developing fibrosing colonopathy is between 2 and 8 years.

**Bile acid sequestrants**

Colestyramine p. 120 is an anion-exchange resin that forms an insoluble complex with bile acids in the gastro-intestinal tract; it is used to relieve diarrhea associated with surgical procedures such as ileal resection, or following radiation therapy. Colestyrnamine is also used in the treatment of familial hypercholesterolaemia, and to relieve pruritus in children with partial biliary obstruction. Colestyrnamine is not absorbed from the gastro-intestinal tract.

**Pancreatin**

Pancreatin p. 66, containing a mixture of protease, lipase and amylase in varying proportions, aids the digestion of starch, fat, and protein. Supplements of pancreatin are given by mouth to compensate for reduced or absent exocrine secretion in cystic fibrosis, and following pancreatectomy, total gastrectomy, or chronic pancreatitis.

The dose of pancreatin is adjusted according to size, number, and consistency of stools, and the nutritional status of the child; extra allowance will be needed if snacks are taken between meals.

  - Adjunct in acute massive haemorrhage of gastrointestinal tract or oesophageal varices (specialist use only)
  - **BY INTRAVENOUS INJECTION**
  - Child 12–17 years (body-weight up to 50 kg): Initially 1 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute
  - Child 12–17 years (body-weight 50–69 kg): Initially 1.5 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute
  - Child 12–17 years (body-weight 70 kg and above): Initially 2 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute

---

**7.2 Oesophageal varices**

**PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > VASOPRESSIN AND ANALOGUES**

**Terlipressin acetate**

- **INDICATIONS AND DOSE**

  **GLYPRESSIN® INJECTION**
  - Adjunct in acute massive haemorrhage of gastro-intestinal tract or oesophageal varices (specialist use only)
  - **BY INTRAVENOUS INJECTION**
  - Child 12–17 years (body-weight up to 50 kg): Initially 2 mg every 4 hours until bleeding controlled, then reduced to 1 mg every 4 hours if required, maximum duration 48 hours
  - Child 12–17 years (body-weight 50 kg and above): Initially 2 mg every 4 hours until bleeding controlled, reduced if not tolerated to 1 mg every 4 hours, maximum duration 48 hours

  **VARIQUEL® INJECTION**
  - Adjunct in acute massive haemorrhage of gastro-intestinal tract or oesophageal varices (specialist use only)
  - **BY INTRAVENOUS INJECTION**
  - Child 12–17 years (body-weight up to 50 kg): Initially 1 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute
  - Child 12–17 years (body-weight 50–69 kg): Initially 1.5 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute
  - Child 12–17 years (body-weight 70 kg and above): Initially 2 mg, then 1 mg every 4–6 hours for up to 72 hours, to be administered over 1 minute

---

**Unlicensed use** Unlicensed for use in children.

**Caution** Arrhythmia, electrolyte and fluid disturbances, heart disease, history of QT-interval prolongation, respiratory disease, sepsis, shock, uncontrolled hypertension, vascular disease.

**INTERACTIONS** Caution with concomitant use of drugs that prolong the QT-interval.

**SIDE-EFFECTS**

- Common or very common Abdominal cramps - arrhythmia - bradycardia - diarrhoea - headache - hypertension - hypotension - pallor - peripheral ischaemia
- Uncommon Angina - bronchospasm - convulsions - hot flushes - hyponatraemia - intestinal ischaemia - myocardial infarction - nausea - pulmonary oedema - respiratory failure - tachycardia - vomiting
- Rare Dyspnoea
- Very rare Hyperglycaemia - stroke
- Frequency not known Heart failure - skin necrosis

**Pregnancy** Avoid unless benefits outweigh risk—uterine contractions and increased intra-uterine pressure in early pregnancy, and decreased uterine blood flow reported.

**Breastfeeding** Avoid unless benefits outweigh risk—no information available.

**Renal impairment** Use with caution in chronic renal failure.
Vasopressin

**Indications and dose**
Adjuvant in acute massive haemorrhage of gastrointestinal tract or oesophageal varices (specialist use only)
- **Continuous intravenous infusion**
  - Child: Initially 0.3 unit/kg (max. per dose 20 units), dose to be administered over 20–30 minutes, then 0.3 unit/kg/hour, adjusted according to response (max. per dose 1 unit/kg/hour), if bleeding stops, continue at same dose for 12 hours, then withdraw gradually over 24–48 hours; max. duration of treatment 72 hours, dose may alternatively be infused directly into the superior mesenteric artery

**Unlicensed use**
- Not licensed for use in children.
- **Contra-indications**
  - Chronic nephritis (until reasonable blood nitrogen concentrations attained) - vascular disease (especially disease of coronary arteries) unless extreme caution
- **Caution**
  - Asthma - avoid fluid overload - conditions which might be aggravated by water retention - epilepsy - heart failure - hypertension - migraine
- **Side-effects**
  - Rare: Gangrene
  - Frequency not known: Abdominal cramps - anaphylaxis - anginal attacks - belching - constriction of coronary arteries - desire to defaecate - fluid retention - headache - hypersensitivity reactions - myocardial ischaemia - nausea - pallor - peripheral ischaemia - sweating - tremor - vertigo - vomiting
  - **Pregnancy**
    - Oxytocic effect in third trimester
  - **Breast feeding**
    - Not known to be harmful.
- **Directions for administration**
  - For intravenous infusion (argipressin); dilute with Glucose 5% or Sodium Chloride 0.9% to a concentration of 0.2–1 unit/mL

**Medicinal forms**
- There can be variation in the licensing of different medicines containing the same drug.
- **Solution for injection**
  - **Argipressin (Non-proprietary)**
    - Argipressin 20 unit per 1 ml Argipressin 20 units/1ml solution for injection ampoules | 10 ampoules | £80.00 (Hospital only)

**8 Obesity**

**Obesity**

**Description of condition**
Obesity is directly linked to many health problems including cardiovascular disease, type 2 diabetes, and obstructive sleep apnoea syndrome. It can also contribute to psychological and psychiatric morbidities.

In children and adolescents, body mass index (BMI) should be used as a practical estimation of body fat. However, it should be interpreted with caution as it is not a direct measure of adiposity. Assessing the BMI of children is more complicated than for adults because it changes as they grow and mature, with different growth patterns seen between boys and girls.

Public Health England advises that the British 1990 (UK90) growth reference charts should be used to determine the weight status of children. A child > the 91st centile is classified as overweight, and as obese if > the 98th centile. Waist circumference is not recommended as a routine measure, but should be used as an additional predictor for risk of developing other long-term health problems.

Children who are overweight or obese and have significant comorbidities or complex needs should be considered for specialist referral.

**Aims of treatment**
Children who are overweight or obese and are no longer growing taller will ultimately need to lose weight and maintain weight loss to improve their BMI. However, preventing further weight gain while making lifestyle changes, may be an appropriate short-term aim.

**Overview**
- The goals of management of obesity should be agreed together with the child and their parents or carers; parents or carers should be encouraged to take responsibility for lifestyle changes of their children. Referral to a specialist can be considered for children who are overweight or obese and have significant comorbidities or complex needs (e.g. learning disabilities). Children should be assessed for comorbidities such as hypertension, hyperinsulinaemia, dyslipidaemia, type 2 diabetes, psychosocial dysfunction, and exacerbation of conditions such as asthma.

- An initial assessment should consider potential underlying causes (e.g. hypothyroidism) and a review of the appropriateness of current medications, which are known to cause weight gain, e.g. atypical antipsychotics, beta adrenoceptor blocking drugs, insulin (when used in the treatment of type 2 diabetes), sodium valproate, and tricyclic antidepressants.

**Lifestyle changes**
- Obese children should be encouraged to engage in a sustainable weight management programme which includes strategies to change behaviour, increase physical activity and improve diet and eating behaviour. These changes should be encouraged within the whole family. Any dietary changes should be age appropriate and consistent with healthy eating recommendations. Surgical intervention is not generally recommended in children or adolescents.
Drug treatment

Drug treatment is not generally recommended for children younger than 12 years, unless there are exceptional circumstances, such as if severe comorbidities are present. In children over 12 years, drug treatment is only recommended if physical comorbidities, such as orthopaedic problems or sleep apnoea, or severe psychological comorbidities are present. Drug treatment should never be used as the sole element of treatment and should be used as part of an overall weight management plan. Orlistat below [unlicensed use] is the only drug currently available in the UK that is recommended specifically for the treatment of obesity; it acts by reducing the absorption of dietary fat. Treatment should be started and monitored in a specialist paediatric setting by experienced multidisciplinary teams. An initial 6–12 month trial is recommended, with regular review to assess effectiveness, adverse effects and adherence. Treatment may also be used to maintain weight loss rather than to continue to lose weight. A vitamin and mineral supplement may also be considered if there is concern about inadequate micronutrient intake, particularly for younger children who need vitamins and minerals for growth and development.

Useful Resources

PERIPHERALLY ACTING ANTIOBESITY DRUGS ➤
LIPASE INHIBITORS

Orlistat

- **DRUG ACTION** Orlistat, a lipase inhibitor, reduces the absorption of dietary fat.

- **INDICATIONS AND DOSE**
  - **Adjunct in obesity**
    - **BY MOUTH**
      - Child 12–17 years (initiated by a specialist): 120 mg up to 3 times a day, dose to be taken immediately before, during, or up to 1 hour after each main meal, continue treatment beyond 12 weeks only under specialist supervision, if a meal is missed or contains no fat, the dose of orlistat should be omitted.

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Cholelithiasis - chronic malabsorption syndrome

- **CAUTIONS** Chronic kidney disease • may impair absorption of fat-soluble vitamins • volume depletion

- **INTERACTIONS** ➤ Appendix 1 (orlistat).

- **SIDE-EFFECTS**
  - **Common or very common** Abdominal distension (gastro-intestinal effects minimised by reduced fat intake) • abdominal pain (gastro-intestinal effects minimised by reduced fat intake) • anxiety • faecal incontinence • faecal urgency • flatulence • gingival disorders • headache • hypoglycaemia • liquid stools • malaise • menstrual

- **BREAST FEEDING** Use with caution.

- **PREGNANCY** Use with caution.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Capsule**
    - Orlistat (Non-proprietary)
      - Orlistat 120 mg Orlistat 120mg capsules | 84 capsule £30.05 DT price = £20.07
      - Alli (GlaxoSmithKline Consumer Healthcare)
        - Orlistat 60 mg Alli 60mg capsules | 42 capsule £19.20 | 84 capsule £29.10 | 120 capsule £36.32
    - Beacita (Octavis UK Ltd)
      - Orlistat 120 mg Beacita 120mg capsules | 84 capsule £31.63 DT price = £20.07
    - Xenical (Roche Products Ltd)
      - Orlistat 120 mg Xenical 120mg capsules | 84 capsule £31.63 DT price = £20.07

9 Rectal and anal disorders

Rectal and anal disorders

**Overview**

In children with perianal soreness or pruritus ani, good toilet hygiene is essential; the use of alcohol-free ‘wet-wipes’ after each bowel motion, regular bathing and the avoidance of local irritants such as bath additives is recommended. Excoriated skin is best treated with a protective barrier emollient; in children over 1 month, hydrocortisone p. 411 ointment or cream or a compound rectal preparation may be used for a short period of time, up to a maximum of 7 days. Pruritus ani caused by threadworm infection requires treatment with an anthelmintic. Topical application of white soft paraffin or other bland emollient may reduce anal irritation caused by threadworms. Perianal erythema caused by streptococcal infection should be treated initially with an oral antibacterial such as penicillin. Abscess or erythromycin p. 310, while awaiting results of culture and sensitivity testing. Perianal candidiasis (thrush) requires treatment with a topical antifungal preparation. Proctitis associated with inflammatory bowel disease in children is treated with corticosteroids and aminosalicylates.

**Soothing anal and rectal preparations**

Haemorrhoids in children are rare, but may occur in infants with portal hypertension. Soothing rectal preparations containing mild astringents such as bismuth subgallate, zinc oxide, and hamamelis may provide symptomatic relief, but proprietary preparations which also contain lubricants, vasoconstrictors, or mild antiseptics may cause further perianal irritation.

Local anaesthetics may be used to relieve pain in children with anal fissures or pruritus ani, but local anaesthetics are absorbed through the rectal mucosa and may cause sensitisation of the anal skin. Excessive use of local anaesthetics may result in systemic effects. Preparations containing local anaesthetics should be used for no longer than 2–3 days.

Lidocaine hydrochloride ointment p. 780 may be applied before defaecation to relieve pain associated with anal fissure, but local anaesthetics can cause stinging initially and this may aggravate the child’s fear of pain.
Other local anaesthetics such as tetracaine p. 635, cinchocaine (dibucaine), and pramocaine (pramoxine) may be included in rectal preparations, but these are more irritant than lidocaine hydrochloride. Corticosteroids are often combined with local anaesthetics and soothing agents in topical preparations for haemorrhoids and proctitis. Topical preparations containing corticosteroids should not be used long-term or if infection (such as herpes simplex) is present.

**Anal fissures**
The management of anal fissures includes stool softening and the short-term use of a topical preparation containing a local anaesthetic. If these measures are inadequate, children with chronic anal fissures should be referred for specialist treatment in hospital. Topical glyceryl trinitrate 0.05% or 0.1% ointment p. 127, may be used in children to relax the anal sphincter, relieve pain and aid healing of anal fissures. Excessive application of topical nitrates causes side-effects such as headache, flushing, dizziness, and postural hypotension.

Before considering surgery, diltiazem hydrochloride 0.2% ointment may be used in children with chronic anal fissures resistant to topical nitrates. Ointments containing glyceryl trinitrate in a range of strengths or diltiazem hydrochloride 2% ointment may be used in children with chronic anal fissures resistant to topical nitrates.

### 9.1 Haemorrhoids

**Corticosteroids**

#### Benzyl benzoate with bismuth oxide, bismuth subgallate, hydrocortisone acetate, peru balsam and zinc oxide

**INDICATIONS AND DOSE**

**Haemorrhoids / Pruritus ani**

- **BY RECTUM USING OINTMENT**
  - Child 12-17 years: Apply twice daily for no longer than 7 days, to be applied morning and night and after a bowel movement

- **BY RECTUM USING SUPPOSITORY**
  - Child 12-17 years: 1 suppository twice daily for no longer than 7 days, to be inserted night and morning, additional dose after a bowel movement

**CAUTIONS**

Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application) - local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)

**PRESCRIBING AND DISPENSING INFORMATION**

A proprietary brand Anusol Plus HC® (ointment and suppositories) is on sale to the public.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suppository**

- Benzyl benzoate with bismuth oxide, bismuth subgallate, hydrocortisone acetate, peru balsam and zinc oxide (Non-proprietary)
  - Hydrocortisone acetate 10 mg, Bismuth oxide 24 mg, Benzyl benzoate 33 mg, Peru Balsam 49 mg, Bismuth subgallate 59 mg, Zinc oxide 296 mg
  - Anusol Soothing Relief suppositories | 12 suppository | £3.34
  - Anusol-Hc (McNeil Products Ltd)
    - Hydrocortisone acetate 10 mg, Bismuth oxide 24 mg, Benzyl benzoate 33 mg, Peru Balsam 49 mg, Bismuth subgallate 59 mg, Zinc oxide 296 mg
    - Anusol HC suppositories | 12 suppository | £1.74

**Ointment**

- Benzyl benzoate with bismuth oxide, bismuth subgallate, hydrocortisone acetate, peru balsam and zinc oxide (Non-proprietary)
  - Hydrocortisone acetate 2.5 mg per 1 gram, Bismuth oxide 8.75 mg per 1 gram, Benzyl benzoate 12.5 mg per 1 gram, Peru Balsam 18.75 mg per 1 gram, Bismuth subgallate 22.5 mg per 1 gram, Zinc oxide 107.5 mg per 1 gram
  - Anusol Soothing Relief ointment | 15 gram | £3.34
  - Anusol-Hc (McNeil Products Ltd)
  - Anusol HC ointment | 15 gram | £3.03

**Cream**

- Anusol-Hc (Pfizer Ltd)
  - Hydrocortisone acetate 5 mg per 1 gram, Bismuth oxide 8.75 mg per 1 gram, Pramocaine hydrochloride 10 mg per 1 gram, Benzyl benzoate 12 mg per 1 gram, Peru Balsam 18.5 mg per 1 gram, Zinc oxide 123.5 mg per 1 gram
  - Anusol-Hc cream | 30 gram | £3.71

**Cinchocaine hydrochloride with fluocortolone caproate and fluocortolone pivalate**

**INDICATIONS AND DOSE**

**Haemorrhoids / Pruritus ani**

- **BY RECTUM USING OINTMENT**
  - Child: Apply twice daily for 5–7 days, apply 3–4 times a day if required, on the first day of treatment, then apply once daily for a few days after symptoms have cleared

- **BY RECTUM USING SUPPOSITORIES**
  - Child 12-17 years: Initially 1 suppository daily for 5–7 days, to be inserted after a bowel movement, then 1 suppository once daily on alternate days for 1 week

**CAUTIONS**

Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application) - local anaesthetic component may cause sensitisation (use for short periods only—no longer than a few days)
**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Suppository**
- [Proctosedyl](Sanofi) Cinchocaine hydrochloride 5 mg per 1 gram, Hydrocortisone 5 mg per 1 gram [Proctosedyl ointment | 30 gram (PSt) £10.34]
- [Uniorid HC](Chemiedex Pharma Ltd) Cinchocaine hydrochloride 5 mg per 1 gram, Hydrocortisone 5 mg per 1 gram [Uniorid HC ointment | 30 gram (PSt) £4.23]

**Cinchocaine with hydrocortisone**

**INDICATIONS AND DOSE**

**Proctosedyl® OINTMENT**

**Haemorrhoids | Pruritus ani**
- **TO THE SKIN, OR BY RECTUM**
  - Child: Apply twice daily, to be administered morning and night and after a bowel movement. Apply externally or by rectum. Do not use for longer than 7 days

**Proctosedyl® SUPPOSITORIES**

**Haemorrhoids | Pruritus ani**
- **BY RECTUM**
  - Child 12-17 years: 1 suppository, insert suppository night and morning and after a bowel movement. Do not use for longer than 7 days

**Uniorid-HC® OINTMENT**

**Haemorrhoids | Pruritus ani**
- **TO THE SKIN, OR BY RECTUM**
  - Child 12-17 years: 1 suppository, insert suppository day and night and after a bowel movement. Do not use for longer than 7 days
  - Child 12-17 years: Apply twice daily, and apply after a bowel movement, apply externally or by rectum, do not use for longer than 7 days

**Uniorid-HC® SUPPOSITORIES**

**Haemorrhoids | Pruritus ani**
- **BY RECTUM**
  - Child 12-17 years: 1 suppository, insert suppository day and night and after a bowel movement. Do not use for longer than 7 days

**Cautions**
- Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application) - local anaesthetic component may cause sensitisation (use for short periods only — no longer than a few days)

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Suppository**
- Cinchocaine with hydrocortisone (Non-proprietary) Cinchocaine hydrochloride 5 mg, Hydrocortisone 5 mg Cinchocaine 5 mg / Hydrocortisone 5 mg suppositories | 12 suppository (PSt) no price available
- Proctosedyl Cinchocaine hydrochloride 5 mg, Hydrocortisone 5 mg Cinchocaine hydrochloride 5 mg / Hydrocortisone 5 mg suppositories | 12 suppository (PSt) £5.08
- Uniorid HC Cinchocaine hydrochloride 5 mg, Hydrocortisone 5 mg Uniorid HC suppositories | 12 suppository (PSt) £1.91
- Xyloproct Cinchocaine hydrochloride 5 mg, Hydrocortisone 5 mg Cinchocaine hydrochloride 5 mg per 1 gram, Hydrocortisone 5 mg per 1 gram Cinchocaine 0.5% / Hydrocortisone 0.5% ointment | 30 gram (PSt) no price available

**Ointment**
- Cinchocaine with hydrocortisone (Non-proprietary) Cinchocaine hydrochloride 5 mg per 1 gram, Hydrocortisone 5 mg per 1 gram Cinchocaine 0.5% / Hydrocortisone 0.5% ointment | 30 gram (PSt) no price available

**Cinachocaine with prednisolone**

**INDICATIONS AND DOSE**

**Haemorrhoids | Pruritus ani**
- **BY RECTUM USING OINTMENT**
  - Child: Apply twice daily for 5–7 days, apply 3–4 times a day on the first day if necessary, then apply once daily for a few days after symptoms have cleared
  - Child 12–17 years: 1 suppository daily for 5–7 days, to be inserted after a bowel movement

**Haemorrhoids (severe cases) | Pruritus ani (severe cases)**
- **BY RECTUM USING SUPPOSITORIES**
  - Child 12–17 years: Initially 1 suppository 2–3 times a day, then 1 suppository daily for a total of 5–7 days, to be inserted after a bowel movement

**Cautions**
- Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application) - local anaesthetic component may cause sensitisation (use for short periods only — no longer than a few days)

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Suppository**
- Scheriproct (Bayer Plc) Cinchocaine hydrochloride 1 mg, Prednisolone hexanoate 1.3 mg Scheriproct suppositories | 12 suppository (PSt) £1.38 DT price = £1.38
- Xyloproct Cinchocaine hydrochloride 5 mg, Prednisolone hexanoate 1.9 mg Cinchocaine hydrochloride 5 mg per 1 gram Scheriproct ointment | 30 gram (PSt) £2.94 DT price = £2.94

**Ointment**
- Scheriproct (Bayer Plc) Prednisolone hexanoate 1.9 mg per 1 gram, Cinchocaine hydrochloride 5 mg per 1 gram Scheriproct ointment | 30 gram (PSt) £2.94

**Hydrocortisone with lidocaine**

**INDICATIONS AND DOSE**

**Haemorrhoids | Pruritus ani**
- **BY RECTUM USING AEROSOL SPRAY**
  - Child 2–13 years (under medical advice only): 1 spray up to 3 times a day, spray once over the affected area
  - Child 14–17 years: 1 spray up to 3 times a day for no longer than 7 days without medical advice, spray once over the affected area

**Cautions**
- Local anaesthetic component can be absorbed through the rectal mucosa (avoid excessive application) - local anaesthetic component may cause sensitisation (use for short periods only — no longer than a few days)

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Suppository**
- Hydrocortisone with lidocaine (Non-proprietary) Hydrocortisone acetate 2.75 mg per 1 gram, Lidocaine 50 mg per 1 gram Hydrocortisone acetate 2.75 mg, Lidocaine 50 mg suppositories | 12 suppository (PSt) no price available DT price = £4.19
- Scheriproct (Bayer Plc) Hydrocortisone acetate 2.75 mg per 1 gram, Lidocaine 50 mg per 1 gram Hydrocortisone acetate 2.75 mg, Lidocaine 50 mg suppositories | 12 suppository (PSt) no price available DT price = £4.19

**Ointment**
- Hydrocortisone acetate 2.75 mg per 1 gram, Lidocaine 50 mg per 1 gram Hydrocortisone acetate 2.75 mg, Lidocaine 50 mg ointment | 30 gram (PSt) £2.94
- Scheriproct (Bayer Plc) Hydrocortisone acetate 2.75 mg, Lidocaine 50 mg Scheriproct ointment | 30 gram (PSt) £2.94
Gastro-intestinal system

10 Reduced exocrine secretions

Pancreatic Enzymes

Drug Action
Supplements of pancreatic enzymes are given to compensate for reduced or absent exocrine secretion. They assist the digestion of starch, fat, and protein.

Indications and Dose

CREON® MICRO
Pancreatic insufficiency

- **BY MOUTH**
- Neonate: Initially 100 mg, to be given before each feed; granules can be mixed with a small amount of breast milk or formula feed and administered immediately (manufacturer recommends mixing with a small amount of apple juice before administration), granules should not be chewed before swallowing.

Dose Equivalence and Conversion
For Creon® Micro: 100 mg granules = one measured scoopful (scsop supplied with product).

Nutrizym 22® Gastro-Resistant Capsules

Pancreatic insufficiency

- **BY MOUTH**
- Child 15-17 years: Initially 1–2 capsules, dose to be taken during each meal and 1 capsule as required, dose to be taken with snacks, should be swallowed whole or contents taken with water or mixed with soft food (then swallowed immediately without chewing)

Pancrease HL®

Pancreatic insufficiency

- **BY MOUTH**
- Child 15-17 years: Initially 1–2 capsules, dose to be taken during each meal and 1 capsule, to be taken with snacks, all doses either taken whole or contents mixed with slightly acidic liquid or soft food (then swallowed immediately without chewing)

Pancrex®

Pancreatic insufficiency

- **BY MOUTH**
- Child 1-11 months: 1–2 capsules, contents of capsule to be mixed with feeds
- Child 1-7 years: 2–6 capsules, dose to be taken with each meal either swallowed whole or sprinkled on food

Pancrex® V Capsules '125'

Pancreatic insufficiency

- **BY MOUTH**
- Neonate: 1–2 capsules, contents of capsule to be given in each feed (or mixed with feed and given by spoon).

Pancrex® V Powder

Pancreatic insufficiency

- **BY MOUTH**
- Neonate: 250–500 mg, dose to be taken with each feed.
- Child: 0.5–2 g, to be taken before or with meals, washed down or mixed with milk or water

Pancrex® V Tablets

Pancreatic insufficiency

- **BY MOUTH**
- Child 2-7 years: 5–15 tablets, to be taken before meals

Pancrex® V Tablets Forte

Pancreatic insufficiency

- **BY MOUTH**
- Child 2-7 years: 6–10 tablets, to be taken before meals
11 Stoma care

Description of condition
A stoma is an artificial opening on the abdomen to divert flow of faeces or urine into an external pouch located outside of the body. This procedure may be temporary or permanent. Colostomy and ileostomy are the most common forms of stoma but a gastrostomy, jejuno-stomy, duodenostomy or caecostomy may also be performed. Understanding the type and extent of surgical intervention in each patient is crucial in managing the patient’s pharmaceutical needs correctly.

Overview
Prescribing for patients with stoma calls for special care due to modifications in drug delivery, resulting in a higher risk of sub-optimal absorption. The following is a brief account of some of the main points to be borne in mind.

Enteric-coated and modified-release medicines are unsuitable, particularly in patients with an ileostomy, as there may not be sufficient release of active ingredient. Soluble tablets, liquids, capsules or uncoated tablets are more suitable due to their quicker dissolution. When a solid-dose form such as a capsule or a tablet is given, the contents of the ostomy bag should be checked for any remnants.

Preparations containing sorbitol as an excipient should be avoided, due to its laxative side effects.

Analgesics
Opioid analgesics may cause troublesome constipation in colostomy patients. When a non-opioid analgesic is required, paracetamol is usually suitable. Anti-inflammatory analogues may cause gastric irritation and bleeding; faecal output should be monitored for traces of blood.

Antacids
The tendency to diarrhoea from magnesium salts or constipation from aluminium or calcium salts may be increased in patients with stoma.

Antisecretory drugs
The gastric acid secretion often increases stoma output. Proton pump inhibitors and somatostatin analogues (octreotide p. 434) are often used to reduce this risk.

Anti diarrhoeal drugs
Loperamide hydrochloride p. 44 and codeine phosphate p. 259 reduce intestinal motility and decrease water and
sodium output from an ileostomy. Loperamide hydrochloride circulates through the enterohepatic circulation, which is disrupted in patients with a short bowel; high doses of loperamide hydrochloride may be required. Codeine phosphate can be added if response with loperamide hydrochloride alone is inadequate.

**Digoxin**
Children with a stoma are particularly susceptible to hypokalaemia. This predisposes children on digoxin p. 75 to digoxin toxicity; potassium supplements or a potassium-sparing diuretic may be advisable.

**Diuretics**
Diuretics should be used with caution in patients with an ileostomy or with urostomy as they may become excessively dehydrated and potassium depletion may easily occur. It is usually advisable to use a potassium-sparing diuretic.

**Iron preparations**
Iron preparations may cause loose stools and sore skin in these patients. If this is troublesome and if iron is definitely indicated, an intramuscular iron preparation should be used. Modified-release preparations should be avoided for the reasons given above.

**Laxatives**
Laxatives should be used in children with stoma only under specialist supervision; they should be prescribed with caution for those with an ileostomy as they may cause rapid and severe loss of water and electrolytes. Colostomy patients may suffer from constipation and whenever possible it should be treated by increasing fluid intake or dietary fibre. If a laxative is required, it should generally be used for short periods only.

**Care of stoma**
Patients and their carers are usually given advice about the use of cleansing agents, protective creams, lotions, deodorants, or sealants whilst in hospital, either by the surgeon or by stoma care nurses. Voluntary organisations offer help and support to patients with stoma.
Chapter 2
Cardiovascular system

1 Arrhythmias

Overview
Management of an arrhythmia requires precise diagnosis of the type of arrhythmia; electrocardiography and referral to a paediatric cardiologist is essential; underlying causes such as heart failure require appropriate treatment.

Bradyarrhythmias
Adrenaline/epinephrine p. 128 is useful in the treatment of symptomatic bradycardia in an infant or child.

Supraventricular tachycardia
In supraventricular tachycardia adenosine p. 73 is given by rapid intravenous injection. If adenosine is ineffective, intravenous amiodarone hydrochloride p. 72, flecainide acetate p. 71, or a beta-blocker (such as esmolol hydrochloride p. 98) can be tried; verapamil hydrochloride p. 101 can also be considered in children over 1 year. Atenolol p. 97, sotalol hydrochloride p. 74 and flecainide acetate are used for the prophylaxis of paroxysmal supraventricular tachycardias.

The use of d.c. shock and vagal stimulation also have a role in the treatment of supraventricular tachycardia.

Syndromes associated with accessory conducting pathways
Amiodarone hydrochloride, flecainide acetate, or a beta-blocker is used to prevent recurrence of supraventricular tachycardia in infants and young children with these syndromes (e.g. Wolff-Parkinson-White syndrome).

Atrial flutter
In atrial flutter without structural heart defects, sinus rhythm is restored with d.c. shock or cardiac pacing; drug treatment is usually not necessary. Amiodarone hydrochloride is used in atrial flutter when structural heart defects are present or after heart surgery. Sotalol hydrochloride may also be considered.

Atrial fibrillation
Atrial fibrillation is very rare in children. To restore sinus rhythm d.c. shock is used; beta-blockers, alone or together with digoxin p. 75 may be useful for ventricular rate control.

Ectopic tachycardia
Intravenous amiodarone hydrochloride is used in conjunction with body cooling and synchronised pacing in postoperative junctional ectopic tachycardia. Oral amiodarone hydrochloride or flecainide acetate are used in congenital junctional ectopic tachycardia.

Amiodarone hydrochloride, flecainide acetate, or a beta-blocker are used in atrial ectopic tachycardia; amiodarone hydrochloride is preferred in those with poor ventricular function.

Ventricular tachycardia and ventricular fibrillation
Pulseless ventricular tachycardia or ventricular fibrillation require resuscitation, see Paediatric Advanced Life Support algorithm. Amiodarone hydrochloride is used in resuscitation for pulseless ventricular tachycardia or ventricular fibrillation unresponsive to d.c. shock; lidocaine hydrochloride p. 70 can be used as an alternative only if amiodarone hydrochloride is not available.

Amiodarone hydrochloride is also used in a haemodynamically stable child when drug treatment is required; lidocaine hydrochloride can be used as an alternative only if amiodarone hydrochloride is not available.

Torsade de points
Torsade de points is a form of ventricular tachycardia associated with long QT syndrome, which may be congenital or drug induced. Episodes may be self-limiting, but are frequently recurrent and can cause impairment or loss of consciousness. If not controlled, the arrhythmia can progress to ventricular fibrillation and sometimes death. Intravenous magnesium sulfate can be used to treat torsade de points (dose recommendations vary—consult local guidelines). Anti-arrhythmics can further prolong the QT interval, thus worsening the condition.

Drugs for arrhythmias
Anti-arrhythmic drugs can be classified clinically into those that act on supraventricular arrhythmias (e.g. verapamil hydrochloride), those that act on both supraventricular and ventricular arrhythmias (e.g. amiodarone hydrochloride), and those that act on ventricular arrhythmias (e.g. lidocaine hydrochloride).

Anti-arrhythmic drugs can also be classified according to their effects on the electrical behaviour of myocardial cells during activity (the Vaughan Williams classification) although this classification is of less clinical significance:
Arrhythmias

ANTIARRHYTHMICS > CLASS IB

Lidocaine hydrochloride
(Lignocaine hydrochloride)

- INDICATIONS AND DOSE
  Ventricular arrhythmias | Pulseless ventricular tachycardia | Ventricular fibrillation
  ▶ Initially by intravenous injection, or by intraosseous injection

  - Neonate: Initially 0.5–1 mg/kg, followed immediately by (by intravenous infusion) 0.6–3 mg/kg/hour, alternatively (by intravenous injection or by intraosseous injection) 0.5–1 mg/kg repeated at intervals of not less than 5 minutes if infusion is not immediately available following initial injection, until infusion can be initiated; maximum 3 mg/kg per course.

  - Child 1 month–11 years: Initially 0.5–1 mg/kg, followed immediately by (by intravenous infusion) 0.6–3 mg/kg/hour, alternatively (by intravenous injection or by intraosseous injection) 0.5–1 mg/kg repeated at intervals of not less than 5 minutes if infusion is not immediately available following initial injection, until infusion can be initiated; maximum 3 mg/kg per course.

  - Child 12–17 years: Initially 50–100 mg, followed by (by intravenous infusion) 120 mg, dose to be given over 30 minutes, then (by intravenous infusion) 240 mg, dose to be given over 2 hours, then (by intravenous infusion) 60 mg/hour, reduce dose further if infusion is continued beyond 24 hours, if infusion not immediately available following initial injection, the initial injection dose may be repeated at intervals of not less than 5 minutes (to a maximum 300 mg dose in 1 hour) until infusion can be initiated.

Neonatal seizures
  ▶ By intravenous infusion

  - Neonate: Initially 2 mg/kg, dose to be given over 10 minutes, followed by 6 mg/kg/hour for 6 hours; reduced to 4 mg/kg/hour for 12 hours, then reduced to 2 mg/kg/hour for a further 12 hours, preterm neonates may require lower doses.

- UNLICENSED USE
  Not licensed for use in children under 1 year.

- CONTRA-INDICATIONS
  All grades of atrioventricular block - severe myocardial depression - sino-atrial disorders

- CAUTIONS
  Acute porphyria (consider infusion with glucose for its anti-porphyrinogenic effects) - congestive cardiac failure (consider lower dose) - post cardiac surgery (consider lower dose)

- INTERACTIONS → Appendix 1 (lidocaine).

- SIDE-EFFECTS
  ▶ Common or very common
  Bradyarrhythmia (may lead to cardiac arrest) - confusion - convulsions - dizziness (particularly if injection too rapid) - drowsiness (particular if injection too rapid) - hypotension (may lead to cardiac arrest) - paraesthesia (particularly if injection too rapid) - respiratory depression

  ▶ Rare
  Anaphylaxis

- PREGNANCY
  Crosses the placenta but not known to be harmful in animal studies — use if benefit outweighs risk.

- BREAST FEEDING
  Present in milk but amount too small to be harmful.

- HEPATIC IMPAIRMENT
  Caution — increased risk of side-effects.

- RENAL IMPAIRMENT
  Possible accumulation of lidocaine and active metabolite; caution in severe impairment.
 MONITORING REQUIREMENTS
- Monitor ECG and have resuscitation facilities available.
- DIRECTIONS FOR ADMINISTRATION For intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection
- Lidocaine hydrochloride (Non-proprietary)
  - Lidocaine hydrochloride 5 mg per 1 ml Lidocaine 50mg/10ml (0.5%) solution for injection ampoules | 10 ampoule (PO) £7.00
  - Lidocaine hydrochloride 10 mg per 1 ml Lidocaine 100mg/10ml (1%) solution for injection Mini-Plasco ampoules | 20 ampoule (PO) £10.89
- Lidocaine 100mg/10ml (1%) solution for injection ampoules | 10 ampoule (PO) £4.50 DT price = £4.01
- Lidocaine 100mg/10ml (1%) solution for injection Sure-Amp ampoules | 20 ampoule (PO) £8.80
- Lidocaine 200mg/20ml (1%) solution for injection ampoules | 10 ampoule (PO) £18.00–£19.00
- Lidocaine 200mg/20ml (1%) solution for injection ampoules | 10 ampoule (PO) £7.00–£8.75 DT price = £8.75
- Lidocaine 50mg/5ml (1%) solution for injection ampoules | 10 ampoule (PO) £2.35–£3.10 DT price = £2.36
- Lidocaine 20mg/2ml (1%) solution for injection ampoules | 10 ampoule (PO) £3.50 DT price = £1.98
- Lidocaine 50mg/5ml (1%) solution for injection Sure-Amp ampoules | 20 ampoule (PO) £6.00
- Lidocaine hydrochloride 20 mg per 1 ml Lidocaine 100mg/5ml (2%) solution for injection ampoules | 10 ampoule (PO) £2.40–£3.80 DT price = £2.41
- Lidocaine 400mg/20ml (2%) solution for injection ampoules | 10 vial (PO) £18.50–£19.50
- Lidocaine 200mg/10ml (2%) solution for injection Mini-Plasco ampoules | 20 ampoule (PO) £14.52
- Lidocaine 40mg/2ml (2%) solution for injection ampoules | 10 ampoule (PO) £4.00 DT price = £2.11
- Lidocaine 100mg/5ml (2%) solution for injection Sure-Amp ampoules | 20 ampoule (PO) £6.00
- Lidocaine 400mg/20ml (2%) solution for injection ampoules | 10 ampoule (PO) £8.00–£9.00 DT price = £9.00

ANTIARRHYTHMICS CLASS IC

Flecainide acetate

INDICATIONS AND DOSE
- Supraventricular arrhythmias
  - BY MOUTH USING MODIFIED-RELEASE MEDICINES
    - Child 12-17 years: 200 mg daily
  - Resistant re-entry supraventricular tachycardia
    - Ventricular ectopic beats or ventricular tachycardia
      - Arrhythmias associated with accessory conduction pathways (e.g. Wolff-Parkinson-White syndrome)
      - Paroxysmal atrial fibrillation
    - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Neonate: 2 mg/kg 2–3 times a day, adjusted according to response, also adjust dose according to plasma-flecainide concentration.
  - Child 1 month-11 years: 2 mg/kg 2–3 times a day, adjusted according to response, also adjust dose according to plasma-flecainide concentration.; maximum 8 mg/kg per day; maximum 300 mg per day
  - Child 12-17 years: Initially 50–100 mg twice daily; increased if necessary up to 300 mg daily, maximum 400 mg daily for ventricular arrhythmias in heavily built children
  - INITIALL BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
  - Neonate: Initially 1–2 mg/kg, dose to be given over 10–30 minutes, followed by (by continuous intravenous infusion) 100–250 micrograms/kg/hour if required until arrhythmia controlled, transfer patient to oral treatment following intravenous treatment.

- Child 1 month-11 years: Initially 2 mg/kg, dose to be given over 10–30 minutes, followed by (by continuous intravenous infusion) 100–250 micrograms/kg/hour if required until arrhythmia controlled, maximum cumulative dose of 600 mg in the first 24 hours, transfer patient to oral treatment following intravenous treatment

- Child 12-17 years: Initially 2 mg/kg (max. per dose 150 mg), dose to be given over 10–30 minutes, followed by (by continuous intravenous infusion) 1.5 mg/kg/hour if required for 1 hour, then (by continuous intravenous infusion) reduced to 100–250 micrograms/kg/hour until arrhythmia controlled, maximum cumulative dose of 600 mg in the first 24 hours, transfer patient to oral treatment following intravenous treatment

DOSE EQUIVALENCIES AND CONVERSION
- Children stabilised on 200 mg daily immediate-release flecainide may be transferred to modified-release medicines.

UNLICENSED USE
- Not licensed for use in children under 12 years.

CONTRA-INDICATIONS
- Abnormal left ventricular function - atrial conduction defects (unless pacing rescue available) - bundle branch block (unless pacing rescue available) - control of arrhythmias in acute situations (for modified-release forms only) - distal block (unless pacing rescue available) - haemodynamically significant valvular heart disease - heart failure - long-standing atrial fibrillation where conversion to sinus rhythm not attempted - second-degree or greater AV block (unless pacing rescue available) - sinus node dysfunction (unless pacing rescue available)

CAUTIONS
- Atrial fibrillation following heart surgery - patients with pacemakers (especially those who may be pacemaker dependent because stimulation threshold may rise appreciably)

INTERACTIONS
- Appendix 1 (flecainide).

SIDE-EFFECTS
- Common or very common
  - Asthenia - dizziness - dyspnoea - fatigue - fever - oedema - pro-arrhythmic effects - visual disturbances
- Rare
  - Amnesia - confusion - convulsions - depression - dyskinesia - hallucinations - peripheral neuropathy - pneumonitis
- Frequency not known

PREGNANCY
- Used in pregnancy to treat maternal and fetal arrhythmias in specialist centres; toxicity reported in animal studies; infant hyperbilirubinaemia also reported.

BREAST FEEDING
- Significant amount present in milk but not known to be harmful.

HEPATIC IMPAIRMENT
- Avoid or reduce dose in severe impairment. Monitor plasma-flecainide concentration.

RENAL IMPAIRMENT
- Reduce dose by 25–50% if estimated glomerular filtration rate less than 35 ml/minute/1.73 m². Monitor plasma-flecainide concentration.

MONITORING REQUIREMENTS
- Plasma-flecainide concentration for optimal response 200–800 micrograms/litre; blood sample should be taken immediately before next dose.
- With intravenous use ECG monitoring and resuscitation facilities must be available.
ANTIARRHYTHMICS > CLASS III

Amiodarone hydrochloride

INDICATIONS AND DOSE

Supraventricular and ventricular arrhythmias (initiated in hospital or under specialist supervision)

> BY MOUTH

- Neonate: Initially 5–10 mg/kg twice daily for 7–10 days, then reduced to 5–10 mg/kg daily.
- Child 1 month–11 years: Initially 5–10 mg/kg twice daily (max. per dose 200 mg) for 7–10 days, then reduced to 5–10 mg/kg once daily; maximum 200 mg per day.
- Child 12–17 years: 200 mg 3 times a day for 1 week, then 200 mg twice daily for 1 week, then usually 200 mg daily adjusted according to response.

> BY INTRAVENOUS INFUSION

- Neonate: Initially 5 mg/kg, then 5 mg/kg every 12–24 hours, dose to be given over 30 minutes.
- Child: Initially 5–10 mg/kg, dose to be given over 20 minutes to 2 hours, then (by continuous intravenous infusion) 300 micrograms/kg/hour, adjusted according to response; (by continuous intravenous infusion) increased if necessary up to 1.5 mg/kg/hour; maximum 1.2 g per day.

VENTRICULAR FIBRILLATION OR PULSELESS VENTRICULAR TACHYCARDIA REFRACTORY TO DEFIBRILLATION (FOR CARDIOPULMONARY RESUSCITATION)

> BY INTRAVENOUS INJECTION

- Neonate: 5 mg/kg, dose to be given over at least 3 minutes.
- Child: 5 mg/kg (max. per dose 300 mg), dose to be given over at least 3 minutes.

UNLICENSED USE Not licensed for use in children under 3 years.

CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS

Avoid in severe conduction disturbances (unless pacemaker fitted) • avoid in sinus node disease (unless pacemaker fitted) • avoid rapid loading after cardiac surgery • iodine sensitivity • sino-atrial heart block (except in cardiac arrest) • sinus bradycardia (except in cardiac arrest) • thyroid dysfunction

SPECIFIC CONTRA-INDICATIONS

- With intravenous use Avoid bolus injection in cardiomyopathy • avoid bolus injection in congestive heart failure • avoid in circulatory collapse • avoid in severe arterial hypotension • avoid in severe respiratory failure

CAUTIONS

GENERAL CAUTIONS

Acute porphyrias p. 562 • conduction disturbances (in excessive dosage) • heart failure • hypokalaemia • severe bradycardia (in excessive dosage)

SPECIFIC CAUTIONS

- With intravenous use Avoid benzyl alcohol containing injections in neonates (in neonates) • moderate and transient fall in blood pressure (circulatory collapse precipitated by rapid administration or overdosage) • severe hepatocellular toxicity

INTERACTIONS

Amiodarone has a long half-life; there is a potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped. Use extreme caution or avoid concomitant use of drugs that prolong QT interval.

SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- Common or very common Bradycardia • hypothyroidism • hypothyroidism • jaundice • nausea • persistent slate grey skin discolouration • phototoxicity • pulmonary toxicity (including pneumonitis and fibrosis) • raised serum transaminases (may require dose reduction or withdrawal if accompanied by acute liver disorders) • reversible corneal microdeposits (sometimes with night glare) • sleep disorders • taste disturbances • tachycardia • taste disturbances • tremor • vomiting

- Uncommon Conduction disturbances • onset or worsening of arrhythmia • peripheral myopathy (usually reversible on withdrawal) • peripheral neuropathy (usually reversible on withdrawal)

- Very rare Alopecia • aplastic anaemia • ataxia • benign intracranial hypertension • bronchospasm (in patients with severe respiratory failure) • chronic liver disease • cirrhosis • epidermidy-orchitis • exfoliative dermatitis • haemolytic anaemia • headache • hypersensitivity • impaired vision due to optic neuritis or optic neuropathy (including blindness) • impotence • rash • sinus arrest • thrombocytopenia • vasculitis • vertigo

- Frequency not known Hot flushes • hypotension • respiratory distress syndrome • sweating

SPECIFIC SIDE-EFFECTS

- Very rare
- With intravenous use Anaphylaxis on rapid injection
SIDE-EFFECTS, FURTHER INFORMATION

- Corneal microdeposits: Most patients taking amiodarone develop corneal microdeposits ( reversible on withdrawal of treatment); these rarely interfere with vision, but drivers may be dazzled by headlights at night. However, if vision is impaired or if optic neuritis or optic neuropathy occur, amiodarone must be stopped to prevent blindness and expert advice sought.

- Thyroid function: Amiodarone contains iodine and can cause disorders of thyroid function; both hypothyroidism and hyperthyroidism can occur. Thyrotoxicosis may be very refractory, and amiodarone should usually be withdrawn at least temporarily to help achieve control; treatment with carbimazole may be required. Hypothyroidism can be treated with replacement therapy without withdrawing amiodarone if it is essential; careful supervision is required.

- Hepatotoxicity: Amiodarone is also associated with hepatotoxicity and treatment should be discontinued if severe liver function abnormalities or clinical signs of liver disease develop.

- Pulmonary toxicity: Pneumonitis should always be suspected if new or progressive shortness of breath or cough develops in a patient taking amiodarone.

- Peripheral neuropathy: Fresh neurological symptoms should raise the possibility of peripheral neuropathy.

- PREGNANCY: Possible risk of neonatal goitre; use only if no alternative.

- BREAST FEEDING: Avoid; present in milk in significant amounts; theoretical risk of neonatal hypothyroidism from release of iodine.

MONITORING REQUIREMENTS

- Thyroid function tests should be performed before treatment and then every 6 months. Clinical assessment of thyroid function alone is unreliable. Thyroxine (T₄) may be raised in the absence of hyperthyroidism; therefore triiodothyronine (T₃), T₄, and thyroid-stimulating hormone (thyrotrophin, TSH) should all be measured. A raised T₃ and T₄ with a very low or undetectable TSH concentration suggests the development of thyrotoxicosis.

- Liver function tests required before treatment and then every 6 months.

- Serum potassium concentration should be measured before treatment.

- Chest x-ray required before treatment.

- Pulmonary function tests required before treatment.

- With intravenous use: ECG monitoring and resuscitation facilities must be available. Monitor liver transaminases closely.

DIRECTIONS FOR ADMINISTRATION

- With intravenous use: Intravenous administration via central venous catheter recommended if repeated or continuous infusion required, as infusion via peripheral veins may cause pain and inflammation. For intravenous infusion, dilute to a concentration of not less than 600 micrograms/mL with Glucose 5%. Incompatible with Sodium Chloride infusion fluids; avoid equipment containing the plasticizer di-2-ethylhexaphthalate (DEHP).

- With oral use: For administration by mouth, tablets may be crushed and dispersed in water; injection solution should not be given orally (irritant).

PATIENT AND CARER ADVICE

Because of the possibility of phototoxic reactions, patients should be advised to shield the skin from light during treatment and for several months after discontinuing amiodarone; a wide-spectrum sunscreen to protect against both long-wave ultraviolet and visible light should be used.

Medicines for Children leaflet: Amiodarone for abnormal heart rhythms - www.medicinesforchildren.org.uk/amiodarone-for-abnormal-heart-rhythms

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 11

ANTIARRHYTHMIQUES > OTHER

Adenosine

- INDICATIONS AND DOSE: Used in conjunction with radionuclide myocardial perfusion imaging in patients who cannot exercise adequately or for whom exercise is inappropriate

  - BY INTRAVENOUS INFUSION

    - Child: (consult product literature)

Termination of supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome) | Diagnosis of supraventricular arrhythmias

  - BY RAPID INTRAVENOUS INJECTION

Neonate: Initially 150 micrograms/kg, then increased in steps of 50–100 micrograms/kg every 1–2 minutes (max. per dose 300 micrograms/kg) if required, dose to be repeated until tachycardia terminated or maximum single dose given.

Child 1-11 years: Initially 100 micrograms/kg, then increased in steps of 50–100 micrograms/kg every 1–2 minutes (max. per dose 12 mg/kg) if required, dose to be repeated until tachycardia terminated or maximum single dose given.

Child 12-17 years: Initially 3 mg, followed by 6 mg after 1–2 minutes if required, followed by 12 mg after 1–2 minutes if required, in some children over 12 years 3 mg dose ineffective (e.g. if a small peripheral vein is used for administration) and higher initial dose sometimes used; however, those with heart transplant are very sensitive to the effects of adenosine, and should not receive higher initial doses.

DOSE ADJUSTMENTS DUE TO INTERACTIONS

If essential to give with dipyridamole reduce adenosine dose to a quarter of the usual dose.

- UNLICENSED USE: Adenocor® licensed for treatment of paroxysmal supraventricular tachycardia in children; not

AMIODARONE FOR ABNORMAL HEART RHYTHMS

- DIRECTIONS FOR ADMINISTRATION

Termination of supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome) | Diagnosis of supraventricular arrhythmias

- BY RAPID INTRAVENOUS INJECTION

Neonate: Initially 150 micrograms/kg, then increased in steps of 50–100 micrograms/kg every 1–2 minutes (max. per dose 300 micrograms/kg) if required, dose to be repeated until tachycardia terminated or maximum single dose given.

Child 1-11 years: Initially 100 micrograms/kg, then increased in steps of 50–100 micrograms/kg every 1–2 minutes (max. per dose 12 mg/kg) if required, dose to be repeated until tachycardia terminated or maximum single dose given.

Child 12-17 years: Initially 3 mg, followed by 6 mg after 1–2 minutes if required, followed by 12 mg after 1–2 minutes if required, in some children over 12 years 3 mg dose ineffective (e.g. if a small peripheral vein is used for administration) and higher initial dose sometimes used; however, those with heart transplant are very sensitive to the effects of adenosine, and should not receive higher initial doses.

DOSE ADJUSTMENTS DUE TO INTERACTIONS

If essential to give with dipyridamole reduce adenosine dose to a quarter of the usual dose.

- UNLICENSED USE: Adenocor® licensed for treatment of paroxysmal supraventricular tachycardia in children; not
Arrhythmias

Sotalol hydrochloride

**INDICATIONS AND DOSE**

- **Life-threatening arrhythmias including ventricular tachyarrhythmias**
  - **BY MOUTH**
    - Child 12–17 years: Initially 80 mg once daily, alternatively initially 40 mg twice daily, then increased to 80–160 mg twice daily, dose to be increased gradually at intervals of 2–3 days; higher doses of 480–640 mg daily may be required for life-threatening ventricular arrhythmias (under specialist supervision)

- **Ventricular arrhythmias, life-threatening ventricular tachyarrhythmia and supraventricular arrhythmias (initiated under specialist supervision)**
  - **BY MOUTH**
    - Neonate: Initially 1 mg/kg twice daily, increased if necessary up to 4 mg/kg twice daily, dose to be increased at intervals of 2–4 days.
    - Child 1 year: Initially 80 mg once daily, alternatively initially 40 mg twice daily, increased to 80–160 mg twice daily, dose to be increased gradually at intervals of 2–3 days.

**UNLICENSED USE**

- Not licensed for use in children under 12 years.

**IMPORTANT SAFETY INFORMATION**

Sotalol may prolong the QT interval, and it occasionally causes life threatening ventricular arrhythmias (important: particular care is required to avoid hypokalaemia in patients taking sotalol—electrolyte disturbances, particularly hypokalaemia and hypomagnesaemia should be corrected before sotalol started and during use).

Reduce dose or discontinue if corrected QT interval exceeds 550 msec.

**CONTRA-INDICATIONS**

- Long QT syndrome (congenital or acquired), torsade de pointes

**CAUTIONS**

- Diarrhoea (severe or prolonged)

**INTERACTIONS**

- Extreme caution or avoid concomitant use of drugs that prolong QT interval.

**SIDE-EFFECTS**

- Arrhythmogenic (pro-arrhythmic) effect (torsade de pointes—increased risk in females)

**BREAST FEEDING**

- Water soluble beta-blockers such as sotalol are present in breast milk in greater amounts than other beta blockers.

**RENAL IMPAIRMENT**

- Halve normal dose if estimated glomerular filtration rate 30–60 mL/minute/1.73 m²; use one-quarter normal dose if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Measurement of corrected QT interval, and monitoring of ECG and electrolytes required; correct hypokalaemia, hypomagnesaemia, or other electrolyte disturbances.

---

Drug Action: Digoxin is a cardiac glycoside that increases the force of myocardial contraction and reduces conductivity within the atrioventricular (AV) node.

Indications and Dose: Digoxin is useful in the treatment of supraventricular arrhythmias or chronic heart failure.

Dose Equivalence and Conversion: Dose may need to be reduced if digoxin (or another cardiac glycoside) has been given in the preceding 2 weeks. When switching from intravenous to oral route may need to increase dose by 20–33% to maintain the same plasma-digoxin concentration.

Unlicensed Use: Digoxin is licensed for use in heart failure and supraventricular arrhythmias.

Contra-indications: Constrictive pericarditis (unless to control atrial fibrillation or improve systolic dysfunction—but use with caution), hypertrophic cardiomyopathy (unless concomitant atrial fibrillation and heart failure—

Cardiac glycosides

Digoxin-specific antibody

Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (see further information, under Emergency treatment of poisoning p. 786). Digoxin-specific antibody p. 795 fragments are indicated for the treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradyarrhythmias unresponsive to atropine sulfate p. 764 and when measures beyond the withdrawal of digoxin below and correction of any electrolyte abnormalities are considered necessary.

Digoxin

Digoxin is most useful in the treatment of supraventricular tachycardias, especially for controlling ventricular response in persistent atrial fibrillation. Digoxin has a limited role in children with chronic heart failure.

For the management of atrial fibrillation, the maintenance dose of digoxin is determined on the basis of the ventricular rate at rest, which should not be allowed to fall below an acceptable level for the child.

Digoxin is now rarely used for rapid control of heart rate, even with intravenous administration, response may take many hours; persistence of tachycardia is therefore not an indication for exceeding the recommended dose. The intramuscular route is not recommended.

In children with heart failure who are in sinus rhythm, a loading dose may not be required.

Unwanted effects depend both on the concentration of digoxin in the plasma and on the sensitivity of the conducting system or of the myocardium, which is often increased in heart disease. It can sometimes be difficult to distinguish between toxic effects and clinical deterioration because the symptoms of both are similar. The plasma-digoxin concentration alone cannot indicate toxicity reliably, but the likelihood of toxicity increases progressively through the range 1.5 to 3 micrograms/litre for digoxin.

Renal function is very important in determining digoxin dosage.

Hypokalaemia predisposes the child to digitalis toxicity and should be avoided; it is managed by giving a potassium-sparing diuretic or, if necessary, potassium supplements.

If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management. Digoxin-specific antibody fragments are available for reversal of life-threatening overdosage.

DIRECTIONS FOR ADMINISTRATION

For administration by mouth, tablets may be crushed and dispersed in water.

Digoxin

Digoxin is most useful in the treatment of supraventricular tachycardias, especially for controlling ventricular response in persistent atrial fibrillation. Digoxin has a limited role in children with chronic heart failure.

For the management of atrial fibrillation, the maintenance dose of digoxin is determined on the basis of the ventricular rate at rest, which should not be allowed to fall below an acceptable level for the child.

Digoxin is now rarely used for rapid control of heart rate, even with intravenous administration, response may take many hours; persistence of tachycardia is therefore not an indication for exceeding the recommended dose. The intramuscular route is not recommended.

In children with heart failure who are in sinus rhythm, a loading dose may not be required.

Unwanted effects depend both on the concentration of digoxin in the plasma and on the sensitivity of the conducting system or of the myocardium, which is often increased in heart disease. It can sometimes be difficult to distinguish between toxic effects and clinical deterioration because the symptoms of both are similar. The plasma-digoxin concentration alone cannot indicate toxicity reliably, but the likelihood of toxicity increases progressively through the range 1.5 to 3 micrograms/litre for digoxin.

Renal function is very important in determining digoxin dosage.

Hypokalaemia predisposes the child to digitalis toxicity and should be avoided; it is managed by giving a potassium-sparing diuretic or, if necessary, potassium supplements.

If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management. Digoxin-specific antibody fragments are available for reversal of life-threatening overdosage.

DOSE EQUIVALENCE AND CONVERSION

Dose may need to be reduced if digoxin (or another cardiac glycoside) has been given in the preceding 2 weeks. When switching from intravenous to oral route may need to increase dose by 20–33% to maintain the same plasma-digoxin concentration.

UNLICENSED USE

Digoxin is licensed for use in heart failure and supraventricular arrhythmias.

CONTRA-INDICATIONS

Constrictive pericarditis (unless to control atrial fibrillation or improve systolic dysfunction—but use with caution), hypertrophic cardiomyopathy (unless concomitant atrial fibrillation and heart failure—

CONTRA-INDICATIONS

Digoxin is licensed for use in heart failure and supraventricular arrhythmias.

CONTRA-INDICATIONS

Digoxin is licensed for use in heart failure and supraventricular arrhythmias.
but use with caution) - intermittent complete heart block - myocarditis - second degree AV block - supraventricular arrhythmias associated with accessory conducting pathways e.g. Wolff-Parkinson-White syndrome (although can be used in infancy) - ventricular tachycardia or fibrillation

**CAUTIONS**
- Avoid hypercalcaemia (risk of digitalis toxicity)
- Avoid hypokalaemia (risk of digitalis toxicity)
- Avoid hypomagnesaemia (risk of digitalis toxicity)
- Avoid hypoxia (risk of digitalis toxicity)
- Severe respiratory disease - sick sinus syndrome - thyroid disease

**INTERACTIONS**
- Appendix 1 (cardiac glycosides)

**SIDE-EFFECTS**
- Common or very common - Arrhythmias - blurred vision - conduction disturbances - diarrhoea - dizziness - eosinophilia - nausea - rash - vomiting - yellow vision
- Uncommon - Depression
- Very rare - Anorexia - apathy - confusion - fatigue - gynaecomastia on long-term use - headache - intestinal ischaemia and necrosis - psychosis - thrombocytopenia - weakness

Overdose
- If toxicity occurs, digoxin should be withdrawn; serious manifestations require urgent specialist management.

**PREGNANCY**
- May need dosage adjustment.

**BREAST FEEDING**
- Amount too small to be harmful.

**RENAL IMPAIRMENT**
- Use half normal dose if estimated glomerular filtration rate is 10–50 mL/minute/1.73 m² and use a quarter normal dose if estimated glomerular filtration rate is less than 10 mL/minute/1.73 m². Monitor plasma-digoxin concentration in renal impairment.

**MONITORING REQUIREMENTS**
- For plasma-digoxin concentration assay, blood should be taken at least 6 hours after a dose.
- Plasma-digoxin concentration should be maintained in the range 0.8–2 micrograms/litre.
- Monitor serum electrolytes and renal function. Toxicity increased by electrolyte disturbances.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use - Avoid rapid intravenous administration (risk of hypertension and reduced coronary flow). For *intravenous infusion*, dilute with Sodium Chloride 0.9% or Glucose 5% to a max. concentration of 62.5 micrograms/mL; loading doses should be given over 30–60 minutes and maintenance dose over 10–20 minutes.
- With oral use - For *oral administration*, oral solution must not be diluted.

**PATIENT AND CARER ADVICE**
- Patient counselling is advised for digoxin elixir (use pipette).

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

### Tablet
- **Digoxin (Non-proprietary)**
  - Digoxin 62.5 microgram | 28 tablet [PST] £9.99 DT price + £2.87 | 500 tablet [PST] no price available
  - Digoxin 125 microgram | 28 tablet [PST] £5.02 DT price + £3.02
  - Digoxin 250 microgram | 28 tablet [PST] £7.09 DT price + £4.85 | 500 tablet [PST] no price available
- **Lanoxin (Aspen Pharma Trading Ltd)**
  - Digoxin 62.5 microgram | 500 tablet [PST] £8.09
  - Digoxin 125 microgram | 500 tablet [PST] £8.09
  - Digoxin 250 microgram | 500 tablet [PST] £8.09

**Oral solution**
- **Lanoxin (Aspen Pharma Trading Ltd)**
  - Digoxin 50 microgram per 1 ml | 60 ml [PST] £5.35 DT price + £5.35

**Solution for infusion**
- **Digoxin (Non-proprietary)**
  - Digoxin 100 microgram per 1 ml | 100 micrograms/1ml solution for injection ampoules | 10 ampoule [PST] no price available

### Tranexamic acid

#### INDICATIONS AND DOSE

**Inhibition of fibrinolysis**
- **BY MOUTH**
  - Child: 15–25 mg/kg 2–3 times a day (max. per dose 1.5 g)
- **BY SLOW INTRAVENOUS INJECTION**
  - Child: 10 mg/kg 2–3 times a day (max. per dose 1 g), dose to be given over at least 10 minutes
- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Child: 45 mg/kg, dose to be given over 24 hours

**Menorrhagia**
- **BY MOUTH**
  - Child 12–17 years: 1 g 3 times a day for up to 4 days, to be initiated when menstruation has started; maximum 4 g per day

**Hereditary angioedema**
- **BY MOUTH**
  - Child: 15–25 mg/kg 2–3 times a day (max. per dose 1.5 g), for short-term prophylaxis of hereditary angioedema, tranexamic acid is started several days before planned procedures which may trigger an acute attack of hereditary angioedema (e.g. dental work) and continued for 2–5 days afterwards
- **BY SLOW INTRAVENOUS INJECTION**
  - Child: 10 mg/kg 2–3 times a day (max. per dose 1 g), dose to be given over at least 10 minutes

#### Antifibrinolytic drugs and haemostatics

**Overview**
- Fibrin dissolution can be impaired by the administration of tranexamic acid below, which inhibits fibrinolysis. It can be used to prevent bleeding or treat bleeding associated with excessive fibrinolysis (e.g. in surgery, dental extraction, obstetric disorders, and traumatic haemorrhage) and in the management of menorrhagia; it may also be used in hereditary angioedema, epistaxis, and thrombolytic overdose. Tranexamic acid can also be used in cardiac surgery to reduce blood loss and to reduce the need for use of blood products.
- Desmopressin p. 403 is used in the management of mild to moderate haemophilia and von Willebrand’s disease. It is also used for fibrinolytic response testing.

### Antihaeorrhagics > Antifibrinolytics

## 2 Bleeding disorders

**Antifibrinolytic drugs and haemostatics**

### Tranexamic acid
Coagulation factor deficiencies

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, mouthwash.

**Tablet**
- Tranexamic acid (Non-proprietary)
  - Tranexamic acid 500 mg Tranexamic acid 500mg tablets | 60 tablet | £18.87 DT price | £4.42
  - Tranexamic acid 500 mg Tranexamic acid 500mg tablets | 60 tablet | £14.30 DT price | £4.42

**Solution for injection**
- Tranexamic acid (Non-proprietary)
  - Tranexamic acid 100 mg per 1 ml Tranexamic acid 500mg/5ml solution for injection ampoules | 5 ampoule | £7.50 (Hospital only) | 10 ampoule | £15.47 (Hospital only)
  - Tranexamic acid 100 mg per 1 ml Octaplex® Cyklokapron 500mg/5ml solution for injection ampoules | 10 ampoule | £15.47

### 2.1 Coagulation factor deficiencies

#### BLOOD AND RELATED PRODUCTS

**COAGULATION PROTEINS**

### Dried prothrombin complex

**(Human prothrombin complex)**

**INDICATIONS AND DOSE**

Treatment and peri-operative prophylaxis of haemorrhage in patients with congenital deficiency of factors II, VII, IX, or X if purified specific coagulation factors not available | Treatment and peri-operative prophylaxis of haemorrhage in patients with acquired deficiency of factors II, VII, IX, or X (e.g. during warfarin treatment)

- **BY INTRAVENOUS INFUSION**
  - Child: (consult haematologist)

**CONTRA-INDICATIONS**
- Angina | history of heparin induced thrombocytopenia | recent myocardial infarction (except in life-threatening haemorrhage following overdosage of oral anticoagulants, and before induction of fibrinolytic therapy)
- Disseminated intravascular coagulation | history of myocardial infarction or coronary heart disease | postoperative use | risk of thrombosis | vaccination against hepatitis A and hepatitis B may be required

**SIDE-EFFECTS**
- Rare | Headache
- Very rare | Anaphylaxis | antibody formation | hypersensitivity reactions | pyrexia
- Frequency not known | Disseminated intravascular coagulation | nephrotic syndrome | thrombotic events
- Hepatic impairment | Monitor closely in hepatic impairment (risk of thromboembolic complications).

**PRESCRIBING AND DISPENSING INFORMATION**

Dried prothrombin complex is prepared from human plasma by a suitable fractionation technique, and contains factor IX, together with variable amounts of factors II, VII, and X.

Available from CSL Behring (Beriplex® P/N), Octapharma (Octaplex®).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines identified.
**Factor IX fraction, dried**

**INDICATIONS AND DOSE** Treatment and prophylaxis of haemorrhage in congenital factor IX deficiency (haemophilia B)
- **BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION**
- **Child:** consult haematologist

**CONTRA-INDICATIONS** Disseminated intravascular coagulation

**CAUTIONS** Risk of thrombosis—principally with former low purity products - vaccination against hepatitis A and hepatitis B may be required (not necessary with recombinant preparation)

**SIDE-EFFECTS** Allergic reactions - chills - dizziness - fever - gastrointestinal disturbances - headache

**PRESCRIBING AND DISPENSING INFORMATION** Dried factor IX fraction is prepared from human plasma by a suitable fractionation technique; it may also contain clotting factors II, VII, and X.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- **AlphaNine (Grifols UK Ltd)**
  - Factor IX high purity 1000 unit: £190.00
  - Factor IX high purity 1500 unit: £200.00
- **Haemonine (Biotest (UK) Ltd)**
  - Factor IX high purity 500 unit: £151.80 (Hospital only)
- **Mononine (CSL Behring UK Ltd)**
  - Factor IX high purity 1000 unit: £151.80 (Hospital only)
- **Replene-VF (Bio Products Laboratory Ltd)**
  - Factor IX high purity 500 unit: £180.00
- **Powder and solvent for solution for infusion**
  - **BenefIX (Pfizer Ltd)**
    - Nonacog alfa 250 unit: £151.80 (Hospital only)
    - Nonacog alfa 500 unit: £303.60 (Hospital only)
    - Nonacog alfa 1000 unit: £607.20 (Hospital only)
  - **BenefIX 1000 unit**
    - Nonacog alfa 2500 unit: £1,821.60 (Hospital only)

**SIDE-EFFECTS**
- Very rare Allergic reactions - cerebrovascular accident - coagulation disorders - fever - myocardial infarction - nausea - pain - rash - thrombotic events

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- **NovoSeven (Novo Nordisk Ltd)**
  - Eptacog alfa activated 500000 unit: £525.20 (Hospital only)
  - Eptacog alfa activated 100000 unit: £525.20 (Hospital only)
  - Eptacog alfa activated 250000 unit: £2,626.00 (Hospital only)
  - Eptacog alfa activated 400000 unit: £4,201.60 (Hospital only)

**Factor VIII fraction, dried**

(Human coagulation factor VIII, dried)

**INDICATIONS AND DOSE** Treatment and prophylaxis of haemorrhage in congenital factor VIII deficiency (haemophilia A), acquired factor VIII deficiency - Von Willebrand’s disease
- **BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION, OR BY CONTINUOUS INTRAVENOUS INFUSION**
- **Child:** consult haematologist

**CAUTIONS** Intravascular haemolysis after large or frequently repeated doses in patients with blood groups A, B, or AB—less likely with high potency concentrates - vaccination against hepatitis A and hepatitis B may be required (not necessary with recombinant preparation)

**SIDE-EFFECTS** Anaphylaxis - angioedema - antibody formation - blurred vision - chills - coughing - dizziness - drowsiness - dyspnoea - fever - flushing - gastrointestinal disturbances - headache - hypersensitivity reactions - hypotension - palpitation - paraesthesia - taste disturbances - urticaria

**MONITORING REQUIREMENTS** Monitor for development of factor VIII inhibitors.

**PRESCRIBING AND DISPENSING INFORMATION** Dried factor VIII fraction is prepared from human plasma by a suitable fractionation technique; it may also contain varying amounts of von Willebrand factor. Optiware®, Fanhide®, and Octanate® are not indicated for use in von Willebrand’s disease.

Recombinant human coagulation factor VIII including octocog alfa, moroctocog alfa, and simoctocog alfa are not indicated for use in von Willebrand’s disease.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**
- **Advate (Baxalta UK Ltd)**
  - Octocog alfa 250 unit: £607.20 (Hospital only)
### Factor XIII fraction, dried

**Indications and Dose**

**Congenital factor XIII deficiency**
- By Intravenous Injection, or by Intravenous infusion
- Child: (consult haematologist)

**Caution**
- Vaccination against hepatitis A and hepatitis B may be required

**Side-Effects**
- Rare: Allergic reactions - fever

**Medicinal Forms**
There can be variation in the licensing of different medicines containing the same drug.

- **Powder and solvent for solution for injection**
  - Fibrargamin P (CSL Behring UK Ltd)
  - Factor XIII 250 unit: Fibrogammin 250 unit powder and solvent for solution for injection vials | 1 vial (PFS) £90.59
  - Factor XIII 1250 unit: Fibrogammin 1,250 unit powder and solvent for solution for injection vials | 1 vial (PFS) £452.95

### Fibrinogen, dried

**Indications and Dose**

**Treatment of haemorrhage in congenital hypofibrinogenenaemia or afibrinogenenaemia**
- By Intravenous Injection, or by Intravenous infusion
- Child: (consult haematologist)

**Caution**
- Risk of thrombosis

**Side-Effects**
- Rare: Allergic reactions - fever
- Very rare: Myocardial infarction - pulmonary embolism - thromboembolic events

**Pregnancy**
- Manufacturer advises not known to be harmful — no information available.

**Breast-feeding**
- Manufacturer advises avoid — no information available.

**Prescribing and Dispensing Information**
Fibrinogen is prepared from human plasma.

**Medicinal Forms**
There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for infusion**
  - Ristap (CSL Behring UK Ltd)
  - Fibrinogen 1 gram: Ristap 1g powder for solution for infusion vials | 1 vial (PFS) £340.00

### Protein C concentrate

**Indications and Dose**

**Congenital protein C deficiency**
- By Intravenous Injection
- Child: (consult haematologist)

**Caution**
- Hypersensitivity to heparins - vaccination against hepatitis A and hepatitis B may be required

**Side-Effects**
- Very rare: Bleeding - dizziness - fever - hypersensitivity reactions

**Prescribing and Dispensing Information**
Protein C is prepared from human plasma.

- Child: (consult haematologist)

**Caution**
- Hypersensitivity to heparins - vaccination against hepatitis A and hepatitis B may be required

**Side-Effects**
- Very rare: Bleeding - dizziness - fever - hypersensitivity reactions

**Prescribing and Dispensing Information**
Protein C is prepared from human plasma.
Factor VIII inhibitor bypassing fraction

**INDICATIONS AND DOSE**
Treatment and prophylaxis of haemorrhage in patients with congenital factor VIII deficiency (haemophilia A) and factor VIII inhibitors. Treatment of haemorrhage in non-haemophilic patients with acquired factor VIII inhibitors

- **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
  - Child: (consult haematologist)

**CONTRA-INDICATIONS**
Disseminated intravascular coagulation

**CAUTIONS**
Vaccination against hepatitis A and hepatitis B may be required

**SIDE-EFFECTS**
Anaphylaxis, disseminated intravascular coagulation, flushing, hypersensitivity, hypotension, myocardial infarction, paraesthesia, pyrexia, rash, thrombosis, urticaria

**PRESCRIBING AND DISPENSING INFORMATION**
Preparations with factor VIII inhibitor bypassing activity are prepared from human plasma.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

- **Powder and solvent for solution for injection**
  - FEIBA Immuno (Baxalta UK Ltd)
    - Factor VIII inhibitor bypassing fraction 500 unit FEIBA 500 unit powder and solvent for solution for injection vials | 1 vial | no price available
  - FEIBA Immuno (Baxalta UK Ltd)
    - Factor VIII inhibitor bypassing fraction 1000 unit FEIBA 1000 unit powder and solvent for solution for infusion vials | 1 vial | no price available

**BLOOD AND RELATED PRODUCTS**

**HAEMOSTATIC PRODUCTS**

Fresh frozen plasma

**INDICATIONS AND DOSE**
Replacement of coagulation factors or other plasma proteins where their concentration or functional activity is critically reduced

- **BY INTRAVENOUS INJECTION**
  - Child: (consult haematologist)

**CONTRA-INDICATIONS**
Avoid use as a volume expander - IgA deficiency with confirmed antibodies to IgA

**CAUTIONS**
Cardiac decompensation - need for compatibility - pulmonary oedema - severe protein S deficiency (avoid products with low protein S activity e.g. OctaplusL®); vaccination against hepatitis A and hepatitis B may be required

**SIDE-EFFECTS**
- Common or very common Nausea, pruritus, rash
Anticoagulant therapy should be stopped at the onset of labour and advice sought from a specialist on continuing therapy after birth.

### 3.1 Thromboembolism

#### Venous thromboembolism

**Prophylaxis of venous thromboembolism**

Low-dose heparin (unfractionated) p. 87 by subcutaneous injection is used to prevent thrombotic episodes in ‘high-risk’ patients; laboratory monitoring of APTT or anti-Factor Xa concentration is also required in prophylactic regimens in children. Low molecular weight heparins, aspirin (antiplatelet dose), and warfarin sodium p. 89 can also be used for prophylaxis.

**Treatment of venous thromboembolism**

For the initial treatment of thrombotic episodes heparin (unfractionated) is given as an intravenous loading dose, followed by continuous intravenous infusion (using an infusion pump) or by intermittent subcutaneous injection; the use of intermittent intravenous injection is no longer recommended. Alternatively, a low molecular weight heparin may be given for initial treatment. If an oral anticoagulant (usually warfarin sodium) is also required, it may be started at the same time as the heparin (the heparin needs to be continued for at least 5 days and until the INR has been in the therapeutic range for 2 consecutive days). Laboratory monitoring of coagulation activity, preferably on a daily basis, involves determination of the activated partial thromboplastin time (APTT) (for heparin (unfractionated) only) or of the anti-Factor Xa concentration (for low molecular weight heparins). Local guidelines on recommended APTT for neonates and children should be followed; monitoring of APTT should be discussed with a specialist prior to treatment for thrombotic episodes in neonates.

**Management of venous thromboembolism in pregnancy**

Heparins are used for the management of venous thromboembolism in pregnancy because they do not cross the placenta. Low molecular weight heparins are preferred because they have a lower risk of osteoporosis and of heparin-induced thrombocytopenia. Low molecular weight heparins are eliminated more rapidly in pregnancy, requiring alteration of the dosage regimen for drugs such as dalteparin sodium p. 86, enoxaparin sodium p. 86 and tinzaparin sodium p. 88; see also under individual drugs. Treatment should be stopped at the onset of labour and advice sought from a specialist on continuing therapy after birth.

**Extracorporeal circuits**

Heparin (unfractionated) is also used in the maintenance of extracorporeal circuits in cardiopulmonary bypass and haemodialysis.
Haemorrhage

If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin (unfractionated), but if rapid reversal of the effects of the heparin (unfractionated) is required, protamine sulfate p. 795 is a specific antidote (but only partially reverses the effects of low molecular weight heparin (unfractionated)).

Oral anticoagulants

Overview

The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin mesh enmeshed with platelets and red cells. Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessel thrombi are composed mainly of platelets with little fibrin.

Oral anticoagulants antagonise the effects of vitamin K and take at least 48 to 72 hours for the anticoagulant effect to develop fully; if an immediate effect is required, unfractionated or low molecular weight heparin must be given concomitantly.

Uses

Warfarin sodium p. 89 is the drug of choice for the treatment of systemic thromboembolism in children (not neonates) after initial heparinisation. It may also be used occasionally for the treatment of intravascular or intracardiac thrombi. Warfarin sodium is used prophylactically in those with an INR which is within 2. Warfarin take into account recommendations of the British Society for Haematology Guidelines on Oral Anticoagulation—fourth edition. Br J Haematol 2011; 154: 311–324.

An INR which is within 0.5 units of the target value is generally satisfactory; larger deviations require dosage adjustment. Target values (rather than ranges) are now recommended.

INR 2.5 for:
- treatment of deep-vein thrombosis or pulmonary embolism (including those associated with antiphospholipid syndrome or for recurrence in patients no longer receiving warfarin sodium)
- atrial fibrillation
- cardioversion—target INR should be achieved at least 3 weeks before cardioversion and anticoagulation should continue for at least 4 weeks after the procedure (higher target values, such as an INR of 3, can be used for up to 4 weeks before the procedure to avoid cancellations due to low INR)
- dilated cardiomyopathy
- mitral stenosis or regurgitation in patients with either atrial fibrillation, a history of systemic embolism, a left atrial thrombus, or an enlarged left atrium
- bioprosthetic heart valves in the mitral position (treat for 3 months), or in patients with a history of systemic embolism (treat for at least 3 months), or with a left atrial thrombus at surgery (treat until clot resolves), or with other risk factors (e.g. atrial fibrillation or a low ventricular ejection fraction)
- acute arterial embolism requiring embolectomy (consider long-term treatment)
- myocardial infarction

INR 3.5 for:
- recurrent deep-vein thrombosis or pulmonary embolism in patients currently receiving anticoagulation and with an INR above 2.
- Mechanical prosthetic heart valves:
  - the recommended target INR depends on the type and location of the valve, and patient-related risk factors
  - consider increasing the INR target or adding an antiplatelet drug, if an embolic event occurs whilst anticoagulated at the target INR.

Haemorrhage

The main adverse effect of all oral anticoagulants is haemorrhage. Checking the INR and omitting doses when appropriate is essential; if the anticoagulant is stopped but not reversed, the INR should be measured 2–3 days later to ensure that it is falling. The cause of an elevated INR should be investigated. The following recommendations (which take into account the recommendations of the British Society for Haematology Guidelines on Oral Anticoagulation with Warfarin—fourth edition. Br J Haematol 2011; 154: 311–324) are based on the result of the INR and whether there is major or minor bleeding; the recommendations apply to adults taking warfarin:

- Major bleeding—stop warfarin sodium; give phytomenadione (vitamin K₁) p. 593 by slow intravenous injection; give dried prothrombin complex p. 77 (factors II, VII, IX, and X); if dried prothrombin complex unavailable, fresh frozen plasma can be given but is less effective; recombinant factor VIIa is not recommended for emergency anticoagulation reversal
- INR >8.0, minor bleeding—stop warfarin sodium; give phytomenadione (vitamin K₁) by slow intravenous injection; repeat dose of phytomenadione if INR still too high after 24 hours; restart warfarin sodium when INR <5.0
- INR >8.0, no bleeding—stop warfarin sodium; give phytomenadione (vitamin K₁) by mouth using the intravenous preparation orally [unlicensed use]; repeat dose of phytomenadione if INR still too high after 24 hours; restart warfarin sodium when INR <5.0
- INR 5.0–8.0, minor bleeding—stop warfarin sodium; give phytomenadione (vitamin K₁) by slow intravenous injection; restart warfarin sodium when INR <5.0
- INR 5.0–8.0, no bleeding—withdraw 1 or 2 doses of warfarin sodium and reduce subsequent maintenance dose
- Unexpected bleeding at therapeutic levels—always investigate possibility of underlying cause e.g. unsuspected renal or gastro-intestinal tract pathology
Parenteral anticoagulants

Anticoagulants

Although thrombotic episodes are uncommon in childhood, anticoagulants may be required in children with congenital heart disease; in children undergoing haemodialysis; for preventing thrombosis in children requiring chemotherapy and following surgery; and for systemic venous thromboembolism secondary to inherited thrombophilias, systemic lupus erythematosus, or indwelling central venous catheters.

Heparin

Heparin initiates anticoagulation rapidly but has a short duration of action. It is now often referred to as being standard or heparin (unfractionated) p. 87 to distinguish it from the low molecular weight heparins, which have a longer duration of action. For children at high risk of bleeding, heparin (unfractionated) is more suitable than low molecular weight heparin because its effect can be terminated rapidly by stopping the infusion. Heparins are used in both the treatment and prophylaxis of thromboembolic disease, mainly to prevent further clotting rather than to lyse existing clots—surgery or a thrombolytic drug may be necessary if a thrombus obstructs major vessels.

Low molecular weight heparins

Dalteparin sodium p. 86, enoxaparin sodium p. 86, and tinzaparin sodium p. 88 are low molecular weight heparins used for treatment and prophylaxis of thrombotic episodes in children. Their duration of action is longer than that of heparin (unfractionated) and in adults and older children once-daily subcutaneous dosage is sometimes possible; however, younger children require relatively higher doses (possibly due to larger volume of distribution, altered heparin pharmacokinetics, or lower plasma concentrations of antithrombin) and twice daily dosage is sometimes necessary. Low molecular weight heparins are convenient to use, especially in children with poor venous access.

Heparinoids

Danaparoid sodium p. 85 is a heparinoid that has a role in children who develop heparin-induced thrombocytopenia, providing they have no evidence of cross-reactivity.

Heparin flushes

The use of heparin flushes should be kept to a minimum. For maintaining patency of peripheral venous catheters, sodium chloride injection 0.9% is as effective as heparin flushes. The role of heparin flushes in maintaining patency of arterial and central venous catheters is unclear.

Epoprostenol

Epoprostenol (prostacyclin) p. 110 can be given to inhibit platelet aggregation during renal dialysis when heparins are unsuitable or contra-indicated. It is a potent vasodilator and therefore its side-effects include flushing, headache and hypotension.

**Antithrombotic Drugs \(\triangleright\) Antiplatelet Drugs**

**Antiplatelet drugs**

Antiplatelet drugs decrease platelet aggregation and inhibit thrombus formation in the arterial circulation, because in faster-flowing vessels, thrombi are composed mainly of platelets with little fibrin.

Aspirin below has limited use in children because it has been associated with Reye’s syndrome. Aspirin-containing preparations should not be given to children and adolescents under 16 years, unless specifically indicated, such as for Kawasaki disease, for prophylaxis of clot formation after cardiac surgery, or for prophylaxis of stroke in children at high risk.

If aspirin causes dyspepsia, or if the child is at a high risk of gastro-intestinal bleeding, a proton pump inhibitor or a H₂-receptor antagonist can be added.

Dipyridamole p. 84 is also used as an antiplatelet drug to prevent clot formation after cardiac surgery and may be used with specialist advice for treatment of persistent coronary artery aneurysms in Kawasaki disease.

**Kawasaki disease**

Initial treatment is with high dose aspirin and a single dose of intravenous normal immunoglobulin; this combination has an additive anti-inflammatory effect resulting in faster resolution of fever and a decreased incidence of coronary artery complications. After the acute phase, when the patient is afebrile, aspirin is continued at a lower dose to prevent coronary artery abnormalities.

### Aspirin

**(Acetylsalicylic Acid)**

- **INDICATIONS AND DOSE**
- **Antiplatelet | Prevention of thrombus formation after cardiac surgery**
  - **BY MOUTH**
  - Neonate: 1–5 mg/kg once daily.
  - Child 1 month–11 years: 1–5 mg/kg once daily (max. per dose 75 mg)
  - Child 12–17 years: 75 mg once daily

- **Kawasaki disease**
  - Neonate: Initially 8 mg/kg 4 times a day for 2 weeks or until afebrile, followed by 5 mg/kg once daily for 6–8 weeks, if no evidence of coronary lesions after 8 weeks, discontinue treatment or seek expert advice.
  - Child 1 month–11 years: Initially 7.5–12.5 mg/kg 4 times a day for 2 weeks or until afebrile, then 2–5 mg/kg once daily for 6–8 weeks, if no evidence of coronary lesions after 8 weeks, discontinue treatment or seek expert advice

- **UNLICENSED USE**
  - Not licensed for use in children under 16 years.

- **CONTRA-INDICATIONS**
  - Active peptic ulceration - bleeding disorders (antiplatelet dose) - children under 16 years (risk of Reye’s syndrome) - haemophilia - previous peptic ulceration (analgesic dose) - severe cardiac failure (analgesic dose)

- **CONTRA-INDICATIONS, FURTHER INFORMATION**
  - Reye’s syndrome: Owing to an association with Reye’s syndrome, aspirin-containing preparations should not be given to children under 16 years, unless specifically indicated, e.g. for Kawasaki disease.
Dispersible tablet

**CAUTIONARY AND ADVISORY LABELS 13, 21, 32**

- **Aspirin (Non-proprietary)**
  - **Aspirin 75 mg**
    - Aspirin 75 mg dispersible tablets | 28 tablet | GSK l 1.04 DT price = £0.68 | 28 tablet | P 0.75 DT price = £0.68
    - 100 tablet | P 0.64 DT price = £2.43 | 100 tablet | GSK l 1.27 DT price = £2.43 | 1000 tablet | P 31.28
  - **Aspirin 300 mg**
    - Aspirin 300 mg dispersible tablets | 32 tablet | P 8.40 DT price = £9.40
    - Aspirin 100 mg | P 0.12 DT price = £0.91 | 100 tablet | P 5.48 DT price = £3.41 | 1000 tablet | GSK £37.80

**Gastro-resistant tablet**

**CAUTIONARY AND ADVISORY LABELS 5, 25, 32**

- **Aspirin (Non-proprietary)**
  - **Aspirin 75 mg**
    - Aspirin 75 mg gastro-resistant tablets | 28 tablet | GSK l 0.80 DT price = £0.73 | 28 tablet | P 0.80-0.93 DT price = £0.73 | 56 tablet | P 1.93 | 56 tablet | GSK £1.60
  - **Aspirin 300 mg**
    - Aspirin 300 mg gastro-resistant tablets | 100 tablet | P 20.34 DT price = £20.34
  - **Micropirin (Dexel-Pharma Ltd)**
    - Aspirin 75 mg | Micropirin 75 mg gastro-resistant tablets | 28 tablet | P 1.45 DT price = £0.73 | 56 tablet | P 2.87
  - **Nu-Seals (Alliance Pharmaceuticals Ltd)**
    - Aspirin 75 mg | Nu-Seals 75 gastro-resistant tablets | 56 tablet | P £3.12

---

**Dipyridamole**

**INDICATIONS AND DOSE**

**Kawasaki disease (initiated under specialist supervision)**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICATIONS**
  - Child 1 month–11 years: 1 mg/kg 3 times a day

**Prevention of thrombus formation after cardiac surgery**

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 1 month–11 years: 2.5 mg/kg twice daily
  - Child 12–17 years: 100–200 mg 3 times a day

**UNLICENSED USE**

- Not licensed for use in children.

**CAUTIONS**

- Aortic stenosis: coagulation disorders; heart failure; hypotension; left ventricular outflow obstruction — may exacerbate migraine — myasthenia gravis (risk of exacerbation)

**INTERACTIONS**

- Appendix 1 (dipyridamole).
  - Caution with concomitant use of drugs that increase risk of bleeding.

**SIDE-EFFECTS**

- Angioedema — dizziness — gastro-intestinal effects — hot flushes — hypersensitivity reactions — hypotension — increased bleeding after surgery — increased bleeding during surgery — myalgia — rash — severe bronchospasm — tachycardia — throbbing headache — thrombocytopenia — urticaria

**PREGNANCY**

- Not known to be harmful.

**BREAST FEEDING**

- Not known to be harmful.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use. Injection solution can be given orally.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, dispersion/tablet.
Oral suspension
- Dipyridamole (Non-proprietary)
  - Dipyridamole 10 mg per 1 ml Dipyridamole 50mg/5ml oral suspension sugar free sugar-free | 150 ml (£4.06 DT price = £4.06)
  - Dipyridamole 40 mg per 1 ml Dipyridamole 200mg/5ml oral suspension sugar free sugar-free | 150 ml (£109.35–£131.22 DT price = £120.29)

ANTITHROMBOTIC DRUGS > HEPARINOIDS

Danaparoid sodium

- INDICATIONS AND DOSE
  Thromboembolic disease in patients with history of heparin-induced thrombocytopenia
  - INITIALLY BY INTRAVENOUS INJECTION

  - Neonate: Initially 30 units/kg, then (by continuous intravenous infusion) 1.2–2 units/kg/hour, infusion dose to be adjusted according to coagulation activity.

  - Child 1 month-15 years (body-weight up to 55 kg): Initially 30 units/kg (max. per dose 1250 units), then (by continuous intravenous infusion) 1.2–2 units/kg/hour, infusion dose to be adjusted according to coagulation activity

  - Child 1 month-15 years (body-weight 55 kg and above): Initially 30 units/kg (max. per dose 2500 units), then (by continuous intravenous infusion) 1.2–2 units/kg/hour, infusion dose to be adjusted according to coagulation activity

  - Child 16-17 years (body-weight up to 55 kg): Initially 1250 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days, infusion dose to be adjusted according to coagulation activity

  - Child 16-17 years (body-weight 55–90 kg): Initially 2500 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days, infusion dose to be adjusted according to coagulation activity

  - Child 16-17 years (body-weight 91 kg and above): Initially 3750 units, then (by continuous intravenous infusion) 400 units/hour for 2 hours, then (by continuous intravenous infusion) 300 units/hour for 2 hours, then (by continuous intravenous infusion) 200 units/hour for 5 days, infusion dose to be adjusted according to coagulation activity

- UNLICENSED USE
  - Not licensed for use in children.
  - CONTRA-INDICATIONS
    - Active peptic ulcer (unless this is the reason for the operation) - acute bacterial endocarditis - diabetic retinopathy - epidural anaesthesia (with treatment doses) - haemophilia and other haemorrhagic disorders - recent cerebral haemorrhage - severe hypertension - spinal anaesthesia (with treatment doses) - thrombocytopenia (unless patient has heparin-induced thrombocytopenia)
  - CAUTIONS
    - Antibodies to heparins (risk of antibody-induced thrombocytopenia) - body-weight over 90 kg - recent bleeding - risk of bleeding
  - INTERACTIONS
    - Appendix 1 (danaparoid).
  - SIDE-EFFECTS
    - Bleeding - hypersensitivity reactions - rash
  - PREGNANCY
    - Manufacturer advises avoid — limited information available but not known to be harmful.
  - BREAST FEEDING
    - Amount probably too small to be harmful but manufacturer advises avoid.

- HEPATIC IMPAIRMENT
  - Caution in moderate impairment (increased risk of bleeding). Avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available.

- RENAL IMPAIRMENT
  - Use with caution in moderate impairment. Avoid in severe impairment unless patient has heparin-induced thrombocytopenia and no alternative available. Increased risk of bleeding in renal impairment, monitor anti-Factor Xa activity.

- MONITORING REQUIREMENTS
  - Monitor anti factor Xa activity in patients with body-weight over 90 kg.

- DIRECTIONS FOR ADMINISTRATION
  - For intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%.

- MEDICINAL FORMS
  - There can be variation in the licensing of different medicines containing the same drug.

Solution for injection
- Orgaran (Aspen Pharma Trading Ltd)
  - Danaparoid sodium 1250 unit per 1 ml
  - Orgaran 750units/0.6ml solution for injection ampoules | 10 ampoule (£131.22 DT price = £120.29)

ANTITHROMBOTIC DRUGS > HEPARINS

Heparins

- CONTRA-INDICATIONS
  - Acute bacterial endocarditis - after major trauma - epidural anaesthesia with treatment doses - haemophilia and other haemorrhagic disorders - peptic ulcer - recent cerebral haemorrhage - recent surgery to eye - recent surgery to nervous system - severe hypertension - spinal anaesthesia with treatment doses - thrombocytopenia (including history of heparin-induced thrombocytopenia)

- INTERACTIONS
  - Appendix 1 (heparins).

- SIDE-EFFECTS
  - Rare
    - Alopoeia (on prolonged use) - anaphylaxis - angioedema - hyperkalaemia - hypersensitivity reactions - injection-site reactions - osteoporosis (risk lower with low molecular weight heparins) - priapism - rebound hyperlipidaemia (following unfractionated heparin withdrawal) - skin necrosis - urticaria

  - Frequency not known
    - Haemorrhage - Thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION

- Haemorrhage
  - If haemorrhage occurs it is usually sufficient to withdraw unfractionated or low molecular weight heparin, but if rapid reversal of the effects of the heparin is required, protamine sulfate is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

  - Heparin-induced thrombocytopenia
    - Clinically important heparin-induced thrombocytopenia is immune-mediated and does not usually develop until after 5–10 days; it can be complicated by thrombosis.

    - Signs of heparin-induced thrombocytopenia include a 30% reduction of platelet count, thrombosis, or skin allergy. If heparin-induced thrombocytopenia is strongly suspected or confirmed, the heparin should be stopped and an alternative anticoagulant, such as danaparoid, should be given. Ensure platelet counts return to normal range in those who require warfarin.

    - Hyperkalaemia
      - Inhibition of aldosterone secretion by unfractionated or low molecular weight heparin can result in hyperkalaemia; patients with diabetes mellitus, chronic renal failure, acidosis, raised plasma potassium or those taking potassium-sparing drugs seem to be more susceptible. The risk appears to increase with duration of therapy.
ALLEGY AND CROSS-SENSITIVITY  
Hypersensitivity to unfractionated or low molecular weight heparin.

MONITORING REQUIREMENTS
- Heparin-induced thrombocytopenia  
  Platelet counts should be measured just before treatment with unfractionated or low molecular weight heparin, and regular monitoring of platelet counts may be required if given for longer than 4 days. See the British Society for Haematology’s Guidelines on the diagnosis and management of heparin-induced thrombocytopenia: second edition. Br J Haematol 2012; 159: 528–540.
- Hyperkalaemia  
  Plasma potassium concentration should be measured in patients at risk of hyperkalaemia before starting the heparin and monitored regularly thereafter, particularly if treatment is to be continued for longer than 7 days.

**Dalteparin sodium**

### INICATIONS AND DOSE

**Treatment of thrombotic episodes**
- **BY SUBCUTANEOUS INJECTION**
  - Neonate: 100 units/kg twice daily.
  - Child 1 month–11 years: 100 units/kg twice daily
  - Child 12–17 years: 200 units/kg once daily (max. per dose 18 000 units); reduced to 100 units/kg twice daily, dose reduced if increased risk of bleeding.

**Treatment of venous thromboembolism in pregnancy**
- **BY SUBCUTANEOUS INJECTION**
  - Child 12–17 years (body-weight up to 50 kg): 5000 units twice daily, use body-weight in early pregnancy to calculate the dose
  - Child 12–17 years (body-weight 50–69 kg): 6000 units twice daily, use body-weight in early pregnancy to calculate the dose
  - Child 12–17 years (body-weight 70–89 kg): 8000 units twice daily, use body-weight in early pregnancy to calculate the dose
  - Child 12–17 years (body-weight 90 kg and above): 10 000 units twice daily, use body-weight in early pregnancy to calculate the dose

**Prophylaxis of thrombotic episodes.**
- **BY SUBCUTANEOUS INJECTION**
  - Neonate: 100 units/kg once daily.
  - Child 1 month–11 years: 100 units/kg once daily
  - Child 12–17 years: 2500–5000 units once daily

### UNLICENSED USE
Not licensed for use in children.

### PREGNANCY
Not known to be harmful, low molecular weight heparins do not cross the placenta. Multidose vial contains benzyl alcohol—manufacturer advises avoid.

### BREAST FEEDING
Due to the relatively high molecular weight and inactivation in the gastro-intestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible, however manufacturers advise avoid.

### HEPATIC IMPAIRMENT
Dose reduction may be required in severe impairment—risk of bleeding may be increased.

### RENAL IMPAIRMENT
Risk of bleeding may be increased—dose reduction may be required. Use of unfractionated heparin may be preferable.

### MONITORING REQUIREMENTS
Routine monitoring of anti-Factor Xa activity is not usually required during treatment with dalteparin, except in neonates; monitoring may also be necessary in severely ill children and those with renal or hepatic impairment.

### MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**EXCIPIENTS:** May contain Benzyl alcohol

- Dalteparin sodium (Non-proprietary)
  - Dalteparin sodium 10000 unit per 1 ml Dalteparin sodium 10,000 units/ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PSI) no price available | 3 pre-filled disposable injection no price available
  - Dalteparin sodium 12500 unit per 1 ml Dalteparin sodium 2,500 units/0.2 ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PSI) no price available
  - Dalteparin sodium 25000 unit per 1 ml Dalteparin sodium 7,500 units/0.3 ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PSI) no price available
  - Dalteparin sodium 12,500 units/0.5 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PSI) no price available
  - Dalteparin sodium 5,000 units/0.2 ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PSI) no price available
  - Dalteparin sodium 15,000 units/0.6 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PSI) no price available
  - Dalteparin sodium 10,000 units/0.4 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PSI) no price available
  - Dalteparin sodium 18,000 units/0.72 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PSI) no price available
  - Fragmin (Pfizer Ltd)
    - Dalteparin sodium 2500 unit per 1 ml Fragmin 10,000 units/4 ml solution for injection ampoules | 10 ampoule (PSI) £1.22
    - Dalteparin sodium 10000 unit per 1 ml Fragmin 10,000 units/1 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PSI) £28.23
    - Fragmin 10,000 units/1 ml solution for injection ampoules | 10 ampoule (PSI) £1.22
    - Dalteparin sodium 12500 unit per 1 ml Fragmin 2,500 units/0.2 ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PSI) £18.58
    - Dalteparin sodium 25000 unit per 1 ml Fragmin 18,000 units/0.72 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PSI) £50.82
    - Fragmin 15,000 units/0.6 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PSI) £42.34
    - Fragmin 5,000 units/0.2 ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PSI) £28.23
    - Fragmin 12,500 units/0.5 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PSI) £35.29
    - Fragmin 7,500 units/0.3 ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (PSI) £42.34
    - Fragmin 100,000 units/4 ml solution for injection vials | 1 vial (PSI) £48.66
    - Fragmin 10,000 units/0.4 ml solution for injection pre-filled syringes | 5 pre-filled disposable injection (PSI) £28.23

**Enoxaparin sodium**

### INICATIONS AND DOSE

**Treatment of thrombotic episodes**
- **BY SUBCUTANEOUS INJECTION**
  - Neonate: 1.5–2 mg/kg twice daily.
  - Child 1 month: 1.5 mg/kg twice daily
  - Child 2 months–17 years: 1 mg/kg twice daily

**Treatment of venous thromboembolism in pregnancy**
- **BY SUBCUTANEOUS INJECTION**
  - Child 12–17 years (body-weight up to 50 kg): 40 mg twice daily, dose based on early pregnancy body-weight
  - Child 12–17 years (body-weight 50–69 kg): 60 mg twice daily, dose based on early pregnancy body-weight
  - Child 12–17 years (body-weight 70–89 kg): 80 mg twice daily, dose based on early pregnancy body-weight
  - Child 12–17 years (body-weight 90 kg and above): 100 mg twice daily, dose based on early pregnancy body-weight
Prophylaxis of thrombotic episodes

- **BY SUBCUTANEOUS INJECTION**
  - Neonate: 750 micrograms/kg twice daily.
  - Child 1 month: 750 micrograms/kg twice daily
  - Child 2 months-17 years: 500 micrograms/kg twice daily; maximum 40 mg per day

**DOSE EQUIVALENCE AND CONVERSION**
1 mg equivalent to 100 units.

- **UNLICENSED USE** Not licensed for use in children.
- **PREGNANCY** Not known to be harmful, low molecular weight heparins do not cross the placenta. Multidose vials contains benzyl alcohol—avoid.
- **BREAST FEEDING** Due to the relatively high molecular weight of enoxaparin and inactivation in the gastrointestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible; however manufacturers advise avoid.
- **HEPATIC IMPAIRMENT** Reduce dose in severe impairment—risk of bleeding may be increased.
- **RENAL IMPAIRMENT** Risk of bleeding increased; reduce dose estimated glomerular filtration rate less than 30 ml/minute/1.73 m²—consult product literature for details. Use of unfractionated heparin may be preferable.
- **MONITORING REQUIREMENTS** Routine monitoring of anti-Factor Xa activity is not usually required during treatment with enoxaparin, except in neonates; monitoring may also be necessary in severely ill children and those with renal or hepatic impairment.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
  - Solution for injection
    - EXCIPIENTS: May contain Benzyl alcohol
      - **Clexane (Sanofi)**
        - Enoxaparin sodium 100 mg per 1 ml Clexane 60mg/0.6ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (£39.26 DT price = £38.26)
        - Clexane sodium 300mg/3ml solution for injection multidose vials | 1 vial (£38.79)
        - Clexane sodium 80mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (£55.13 DT price = £55.13)
        - Clexane sodium 40mg/0.4ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (£30.27 DT price = £30.27)
        - Clexane sodium 100mg/1ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (£72.30 DT price = £72.30)
        - Clexane sodium 20mg/0.2ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (£20.06 DT price = £20.86)
        - Enoxaparin sodium 150 mg per 1 ml Clexane Forte 120mg/0.8ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (£87.93 DT price = £87.93)
        - Clexane Forte 150mg/1ml solution for injection pre-filled syringes | 10 pre-filled disposable injection (£99.91 DT price = £99.91)
  - Heparin sodium
    - **Neonate**: 0.5 unit/hour.

Treatment of thrombotic episodes

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Neonate up to 35 weeks corrected gestational age: Initially 50 units/kg, then (by continuous intravenous infusion) 25 units/kg/hour, adjusted according to APTT.
  - Child 1-11 months: Initially 75 units/kg, then (by continuous intravenous infusion) 25 units/kg/hour, adjusted according to APTT
  - Child 1-7 years: Initially 75 units/kg, then (by continuous intravenous infusion) 20 units/kg/hour, adjusted according to APTT
  - **BY SUBCUTANEOUS INJECTION**
    - Child: 250 units/kg twice daily, adjusted according to APTT

**Prophylaxis of thrombotic episodes**
- **BY SUBCUTANEOUS INJECTION**
  - Neonate: 75 units/kg, then (by continuous intravenous infusion) 25 units/kg/hour, adjusted according to APTT.
  - Child 1-11 months: Initially 75 units/kg, then (by continuous intravenous infusion) 25 units/kg/hour, adjusted according to APTT
  - Child 1-7 years: Initially 75 units/kg, then (by continuous intravenous infusion) 20 units/kg/hour, adjusted according to APTT

**Maintenance of cardiac shunts and critical stents**
- **TO THE DEVICE AS A FLUSH**
  - Child: (consult local protocol)

- **UNLICENSED USE** Check product literature for licensed use in children.
- **PREGNANCY** Does not cross the placenta; maternal osteoporosis reported after prolonged use; multidose vials may contain benzyl alcohol—some manufacturers advise avoid.
- **BREAST FEEDING** Not excreted into milk due to high molecular weight.
- **HEPATIC IMPAIRMENT** Risk of bleeding increased—reduce dose or avoid in severe impairment (including oesophageal varices).
- **RENAL IMPAIRMENT** Risk of bleeding increased in severe impairment—dose may need to be reduced.

**DIRECTIONS FOR ADMINISTRATION** For continuous intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%.

- In neonates For maintenance of neonatal umbilical arterial catheter dilute 50 units to a final volume of 50 mL with Sodium Chloride 0.45% or use ready-made bag containing 500 units in 500 mL Sodium Chloride 0.9%; infuse at 0.5 mL/hour. For neonatal intensive care (treatment of thrombosis), dilute 1250 units/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 1 mL/hour provides a dose of 25 units/kg/hour.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

**Solution for injection**
- EXCIPIENTS: May contain Benzyl alcohol
  - **Heparin (unfractionated)**
    - **INDICATIONS AND DOSE**
      - Prevention of clotting in extravascular circuits
        - TO THE DEVICE AS A FLUSH
        - Child: (consult product literature)
      - Maintenance of neonatal umbilical arterial catheter
        - BY INTRAVENOUS INFUSION
      - Neonate: 0.5 unit/hour.
  - Treatment of thrombotic episodes
    - INITIALLY BY INTRAVENOUS INJECTION
      - Neonate up to 35 weeks corrected gestational age: Initially 50 units/kg, then (by continuous intravenous infusion) 25 units/kg/hour, adjusted according to APTT.

- **Heparin sodium 1000 unit per 1 ml** Heparin sodium 1,000units/1ml solution for injection ampoules | 10 ampoule (£34.85)
  - Heparin sodium 5,000units/5ml solution for injection vials | 10 vial (£16.50–£37.41)
  - Heparin sodium 20,000units/20ml solution for injection ampoules | 10 ampoule (£70.80–£70.88)
  - Heparin sodium 5,000units/5ml solution for injection ampoules | 10 ampoule (£37.45–£37.47)
  - Heparin sodium 10,000units/10ml solution for injection ampoules | 10 ampoule (£64.50–£64.90)
  - **Heparin sodium 5000 unit per 1 ml** Heparin sodium 5,000units/1ml solution for injection ampoules | 10 ampoule (£29.94)
    - Heparin Sodium 25,000units/5ml solution for injection vials | 10 vial (£45.00–£48.60)
  - Heparin sodium 25,000units/5ml solution for injection ampoules | 10 ampoule (£75.78)
  - **Heparin calcium 25000 unit per 1 ml** Heparin calcium 5,000units/0.2ml solution for injection ampoules | 10 ampoule (£61.22–£64.70)
Heparin sodium 25000 unit per 1 ml Heparin sodium 25,000units/1ml solution for injection ampoules | 10 ampoule £76.95
Heparin sodium 5,000units/0.2ml solution for injection ampoules | 10 ampoule £37.35

Infusion
- Heparin (unfractionated) (Non-proprietary)
  - Heparin sodium 2 unit per 1 ml Heparin sodium 1,000units/500ml infusion Viaflex bags | 1 bag no price available
  - Heparin sodium 2,000units/1,000ml infusion Viaflex bags | 1 bag no price available

Heparin sodium 5 unit per 1 ml Heparin sodium 5,000units/1litre infusion Viaflex bags | 1 bag no price available

Intravenous flush
- Heparin (unfractionated) (Non-proprietary)
  - Heparin sodium 100 unit per 1 ml Heparin sodium 50units/5ml patency solution ampoules | 10 ampoule £14.96
  - Heparin sodium 50units/5ml IV. flush solution ampoules | 10 ampoule £14.96
  - Heparin sodium 200units/2ml patency solution ampoules | 10 ampoule £15.68

**Tinzaparin sodium**

**INDICATIONS AND DOSE**

- **Treatment of thrombotic episodes**
  - **BY SUBCUTANEOUS INJECTION**
    - Child 1 month: 275 units/kg once daily
    - Child 2-11 months: 250 units/kg once daily
    - Child 1-4 years: 240 units/kg once daily
    - Child 5-9 years: 200 units/kg once daily
    - Child 10-17 years: 175 units/kg once daily

- **Treatment of venous thromboembolism in pregnancy**
  - **BY SUBCUTANEOUS INJECTION**
    - Child 12-17 years: 175 units/kg once daily, dose based on early pregnancy body-weight

- **Prophylaxis of thrombotic episodes**
  - **BY SUBCUTANEOUS INJECTION**
    - Child: 50 units/kg once daily

**UNLICENSED USE** Not licensed for use in children.

**SIDE-EFFECTS**

- Uncommon Headache

**PREGNANCY** Not known to be harmful, low molecular weight heparins do not cross the placenta. Vials contain benzyl alcohol—manufacturer advises avoid.

**BREAST FEEDING** Due to the relatively high molecular weight of tinzaparin and inactivation in the gastrointestinal tract, passage into breast-milk and absorption by the nursing infant are likely to be negligible; however manufacturer advise avoid.

**RENAL IMPAIRMENT** Manufacturer advises caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m². Risk of bleeding may be increased. Unfractionated heparin may be preferable. In renal impairment monitoring of anti-Factor Xa may be required if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** Routine monitoring of anti-Factor Xa activity is not usually required except in neonates; monitoring may also be necessary in severely ill children and those with renal or hepatic impairment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **EXCIPIENTS**: May contain Benzyl alcohol, sulfates
- **Tinzaparin sodium (Non-proprietary)**
  - Tinzaparin sodium 10000 unit per 1 ml Tinzaparin sodium 3,500units/0.35ml solution for injection pre-filled syringes | 10 pre-filled disposable injection £27.71
  - Tinzaparin sodium 4,500units/0.45ml solution for injection pre-filled syringes | 10 pre-filled disposable injection £35.63
  - Tinzaparin sodium 2,500units/0.25ml solution for injection pre-filled syringes | 10 pre-filled disposable injection £19.80
  - Tinzaparin sodium 20,000units/2ml solution for injection vials | 10 vial £85
  - Tinzaparin sodium 20000 unit per 1 ml Tinzaparin sodium 40,000units/2ml solution for injection vials | 1 vial £200

**ANTITHROMBOTIC DRUGS**

**VITAMIN K ANTAGONISTS**

**Vitamin K antagonists**

- **CONTRA-INDICATIONS** Avoid use within 48 hours postpartum - haemorrhagic stroke - significant bleeding

- **CAUTIONS** Bacterial endocarditis (use only if warfarin otherwise indicated) - conditions in which risk of bleeding is increased - history of gastrointestinal bleeding - peptic ulcer - postpartum (delay warfarin until risk of haemorrhage is low—usually 5–7 days after delivery) - recent ischaemic stroke - recent surgery - uncontrolled hypertension

- **INTERACTIONS** Appendix 1 (coumarins, phenindione). Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may affect warfarin control. Caution if concomitant use of drugs that increase risk of bleeding. Avoid cranberry juice.

- **SIDE-EFFECTS** Alopecia - diarrhoea - haemorrhage - hepatic dysfunction - jaundice - nausea - pancreatitis - purpura - pyrexia - rash - skin necrosis (increased risk in patients with protein C or protein S deficiency) - vomiting - ‘purple toes’

- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should be warned of the danger of teratogenicity.

- **PREGNANCY** Should not be given in the first trimester of pregnancy. Warfarin, acenocoumarol, and phenindione cross the placenta with risk of congenital malformations, and placental, fetal, or neonatal haemorrhage, especially during the last few weeks of pregnancy and at delivery. Therefore, if at all possible, they should be avoided in pregnancy, especially in the first and third trimesters (difficult decisions may have to be made, particularly in women with prosthetic heart valves, atrial fibrillation, or with a history of recurrent venous thrombosis or pulmonary embolism). Stopping these drugs before the sixth week of gestation may largely avoid the risk of fetal abnormality.

- **MONITORING REQUIREMENTS**
  - The base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.
  - It is essential that the INR be determined daily or on alternate days in early days of treatment, then at longer
intervals (depending on response), then up to every 12 weeks.

- Change in patient’s clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing.

**PATIENT AND CARER ADVICE** Anticoagulant treatment booklets should be issued to all patients or their carers; these booklets include advice for patients on anticoagulant treatment, an alert card to be carried by the patient at all times, and a section for recording of INR results and dosage information. In England, Wales, and Northern Ireland, they are available for purchase from: Gorse Street, Chadderton Oldham OL9 9QH

Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores. NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmn.com.

In Scotland, treatment booklets and starter information packs can be obtained by emailing stockorders.dppas@theapsgroup.com or by fax on (0131) 6299 967

Electronic copies of the booklets and further advice are also available at www.npsa.nhs.uk/panels/alerts/anticoagulant.

### Warfarin sodium

**INDICATIONS AND DOSE**

#### Treatment and prophylaxis of thrombotic episodes (induction)

- **BY MOUTH**

  - **Neonate** (initiated under specialist supervision): Initially 200 micrograms/kg for 1 dose on day 1, then reduced to 100 micrograms/kg once daily for the following 3 days, subsequent doses dependent on INR levels, induction dose may need to be altered according to condition (e.g. abnormal liver function tests, cardiac failure), concomitant interacting drugs, and if baseline INR above 1.3.

  - **Child**: Initially 200 micrograms/kg (max. per dose 10 mg) for 1 dose on day 1, then reduced to 100 micrograms/kg once daily (max. per dose 5 mg) for the following 3 days, subsequent doses adjusted according to INR levels, induction dose may need to be altered according to condition (e.g. abnormal liver function tests, cardiac failure), concomitant interacting drugs, and if baseline INR above 1.3.

#### Treatment and prophylaxis of thrombotic episodes following induction dose (if INR still below 1.4)

- **BY MOUTH**

  - **Neonate**: 200 micrograms/kg once daily.

  - **Child**: 200 micrograms/kg once daily (max. per dose 10 mg)

#### Treatment and prophylaxis of thrombotic episodes following induction dose (if INR above 3.0)

- **BY MOUTH**

  - **Neonate**: 50 micrograms/kg once daily.

  - **Child**: 50 micrograms/kg once daily (max. per dose 2.5 mg)

#### Treatment and prophylaxis of thrombotic episodes following induction dose (if INR above 3.5)

- **BY MOUTH**

  - **Neonate**: Dose to be omitted.

  - **Child**: Dose to be omitted

### Treatment and prophylaxis of thrombotic episodes (usual maintenance)

- **BY MOUTH**

  - **Neonate**: Maintenance 100–300 micrograms/kg once daily, doses up to 400 micrograms/kg once daily may be required especially if bottle fed, to be adjusted according to INR.

  - **Child**: Maintenance 100–300 micrograms/kg once daily, doses up to 400 micrograms/kg once daily may be required especially if bottle fed, to be adjusted according to INR.

- **UNLICENSED USE** Not licensed for use in children.

- **PREGNANCY** Babies of mothers taking warfarin at the time of delivery need to be offered immediate prophylaxis with intramuscular phytonadione (vitamin K$_1$).

- **BREAST FEEDING** Not present in milk in significant amounts and appears safe. Risk of haemorrhage which is increased by vitamin K deficiency.

- **HEPATIC IMPAIRMENT** Avoid in severe impairment, especially if prothrombin time is already prolonged.

- **RENAL IMPAIRMENT** Use with caution in mild to moderate impairment. In severe renal impairment, monitor INR more frequently.

- **PRESCRIBING AND DISPENSING INFORMATION** Dietary differences Infant formula is supplemented with vitamin K, which makes formula-fed infants resistant to warfarin; they may therefore need higher doses. In contrast breast milk contains low concentrations of vitamin K making breast-fed infants more sensitive to warfarin.

- **PATIENT AND CARER ADVICE** Anticoagulant card to be provided.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

#### Tablet

- **CAUTIONARY AND ADVISORY LABELS** 10

  - Warfarin sodium (Non-proprietary)

    - **Warfarin sodium 500 microgram** Warfarin 500microgram tablets | 28 tablet [P No] £1.92 DT price = £1.54

    - **Warfarin sodium 1 mg** Warfarin 1mg tablets | 28 tablet [P No] £1.16 DT price = £0.76 | 500 tablet [P No] £14.82

    - **Warfarin sodium 3 mg** Warfarin 3mg tablets | 28 tablet [P No] £1.20 DT price = £0.79 | 500 tablet [P No] £15.71

    - **Warfarin sodium 4 mg** Coumadin 4mg tablets | 100 tablet [P No] no price available

    - **Warfarin sodium 5 mg** Warfarin 5mg tablets | 28 tablet [P No] £1.29 DT price = £0.82 | 500 tablet [P No] no price available

    - **Marevan (AMCo)**

      - **Warfarin sodium 1 mg** Marevan 1mg tablets | 28 tablet [P No] £0.31 DT price = £0.76

      - **Warfarin sodium 3 mg** Marevan 3mg tablets | 28 tablet [P No] £0.35 DT price = £0.79

      - **Warfarin sodium 5 mg** Marevan 5mg tablets | 28 tablet [P No] £0.47 DT price = £0.82

#### Oral suspension

- **CAUTIONARY AND ADVISORY LABELS** 10

  - Warfarin sodium (Non-proprietary)

    - **Warfarin sodium 1 mg per 1 ml** Warfarin 1mg/ml oral suspension sugar free sugar-free | 150 ml [P No] £108.00 DT price = £108.00
4 Blood pressure conditions

4.1 Hypertension

Hypertension

Overview

Hypertension in children and adolescents can have a substantial effect on long-term health. Possible causes of hypertension (e.g. congenital heart disease, renal disease and endocrine disorders) and the presence of any complications (e.g. left ventricular hypertrophy) should be established. Treatment should take account of contributory factors and any factors that increase the risk of cardiovascular complications.

Serious hypertension is rare in neonates but it can present with signs of congestive heart failure; the cause is often renal and can follow embolic arterial damage.

Children (or their parents or carers) should be given advice on lifestyle changes to reduce blood pressure or cardiovascular risk; these include weight reduction (in obese children), reduction of dietary salt, reduction of total and saturated fat, increasing exercise, increasing fruit and vegetable intake, and not smoking.

Indications for antihypertensive therapy in children include symptomatic hypertension, secondary hypertension, hypertensive target-organ damage, diabetes mellitus, persistent hypertension despite lifestyle measures, and pulmonary hypertension. The effect of antihypertensive treatment on growth and development is not known; treatment should be started only if benefits are clear.

Antihypertensive therapy should be initiated with a single drug at the lowest recommended dose; the dose can be increased until the target blood pressure is achieved. Once the highest recommended dose is reached, or sooner if the patient begins to experience side-effects, a second drug may be added if blood pressure is not controlled. If more than one drug is required, these should be given as separate products to allow dose adjustment of individual drugs, but fixed-dose combination products may be useful in adolescents if compliance is a problem.

Acceptable drug classes for use in children with hypertension include ACE inhibitors, beta-blockers, calcium-channel blockers, and thiazide diuretics. There is limited information on the use of angiotensin-II receptor antagonists in children. Diuretics and beta-blockers have a long history of safety and efficacy in children. The newer classes of antihypertensive drugs, including ACE inhibitors and calcium-channel blockers have been shown to be safe and effective in short-term studies in children. Refractory hypertension may require additional treatment with agents such as minoxidil p. 108 or clonidine hydrochloride p. 93.

Other measures to reduce cardiovascular risk

Aspirin p. 83 may be used to reduce the risk of cardiovascular events; however, concerns about an increased risk of bleeding and Reye’s syndrome need to be considered.

A statin can be of benefit in older children who have a high risk of cardiovascular disease and have hypercholesterolaemia.

Hypertension in diabetes

Hypertension can occur in type 2 diabetes and treatment prevents both macrovascular and microvascular complications. ACE inhibitors may be considered in children with diabetes and microalbuminuria or proteinuric renal disease. Beta-blockers are best avoided in children with, or at a high risk of developing, diabetes, especially when combined with a thiazide diuretic.

Hypertension in renal disease

ACE inhibitors may be considered in children with microalbuminuria or proteinuric renal disease. High doses of loop diuretics may be required. Specific cautions apply to the use of ACE inhibitors in renal impairment, but ACE inhibitors may be effective. Dihydropyridine calcium-channel blockers may be added.

Hypertension in pregnancy

High blood pressure in pregnancy may usually be due to pre-existing essential hypertension or to pre-eclampsia. Methyldopa is safe in pregnancy. Beta-blockers are effective and safe in the third trimester. Modified-release preparations of nifedipine p. 100 [unlicensed] are also used for hypertension in pregnancy. Intravenous administration of labetalol hydrochloride p. 95 can be used to control hypertensive crises; alternatively hydralazine hydrochloride p. 108 can be given by the intravenous route.

Hypertensive emergencies

Hypertensive emergencies in children may be accompanied by signs of hypertensive encephalopathy, including seizures. Controlled reduction in blood pressure over 72–96 hours is essential; rapid reduction can reduce perfusion leading to organ damage. Treatment should be initiated with intravenous drugs; once blood pressure is controlled, oral therapy can be started. It may be necessary to infuse fluids particularly during the first 12 hours to expand plasma volume should the blood pressure drop too rapidly.

Controlled reduction of blood pressure is achieved by intravenous administration of labetalol hydrochloride or sodium nitroprusside p. 109. Esmolol hydrochloride p. 98 is useful for short-term use and has a short duration of action. Nicardipine hydrochloride p. 100 can be administered as a continuous intravenous infusion for life-threatening hypertension in paediatric intensive care settings. In less severe cases, nifedipine capsules can be used. Other antihypertensive drugs which can be given intravenously include hydralazine hydrochloride and clonidine hydrochloride.

Hypertension in acute nephritis occurs as a result of sodium and water retention; it should be treated with sodium and fluid restriction, and with furosemide p. 132; antihypertensive drugs may be added if necessary.

Also see advice on short-term management of hypertensive episodes in pheochromocytoma.

Phaeochromocytoma

Long-term management of pheochromocytoma involves surgery. However, surgery should not take place until there is adequate blockade of both alpha- and beta-adrenoceptors. Alpha-blockers are used in the short-term management of hypertensive episodes in pheochromocytoma. Once alpha blockade is established, tachycardia can be controlled by the cautious addition of a beta-blocker; a cardioselective beta-blocker is preferred. There is no nationwide consensus on the optimal drug regimen or doses used for the management of pheochromocytoma.

Phenoxybenzamine hydrochloride p. 109, a powerful alpha-blocker, is effective in the management of pheochromocytoma but it has many side-effects.

Pulmonary hypertension

Only pulmonary arterial hypertension is currently suitable for drug treatment. Pulmonary arterial hypertension includes persistent pulmonary hypertension of the newborn, idiopathic pulmonary arterial hypertension in children, and pulmonary hypertension related to congenital heart disease and cardiac surgery.

Some types of pulmonary hypertension are treated with vasodilator antihypertensive therapy and oxygen. Diuretics may also have a role in children with right-sided heart failure.
Initial treatment of persistent pulmonary hypertension of the newborn involves the administration of nitric oxide; epoprostenol p. 110 can be used until nitric oxide is available. Oral sildenafil p. 111 may be helpful in less severe cases. Epoprostenol and sildenafil can cause profound systemic hypotension. In rare circumstances either tolazoline p. 112 or magnesium sulfate p. 556 can be given by intravenous infusion when nitric oxide and epoprostenol have failed.

Treatment of idiopathic pulmonary arterial hypertension is determined by acute vasodilator testing; drugs used for treatment include calcium-channel blockers (usually nifedipine), long-term intravenous epoprostenol, nebulised iloprost p. 110, bosentan p. 111, or sildenafil. Anticoagulation (usually with warfarin sodium p. 89) may also be required to prevent secondary thrombosis.

Inhaled nitric oxide is a potent and selective pulmonary vasodilator. It acts on cyclic guanosine monophosphate (cGMP) resulting in smooth muscle relaxation. Inhaled nitric oxide is used in the treatment of persistent pulmonary hypertension of the newborn, and may also be useful in other forms of arterial pulmonary hypertension. Dependency can occur with high doses and prolonged use; to avoid rebound pulmonary hypertension the drug should be withdrawn gradually, often with the aid of sildenafil p. 111. Excess nitric oxide can cause methaemoglobinaemia; therefore, methaemoglobin concentration should be measured regularly, particularly in neonates.

Nitric oxide increases the risk of haemorrhage by inhibiting platelet aggregation, but it does not usually cause bleeding.

Epoprostenol (prostacyclin) p. 110 is a prostaglandin and a potent vasodilator. It is used in the treatment of persistent pulmonary hypertension of the newborn, idiopathic pulmonary arterial hypertension, and in the acute phase following cardiac surgery. It is given by continuous 24-hour intravenous infusion.

Epoprostenol is a powerful inhibitor of platelet aggregation and there is a possible risk of haemorrhage. It is sometimes used as an antiplatelet in renal dialysis when heparins are unsuitable or contra-indicated. It can also cause serious systemic hypotension and, if withdrawn suddenly, can cause pulmonary hypertensive crisis.

Children on prolonged treatment can become tolerant to epoprostenol, and therefore require an increase in dose. Iloprost p. 110 is a synthetic analogue of epoprostenol and is efficacious when nebulised in adults with pulmonary arterial hypertension, but experience in children is limited. It is more stable than epoprostenol and has a longer half-life.

Bosentan p. 111 is a dual endothelin receptor antagonist used orally in the treatment of pulmonary arterial hypertension. The concentration of endothelin, a potent vasoconstrictor, is raised in sustained pulmonary hypertension.

Sildenafil, a vasodilator developed for the treatment of erectile dysfunction, is also used for pulmonary arterial hypertension. It is used either alone or as an adjunct to other drugs.

Sildenafil is a selective phosphodiesterase type-5 inhibitor. Inhibition of this enzyme in the lungs enhances the vasodilatory effects of nitric oxide and promotes relaxation of vascular smooth muscle.

Sildenafil has also been used in pulmonary hypertension for weaning children off inhaled nitric oxide following cardiac surgery, and less successfully in idiopathic pulmonary arterial hypertension.

Tolazoline p. 112 is now rarely used to correct pulmonary artery vasospasm in pulmonary hypertension of the newborn as better alternatives are available. Tolazoline is an alpha-blocker and produces both pulmonary and systemic vasodilation.

---

### Antihypertensive drugs

#### Vasodilator antihypertensive drugs

Vasodilators have a potent hypotensive effect, especially when used in combination with a beta-blocker and a thiazide. Important: see Hypertension (hypertensive emergencies) for a warning on the hazards of a very rapid fall in blood pressure.

Hydralazine hydrochloride p. 108 is given by mouth as an adjunct to other antihypertensives for the treatment of resistant hypertension but is rarely used; when used alone it causes tachycardia and fluid retention.

Sodium nitroprusside p. 109 is given by intravenous infusion to control severe hypertensive crisis when parenteral treatment is necessary. At low doses it reduces systemic vascular resistance and increases cardiac output; at high doses it can produce profound systemic hypotension—continuous blood pressure monitoring is therefore essential. Sodium nitroprusside may also be used to control paradoxical hypertension after surgery for coarctation of the aorta.

Minoxidil p. 108 should be reserved for the treatment of severe hypertension resistant to other drugs. Vasodilatation is accompanied by increased cardiac output and tachycardia and children develop fluid retention. For this reason the addition of a beta-blocker and a diuretic (usually furosemide p. 132, in high dosage) are mandatory. Hypertrichosis is troublesome and renders this drug unsuitable for females.

Prazosin p. 92 and doxazosin p. 458 have alpha-blocking and vasodilator properties.

#### Centrally acting antihypertensive drugs

Methyldopa, a centrally acting antihypertensive, is of little value in the management of refractory sustained hypertension in infants and children. On prolonged use it is associated with fluid retention (which may be alleviated by concomitant use of diuretics).

Methyldopa is also effective for the management of hypertension in pregnancy. Clonidine hydrochloride p. 93 is also a centrally acting antihypertensive but has the disadvantage that sudden withdrawal may cause a hypertensive crisis. Clonidine hydrochloride is also used under specialist supervision for pain management, sedation, and opioid withdrawal, attention deficit hyperactivity disorder, and Tourette syndrome.

#### Adrenergic neurone blocking drugs

Adrenergic neurone blocking drugs prevent the release of noradrenaline from postganglionic adrenergic neurones. These drugs do not control supine blood pressure and may cause postural hypotension. For this reason they have largely fallen from use in adults and are rarely used in children.

#### Alpha-adrenoceptor blocking drugs

Doxazosin and prazosin have post-synaptic alpha-blocking and vasodilator properties and rarely cause tachycardia.

They can, however, reduce blood pressure rapidly after the first dose and should be introduced with caution.

Alpha-blockers can be used with other antihypertensive drugs in the treatment of resistant hypertension.
**Drugs affecting the**
**renin-angiotensin system**

**Angiotensin-converting enzyme inhibitors**

Angiotensin-converting enzyme inhibitors (ACE inhibitors) inhibit the conversion of angiotensin I to angiotensin II. The main indications of ACE inhibitors in children are shown below. In infants and young children, captopril p. 103 is often considered first.

**Initiation under specialist supervision**

Treatment with ACE inhibitors should be initiated under specialist supervision and with careful clinical monitoring in children.

**Heart failure**

ACE inhibitors have a valuable role in all grades of heart failure, usually combined with a loop diuretic. Potassium supplements and potassium-sparing diuretics should be discontinued before introducing an ACE inhibitor because of the risk of hyperkalaemia. Profound first-dose hypotension can occur when ACE inhibitors are introduced to children with heart failure who are already taking a high dose of a loop diuretic. Temporary withdrawal of the loop diuretic reduces the risk, but can cause severe rebound pulmonary oedema.

**Hypertension**

ACE inhibitors may be considered for hypertension when thiazides and beta-blockers are contra-indicated, not tolerated, or fail to control blood pressure; they may be considered for hypertension in children with type 1 diabetes with nephropathy. ACE inhibitors can reduce blood pressure very rapidly in some patients particularly in those receiving diuretic therapy.

**Diabetic nephropathy**

ACE inhibitors also have a role in the management of diabetic nephropathy.

**Renal effects**

Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if features mentioned below are present). Hyperkalaemia and other side-effects of ACE inhibitors are more common in children with impaired renal function and the dose may need to be reduced.

Concomitant treatment with NSAIDs increases the risk of renal damage, and potassium-sparing diuretics (or potassium-containing salt substitutes) increase the risk of hyperkalaemia.

In children with severe bilateral renal artery stenosis (or severe stenosis of the artery supplying a single functioning kidney), ACE inhibitors reduce or abolish glomerular filtration and are likely to cause severe and progressive renal failure. They are therefore contra-indicated in children known to have these forms of critical renovascular disease.

ACE inhibitor treatment is unlikely to have an adverse effect on overall renal function in children with severe unilateral renal artery stenosis and a normal contralateral kidney, but glomerular filtration is likely to be reduced (or even abolished) in the affected kidney and the long-term consequences are unknown.

ACE inhibitors are therefore best avoided in those with known or suspected renovascular disease, unless the blood pressure cannot be controlled by other drugs. If they are used in these circumstances renal function needs to be monitored.

ACE inhibitors should also be used with particular caution in children who may have undiagnosed and clinically silent renovascular disease. ACE inhibitors are useful for the management of hypertension and proteinuria in children with nephritis. They are thought to have a beneficial effect by reducing intra-glomerular hypertension and protecting the glomerular capillaries and membrane.

**ACE inhibitors in combination with other drugs**

**Concomitant diuretics**

ACE inhibitors can cause a very rapid fall in blood pressure in volume-depleted children; treatment should therefore be initiated with very low doses. In some children the diuretic dose may need to be reduced or the diuretic discontinued at least 24 hours beforehand (may not be possible in heart failure—risk of pulmonary oedema). If high-dose diuretic therapy cannot be stopped, close observation is recommended after administration of the first dose of ACE inhibitor, for at least 2 hours or until the blood pressure has stabilised.

**Angiotensin-II receptor antagonists**

Candesartan cilexetil p. 106, losartan potassium p. 107 and valsartan p. 107 are specific angiotensin-II receptor antagonists with many properties similar to those of the ACE inhibitors. However, unlike ACE inhibitors, they do not inhibit the breakdown of bradykinin and other kinins, and thus are less likely to cause the persistent dry cough which can complicate ACE inhibitor therapy. They are therefore a useful alternative for children who have to discontinue an ACE inhibitor because of persistent cough.

Candesartan cilexetil, losartan potassium or valsartan can be used as an alternative to an ACE inhibitor in the management of hypertension.

**Renal effects**

Angiotensin-II receptor antagonists should be used with caution in renal artery stenosis (see also Renal effects under ACE Inhibitors, above).

**Neonates**

The neonatal response to treatment with ACE inhibitors is very variable, and some neonates develop profound hypotension with even small doses; a test-dose should be used initially and increased cautiously. Adverse effects such as apnoea, seizures, renal failure, and severe unpredictable hypotension are very common in the first month of life and it is therefore recommended that ACE inhibitors are avoided whenever possible, particularly in preterm neonates.

---

**Drugs used for Hypertension not listed below**

Chlortalidone, p. 134 - Diazoxide p. 434

---

**ALPHA-ADRENOCEPTOR BLOCKERS**

**Prazosin**

**INDICATIONS AND DOSE**

**Hypertension**

**BY MOUTH**

- **Child 1 month-11 years:** Initially 10–15 micrograms/kg 2–4 times a day, initial dose to be taken at bedtime, then increased to 500 micrograms/kg daily in divided doses, dose to be increased gradually; maximum 20 mg per day
- **Child 12-17 years:** Initially 500 micrograms 2–3 times a day for 3–7 days, initial dose to be taken at bedtime, then increased to 1 mg 2–3 times a day for a further 3–7 days, then increased if necessary up to 20 mg daily in divided doses, dose should be increased gradually
**Antihypertensives, centrally acting**

### Clonidine hydrochloride

#### INDICATIONS AND DOSE

**Severe hypertension**

- **BY MOUTH**
  - Child 1 month–11 years: Initially 0.5–1 microgram/kg 3 times a day, then increased if necessary up to 25 microgram/kg daily in divided doses, increase dose gradually; maximum 1.2 mg per day
  - **BY SLOW INTRAVENOUS INJECTION**
    - Child 2-17 years: 2–6 microgram/kg (max. per dose 300 micrograms) for 1 dose

#### UNLICENSED USE

- Not licensed for use in children.
- **CONTRA-INDICATIONS**
  - Severe bradycardia secondary to second- or third-degree AV block or sick sinus syndrome
  - **CAUTIONS**
    - Cerebrovascular disease - constipation - heart failure - history of depression - mild to moderate bradycardia - polyneuropathy - Raynaud’s syndrome or other occlusive peripheral vascular disease
- **INTERACTIONS**
  - → Appendix 1 (clonidine).

#### SIDE-EFFECTS

- **Common or very common**
  - Constipation - depression - dizziness - dry mouth - headache - malaise - nausea
- **Uncommon**
  - Bradycardia - delusion - hallucination - hypotension - sleep disturbances - vomiting
- **Rare**
  - Alopecia - AV block - colonic pseudo-obstruction - decreased lacrimation - gynaecomastia - nasal dryness
- **Frequency not known**
  - Bradycardia - confusion - fluid retention - hepatitis - impaired visual accommodation
- **PREGNANCY**
  - May lower fetal heart rate. Avoid oral use unless potential benefit outweighs risk. Avoid using injection.
- **BREAST FEEDING**
  - Avoid — present in milk.

**Beta-adrenoceptor blockers**

**Overview**

Beta-adrenoceptor blocking drugs (beta-blockers) block the beta-adrenoceptors in the heart, peripheral vasculature, bronchi, pancreas, and liver.

Many beta-blockers are available but experience in children is limited to the use of only a few.

Differences between beta-blockers may affect choice. The water-soluble beta-blockers, atenolol p. 97 and sotalol hydrochloride p. 74, are less likely to enter the brain and may therefore cause less sleep disturbance and nightmares. Water-soluble beta-blockers are excreted by the kidneys and dosage reduction is often necessary in renal impairment.

Some beta-blockers, such as atenolol, have an intrinsically longer duration of action and need to be given only once daily. Carvedilol p. 116 and labetalol hydrochloride p. 95 are beta-blockers which have, in addition, an arteriolar vasodilating action and thus lower peripheral resistance. Although carvedilol and labetalol hydrochloride possess both alpha- and beta-blocking properties, these drugs have no important advantages over other beta-blockers in the treatment of hypertension.

Beta-blockers slow the heart and can depress the myocardium; they are contra-indicated in children with second- or third-degree heart block.

Beta-blockers can precipitate asthma and should usually be avoided in children with a history of asthma or bronchospasm. If there is no alternative, a child with well-controlled asthma can be treated for a co-existing condition (e.g. arrhythmia) with a cardioselective beta-blocker, which should be initiated with caution at a low dose by a specialist and the child monitored closely for adverse effects. Atenolol and metoprolol tartrate p. 98 have less effect on the beta₂ (bronchial) receptors and are, therefore, relatively cardioselective, but they are not cardiospecific; they have a lesser effect on airways resistance but are not free of this side-effect.

Beta-blockers are also associated with fatigue, coldness of the extremities, and sleep disturbances with nightmares (may be less common with the water-soluble beta-blockers). Beta-blockers can affect carbohydrate metabolism causing hypoglycaemia or hyperglycaemia in children with or without diabetes; they can also interfere with metabolic and autonomic responses to hypoglycaemia thereby masking symptoms such as tachycardia. However, beta-blockers are not contra-indicated in diabetes, although the cardioselective beta-blockers (e.g. atenolol and metoprolol tartrate) may be preferred. Beta-blockers should be avoided altogether in those with frequent episodes of hypoglycaemia.

**Hypertension**

Beta-blockers are effective for reducing blood pressure, but their mode of action is not understood; they reduce cardiac output, alter baroreceptor reflex sensitivity, and block peripheral adrenoceptors. Some beta-blockers depress plasma renin secretion. It is possible that a central effect may also partly explain their mode of action. Blood pressure can usually be controlled with relatively few side-effects. In general the dose of beta-blocker does not have to be high. Labetalol hydrochloride may be given intravenously for hypertensive emergencies in children; however, care is needed to avoid dangerous hypotension or beta-blockade, particularly in neonates. Esmolol hydrochloride p. 98 is also used intravenously for the treatment of hypertension particularly in the peri-operative period.

Beta-blockers can be used to control the pulse rate in children with phaeochromocytoma. However, they should never be used alone as beta-blockade without concurrent alpha-blockade may lead to a hypertensive crisis.

**Arrhythmias**

In arrhythmias, beta-blockers act principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. They can be used alone or in conjunction with digoxin p. 75 to control the ventricular rate in atrial fibrillation. Beta-blockers are also useful in the management of supraventricular tachycardias and ventricular tachycardias particularly to prevent recurrences of the tachycardia.

Esmolol hydrochloride is a relatively cardioselective beta-blocker with a very short duration of action, used intravenously for the short-term treatment of supraventricular arrhythmias and sinus tachycardia, particularly in the peri-operative period.

Sotalol hydrochloride is a non-cardioselective beta-blocker with additional class III anti-arrhythmic activity. Atenololand sotalol hydrochloride suppress ventricular ectopic beats and non-sustained ventricular tachycardia. However, the pro-arrhythmic effects of sotalol hydrochloride, particularly in children with sick sinus syndrome, may prolong the QT interval and induce torsade de pointes.

**Heart failure**

Beta-blockers may produce benefit in heart failure by blocking sympathetic activity and the addition of a beta-blocker such as carvedilol to other treatment for heart failure may be beneficial. Treatment should be initiated by those experienced in the management of heart failure.

**Thyrotoxicosis**

Beta-blockers are used in the management of thyrotoxicosis including neonatal thyrotoxicosis; propranolol hydrochloride p. 96 can reverse clinical symptoms within 4 days. Beta-blockers are also used for the pre-operative preparation for thyroidectomy; the thyroid gland is rendered less vascular, thus facilitating surgery.

**Other uses**

In tetralogy of Fallot, esmolol hydrochloride or propranolol hydrochloride may be given intravenously in the initial management of cyanotic spells; propranolol hydrochloride is given by mouth for preventing cyanotic spells. If a severe cyanotic spell in a child with congenital heart disease persists despite optimal use of 100% oxygen, propranolol hydrochloride is given by intravenous infusion. If cyanosis is still present after 10 minutes, sodium bicarbonate p. 544 intravenous infusion is given in a dose to correct acidosis (or dose calculated according to arterial blood gas results); sodium bicarbonate 4.2% intravenous infusion is appropriate for a child under 1 year and sodium bicarbonate 8.4% intravenous infusion in children over 1 year. If blood-glucose concentration is less than 3 mmol/litre, glucose 10% intravenous infusion is given, followed by intravenous or intramuscular injection of morphine p. 265.

Beta-blockers are also used in the prophylaxis of migraine. Betaaxol p. 637, carteolol hydrochloride p. 637, levobunolol hydrochloride p. 637, and timolol maleate p. 638 are used topically in glaucoma.
### Beta-adrenoceptor blockers (systemic)

- **CONTRA-INDICATIONS**
  - Asthma - cardiogenic shock - hypotension - marked bradycardia - metabolic acidosis - phaeochromocytoma (apart from specific use with alpha-blockers) - second-degree AV block - severe peripheral arterial disease - sick sinus syndrome - third-degree AV block - uncontrolled heart failure

- **SIDE-EFFECTS**
  - Bradycardia

- **CAUTIONS**
  - Diabetes - first-degree AV block - history of obstructive airways disease (introduce cautiously)
  - myasthenia gravis - portal hypertension (risk of deterioration in liver function)
  - psoriasis - symptoms of thyrotoxicosis may be masked

- **INTERACTIONS** → Appendix 1 (beta-blockers)

- **CAUTIONS, FURTHER INFORMATION**
  - Bronchospasm Beta-blockers, including those considered to be cardioselective, should usually be avoided in patients with a history of asthma, bronchospasm or a history of obstructive airways disease. However, when there is no alternative, a cardioselective beta-blocker can be given to these patients with caution and under specialist supervision. In such cases the risk of inducing bronchospasm should be appreciated and appropriate precautions taken.

- **SIDE-EFFECTS**
  - Rare Dry eyes (reversible on withdrawal) - rashes (reversible on withdrawal)
  - **Frequency not known**
    - Alopecia - bradycardia - bronchospasm - coldness of the extremities - conduction disorders - dizziness - dyspnoea - exacerbation of intermittent claudication - exacerbation of psoriasis - exacerbation of Raynaud’s phenomenon - fatigue - gastrointestinal disturbances - headache - heart failure - hyperglycaemia (in patients with or without diabetes) - hypoglycaemia (in patients with or without diabetes) - hypotension - paraesthesia - peripheral vasoconstriction - psychoses - purpura - sexual dysfunction - sleep disturbances (with nightmares) - symptoms of hypoglycaemia masked - thrombocytopenia - vertigo - visual disturbances

### Labetalol hydrochloride

#### INDICATIONS AND DOSE

<table>
<thead>
<tr>
<th>Hypertensive emergencies</th>
<th>By intravenous infusion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neonate: Initially 0.5 mg/kg/hour (max. per dose 4 mg/kg/hour), dose to be adjusted according to response at intervals of at least 15 minutes</td>
<td></td>
</tr>
<tr>
<td>Child 1 month–11 years: Initially 0.5–1 mg/kg/hour (max. per dose 3 mg/kg/hour), dose to be adjusted according to response at intervals of at least 15 minutes</td>
<td></td>
</tr>
<tr>
<td>Child 12–17 years: Initially 30–120 mg/hour, dose to be adjusted according to response at intervals of at least 15 minutes</td>
<td></td>
</tr>
</tbody>
</table>

- **Hypertension**
  - **By mouth**
    - Child 1 month–11 years: 1–2 mg/kg 3–4 times a day
    - Child 12–17 years: Initially 50–100 mg twice daily, dose to be increased if required at intervals of 3–14 days; usual dose 200–400 mg twice daily, higher doses to be given in 3–4 divided doses; maximum 2.4 g per day
  - **By intravenous injection**
    - Child 1 month–11 years: 250–500 micrograms/kg (max. per dose 20 mg) for 1 dose
    - Child 12–17 years: 50 mg, dose to be given over at least 1 minute, then 50 mg after 5 minutes if required; maximum 200 mg per course

- **UNLICENSED USE**
  - Not licensed for use in children.

### IMPORTANT SAFETY INFORMATION

- With intravenous use
  - Consult local guidelines. In hypertensive encephalopathy reduce blood pressure to normotensive level over 24–48 hours (more rapid reduction may lead to cerebral infarction, blindness, and death). If child fitting, reduce blood pressure rapidly, but not to normal levels.

- **CAUTIONS**
  - Liver damage

- **SIDE-EFFECTS**
  - Rare Lichenoid rash
  - **Frequency not known**
    - Difficulty in micturition - epigastric pain - liver damage - nausea - postural hypotension - vomiting - weakness

- **PREGNANCY**
  - The use of labetalol in maternal hypertension is not known to be harmful, except possibly in the first trimester. If labetalol is used close to delivery, infants should be monitored for signs of alpha-blockade (as well as beta-blockade).

- **BREAST FEEDING**
  - Infants should be monitored as there is a risk of possible toxicity due to alpha-blockade (in addition to beta-blockade).
**Cardiovascular system**

- **NON-SELECTIVE**
- **MEDICINAL FORMS**
  - With oral use
  - With intravenous use
- **DIRECTIONS FOR ADMINISTRATION**
  - Interferes with laboratory tests for catecholamines.
- **MONITORING REQUIREMENTS**
  - Liver damage: Severe hepatocellular damage reported after both short-term and long-term treatment. Appropriate laboratory testing needed at first symptom of liver dysfunction and if laboratory evidence of damage (or jaundice) labetalol should be stopped and not restarted.
- **EFFECT ON LABORATORY TESTS**
  - Interferes with laboratory tests for catecholamines.
- **RENAITAL IMPAIRMENT**
  - Renal impairment reported.
- **HEPATIC IMPAIRMENT**
  - Hepatic impairment reported.

- **INDICATIONS AND DOSE**
  - Propranolol hydrochloride
  - **Trandate** (Focus Pharmaceuticals Ltd)
  - **Tablet**
    - **Acceptable doses**
      - Neonate: 25–50 micrograms/kg every 6–8 hours, adjusted according to response, up to maximum 4 mg/kg per day
      - Child: 25–50 micrograms/kg every 6–8 hours, adjusted according to response, up to maximum 4 mg/kg per day
      - Adult: 80–200 mg twice daily
  - **Solution for injection**
    - **Acceptable doses**
      - Neonate: 25–100 micrograms/ml every 6–8 hours, adjusted according to response, up to maximum 4 mg/kg per day
      - Child: 100–250 micrograms/ml every 6–8 hours, adjusted according to response, up to maximum 4 mg/kg per day

**Medicines for Children leaflet: Labetalol hydrochloride for hypertension**

- **INDICATIONS AND DOSAGE**
  - Labetalol hydrochloride
  - **Trandate** (Focus Pharmaceuticals Ltd)
  - **Tablet**
    - **Acceptable doses**
      - Neonate: 100 micrograms/kg per dose (maximum 5 mg), increased if necessary up to 1 mg/kg every 8 hours
      - Child: 100–200 micrograms/kg per dose (maximum 5 mg), increased if necessary up to 1 mg/kg every 8 hours
      - Adult: 400 micrograms/kg per dose (maximum 100 mg)
  - **Solution for injection**
    - **Acceptable doses**
      - Neonate: 50 micrograms/kg per dose (maximum 2.5 mg), increased if necessary up to 1 mg/kg per dose
      - Child: 50–100 micrograms/kg per dose (maximum 2.5 mg), increased if necessary up to 1 mg/kg per dose
      - Adult: 500 micrograms/kg per dose (maximum 25 mg)

**Neonate**

- **BY MOUTH**
  - Initially 25–50 micrograms/kg every 6–8 hours, increased if necessary up to 1 mg/kg every 8 hours
  - By intravenous injection
    - Neonate: Initially 20–50 micrograms/kg, then 20–50 micrograms/kg every 6–8 hours if required, eCG monitoring required
    - Child: 25–50 micrograms/kg, then 25–50 micrograms/kg every 6–8 hours if required, eCG monitoring required
Hypertension 97

BETA-ADRENERGIC BLOCKERS

SELECTIVE

Atenolol

- INDICATIONS AND DOSE

Hypertension

- BY MOUTH

- Neonate: 0.5–2 mg/kg once daily, dose may be given in 2 divided doses.

- Child 1 month–11 years: 0.5–2 mg/kg once daily, dose may be given in 2 divided doses, doses higher than 50 mg/kg daily are rarely necessary.

- Child 12–17 years: 25–50 mg once daily, dose may be given in 2 divided doses, doses higher than 50 mg/kg daily are rarely necessary.

Arrhythmias

- BY MOUTH

- Neonate: 0.5–2 mg/kg once daily, dose may be given in 2 divided doses.

- Child 1 month–11 years: 0.5–2 mg/kg once daily, dose may be given in 2 divided doses, maximum 100 mg per day.

- Child 12–17 years: 50–100 mg once daily, dose may be given in 2 divided doses.

- UNLICENSED USE

Not licensed for use in children under 12 years.

- BREAST FEEDING

Water soluble beta-blockers such as atenolol are present in breast milk in greater amounts than other beta blockers.

- RENAL IMPAIRMENT

Initially use 50% of usual dose if estimated glomerular filtration rate 10–35 ml/minute/1.73 m²; initially use 30–50% of usual dose if estimated glomerular filtration rate less than 10 ml/minute/1.73 m².

- PATIENT AND CARER ADVICE

Medicines for Children leaflet: Atenolol for hypertension

www.medicinesforchildren.org.uk/atenolol-hypertension-0
Esmolol hydrochloride

**INDICATIONS AND DOSE**

**Arrhythmias** | **Hypertensive emergencies**

- **Initially by intravenous injection**
  - **Child**: Loading dose 500 micrograms/kg, to be given over 1 minute, then (by intravenous infusion) maintenance 50 micrograms/kg/minute for 4 minutes (rate reduced if low blood pressure or low heart rate), if inadequate response, repeat loading dose and increase maintenance infusion, (by intravenous injection) loading dose 500 micrograms/kg, given over 1 minute, then (by intravenous infusion) maintenance 100 micrograms/kg/minute for 4 minutes, if response still inadequate, repeat loading dose and increase maintenance infusion, (by intravenous injection) loading dose 500 micrograms/kg, given over 1 minute, then (by intravenous infusion) maintenance 150 micrograms/kg/minute for 4 minutes, if response still inadequate, repeat loading dose and increase maintenance infusion, (by intravenous injection) loading dose 500 micrograms/kg, given over 1 minute, then (by intravenous infusion) maintenance 200 micrograms/kg/minute for 4 minutes, doses over 300 micrograms/kg/minute not recommended.

**Tetralogy of Fallot**

- **Initially by intravenous injection**
  - **Neonate**: Initially 600 micrograms/kg, dose to be given over 1–2 minutes, then (by intravenous infusion) 300–900 micrograms/kg/minute if required.

**UNLICENSED USE** Not licensed for use in children.

**SIDE-EFFECTS** Thrombophlebitis - venous irritation

**BREAST FEEDING** Manufacturer advises avoidance.

**RENAL IMPAIRMENT** Manufacturer advises caution.

**DIRECTIONS FOR ADMINISTRATION** Give through a central venous catheter; incompatible with bicarbonate.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Brevibloc** (Baxter Healthcare Ltd)
  - **Esmolol hydrochloride 10 mg per 1 ml** Brevibloc Premixed 100mg/10ml solution for injection vials | 5 vial [Price] no price available.

**Metoprolol tartrate**

**INDICATIONS AND DOSE**

**Hypertension**

- **By mouth using immediate-release medicines**
  - **Child 1 month–11 years**: Initially 1 mg/kg twice daily, increased if necessary up to 8 mg/kg daily in 2–4 divided doses (max. per dose 400 mg)
  - **Child 12–17 years**: Initially 50–100 mg daily, increased if necessary to 200 mg daily in 1–2 divided doses, high doses are rarely necessary; maximum 400 mg per day.

**Arrhythmias**

- **By mouth using modified-release medicines**
  - **Child 12–17 years**: Usual dose 50 mg 2–3 times a day, then increased if necessary up to 300 mg daily in divided doses.

**UNLICENSED USE** Not licensed for use in children.

**HEPATIC IMPAIRMENT** Reduce dose in severe impairment.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution.

**Tablet**

**CALCIUM-CHANNEL BLOCKERS**

**Calcium-channel blockers**

**Overview**

Calcium-channel blockers differ in their predilection for the various possible sites of action and, therefore, their therapeutic effects are disparate, with much greater variation than those of beta-blockers. There are important differences between verapamil hydrochloride p. 101, diltiazem hydrochloride p. 136, and the dihydropyridine calcium-channel blockers (amlodipine p. 99, nicardipine hydrochloride p. 100, nifedipine p. 100, and nimodipine p. 80). Verapamil hydrochloride and diltiazem hydrochloride should usually be avoided in heart failure because they may further depress cardiac function and cause clinically significant deterioration.

Verapamil hydrochloride is used for the treatment of hypertension and arrhythmias. However, it is no longer first-line treatment for arrhythmias in children because it has been associated with fatal collapse especially in infants under 1 year; adenosine p. 73 is now recommended for first-line use.

Verapamil hydrochloride is a highly negatively inotropic calcium-channel blocker and it reduces cardiac output, slows the heart rate, and may impair atrioventricular conduction. It may precipitate heart failure, exacerbate conduction disorders, and cause hypotension at high doses and should...
not be used with beta-blockers. Constipation is the most common side-effect.
Nifedipine relaxes vascular smooth muscle and dilates coronary and peripheral arteries. It has more influence on vessels and less on the myocardium than does verapamil hydrochloride and unlike verapamil hydrochloride has no anti-arrhythmic activity. It rarely precipitates heart failure because any negative inotropic effect is offset by a reduction in left ventricular work. Short-acting formulations of nifedipine may be used if a modified-release preparation delivering the appropriate dose is not available or if a child is unable to swallow (a liquid preparation may be prepared using capsules). Nifedipine may also be used for the management of angina due to coronary artery disease in Kawasaki disease or progeria and in the management of Raynaud’s syndrome.

Nicardipine hydrochloride has similar effects to those of nifedipine and may produce less reduction of myocardial contractility; it should only be used for the treatment of life-threatening hypertension in paediatric intensive care settings and in postoperative hypertension.

Amlodipine also resembles nifedipine and nicardipine hydrochloride in its effects and does not reduce myocardial contractility or produce clinical deterioration in heart failure. It has a longer duration of action and can be given once daily. Nifedipine and amlodipine are used for the treatment of hypertension. Side-effects associated with vasodilatation such as flushing and headache (which become less obtrusive after a few days), and ankle swelling (which may respond only partially to diuretics) are common.

Nimodipine is related to nifedipine but the smooth muscle relaxant effect preferentially acts on cerebral arteries. Its use is confined to prevention and treatment of vascular spasm following aneurysmal subarachnoid haemorrhage.

Diltiazem hydrochloride is a peripheral vasodilator and also has mild depressor effects on the myocardium. It is used in the treatment of Raynaud’s syndrome.

### Calcium-channel blockers

**Drug Action** Calcium-channel blockers (less correctly called ‘calcium-antagonists’) interfere with the inward displacement of calcium ions through the slow channels of active cell membranes. They influence the myocardial cells, the cells within the specialised conducting system of the heart, and the cells of vascular smooth muscle. Thus, myocardial contractility may be reduced, the formation and propagation of electrical impulses within the heart may be depressed, and coronary or systemic vascular tone may be diminished.

**Side-effects**

- **Overdose**
  Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur.
  For details on the management of poisoning, see Calcium-channel blockers, under Emergency treatment of poisoning p. 766.

- **Treatment Cessation** There is some evidence that sudden withdrawal of calcium-channel blockers may be associated with an exacerbation of myocardial ischaemia.

- **Renal failure**

- **Hepatic impairment**

- **Pregnancy**

- **Child 12–17 years:**
  - Nifedipine: 5 mg once daily, then increased up to 10 mg once daily, adjusted at intervals of 1–2 weeks
  - Amlodipine: 10 mg once daily

- **Child 18 years:**
  - Amlodipine: 10 mg once daily

### Amlodipine

**Drug Action** Amlodipine is a dihydropyridine calcium-channel blocker.

**Indications and Dose**

- **Hypertension**
  - Child 1 month–11 years: Initially 100–200 micrograms/kg once daily, increased if necessary up to 400 micrograms/kg once daily, adjusted at intervals of 1–2 weeks
  - Child 12–17 years: Initially 5 mg once daily, then increased if necessary up to 10 mg once daily, adjusted at intervals of 1–2 weeks

**Dose Equivalence and Conversion**

- Tablets from various suppliers may contain different salts (e.g. amlodipine besilate, amlodipine maleate, and amlodipine mesilate) but the strength is expressed in terms of amlodipine (base); tablets containing different salts are considered interchangeable.

**Unlicensed Use** Not licensed for use in children under 6 years.

**Contra-Indications** Cardiogenic shock - significant aortic stenosis

**Interactions** → Appendix 1 (calcium-channel blockers).

**Side-effects**

- Common or very common
  - Abdominal pain
  - Dizziness
  - Fatigue
  - Headache
  - Nausea
  - Oedema
  - Palpitation
  - Sleep disturbances

- Uncommon
  - Angina
  - Arthralgia
  - Asthma
  - Back pain
  - Chest pain
  - Dry mouth
  - Dyspnoea
  - Gastro-intestinal disturbances
  - Gynaecomastia
  - Hypotension
  - Impotence
  - Mood changes
  - Muscle cramps
  - Myalgia
  - Myocardial infarction
  - Pancreatitis
  - Peripheral neuropathy
  - Tachycardia
  - Thrombocytopenia
  - Urticaria
  - Vasculitis

**Frequency Not Known** Erythema multiforme

**Overdose**

- In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.

**Pregnancy**

- No information available—manufacturer advises avoid, but risk to fetus should be balanced against risk of uncontrolled maternal hypertension.

**Breast Feeding**

- Manufacturer advises avoid—no information available.

**Hepatic Impairment**

- May need dose reduction—half-life prolonged.

**Directions for Administration**

- Tablets may be dispersed in water.

**Patient and Carer Advice**

- Medicines for Children leaflet: Amlodipine for hypertension
  www.medicinesforchildren.org.uk/amlodipine-for-hypertension

**Medicinal Forms**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- Amlodipine (Non-proprietary)
  - Amlodipine 5 mg: Amlodipine 5mg tablets | 28 tablet £9.42 DT price = £0.72
  - Amlodipine 10 mg: Amlodipine 10mg tablets | 28 tablet £14.07 DT price = £0.77
Nicardipine hydrochloride

**DRUG ACTION** Nicardipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE**

- **Life-threatening hypertension (specialist use only) / Postoperative hypertension (specialist use only)**
  - By continuous intravenous infusion:
    - Neonate: Initially 500 nanograms/kg/minute (max. per dose 5 micrograms/kg/minute), adjusted according to response; maintenance 1–4 micrograms/kg/minute.
    - Child: Initially 500 nanograms/kg/minute (max. per dose 5 micrograms/kg/minute), adjusted according to response; maintenance 1–4 micrograms/kg/minute (max. per dose 250 micrograms/minute).

- **Contra-INDICATIONS** Acute porphyrias p. 562 - avoid within 8 days of myocardial infarction - cardiogenic shock - compensatory hypertension - significant or advanced aortic stenosis.

- **CAUTIONS** Congestive heart failure - elevated intracranial pressure - increased risk of serious hypotension - portal hypertension - pulmonary oedema - significantly impaired left ventricular function - stroke.

- **INTERACTIONS** Appendix 1 (calcium-channel blockers).

SIDE-EFFECTS, FURTHER INFORMATION

- Hypotension and reflex tachycardia: Systemic hypotension and reflex tachycardia with rapid reduction of blood pressure may occur — during intravenous use consider stopping infusion or decreasing dose by half.

- **Overdose**
  - In overdose, the dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.
  - **Pregnancy** May inhibit labour. Not to be used in multiple pregnancy (twins or more) unless there is no other acceptable alternative. Toxicity in animal studies. Risk of severe maternal hypotension and fatal foetal hypoxia — avoid excessive decrease in blood pressure.
  - **Breast Feeding** Manufacturer advises avoid — present in breast milk.

- **Hepatic Impairment** Half-life prolonged in severe impairment — consider using low initial dose. Use with caution in hepatic impairment — increased risk of serious hypotension.

- **Renal Impairment** Use with caution — increased risk of serious hypotension; consider using low initial dose.

- **Monitoring Requirements** Monitor blood pressure and heart rate at least every 5 minutes during intravenous infusion, and then until stable, and continue monitoring for at least 12 hours after end of infusion.

- **Directions for Administration** Intravenous nicardipine should only be administered under the supervision of a specialist and in a hospital or intensive care setting in which patients can be closely monitored. For continuous intravenous infusion, dilute to a concentration of 100–200 micrograms/ml with Glucose 5% and give via volumetric infusion pump or syringe driver; protect from light; to minimise peripheral venous irritation, change site of infusion every 12 hours; risk of adsorption on to plastic in the presence of saline solutions; incompatible with bicarbonate or alkaline solutions — consult product literature.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Solution for infusion**
  - Nicardipine hydrochloride (Non-proprietary)
    - Nicardipine hydrochloride 1 mg per 1 ml Nicardipine 10mg/10ml solution for injection ampoules 1 50ml 78.00
    - Nicardipine hydrochloride 2.5 mg per 1 ml Cardene I.V. 25mg/10ml solution for infusion ampoules 1 10ampoules price = £0.99

**Nifedipine**

**DRUG ACTION** Nifedipine is a dihydropyridine calcium-channel blocker.

**INDICATIONS AND DOSE**

- **Hypertensive crisis / Acute angina in Kawasaki disease or progeria**
  - **By mouth using immediate-release medicines**
    - Child: Initially 250–500 micrograms/kg (max. per dose 10 mg), then repeat once if necessary, may cause unpredictable and severe reduction of blood pressure — monitor closely following administration; if ineffective consider alternative treatment and seek specialist advice.

- **Hypertension / Angina in Kawasaki disease or progeria**
  - **By mouth using immediate-release medicines**
    - Child 1 month–11 years: 200–300 micrograms/kg/3 times a day, dose frequency depends on preparation used; maximum 3 mg/kg per day; minimum 90 mg per day.
    - Child 12–17 years: 5–20 mg 3 times a day, dose frequency depends on preparation used; maximum 90 mg per day.

- **Raynaud’s syndrome**
  - **By mouth using immediate-release medicines**
    - Child 2–17 years: 2.5–10 mg 2–4 times a day, start with low doses at night and increase gradually to avoid postural hypotension, dose frequency depends on preparation used.

- **Persistent hyperinsulinaemic hypoglycaemia**
  - **By mouth using immediate-release medicines**
    - Neonate: 100–200 micrograms/kg/4 times a day (max. per dose 600 micrograms/kg).

**DOSE EQUIVALENCE AND CONVERSION**

**Adalat**

Adalat liquid gel capsules contain 5 mg nifedipine in 0.17 mL and 10 mg nifedipine in 0.34 mL.

- **Unlicensed use** Not licensed for use in children.

- **Contra-Indications** Cardiogenic shock — significant aortic stenosis.

- **Caution** Diabetes mellitus - heart failure - poor cardiac reserve - severe hypotension - short-acting formulations are not recommended for angina or long-term management of hypertension; their use may be associated with large variations in blood pressure and reflex.
Hypertension 101

Blood-pressure monitoring, dose can be repeated after 30 minutes if necessary

**Hypertension**
- **By Mouth Using Immediate-Release Medicines**
  - Child 12–23 months (administered on expert advice): 20 mg 2–3 times a day
  - Child 2–17 years (administered on expert advice): 40–120 mg 2–3 times a day

**Prophylaxis of Supraventricular Arrhythmias (administered on expert advice)**
- **By Mouth Using Immediate-Release Medicines**
  - Child 12–23 months: 20 mg 2–3 times a day
  - Child 2–17 years: 40–120 mg 2–3 times a day

**Contra-Indications**
Acute porphyrias p. 562 · atrial flutter or fibrillation associated with accessory conducting pathways (e.g. Wolff-Parkinson-White-syndrome) · bradycardia · cardiogenic shock · history of heart failure (even if controlled by therapy) · history of significantly impaired left ventricular function (even if controlled by therapy) · hypotension · second- and third-degree AV block · sick sinus syndrome · sino-atrial block

**Caution**
- First-degree AV block

**Interactions**
- COMMON OR VERY COMMON · Asthenia · dizziness · gastro-intestinal disturbance · headache · hypotension · lethargy · oedema · palpitation · vasodilatation
- UNCOMMON · Angioedema · anxiety · chills · dyspnoea · dysuria · epistaxis · erectile dysfunction · hypersensitivity reactions · jaundice · joint swelling · migraine · myalgia · nasal congestion · nocturia · paraesthesia · polyuria · pruritus · rash · sleep disturbance · sweating · syncope · tachycardia · tremor · urticaria · vertigo · visual disturbance

**Side-effects**
- Common or very common · Anorexia · gum hyperplasia · hypergycæmia · male infertility · mood disturbances · photosensitivity reactions · purpura
- Frequency not known · Agranulocytosis · anaphylaxis · dysphagia · gynaecomastia · intestinal obstruction · intestinal ulcer

**Dose Reduction**
Might be required in severe liver disease.

**DIRECTIONS FOR ADMINISTRATION**
For rapid effect in hypertensive crisis, bite capsules and swallow liquid or use liquid preparation if 5 mg or 10 mg dose inappropriate. If liquid unavailable, extract contents of capsule via a syringe and use immediately—cover syringe with foil to protect contents from light; capsule contents may be diluted with water if necessary.

**PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Nifedipine for high blood pressure www.medicinesforchildren.org.uk/nifedipine-for-high-blood-pressure

**Medications**
Nifedipine contains calcium channel blocking agents. It is not known whether the usual adult dose of nifedipine is too high if given to children.

**INDICATIONS AND DOSE**
Treatment of supraventricular arrhythmias
- **By Slow Intravenous Injection**
  - Child 1–7 years (administered on expert advice): 100–300 micrograms/kg (max. per dose 5 mg) for 1 dose, to be given over 2–3 minutes (with ECG and blood-pressure monitoring), dose can be repeated after 30 minutes if necessary

**Cardiovascular System**

**Verapamil hydrochloride**

**Indications and dose**
- Treatment of supraventricular arrhythmias
  - By slow intravenous injection
  - Child 1–7 years (administered on expert advice): 100–300 micrograms/kg (max. per dose 5 mg) for 1 dose, to be given over 2–3 minutes (with ECG and blood-pressure monitoring), dose can be repeated after 30 minutes if necessary

**Hypertension**
- By mouth using immediate-release medicines
  - Child 12–23 months (administered on expert advice): 20 mg 2–3 times a day
  - Child 2–17 years (administered on expert advice): 40–120 mg 2–3 times a day

**Prophylaxis of supraventricular arrhythmias (administered on expert advice)**
- By mouth using immediate-release medicines
  - Child 12–23 months: 20 mg 2–3 times a day
  - Child 2–17 years: 40–120 mg 2–3 times a day

**Contra-indications**
Acute porphyrias p. 562 · atrial flutter or fibrillation associated with accessory conducting pathways (e.g. Wolff-Parkinson-White-syndrome) · bradycardia · cardiogenic shock · history of heart failure (even if controlled by therapy) · history of significantly impaired left ventricular function (even if controlled by therapy) · hypotension · second- and third-degree AV block · sick sinus syndrome · sino-atrial block

**Caution**
First-degree AV block

**Interactions**
- Common or very common · Asthenia · dizziness · fatigue · flushing · headache · nausea · vomiting
- Uncommon · Ankle oedema · dizziness · fatigue · flushing · headache · nausea · vomiting
- Rare · Allergic reactions · angioedema · anaphylaxis · arthralgia · asystole · bradycardia · chills · dyspnoea · erythema · erythromelalgia · gingival hyperplasia after long-term treatment · gynaecomastia · heart failure · heart failure · hypotension · second- and third-degree AV block · sick sinus syndrome · sino-atrial block

**Side-effects**
- Common or very common · Asthenia · dizziness · fatigue · flushing · headache · nausea · vomiting
- Uncommon · Ankle oedema · dizziness · fatigue · flushing · headache · nausea · vomiting
- Rare · Allergic reactions · angioedema · anaphylaxis · arthralgia · asystole · bradycardia · chills · dyspnoea · erythema · erythromelalgia · gingival hyperplasia after long-term treatment · gynaecomastia · heart failure · heart failure · hypotension · second- and third-degree AV block · sick sinus syndrome · sino-atrial block

**Dose Reduction**
Might be required in severe liver disease.

**DIRECTIONS FOR ADMINISTRATION**
For rapid effect in hypertensive crisis, bite capsules and swallow liquid or use liquid preparation if 5 mg or 10 mg dose inappropriate. If liquid unavailable, extract contents of capsule via a syringe and use immediately—cover syringe with foil to protect contents from light; capsule contents may be diluted with water if necessary.
Cardiovascular system

PREGNANCY

Frequency not known

Uncommon

Existing conditions

Potassium loss

DIURETICS

Thiazides and related diuretics

CONTRA-INDICATIONS

Addison’s disease · hypercalcaemia · hypotraemia · refractory hypokalaemia · symptomatic hyperuricaemia

CAUTIONS

Diabetes · gout · hyperaldosteronism · malnourishment · nephrotic syndrome · systemic lupus erythematosus

CAUTIONS, FURTHER INFORMATION

Potassium loss Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.

Hypokalaemia is particularly dangerous in children being treated with cardiac glycosides. In hepatic failure hypokalaemia caused by diuretics can precipitate encephalopathy.

The use of potassium-sparing diuretics avoids the need to take potassium supplements.

Existing conditions Thiazides and related diuretics can exacerbate diabetes, gout, and systemic lupus erythematosus.

INTERACTIONS

Appendix 1 (diuretics).

SIDE-EFFECTS

Common or very common

Altered plasma-lipid concentrations · gout · hypercalcaemia · hyperglycaemia · hyperuricaemia · hypercholaemic alkalosis · hypokalaemia · hypomagnesaemia · hypotraemia · metabolic and electrolyte disturbances · mild gastrointestinal disturbances · postural hypotension

Uncommon

Agranulocytosis · blood disorders · impotence · leucopenia · thrombocytopenia

Frequency not known

Cardiac arrhythmias · dizziness · headache · hypersensitivity reactions · intrahepatic cholestasis · pancreatitis · paraesthesia · photosensitivity · pneumonitis · pulmonary oedema · severe skin reactions · visual disturbances

PREGNANCY

Thiazides and related diuretics should not be used to treat gestational hypertension. They may cause neonatal thrombocytopenia, bone marrow suppression, jaundice, electrolyte disturbances, and hypoglycaemia; placental perfusion may also be reduced. Stimulation of labour, uterine inertia, and meconium staining have also been reported.

HEPATIC IMPAIRMENT

Caution in mild to moderate impairment. Avoid in severe liver disease. Hypokalaemia may precipitate coma in hepatic impairment, although hypokalaemia can be prevented by using a potassium-sparing diuretic.

RENAL IMPAIRMENT

Thiazides and related diuretics should be used with caution because they can further reduce renal function. They are ineffective if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m² and should be avoided. Metolazone remains effective if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m² but is associated with a risk of excessive diuresis. Electrolytes should be monitored in renal impairment.

MONITORING REQUIREMENTS

Electrolytes should be monitored, particularly with high doses and long-term use.

Bendroflumethiazide

(Bendrofluazide)

INDICATIONS AND DOSE

Hypertension

BY MOUTH

Child 1 month–1 year: 50–100 micrograms/kg daily, adjusted according to response

Child 2–11 years: Initially 50–400 micrograms/kg daily (max. per dose 10 mg), then maintenance 50–100 micrograms/kg daily, adjusted according to response; maximum 10 mg per day

Child 12–17 years: 2.5 mg once daily, dose to be taken as a single dose in the morning, higher doses are rarely necessary

Oedema in heart failure, renal disease and hepatic disease Pulmonary oedema

BY MOUTH

Child 1 month–1 year: 50–100 micrograms/kg daily, adjusted according to response

Child 2–11 years: Initially 50–400 micrograms/kg daily (max. per dose 10 mg), then maintenance 50–100 micrograms/kg daily, adjusted according to response; maximum 10 mg per day

Child 12–17 years: Initially 5–10 mg once daily or on alternate days, adjusted according to response, dose to be taken as a single dose in the morning; maximum 10 mg per day

BREAST FEEDING

The amount present in milk is too small to be harmful. Large doses may suppress lactation.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

Verapamil hydrochloride (Non-proprietary)

Verapamil hydrochloride 40 mg Verapamil 40mg tablets | 84 tablet (Po) £0.02 DT price = £1.65

Verapamil hydrochloride 80 mg Verapamil 80mg tablets | 84 tablet (Po) £0.23 DT price = £1.90

Verapamil hydrochloride 120 mg Verapamil 120mg tablets | 28 tablet (Po) £0.01 DT price = £1.47

Verapamil hydrochloride 160 mg Verapamil 160mg tablets | 56 tablet (Po) £3.94 DT price = £22.20

Oral solution

Verapamil hydrochloride (Non-proprietary)

Verapamil hydrochloride 8 mg per 1 ml Verapamil 40mg/5ml oral solution sugar free sugar-free | 150 ml (Po) £39.00 DT price = £36.90

Zolpresa (Rosemont Pharmaceuticals Ltd)

Verapamil hydrochloride 8 mg per 1 ml Zolpresa 40mg/5ml oral solution sugar-free | 150 ml (Po) £36.90 DT price = £36.90

Solution for injection

Securin (BGP Products Ltd)

Verapamil hydrochloride 2.5 mg per 1 ml Securin IV 5mg/2ml solution for injection ampoules | 5 ampoule (Po) £5.41

VERAPAMIL HYDROCHLORIDE (NON-PROPRIETARY)

VERAPAMIL HYDROCHLORIDE FOR ORAL SOLUTION 40 MG/ML SOLUTION FOR INJECTION 5 ML ORAL SOLUTION SUGAR-FREE

Manufacturers include: oral suspension, oral solution

102 Blood pressure conditions

BNFC 2016–2017
Chlorothiazide

**INDICATIONS AND DOSE**

Heart failure | Hypertension | Ascites

▶ **BY MOUTH**
- Neonate: 10–20 mg/kg twice daily.
- Child 1–5 months: 10–20 mg/kg twice daily
- Child 6 months–11 years: 10 mg/kg twice daily; maximum 1 g per day.
- Child 12–17 years: 0.25–1 g once daily, alternatively 125–500 mg twice daily.

**Reduction of diazoxide-induced sodium and water retention in the management of chronic hypoglycaemia**

Potentiating the glycaemic effect of diazoxide in the management of chronic hypoglycaemia

▶ **BY MOUTH**
- Child: 3–5 mg/kg twice daily

**Nephrogenic and partial pituitary diabetes insipidus**

▶ **BY MOUTH**
- Child: 10–20 mg/kg twice daily (max. per dose 500 mg)

**UNLICENSED USE** Not licensed.

**CAUTIONS**

- Neonate (theoretical risk of kernicterus if very jaundiced)

**BREAST FEEDING**
The amount present in milk is too small to be harmful. Large doses may suppress lactation.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution.

**Tablet**
- Chlorothiazide (Non-proprietary)
  - Chlorothiazide 250 mg (Diuril 250 mg tablets | 100 tablet cards) no price available
- Oral suspension
  - Chlorothiazide (Non-proprietary)
    - Chlorothiazide 50 mg per 1 ml (Diuril 250 mg/5ml oral suspension | 237 ml) no price available

**DRUGS ACTING ON THE RENIN-ANGIOTENSIN SYSTEM ▶ ACE INHIBITORS**

An angiotensin-converting enzyme inhibitors

**CONTRA-INDICATIONS** Bilateral renovascular disease

**CAUTIONS**

- Afro-Caribbean patients (may respond less well to ACE inhibitors) - concomitant diuretics - first dose hypotension (especially in patients taking high doses of diuretics, on a low-sodium diet, on dialysis, dehydrated, or with heart failure) - neonates (in neonates) - primary aldosteronism (patients may respond less well to ACE inhibitors) - the risk of agranulocytosis is possibly increased in collagen vascular disease (blood counts recommended) - use with care (or avoid) in those with a history of idiopathic or hereditary angioedema - use with care in patients with hypertrrophic cardiomyopathy - use with care in patients with severe or symptomatic aortic stenosis (risk of hypotension)

**CAUTIONS, FURTHER INFORMATION**

- Anaphylactoid reactions To prevent anaphylactoid reactions, ACE inhibitors should be avoided during dialysis with high-flux polyacrylonitrile membranes and during low-density lipoprotein apheresis with dextran sulfate; they should also be withheld before desensitisation with wasp or bee venom.

**INTERACTIONS** ▶ Appendix 1 (ACE inhibitors).

**SIDE-EFFECTS**

- Common or very common Apnoea (in neonates) - renal failure (in neonates) - seizures (in neonates) - severe unpredictable hypotension (in neonates)

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hepatic effects In light of reports of cholestatic jaundice, hepatitis, fulminating hepatic necrosis, and hepatic failure, ACE inhibitors should be discontinued if marked elevation of hepatic enzymes or jaundice occur.
- ALLERGY AND CROSS-SENSITIVITY ACE inhibitors are contra-indicated in patients with hypersensitivity to ACE inhibitors (including angioedema).
- PREGNANCY ACE inhibitors should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; skull defects and oligohydramnios have also been reported.

**BREAST FEEDING** Information on the use of ACE inhibitors in breast-feeding is limited.

**RENAI IMPAIRMENT** Use with caution, starting with low dose, and adjust according to response. Hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced.

**MONITORING REQUIREMENTS** Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if side effects mentioned are present).

**DIRECTIONS FOR ADMINISTRATION** For hypertension the first dose should preferably be given at bedtime.

**Captopril**

**INDICATIONS AND DOSE**

**Hypertension**

▶ **BY MOUTH**
- Preterm neonate (initiated under specialist supervision): Test dose 10 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 300 micrograms/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.
- Neonate (initiated under specialist supervision): Test dose 10–50 micrograms/kg, monitor blood pressure carefully for 1–2 hours; usual dose 10–50 micrograms/kg 2–3 times a day, then increased if necessary up to 2 mg/kg daily in divided doses, ongoing doses should only be given if test dose tolerated.
- Child 1–11 months (initiated under specialist supervision): Test dose 100 micrograms/kg (max. per dose 6.25 mg), monitor blood pressure carefully for continued ➔

**SIDE EFFECTS**

- Uncommon Angina, arrhythmia, flushing, pallor, palpitation, Raynaud’s syndrome, tachycardia
- Rare Anorexia, stomatitis
- Very rare Allergic alveolitis, blurred vision, cardiac arrest, cardiogenic shock, cerebrovascular events, confusion, depression, eosinophilic pneumonia, glossitis, gynaecomastia, hyponatraemia, impotence, peptic ulcer, photosensitivity, Stevens-Johnson syndrome, syncope

**DIRECTIONS FOR ADMINISTRATION**

Administer under close supervision. Give test dose whilst child supine. Tablets can be dispersed in water.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Captopril for heart failure

www.medicinesforchildren.org.uk/captopril-heart-failure-0
Enalapril maleate

INDICATIONS AND DOSE

Hypertension

BY MOUTH

• Neonate (under expert supervision): Initially 10 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, increased if necessary up to 500 micrograms/kg daily in 1–3 divided doses, limited information.

• Child 1 month–11 years (under expert supervision): Initially 100 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, then increased if necessary up to 1 mg/kg daily in 1–2 divided doses

• Child 12–17 years (under expert supervision) (body-weight up to 50 kg): Initially 2.5 mg once daily, monitor blood pressure carefully for 1–2 hours, maintenance 10–20 mg daily in 1–2 divided doses

• Child 12–17 years (body-weight 50 kg and above): Initially 2.5 mg once daily, monitor blood pressure carefully for 1–2 hours, maintenance 10–20 mg daily in 1–2 divided doses; maximum 40 mg per day

Heart failure

• Neonate (under expert supervision): Initially 10 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, increased if necessary up to 500 micrograms/kg daily in 1–3 divided doses, limited information.

• Child 1 month–11 years (under expert supervision): Initially 100 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, then increased if necessary up to 1 mg/kg daily in 1–2 divided doses

• Child 12–17 years (under expert supervision) (body-weight up to 50 kg): Initially 2.5 mg once daily, monitor blood pressure carefully for 1–2 hours, maintenance 10–20 mg daily in 1–2 divided doses

Proteinuria in nephritis (under expert supervision)

• Neonate: Initially 10 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, increased if necessary up to 500 micrograms/kg daily in 1–3 divided doses, limited information.

• Child 1 month–11 years: Initially 100 micrograms/kg once daily, monitor blood pressure carefully for 1–2 hours, then increased if necessary up to 1 mg/kg daily in 1–2 divided doses

UNLICENSED USE

Not licensed for use in children for congestive heart failure, proteinuria in nephritis or diabetic nephropathy; not licensed for use in children less than 20 kg for hypertension.

SIDE-EFFECTS

• Common or very common Asthenia - blurred vision - depression - dyspnoea

• Uncommon Alopecia - anorexia - arrhythmias - confusion - drowsiness - dry mouth - flushing - hyponatraemia - ilesus - impotence - insomnia - muscle cramps - nervousness - palpitation - peptic ulcer - sweating - tinnitus - vertigo

• Rare Abnormal dreams - allergic alveolitis - exfoliative dermatitis - glossitis - gynaecomastia - pempigus - pulmonary infiltrates - Raynaud's syndrome - Stevens-Johnson syndrome - stomatitis - toxic epidermal necrolysis

• Very rare Gastro-intestinal angioedema

BREAST FEEDING

Avoid in first few weeks after delivery, particularly in preterm infants—risk of profound neonatal hypotension; can be used in mothers breast-feeding older infants if essential but monitor infant’s blood pressure.

HEPATIC IMPAIRMENT

Enalapril is a produrg and requires close monitoring in patients with hepatic impairment.

DIRECTIONS FOR ADMINISTRATION

Tablets may be crushed and suspended in water immediately before use.

PATIENT AND CARER ADVICE

Medicinal forms

Patient and carer advice

Breast feeding

Very rare ▶ Rare ▶ Uncommon

Side-effects

Information during breast-feeding, are available. Treatment options, with better established safety

Renal impairment

Caution

Afro-Caribbean patients—particularly those with left ventricular hypertrophy (may not benefit from an angiotensin-II receptor antagonist) · aortic or mitral valve stenosis · hypertrophic cardiomyopathy · patients with a history of angioedema · patients with primary aldosteronism (may not benefit from an angiotensin-II receptor antagonist) · renal artery stenosis

Interactions

Drug interactions

Pregnancy

Angiotensin II receptor antagonists

Caution

Angiotensin II receptor antagonists should be avoided in pregnancy unless essential. They may adversely affect fetal and neonatal blood pressure control and renal function; neonatal skull defects and oligohydramnios have also been reported.

Breast feeding

Information on the use of angiotensin-II receptor antagonists in breast-feeding is limited. They are not recommended in breast-feeding and alternative treatment options, with better established safety information during breast-feeding, are available.

Renal impairment

Use with caution, starting with low dose, and adjust according to response.

Monitoring requirements

Monitor plasma-potassium concentration, particularly in children with renal impairment.

Candesartan cilexetil

Indications and dose

Hypertension

By mouth

Child 6–17 years (under expert supervision) (body-weight up to 50 kg): Initially 4 mg once daily, adjusted according to response, lower dose may be used in intravascular volume depletion; maximum 8 mg per day

Child 6–17 years (under expert supervision) (body-weight 50 kg and above): Initially 4 mg once daily, adjusted according to response, lower dose may be used in intravascular volume depletion; maximum 16 mg per day

Contra-indications

Cholestasis

Side-effects

Common or very common

Cough · headache · rash · vertigo

Uncommon

Hyponatraemia

Very rare

Arthralgia · back pain · blood disorders · hepatitis · myalgia · nausea · priapism · urticaria

Hepatic impairment

Reduce initial dose in mild or moderate impairment. Avoid in severe hepatic impairment.

Renal impairment

Reduce initial dose. Use with caution if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m²—no information available.
Losartan potassium

- **INDICATIONS AND DOSE**
  - **Hypertension**
    - Child 6–17 years (under expert supervision) (body-weight 20–49 kg): Initially 700 micrograms/kg once daily (max. per dose 25 mg), adjusted according to response to 50 mg daily, lower initial dose may be used in intravascular volume depletion; maximum 50 mg per day
    - Child 6–17 years (under expert supervision) (body-weight 50 kg and above): Initially 50 mg once daily, adjusted according to response; maximum 100 mg per day

- **Hypertension with intravascular volume depletion**
  - **BY MOUTH**
    - Child 6–17 years (under expert supervision) (body-weight 50 kg and above): Initially 25 mg once daily; adjusted according to response to 1.4 mg/kg once daily; maximum 100 mg per day

- **CAUTIONS** Severe heart failure
- **SIDE-EFFECTS**
  - Common or very common Anaemia - malaise
  - Uncommon Abdominal pain - angina - constipation - cough - diarrhoea - drowsiness - dyspnoea - headache - malaise - oedema - palpitation - pruritus - rash - sleep disorders - urticaria - vomiting
  - Rare Atrial fibrillation - cerebrovascular accident - hepatitis - paraesthesia
  - Frequency not known Arthralgia - depression - erectile dysfunction - Henoch-Schönlein purpura - hypogonadism - myalgia - pancreatitis - photosensitivity - rhabdomyolysis - thrombocytopenia - tinnitus - vasculitis

- **HEPATIC IMPAIRMENT** Avoid—no information available.
- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m²—no information available.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include berry-citrus.

Valsartan

- **INDICATIONS AND DOSE**
  - **Hypertension**
    - Child 6–17 years (under expert supervision) (body-weight 18–34 kg): Initially 40 mg once daily, adjusted according to response; maximum 80 mg per day
    - Child 6–17 years (under expert supervision) (body-weight 35–79 kg): Initially 80 mg once daily, adjusted according to response; maximum 160 mg per day
    - Child 6–17 years (under expert supervision) (body-weight 80 kg and above): Initially 80 mg once daily, adjusted according to response; maximum 320 mg per day

- **UNLICENSED USE** Capsules not licensed for use in children.
- **CONTRA-INDICATIONS** Biliary cirrhosis - cholestasis
- **SIDE-EFFECTS**
  - Uncommon Abdominal pain - cough - diarrhoea - headache - malaise - nausea
  - Frequency not known Anaemia - myalgia - neutropenia - pruritus - rash - renal failure - serum sickness - thrombocytopenia - vasculitis

- **HEPATIC IMPAIRMENT** Max. dose 80 mg daily in mild to moderate impairment. Avoid in severe hepatic impairment.
- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m²—no information available.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

- **Losartan potassium (Non-proprietary)**
  - Losartan potassium 12.5 mg: Losartan 12.5 mg tablets | 28 tablet | £3.49 DT price = £3.49
  - Losartan potassium 25 mg: Losartan 25 mg tablets | 28 tablet | £3.53 DT price = £6.66
  - Losartan potassium 50 mg: Losartan 50 mg tablets | 28 tablet | £13.69 DT price = £13.69
  - Losartan potassium 100 mg: Losartan 100 mg tablets | 28 tablet | £14.69 DT price = £14.69

- **Valsartan (Non-proprietary)**
  - Valsartan 40 mg: Valsartan 40 mg tablets | 7 tablet | £3.49 DT price = £2.66
  - Valsartan 80 mg: Valsartan 80 mg tablets | 28 tablet | £13.69 DT price = £13.69

- **Valsartan 160 mg**
  - Valsartan 160 mg tablets | 28 tablet | £14.69 DT price = £14.69

- **Valsartan 320 mg**
  - Valsartan 320 mg tablets | 28 tablet | £20.23 DT price = £14.32

Cardiovascular system
CARDIOVASCULAR SYSTEM

FREQUENCY NOT KNOWN

SIDE-EFFECTS
INTERACTIONS
CAUTIONS

UNLICENSED USE

SIDE-EFFECTS, FURTHER INFORMATION

The incidence of side-effects is lower if the dose is kept low, but systemic lupus erythematosus should be suspected if there is unexplained weight loss, arthritis, or any other unexplained ill health.

PREGNANCY

Neonatal thrombocytopenia reported, but risk should be balanced against risk of uncontrolled maternal hypertension. Manufacturer advises avoid before third trimester.

BREAST FEEDING

Present in milk but not known to be harmful.

Monitor infant in breast-feeding.

HEPATIC IMPAIRMENT
Reduce dose.

RENAL IMPAIRMENT
Reduce dose if estimated glomerular filtration rate less than 30 ml/minute/1.73 m².

MONITORING REQUIREMENTS
Manufacturer advises test for antinuclear factor and for proteinuria every 6 months and check acetylator status before increasing dose, but evidence of clinical value unsatisfactory.

DIRECTIONS FOR ADMINISTRATION

With oral use for administration by mouth, diluted injection may be given orally.

With intravenous use for continuous intravenous infusion, initially reconstitute 20 mg with 1 ml. Water for Injections, then dilute with Sodium Chloride 0.9%. Incompatible with Glucose intravenous infusion. For intraavenous injection, initially reconstitute 20 mg with 1 ml Water for Injections, then dilute to a concentration of 0.5–1 mg/ml with Sodium Chloride 0.9% and administer over 5–20 minutes.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

TABLET

EXCIPIENTS: May contain Gluten, propylene glycol

Hydralazine hydrochloride (non-proprietary)

Hydralazine hydrochloride 10 mg Apo-Hydralazine 10mg tablets | 100 tablet | no price available

Hydralazine hydrochloride 25 mg Hydralazine hydrochloride 25mg tablets | 56 tablet | £8.56 DT price = £17.71 | 84 tablet | £14.00

Hydralazine hydrochloride 50 mg Hydralazine 50mg tablets | 56 tablet | £15.74 DT price = £33.15

Apresoline (AMCo)

Hydralazine hydrochloride 25 mg Apresoline 25mg tablets | 84 tablet | £3.38

Powder for solution for injection

Hydralazine hydrochloride (non-proprietary)

Hydralazine hydrochloride 20 mg Hydralazine 20mg powder for concentrate for solution for injection ampoules | 5 ampoule | £64.50

Apresoline (AMCo)

Hydralazine hydrochloride 20 mg Apresoline 20mg powder for solution for injection ampoules | 5 ampoule | £11.09

Minoxidil

INDICATIONS AND DOSE

Severe hypertension

BY MOUTH

Child 1 month–11 years: Initially 200 micrograms/kg daily in 1–2 divided doses, then increased in steps of 100–200 micrograms/kg, increased at intervals of at least 3 days; maximum 1 mg/kg per day

Child 12–17 years: Initially 5 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg daily, increased at intervals of at least 3 days, seldom necessary to exceed 50 mg daily; maximum 100 mg per day

CONTRA-INDICATIONS

Phaeochromocytoma

CAUTIONS

Acute porphyrias p. 562

Vasodilators \ VASODILATOR ANTIHYPERTENSIVES

Hydralazine hydrochloride

INDICATIONS AND DOSE

Resistant hypertension (adj)

BY MOUTH

Neonate: 250–500 micrograms/kg every 8–12 hours, increased if necessary to 2–3 mg/kg every 8 hours.

Child 1 month–11 years: 250–500 micrograms/kg every 8–12 hours, increased if necessary to 7.5 mg/kg daily; maximum 200 mg per day

Child 12–17 years: 25 mg twice daily, increased to 50–100 mg twice daily

BY SLOW INTRAVENOUS INJECTION

Neonate: 100–500 micrograms/kg, dose may be repeated if necessary every 4–6 hours; maximum 3 mg/kg per day.

Child 1 month–11 years: 100–500 micrograms/kg, dose may be repeated if necessary every 4–6 hours; maximum 3 mg/kg per day; maximum 60 mg per day

Child 12–17 years: 5–10 mg, dose may be repeated if necessary every 4–6 hours

BY CONTINUOUS INTRAVENOUS INFUSION

Neonate: 12.5–50 micrograms/kg/hour, continuous intravenous infusion is the preferred route in cardiac patients; maximum 2 mg/kg per day.

Child 1 month–11 years: 12.5–50 micrograms/kg/hour, continuous intravenous infusion is the preferred route in cardiac patients; maximum 3 mg/kg per day

Child 12–17 years: 3–9 mg/hour, continuous intravenous infusion is the preferred route in cardiac patients; maximum 3 mg/kg per day

UNLICENSED USE
Not licensed for use in children.

CONTRA-INDICATIONS
Acute porphyrias p. 562 - cor pulmonale - high output heart failure - idiopathic systemic lupus erythematosus - myocardial insufficiency due to mechanical obstruction - severe tachycardia

CAUTIONS
Cerebrovascular disease - occasionally blood pressure reduction too rapid even with low parenteral doses

INTERACTIONS
Appendix 1 (hydralazine).

SIDE-EFFECTS

Rare

Frequency not known

108 Blood pressure conditions

BNFC 2016–2017
4.1a Hypertension associated with phaeochromocytoma

**VASODILATORS > PERIPHERAL VASODILATORS**

**Phenoxybenzamine hydrochloride**

- **INDICATIONS AND DOSE**
  - **Hypertension in phaeochromocytoma**
    - **BY MOUTH**
    - Child: 0.5–1 mg/kg twice daily, adjusted according to response

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** History of cerebrovascular accident
- **CAUTIONS** Avoid contact with skin (risk of contact sensitisation) - avoid in Acute porphyrias p. 562 - carcinogenic in animals - cerebrovascular disease - congestive heart failure - severe ischaemic heart disease
- **SIDE-EFFECTS**
  - Rare Gastro-intestinal disturbances
  - Frequency not known Inhibition of ejaculation - lassitude - miosis - nasal congestion - postural hypotension (with dizziness and marked compensatory tachycardia)
  - **PREGNANCY** Hypotension may occur in newborn.
  - **BREAST FEEDING** May be present in milk.
  - **RENAI IMPAIRMENT** Use with caution.
- **DIRECTIONS FOR ADMINISTRATION** For administration by mouth, capsules may be opened.
- **HANDLING AND STORAGE** Owing to risk of contact sensitisation healthcare professionals should avoid contamination of hands.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
  - **Capsule**
    - Phenoxylbenzamine hydrochloride (Non-proprietary)
    - Phenoxylbenzamine hydrochloride 10 mg Phenoxylbenzamine 10mg capsules | 30 capsule | £57.38

**4.1b Hypertensive crises**

**Drugs used for Hypertensive crises not listed below**

**Esmolol hydrochloride** p. 98 - Labetalol hydrochloride, p. 95

**VASODILATORS > VASODILATOR ANTIHYPERTENSIVES**

**Sodium nitroprusside**

- **INDICATIONS AND DOSE**
  - **Hypertensive emergencies**
    - **BY CONTINUOUS INTRAVENOUS INFUSION**
      - Neonate: Initially 500 nanograms/kg/minute, then increased in steps of 200 nanograms/kg/minute (max. per dose 8 micrograms/kg/minute) as required, max. 4 micrograms/kg/minute if used for longer than 24 hours.
      - Child: Initially 500 nanograms/kg/minute, then increased in steps of 200 nanograms/kg/minute (max. per dose 8 micrograms/kg/minute) as required, max. 4 micrograms/kg/minute if used for longer than 24 hours

- **UNLICENSED USE** Not licensed for use in the UK.
- **CONTRA-INDICATIONS** Compensatory hypertrophy - Leber’s optic atrophy - severe vitamin B12 deficiency
- **CAUTIONS** Hyponatraemia - hypothermia - hypothyroidism - impaired cerebral circulation
- **INTERACTIONS** → Appendix 1 (sodium nitroprusside).
- **SIDE-EFFECTS** Abdominal pain - acute transient phlebitis - anxiety - dizziness - headache - nausea - palpitation - perspiration - reduced platelet count - retching - retrosternal discomfort
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Side-effects associated with over rapid reduction in blood pressure: Headache, dizziness, nausea, retching, abdominal pain, perspiration, palpitation, anxiety, retrosternal discomfort—reduce infusion rate if any of these side-effects occur.
- **Overdose**
  - Side-effects caused by excessive plasma concentration of the cyanide metabolite include tachycardia, sweating, hyperventilation, arrhythmias, marked metabolic acidosis (discontinue and give antidote, see cyanide in Emergency treatment of poisoning p. 786).
- **PREGNANCY** Avoid prolonged use—potential for accumulation of cyanide in fetus.
- **BREAST FEEDING** No information available. Caution advised due to thiocyanate metabolite.
- **HEPATIC IMPAIRMENT** Use with caution. Avoid in hepatic failure—cyanide or thiocyanate metabolites may accumulate.
- **RENAI IMPAIRMENT** Avoid prolonged use—cyanide or thiocyanate metabolites may accumulate.
- **MONITORING REQUIREMENTS** Monitor blood pressure (including intra-arterial blood pressure) and blood-cyanide concentration, and if treatment exceeds 3 days, also blood thiocyanate concentration.
- **TREATMENT CESSATION** Avoid sudden withdrawal—terminate infusion over 15–30 minutes.
- **DIRECTIONS FOR ADMINISTRATION** For continuous intravenous infusion in Glucose 5%, infuse via infusion device to allow precise control. For further details, consult product literature. Protect infusion from light.
4.1c Pulmonary hypertension

ANTITHROMBOTIC DRUGS > PROSTAGLANDINS, CARDIOVASCULAR

**Epoprostenol (Prostacyclin)**

- **DRUG ACTION** Epoprostenol is a prostaglandin and a potent vasodilator. It is also a powerful inhibitor of platelet aggregation.

- **INDICATIONS AND DOSE**
  - **Persistent pulmonary hypertension of the newborn**
  - **by continuous intravenous infusion**
    - Neonate: Initially 2 nanograms/kg/minute (max. per dose 20 nanograms/kg/minute), adjusted according to response, rarely doses up to 40 nanograms/kg/minute are used.
  - **Idiopathic pulmonary arterial hypertension**
  - **by continuous intravenous infusion**
    - Child: Initially 2 nanograms/kg/minute, increased if necessary up to 40 nanograms/kg/minute

- **PHARMACOKINETICS**
  Short half-life of approximately 3 minutes, therefore it must be administered by continuous intravenous infusion.

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Pulmonary veno-occlusive disease - severe left ventricular dysfunction

- **CAUTIONS** Avoid abrupt withdrawal (risk of rebound pulmonary hypertension/pulmonary hypertensive crisis) - haemorrhagic diathesis

- **INTERACTIONS** Caution with concomitant use of drugs that increase risk of bleeding.

- **SIDE EFFECTS**
  - **Common or very common** Abdominal pain - anxiety - arthralgia - bleeding - bradycardia - chest pain - diarrhoea - flushing - headache - hypotension - jaw pain - nausea - sepsis - tachycardia - vomiting
  - **Uncommon** Dry mouth - pulmonary oedema - sweating
  - **Rare** Agitation - pallor
  - **Frequency not known** Serious systemic hypotension

- **PREGNANCY** Manufacturer advises caution — no information available.

- **BREAST FEEDING** Manufacturer advises avoid — no information available.

- **MONITORING REQUIREMENTS**
  - Anticoagulant monitoring required when given with anticoagulants.
  - Monitor blood pressure.

- **TREATMENT CESSATION** Avoid abrupt withdrawal (risk of rebound pulmonary hypertension and pulmonary hypertensive crisis).

- **DIRECTIONS FOR ADMINISTRATION** Reconstitute using the glycine buffer diluent provided to make a concentrate (pH 10.5); filter the concentrate using the filter provided. The concentrate can be administered via a central venous catheter, alternatively it may be diluted further either with the glycine buffer diluent or to a minimum concentration of 1.43 micrograms/mL with Sodium Chloride 0.9%. Solution stable for 12 hours at room temperature, although some units use for 24 hours and allow for loss of potency; solution stable for 24 hours if prepared in glycerine buffer diluent only and administered via an antimicrobial cold pack system (to maintain solution at 2–8°C). *Neonatal intensive care*, prepare a filtered concentrate of 10 micrograms/mL using the 500-microgram vial. *Neonate body-weight under 2 kg*, using the concentrate, dilute 150 micrograms/kg body-weight to a final volume of 50 mL with Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 nanograms/kg/minute. *Neonate body-weight over 2 kg*, using the concentrate, dilute 60 micrograms/kg body-weight to a final volume of 50 mL with Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 2 nanograms/kg/minute.

**Iloprost**

- **INDICATIONS AND DOSE**
  - **Idiopathic or familial pulmonary arterial hypertension (initiated under specialist supervision)**
  - **by inhalation of nebulised solution**
    - Child 8–17 years: Initially 2.5 micrograms for 1 dose, increased to 5 micrograms for 1 dose, increased if tolerated to 5 micrograms 6–9 times a day, adjusted according to response; reduced if not tolerated to 2.5 micrograms 6–9 times a day, reduced to lower maintenance dose if high dose not tolerated
  - **Raynaud’s syndrome**
    - **by intravenous infusion**
      - Child 12–17 years: Initially 30 nanograms/kg/hour, increased to 60–120 nanograms/kg/hour daily for 3–5 days, dose to be given over 6 hours, dose increase should be performed gradually

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Conditions which increase risk of haemorrhage - congenital or acquired valvular defects of the myocardium - decompression illness (under close medical supervision) - pulmonary veno-occlusive disease - severe arrhythmias - severe coronary heart disease
ENDOTHELIN RECEPTOR ANTAGONISTS

Bosentan

**INDICATIONS AND DOSE**
Pulmonary arterial hypertension (initiated under specialist supervision)
- **BY MOUTH**
  - Child 2-17 years (body-weight 10–20 kg): Initially 31.25 mg once daily for 4 weeks, then increased to 31.25 mg twice daily
  - Child 2-17 years (body-weight 20–40 kg): Initially 31.25 mg twice daily for 4 weeks, then increased to 62.5 mg twice daily
  - Child 12-17 years (body-weight 40 kg and above): Initially 62.5 mg twice daily for 4 weeks, then increased to 125 mg twice daily (max. per dose 250 mg)

**CONTRA-INDICATIONS**
Acute porphyrias p. 562

**CAUTIONS**
- **GENERAL CAUTIONS**
  - Hypotension (do not initiate if systolic blood pressure below 85 mmHg)
  - **UNLICENSED USE**
  - Not licensed for use in children under 1 year.

**INTERACTIONS**
- **Not to be initiated if systemic systolic blood pressure is below 85 mmHg**
- **Appendix 1 (bosentan).**

**SIDE-EFFECTS**
- **Common or very common**
  - Anaemia - diarhoea - flushing - gastro-oesophageal reflux - headache - hypotension - oedema - palpitation - syncope
- **Uncommon**
  - Leucopenia - neutropenia - thrombocytopenia
- **Rare**
  - Liver cirrhosis - liver failure

**CONCEPTION AND CONTRACEPTION**
Effective contraception required during administration (hormonal contraception not considered effective). Monthly pregnancy tests advised.

**PREGNANCY**
Avoid (teratogenic in animal studies).

**BREAST FEEDING**
Manufacturer advises avoid - no information available.

**HEPATIC IMPAIRMENT**
Avoid in moderate and severe impairment.

**MONITORING REQUIREMENTS**
- **Monitor haemoglobin before and during treatment** (monthly for first 4 months, then 3-monthly).
- Monitor liver function before treatment, monthly then every 3 months during treatment and 2 weeks after dose increase (reduce dose or suspend treatment if liver enzymes raised significantly) - discontinue if symptoms of liver impairment.

**TREATMENT CESSATION**
Abrupt withdrawal - withdraw treatment gradually.

**DIRECTIONS FOR ADMINISTRATION**
 Tablets may be cut, or suspended in water or non-acidic liquid. Suspension is stable at room-temperature (max. 25°C) for 24 hours.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- Tracleer (Actelion Pharmaceuticals UK Ltd)
  - Bosentan (as Bosentan monohydrate) 62.5 mg Tracleer 62.5mg tablets | 56 tablet pack £1,510.21
  - Bosentan (as Bosentan monohydrate) 125 mg Tracleer 125mg tablets | 56 tablet pack £1,510.21

**PHOSPHODIESTERASE TYPE-5 INHIBITORS**

Sildenafil

**INDICATIONS AND DOSE**
Pulmonary arterial hypertension (initiated under specialist supervision)
- **BY MOUTH**
  - Neonate: Initially 250–500 micrograms/kg every 4–8 hours, adjusted according to response, start with the lower dose and frequency, especially if used with other vasodilators; maximum 30 mg per day.
  - Child 1-11 months: Initially 250–500 micrograms/kg every 4–8 hours, adjusted according to response, start with the lower dose and frequency, especially if used with other vasodilators; maximum 30 mg per day.
  - Child 1-17 years (body-weight up to 20 kg): 10 mg 3 times a day
  - Child 1-17 years (body-weight 20 kg and above): 20 mg 3 times a day

**UNLICENSED USE**
Not licensed for use in children under 1 year.

**CONTRA-INDICATIONS**
Hereditary degenerative retinal disorders, history of non-arteritic anterior ischaemic optic neuropathy, recent history of stroke, sickle-cell anaemia

**CAUTIONS**
Active peptic ulceration, anatomical deformation of the penis, autonomic dysfunction...
bleeding disorders - cardiovascular disease - hypotension (avoid if severe) - intravascular volume depletion - left ventricular outflow obstruction - ocular disorders - predisposition to priapism - pulmonary veno-occlusive disease

- INTERACTIONS → Appendix 1 (sildenafil).
  Initiate cautiously if child also on epoprostenol, iloprost, bosentan or nitric oxide.

- SIDE-EFFECTS
  > Uncommon Gynaecomastia - haematuria - penile haemorrhage - priapism
  > Frequency not known Non-arteritic anterior ischaemic optic neuropathy (discontinue if sudden visual impairment occurs) - rash - retinal vascular occlusion - sudden hearing loss (advise patient to seek medical help)

- PREGNANCY Use only if potential benefit outweighs risk—no evidence of harm in animal studies.

- BREAST FEEDING Manufacturer advises avoid—no information available.

- HEPATIC IMPAIRMENT Reduce dose if not tolerated in mild to moderate impairment. Manufacturer advises avoid in severe impairment.

- RENAL IMPAIRMENT Reduce dose if not tolerated

- TREATMENT CESSATION Avoid abrupt withdrawal.

- PATIENT AND CARER ADVICE
  Medicines for Children leaflet: Sildenafil for pulmonary hypertension www.medicinesforchildren.org.uk/ sildenafil-for-pulmonary-hypertension

- NATIONAL FUNDING/ACCESS DECISIONS
  Scottish Medicines Consortium (SMC) Decisions
  The Scottish Medicines Consortium has advised (October 2012) that sildenafil (Revatio®) is accepted for restricted use within NHS Scotland for the treatment of pulmonary arterial hypertension in children aged 1–17 years; sildenafil should only be prescribed on the advice of specialists in the Scottish Pulmonary Vascular Unit or the Scottish Adult Congenital Cardiac Service.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  **Tablet**
  > **Revatio** (Pfizer Ltd)
  > Sildenafil (as Sildenafil citrate) 20 mg Revatio 20mg tablets | 90 tablet (Pf) £446.33

  **Oral suspension**
  > **Revatio** (Pfizer Ltd)
  > Sildenafil (as Sildenafil citrate) 10 mg per 1 ml Revatio 10mg/ml oral suspension sugar-free | 112 ml (Ppd) £186.75

- VASODILATORS ➔ PERIPHERAL VASODILATORS

  **Tolazoline**
  > **DRUG ACTION** Tolazoline is an alpha-blocker and produces both pulmonary and systemic vasodilation.

  > **INDICATIONS AND DOSE**
  Correction of pulmonary vasospasm in neonates
  > INITIALLY BY INTRAVENOUS INJECTION
  > Neonate: Initially 1 mg/kg, to be given over 2–5 minutes, followed by (by continuous intravenous infusion) maintenance 200 micrograms/kg/hour if required, careful blood pressure monitoring should be carried out, doses above 300 micrograms/kg/hour associated with cardiotoxicity and renal failure.

  > BY ENDOTRACHEAL TUBE
  > Neonate: 200 micrograms/kg.

  > **UNLICENSED USE** Not licensed for use in children.

  > **CONTRA-INDICATIONS** Peptic ulcer disease

  > **CAUTIONS** Cardiotoxic accumulation may occur with continuous infusion (particularly in renal impairment) - mitral stenosis

  > **INTERACTIONS → Appendix 1 (alpha-blockers).**

  > **SIDE-EFFECTS** Blood dyscrasias - blotchy skin - cardiac arrhythmias - diarrhoea - epigastric pain - flushing - haematuria - haemorrhage (with high doses) - headache - marked hypertension (with high doses) - metabolic alkalosis - nausea - oligaemia - renal failure (with high doses)
  > severe hypotension (with high doses) - shivering - sweating - tachycardia - thrombocytopenia - vomiting

  > **RENAL IMPAIRMENT** Lower doses may be necessary. Accumulates in renal impairment. Risk of cardiotoxicity.

  > **MONITORING REQUIREMENTS** Monitor blood pressure regularly for sustained systemic hypotension.

  > **DIRECTIONS FOR ADMINISTRATION** For continuous intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%. Prepare a fresh solution every 24 hours. For endotracheal administration, dilute with 0.5–1 mL of Sodium Chloride 0.9%.

  > **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

## 4.2 Hypotension and shock

### Sympathomimetics

#### Overview

The properties of sympathomimetics vary according to whether they act on alpha or on beta adrenergic receptors. Response to sympathomimetics can also vary considerably in children, particularly neonates. It is important to titrate the dose to the desired effect and to monitor the child closely.

#### Inotropic sympathomimetics

Dopamine hydrochloride p. 114 has a variable, unpredictable, and dose dependent impact on vascular tone. Low dose infusion normally causes vasodilatation, but there is little evidence that this is clinically beneficial; moderate doses increase myocardial contractility and cardiac output in older children, but in neonates moderate doses may cause a reduction in cardiac output. High doses cause vasoconstriction and increase vascular resistance, and should therefore be used with caution following cardiac
surgery, or where there is co-existing neonatal pulmonary hypertension.

In neonates the response to inotropic sympathomimetics varies considerably, particularly in those born prematurely; careful dose titration and monitoring are necessary.

**Isoprenaline** injection is available from ‘special-order’ manufacturers or specialist importing companies.

**Shock**

Shock is a medical emergency associated with a high mortality. The underlying causes of shock such as haemorrhage, sepsis or myocardial insufficiency should be corrected. Additional treatment is dependent on the type of shock.

Septic shock is associated with severe hypovolaemia (due to vasodilatation and capillary leak) which should be corrected. Crystallloid or colloid fluids in neonates with hypovolaemia is haemorrhage) and further steps to improve vascular resistance can be taken, as in cardiogenic shock.

If the shock is resistant to volume expansion and vasodilatation, and there is suspected or proven adrenal insufficiency, low dose hydrocortisone p. 411 can be used. ACTH-stimulated plasma-cortisol concentration should be measured; however, hydrocortisone can be started without such information. Alternatively, if the child is resistant to catecholamines, and vascular resistance is low, vasopressin p. 62 can be added.

Neonatal septic shock can be complicated by the transition from fetal to neonatal circulation. Treatment to reverse right ventricular failure, by decreasing pulmonary artery pressures, is commonly needed in neonates with fluid-refractory shock and persistent pulmonary hypertension of the newborn. Rapid administration of fluid in neonates with patent ductus arteriosus may cause left-to-right shunting and congestive heart failure induced by ventricular overload.

In cardiogenic shock, the aim is to improve cardiac output and to reduce the afterload on the heart. If central venous pressure is low, cautious volume expansion with a colloid or crystalloid can be used. An inotrope such as adrenaline/epinephrine or dopamine hydrochloride should be given to increase cardiac output. Dobutamine below is a peripheral vasodilator and is an alternative if hypotension is not significant.

Milrinone has both inotropic and vasodilatory effects and can be used when vascular resistance is high. Alternatively, glyceryl trinitrate or sodium nitroprusside (on specialist advice only) can be used to reduce vascular resistance.

The use of sympathomimetic inotropes and vasoconstrictors should preferably be confined to the intensive care setting and undertaken with invasive haemodynamic monitoring. See also advice on the management of anaphylactic shock in Antihistamines, allergen immunotherapy and allergic emergencies p. 162.

**Vasoconstrictor sympathomimetics**

Vasoconstrictor sympathomimetics raise blood pressure transiently by acting on alpha-adrenergic receptors to constrict peripheral vessels. They are sometimes used as an emergency method of elevating blood pressure where other measures have failed.

The danger of vasoconstrictors is that although they raise blood pressure they also reduce perfusion of vital organs such as the kidney.

Epinephrine hydrochloride p. 114 is used to reverse hypotension caused by spinal and epidural anaesthesia.

Metaraminol p. 115 is used as a vasopressor during cardiopulmonary bypass.

Phenylephrine hydrochloride p. 116 causes peripheral vasoconstriction and increases arterial pressure.

Ephedrine hydrochloride, metaraminol and phenylephrine hydrochloride are rarely needed in children and should be used under specialist supervision.

Noradrenaline/norepinephrine is reserved for children with low systemic vascular resistance that is unresponsive to fluid resuscitation following septic shock, spinal shock, and anaphylaxis.

Adrenaline/epinephrine is mainly used for its inotropic action. Low doses (acting on beta receptors) cause systemic and pulmonary vasoconstriction, with some increase in heart rate and stroke volume and also an increase in contractility; high doses act predominantly on alpha receptors causing intense systemic vasoconstriction.

**SYMPATHOMIMETICS › INOTROPIC**

**Dobutamine**

- **DRUG ACTION** Dobutamine is a cardiac stimulant which acts on beta, receptors in cardiac muscle, and increases contractility with little effect on rate.

- **INDICATIONS AND DOSE**

  **Inotropic support in low cardiac output states, after cardiac surgery, cardiomyopathies, shock**

  - **BY CONTINUOUS INTRAVENOUS INFUSION**

    - **Neonate:** Initially 5 micrograms/kg/minute, then adjusted according to response to 2–20 micrograms/kg/minute, doses as low as 0.5–1 microgram/kg/minute have been used.

    - **Child:** Initially 5 micrograms/kg/minute, then adjusted according to response to 2–20 micrograms/kg/minute, doses as low as 0.5–1 microgram/kg/minute have been used.

- **CONTRA-INDICATIONS** Phaeochromocytoma

- **CAUTIONS** Acute heart failure · acute myocardial infarction · arrhythmias · correct hypercapnia before starting and during treatment · correct hypovolaemia before starting and during treatment · correct hypoxia before starting and during treatment · correct metabolic acidosis before starting and during treatment · diabetes mellitus · extravasation may cause tissue necrosis · extreme caution or avoid in marked obstruction of cardiac ejection (such as idiopathic hypertrophic subaortic stenosis) · hyperthyroidism · inchaemic heart disease · occlusive vascular disease · severe hypotension · susceptibility to angle-closure glaucoma · tachycardia · tolerance may develop with continuous infusions longer than 72 hours

- **INTERACTIONS** → Appendix 1 (sympathomimetics).

- **SIDE-EFFECTS**

  - **Rare** Psychosis

  - **Very rare** Angle-closure glaucoma · AV block · bradycardia · cardiac arrest · coronary artery spasm · hypokalaemia · myocardial infarction · petechial bleeding

- **Frequency not known** Anxiety · arrhythmias · bronchospasm · cerebral haemorrhage · chest pain · dyspnœa · eosinophilia · fever · headache · hypertension (marked increase in systolic blood pressure indicates overdose) · hypotension · increased urinary urgency ·
myoclonic spasm • nausea • palpitation • paraesthesia • phlebitis • pruritus of scalp • pulmonary oedema • rash • reduced platelet aggregation (on prolonged use) • tachycardia • tremor • vomiting

- PREGNANCY No evidence of harm in animal studies—manufacturer advises use only if potential benefit outweighs risk.
- BREAST FEEDING May suppress lactation—unknown to be harmful.
- DIRECTIONS FOR ADMINISTRATION Dobutamine concentrate for intravenous infusion to be diluted before use.
  
  For continuous intravenous infusion, dilute to a max. concentration of 3.2 mg/mL with Glucose 5% or Sodium Chloride 0.9%; infuse higher concentration solutions through central venous catheter using a syringe pump to avoid extravasation and fluid overload. Incompatible with bicarbonate and other alkaline solutions.
  
  In neonates Neonatal intensive care, dilute 30 mg/kg bodyweight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.5–1 mg/mL (max. 5 mg/mL if fluid restricted) with Glucose 5% or Sodium Chloride 0.9%; infuse higher concentration solutions through central venous catheter only. Incompatible with bicarbonate and other strong alkaline solutions.
  
  In neonates Neonatal intensive care, dilute 30 mg/kg bodyweight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.5–1 mg/mL (max. 5 mg/mL if fluid restricted) with Glucose 5% or Sodium Chloride 0.9%; infuse higher concentration solutions through central venous catheter only. Incompatible with bicarbonate and other strong alkaline solutions.

- MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for infusion

- Dobutamine (Non-proprietary)
  
  Dobutamine hydrochloride 40 mg per 1 ml Dopamine 200 mg/5 ml solution for infusion ampoules | 5 ampoule [P] £19.42–£20.00
  | 10 ampoule [P] £9.04
  
  Dopamine hydrochloride 160 mg per 1 ml Dopamine 800 mg/5 ml solution for infusion ampoules | 10 ampoule [P] £34.00

Dopamine hydrochloride

- DRUG ACTION Dopamine is a cardiac stimulant which acts on beta-receptors in cardiac muscle, and increases contractility with little effect on rate.

- INDICATIONS AND DOSE To correct the haemodynamic imbalance due to acute hypotension, shock, cardiac failure, adjunct following cardiac surgery

  - BY CONTINUOUS INTRAVENOUS INFUSION

  - Neonate: Initially 3 micrograms/kg/minute (max. per dose 20 micrograms/kg/minute), adjusted according to response.

  - Child: Initially 5 micrograms/kg/minute (max. per dose 20 micrograms/kg/minute), adjusted according to response.

- UNLICENSED USE Not licensed for use in children under 12 years.

- CONTRA-INDICATIONS Phaeochromocytoma • tachyarrhythmia

- CAUTIONS Correct hypovolaemia • hyperthyroidism

- INTERACTIONS Appendix 1 (sympathomimetics).

- SIDE-EFFECTS

  - Common or very common Chest pain • dyspnoea • headache • hypotension • nausea • palpitation • tachycardia • vasoconstriction • vomiting

  - Uncommon Bradycardia • gangrene • hypertension • mydriasis

  - Rare Fatal ventricular arrhythmias

- PREGNANCY No evidence of harm in animal studies—manufacturer advises use only if potential benefit outweighs risk.

- BREAST FEEDING May suppress lactation—unknown to be harmful.

- SYMPATHOMIMETICS > VASOCONSTRICTOR

Ephedrine hydrochloride

- INDICATIONS AND DOSE Reversal of hypotension from spinal or epidural anaesthesia

  - BY SLOW INTRAVENOUS INJECTION

  - Child 1–11 years: 500–750 micrograms/kg every 3–4 minutes, adjusted accordingly to response, alternatively 17–25 mg/m² every 3–4 minutes, adjusted according to response, injection solution to contain ephedrine hydrochloride 3 mg/mL; maximum 30 mg per course

  - Child 12–17 years: 3–7.5 mg every 3–4 minutes (max. per dose 9 mg), adjusted according to response, injection solution to contain ephedrine hydrochloride 3 mg/mL; maximum 30 mg per course

- CAUTIONS Diabetes mellitus • hypertension • hyperthyroidism • susceptibility to angle-closure glaucoma

- INTERACTIONS Appendix 1 (sympathomimetics).

- SIDE-EFFECTS

  - Common or very common Anginal pain • anorexia • anxiety • arrhythmias • changes in blood-glucose concentration • confusion • difficulty in micturition • dizziness • dyspnoea • flushing • headache • hypersalivation • insomnia • nausea • psychoses • restlessness • sweating • tachycardia • tremor • urine retention • vasoconstriction with hypertension • vasoconstriction with hypotension • vomiting

  - Very rare Angle-closure glaucoma

  - Frequency not known Bradycardia • Increased lacrimation (can have adverse effects on contact lens wear)

- PREGNANCY Increased fetal heart rate reported with parenteral ephedrine.

- BREAST FEEDING Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.
**DIRECTIONS FOR ADMINISTRATION**

**Medically necessary use.**

**For slow intravenous injection,** give via central venous catheter using a solution containing ephedrine hydrochloride 3 mg/ml.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection.

**Solution for injection**

- Ephedrine hydrochloride (Non-proprietary)
  - Ephedrine hydrochloride 3 mg per 1 ml Ephedrine 30mg/10ml solution for injection ampoules [POD] £73.21
  - Ephedrine 30mg/10ml solution for injection pre-filled syringes [POD] £7.29–£9.50
  - 12 pre-filled disposable injection [POD] £114.00
  - Ephedrine hydrochloride 30 mg per 1 ml Ephedrine 30mg/1ml solution for injection ampoules [POD] £4.31–£4.14

**SIDE-EFFECTS**

- Tremor.
- Palpitation.
- Arrhythmias.
- Cause a prolonged rise in blood pressure.
- Noradrenaline, and an excessive vasopressor response may cause necrosis.
- Peripheral ischaemia.
- Perivascular thrombosis.
- Prinzmetal's variant angina.
- Susceptibility to angle-closure glaucoma.
- Uncorrected hypovolaemia.

**INTERACTIONS**

- Hyperthermic response.
- Metaraminol has a longer duration of action than noradrenaline, and an excessive vasopressor response may cause a prolonged rise in blood pressure.

**CONTRA-INDICATIONS**

- Hypertension.
- Cirrhosis. coronary vascular thrombosis - diabetes mellitus. extravasation at injection site may cause necrosis. following myocardial infarction. hypercapnia. hyperthyroidism. hypoxia. mesenteric vascular thrombosis. peripheral vascular thrombosis. Prinzmetal's variant angina. susceptibility to angle-closure glaucoma. uncorrected hypovolaemia.

**CAUTIONS**

- Neonatal intensive care.
- Fluid-restricted with bicarbonate or alkaline solutions.
- In neonates. Neonatal intensive care, dilute 600 micrograms (base)/kg body weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 20 micrograms (base)/kg/minute; infuse through central venous catheter; max. concentration of noradrenaline (base) 40 micrograms/mL. (higher concentrations can be used if fluid-restricted) with Glucose 5% or Sodium Chloride and Glucose. Infuse through central venous catheter; discard if discoloured. Incompatible with bicarbonate or alkaline solutions.

**SIDE-EFFECTS**

- Angle-closure glaucoma.
- Anorexia.
- Anxiety.
- Arhythmias.
- Bradycardia.
- Confusion.
- Dyspnoea.
- Fatal ventricular arrhythmia reported in Laennec's cirrhosis.
- Headache.
- Hypertension.
- Hypercapnia.
- Insomnia.
- Nausea.
- Palpitation.
- Peripheral ischaemia.
- Psychosis.
- Tachycardia.
- Tremor.
- Urinary retention.
- Vomiting.
- Weakness.

**PREGNANCY**

- May reduce placental perfusion.

**MONITORING REQUIREMENTS**

- Monitor blood pressure and rate of flow frequently.

**DIRECTIONS FOR ADMINISTRATION**

- For continuous intravenous infusion, dilute to a max. concentration of noradrenaline (base) 40 micrograms/mL. (higher concentrations can be used if fluid-restricted) with Glucose 5% or Sodium Chloride and Glucose. Infuse through central venous catheter; discard if discoloured. Incompatible with bicarbonate or alkaline solutions.

- Neonatal intensive care, dilute 600 micrograms (base)/kg body weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 20 micrograms (base)/kg/minute; infuse through central venous catheter; max. concentration of noradrenaline (base) 40 micrograms/mL. (higher concentrations can be used if fluid-restricted) with Glucose 5% or Sodium Chloride and Glucose. Infuse through central venous catheter; discard if discoloured. Incompatible with bicarbonate or alkaline solutions.

**PRESCRIBING AND DISPENSING INFORMATION**

- For a period of time, preparations on the UK market may be described as either noradrenaline base or noradrenaline acid tartrate; doses in the BNF are expressed as the base.
Phenylephrine hydrochloride

**Indications and Dose**

- **Acute hypertension**
  - BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
    - Child 1-11 years: 100 micrograms/kg every 1–2 hours (max. per dose 5 mg) as required
    - Child 12-17 years: Initially 2–5 mg (max. per dose 5 mg), followed by 1–10 mg, after at least 15 minutes if required
  - BY SLOW INTRAVENOUS INJECTION
    - Child 1-11 years: Initially 5–20 micrograms/kg (max. per dose 500 micrograms), repeated as necessary at least 15 minutes
    - Child 12-17 years: 100–500 micrograms, repeated as necessary after at least 15 minutes
      - Child 1-15 years: Initially 100–500 nanograms/kg/minute, adjusted according to response
      - Child 16-17 years: Initially up to 180 micrograms/minute, reduced to 30–60 micrograms/minute, adjusted according to response

**Unlicensed Use**

Not licensed for use in children by intravenous infusion or injection.

**Contra-Indications**

Hypertension - severe hyperthyroidism

**CAUTIONS**

Coronary disease - coronary vascular thrombosis - diabetes - extravasation at injection site may cause necrosis - following myocardial infarction - hypercapnia - hyperthyroidism - hypoxia - mesenteric vascular thrombosis - peripheral vascular thrombosis - Prinzmetal’s variant angina - susceptibility to angle-closure glaucoma - uncorrected hypovolaemia

**CAUTIONS, FURTHER INFORMATION**

Hypertensive response Phenylephrine has a longer duration of action than noradrenaline (norepinephrine), and an excessive vasopressor response may cause a prolonged rise in blood pressure.

**Interactions**

Appendix 1 (sympathomimetics).

Phenylephrine may interact with systemically administered monoamine-oxidase inhibitors.

**Side Effects**

Angle-closure glaucoma - anorexia - anxiety - arrhythmias - bradycardia (also reflex bradycardia) - confusion - dyspnoea - headache - hypertension - hypoxia - insomnna - nausea - palpititation - peripheral ischaemia - psychosis - tachycardia - tremor - urinary retention - vomiting - weakness

**Pregnancy**

Avoid if possible; malformations reported following use in first trimester; fetal hypoxia and bradycardia reported in late pregnancy and labour.

**Monitoring Requirements**

- Contra-indicated in hypertension—monitor blood pressure and rate of flow frequently.

**Directions for Administration**

For intravenous injection, dilute to a concentration of 1 mg/mL with Water for Injections and administer slowly. For intravenous infusion, dilute to a concentration of 20 micrograms/mL with Glucose 5% or Sodium Chloride 0.9% and administer as a continuous infusion via a central venous catheter using a controlled infusion device.

**Prescribing and Dispensing Information**

Intravenous administration preferred when managing acute hypotension in children.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for Injection**

- Phenylephrine hydrochloride (Non-proprietary)
  - Phenylephrine (as Phenylephrine hydrochloride) 50 microgram per 1 ml Phenylephrine 50 micrograms/mL solution for injection pre-filled syringes | 1 pre-filled disposable injection 0.00 | 10 pre-filled disposable injection 0.00
  - Phenylephrine hydrochloride 100 microgram per 1 ml Phenylephrine 100 micrograms/mL solution for injection ampoules | 10 ampoule 0.00
  - Phenylephrine hydrochloride 10 mg per 1 ml Phenylephrine 10 mg/mL solution for injection ampoules | 10 ampoule 0.00

---

**Heart Failure**

Drugs used for Heart failure not listed below

- Bendroflumethiazide, p. 102
- Captopril, p. 103
- Chlorothiazide, p. 103
- Chlortalidone, p. 134
- Digoxin, p. 75
- Enalapril maleate, p. 105
- Glyceryl trinitrate, p. 127
- Lisinopril, p. 106
- Prasozin, p. 92

**Beta-Adrenoceptor Blockers**

**Alpha- and Beta-Adrenoceptor Blockers**

---

**Carvedilol**

**Indications and Dose**

Adjunct in heart failure (limited information available)

- **By Mouth**
  - Child 2-17 years: Initially 50 micrograms/kg twice daily (max. per dose 3.125 mg) for at least 2 weeks, then increased to 100 micrograms/kg twice daily for at least 2 weeks, then increased to 200 micrograms/kg twice daily, then increased if necessary up to 350 micrograms/kg twice daily (max. per dose 25 mg)

**Unlicensed Use**

Not licensed for use in children under 18 years.

**Contra-Indications**

Acute or decompensated heart failure requiring intravenous inotropes

**Side Effects**

Allergic skin reactions - angina - AV block - changes in liver enzymes - depressed mood - disturbances of micturition - influenza-like symptoms - leucopenia - nasal stuffiness - postural hypotension - thrombocytopenia - wheezing

**Pregnancy**

Information on the safety of carvedilol during pregnancy is lacking. If carvedilol is used close to delivery,
infants should be monitored for signs of alpha-blockade (as well as beta-blockade).

**BREAST FEEDING** Infants should be monitored as there is a risk of possible toxicity due to alpha-blockade (in addition to beta-blockade).

**HEPATIC IMPAIRMENT** Avoid in hepatic impairment.

**MONITORING REQUIREMENTS** Monitor renal function during dose titration in patients with heart failure who also have renal impairment, low blood pressure, ischaemic heart disease, or diffuse vascular disease.

**PATIENT AND CARER ADVICE** Medicines for Children leaflet: Carvedilol for heart failure www.medicinesforchildren.org.uk/carvedilol-heart-failure-0

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

- **Tablet**
  - Carvedilol (Non-proprietary)
    - Carvedilol 3.125 mg Carvedilol 3.125mg tablets | 28 tablet [P BMI £8.00 DT price = £0.80
    - Carvedilol 6.25 mg Carvedilol 6.25mg tablets | 28 tablet [P BMI £8.99 DT price = £0.98
    - Carvedilol 12.5 mg Carvedilol 12.5mg tablets | 28 tablet [P BMI £9.99
    - Carvedilol 25 mg Carvedilol 25mg tablets | 28 tablet [P BMI £12.50

**DIURETICS > POTASSIUM-SPARING DIURETICS > ALDOSTERONE ANTAGONISTS**

**Potassium canrenoate**

**INDICATIONS AND DOSE**

- **Short-term diuresis for oedema in heart failure and in ascites**
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
    - Neonate: 1–2 mg/kg twice daily.
    - Child 1 month-11 years: 1–2 mg/kg twice daily
    - Child 12-17 years: 1–2 mg/kg twice daily (max. per dose 200 mg)

**DOSE EQUIVALENCE AND CONVERSION**

To convert to equivalent oral spironolactone dose, multiply potassium canrenoate dose by 0.7.

**UNLICENSED USE** Not licensed for use in the UK.

**CONTRA-INDICATIONS**

- Hyperkalaemia - hyponatraemia
- **CAUTIONS**
  - Acute porphyrias p. 562 - hypotension - potential metabolic products carcinogenic in rodents

**INTERACTIONS** ▶ Appendix 1 (diuretics).

**SIDE-EFFECTS**

- **Common or very common** Ataxia - drowsiness - headache - hyperuricaemia - menstrual irregularities - pain at injection site on rapid administration
- **Uncommon**
  - Eosinophilia - hyperkalaemia - thrombocytopenia
- **Rare**
  - Agranulocytosis - alopecia - deepening of voice - erythema - hepatotoxicity - hoarseness - hypersensitivity reactions - osteomalacia - urticaria
- **Frequency not known**
  - Gastro-intestinal disturbances - gynaecomastia - hirsutism - hypochloremic acidosis - hyponaetraemia - hypotension - mastalgia - transient confusion with high doses

**PREGNANCY**

- Crosses placenta. Feminisation and undescended testes in male fetus in animal studies - manufacturer advises avoid.
- **BREAST FEEDING** Present in breast milk — manufacturer advises avoid.

**RENA E IMPAIRMENT** Use with caution if estimated glomerular filtration rate 30–60 mL/minute/1.73 m². Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m². Monitor plasma-potassium concentration if estimated glomerular filtration rate 30–60 mL/minute/1.73 m².

**MONITORING REQUIREMENTS** Monitor electrolytes (discontinue if hyperkalaemia occurs).

**DIRECTIONS FOR ADMINISTRATION** Consult product literature. Intravenous injection to be given over at least 3 minutes.

**PRESCRIBING AND DISPENSING INFORMATION** Potassium canrenoate injection is available from ‘special-order’ manufacturers or specialist importing companies.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Potassium canrenoate (Non-proprietary)**
  - Aldactone 200mg/10ml solution for injection ampoules | 10 ampoule [P BMI no price available

**Spironolactone**

**INDICATIONS AND DOSE**

- Oedema in heart failure and in ascites | Nephrotic syndrome | Reduction of hypokalaemia induced by diuretics or amphotericin

**BY MOUTH**

- Neonate: Initially 1–2 mg/kg daily in 1–2 divided doses; increased if necessary up to 7 mg/kg daily, in resistant ascites.
- Child 1 month-11 years: Initially 1–3 mg/kg daily in 1–2 divided doses; increased if necessary up to 9 mg/kg daily, in resistant ascites
- Child 12-17 years: Initially 50–100 mg daily in 1–2 divided doses; increased if necessary up to 9 mg/kg daily, in resistant ascites; maximum 400 mg per day

**UNLICENSED USE** Not licensed for reduction of hypokalaemia induced by diuretics or amphotericin.

**CONTRA-INDICATIONS**

- Addison’s disease - anuria - hyperkalaemia

**CAUTIONS**

- Acute porphyrias p. 562 - potential metabolic products carcinogenic in rodents

**INTERACTIONS** ▶ Appendix 1 (diuretics).

Potassium supplements must not be given with potassium-sparing diuretics. Administration of a potassium-sparing diuretic to a patient receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.

**SIDE-EFFECTS**

**PREGNANCY**

- Use only if potential benefit outweighs risk — feminisation of male fetus in animal studies.

**BREAST FEEDING**

Metabolites present in milk, but amount probably too small to be harmful.

**RENA E IMPAIRMENT** Avoid in acute renal insufficiency or severe impairment. Monitor plasma-potassium concentration (high risk of hyperkalaemia in renal impairment).
PHOSPHODIESTERASE TYPE-3 INHIBITORS

**Enoximone**

**DRUG ACTION** Enoximone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

**INDICATIONS AND DOSE**

Congestive heart failure, low cardiac output following cardiac surgery

- **INITIALLY BY SLOW INTRAVENOUS INJECTION**
  - Neonate: Loading dose 500 micrograms/kg, followed by (by continuous intravenous infusion)
    - 5–20 micrograms/kg/minute, adjusted according to response, infusion to be given over 24 hours; maximum 24 mg/kg per day.
  - Child: Loading dose 500 micrograms/kg, followed by (by continuous intravenous infusion)
    - 5–20 micrograms/kg/minute, adjusted according to response, infusion dose to be given over 24 hours; maximum 24 mg/kg per day

**UNLICENSED USE** Not licensed for use in children.

**CAUTIONS** Heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction

**INTERACTIONS** → Appendix 1 (phosphodiesterase type-3 inhibitors).

**SIDE-EFFECTS** Chills, diarrhoea, ectopic beats, fever, headache, hypotension, insomnia, nausea, oliguria, supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias), upper and lower limb pain, urinary retention, ventricular tachycardia (more likely in patients with pre-existing arrhythmias), vomiting

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises caution—no information available.

**HEPATIC IMPAIRMENT** Dose reduction may be required.

**RENAL IMPAIRMENT** Consider dose reduction.

**MONITORING REQUIREMENTS** Monitor blood pressure, heart rate, ECG, central venous pressure, fluid and electrolyte status, renal function, platelet count and hepatic enzymes.

**DIRECTIONS FOR ADMINISTRATION** Incompatible with glucose solutions. Use only plastic containers or syringes; crystal formation if glass used. Avoid extravasation.

**CONTRA-INDICATIONS** Severe hypovolaemia

**CAUTIONS** Correct hypokalaemia • heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction

**INTERACTIONS** → Appendix 1 (phosphodiesterase type-3 inhibitors).

**SIDE-EFFECTS** Common or very common: Ectopic beats, headache, hypotension, supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias), ventricular tachycardia

Uncommon: Chest pain, hypokalaemia, thrombocytopenia, tremor, ventricular fibrillation

Very rare: Anaphylaxis, bronchospasm, rash

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

**Milrinone**

**DRUG ACTION** Milrinone is a phosphodiesterase type-3 inhibitor that exerts most effect on the myocardium; it has positive inotropic properties and vasodilator activity.

**INDICATIONS AND DOSE**

Congestive heart failure, low cardiac output following cardiac surgery, shock

- **INITIALLY BY INTRAVENOUS INFUSION**
  - Neonate: Initially 50–75 micrograms/kg, given over 30–60 minutes, reduce or omit initial dose if at risk of hypotension, then (by continuous intravenous infusion)
    - 30–45 micrograms/kg/hour for 2–3 days (usually for 12 hours after cardiac surgery).
  - Child: Initially 50–75 micrograms/kg, given over 30–60 minutes, reduce or omit initial dose if at risk of hypotension, then (by continuous intravenous infusion)
    - 30–45 micrograms/kg/hour for 2–3 days (usually for 12 hours after cardiac surgery)

**UNLICENSED USE** Not licensed for use in children under 18 years.

**CONTRA-INDICATIONS** Severe hypovolaemia

**CAUTIONS** Correct hypokalaemia • heart failure associated with hypertrophic cardiomyopathy, stenotic or obstructive valvular disease or other outlet obstruction

**INTERACTIONS** → Appendix 1 (phosphodiesterase type-3 inhibitors).

**SIDE-EFFECTS** Common or very common: Ectopic beats, headache, hypotension, supraventricular arrhythmias (more likely in patients with pre-existing arrhythmias), ventricular tachycardia

Uncommon: Chest pain, hypokalaemia, thrombocytopenia, tremor, ventricular fibrillation

Very rare: Anaphylaxis, bronchospasm, rash

**PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
**Hyperlipidaemia**

6  Hyperlipidaemia

**Lipid-regulating drugs**

**Risk factors for cardiovascular disease**

Atherosclerosis begins in childhood and raised serum cholesterol in children is associated with cardiovascular disease in adulthood. Lowering the cholesterol, without hindering growth and development in children and adolescents, should reduce the risk of cardiovascular disease in later life.

The risk factors for developing cardiovascular disease include raised serum cholesterol concentration, smoking, hypertension, impaired glucose tolerance, male sex, ethnicity, obesity, triglyceride concentration, chronic kidney disease, and a family history of cardiovascular disease. Heterozygous familial hypercholesterolaemia is the most common cause of raised serum cholesterol in children; homozygous familial hypercholesterolaemia is very rare and its specialised management is not covered in BNF for Children. Familial hypercholesterolaemia can lead to a greater risk of early coronary heart disease and should be managed by a specialist.

Secondary causes of hypercholesterolaemia should be addressed, these include obesity, diet, diabetes mellitus, hypothyroidism, nephrotic syndrome, obstructive biliary disease, glycogen storage disease, and drugs such as corticosteroids.

**Management**

The aim of management of hypercholesterolaemia is to reduce the risk of atherosclerosis while ensuring adequate growth and development. Children with hypercholesterolaemia (or their carers) should receive advice on appropriate lifestyle changes such as improved diet, increased exercise, weight reduction, and not smoking; Hypertension p. 90 should also be managed appropriately. Drug therapy may also be necessary.

**Hypothyroidism**

Children with hypothyroidism should receive adequate thyroid replacement therapy before their requirement for lipid-regulating treatment is assessed because correction of hypothyroidism itself may resolve the lipid abnormality. Untreated hypothyroidism increases the risk of myositis with lipid regulating drugs.

**Drug treatment in heterozygous familial hypercholesterolaemia**

Lifestyle modifications alone are unlikely to lower cholesterol concentration adequately in heterozygous familial hypercholesterolaemia and drug treatment is often required. Lipid-regulating drugs should be considered by the age of 10 years. The decision to initiate drug treatment will depend on the child’s age, the age of onset of coronary heart disease within the family, and the presence of other cardiovascular risk factors. In children with a family history of coronary heart disease in early adulthood, drug treatment before the age of 10 years, and a combination of lipid-regulating drugs may be necessary.

**Drug treatment in secondary hypercholesterolaemia**

If 6–12 months of dietary and other lifestyle interventions has failed to lower cholesterol concentration adequately, drug treatment may be indicated in children 10 years old and older (rarely necessary in younger children) who are at a high risk of developing cardiovascular disease.

**Choice of drugs**

Experience in the use of lipid-regulating drugs in children is limited; and they should be initiated on specialist advice.

**Statins** are more effective than other classes of drugs in lowering LDL-cholesterol but less effective than the fibrates in reducing triglycerides. Statins also increase concentrations of HDL-cholesterol. Statins reduce cardiovascular disease events and total mortality in adults, irrespective of the initial cholesterol concentration. They are the drugs of first choice in children and are generally well tolerated; atorvastatin p. 123 and simvastatin p. 125 are the preferred statins. Other lipid-regulating drugs can be used if statins are ineffective or are not tolerated.

Ezetimibe p. 121 can be used alone when statins are not tolerated, or in combination with a statin when a high dose statin fails to control cholesterol concentration adequately.

**Bile acid sequestrants** are also available but tolerability of and compliance with these drugs is poor, and their use is declining.

**Fibrates** may reduce the risk of coronary heart disease in those with low HDL-cholesterol or with raised triglycerides. Evidence for the use of a fibrate (bezafibrate p. 121 or fenofibrate p. 122) in children is limited; fibrates should be considered only if dietary intervention and treatment with a statin and a bile acid sequestrant is unsuccessful or contra-indicated.

In hypertriglyceridaemia which cannot be controlled by very strict diet, omega-3 fatty acid compounds can be considered.
LIPID MODIFYING DRUGS > BILE ACID SEQUESTRANTS

**Bile acid sequestrants**

- **Drug Action** Bile acid sequestrants act by binding bile acids, preventing their reabsorption; this promotes hepatic conversion of cholesterol into bile acids; the resultant increased LDL-receptor activity of liver cells increases the clearance of LDL-cholesterol from the plasma.

- **Caution** Interference with the absorption of fat-soluble vitamins (supplements of vitamins A, D, K, and folic acid) may be required when treatment is prolonged.

- **Side-effects** Constipation, diarrhoea, gastrointestinal discomfort, hypertriglyceridaemia (aggravation), hypoprothrombinaemia associated with vitamin K deficiency, increased risk of bleeding, nausea, vomiting.

- **Pregnancy** Bile acid sequestrants should be used with caution as although the drugs are not absorbed, they may cause fat-soluble vitamin deficiency on prolonged use.

- **Note** Patient counselling on bile acid sequestrants is provided.

**Colestipol hydrochloride**

- **Indications and Dose**
  
  **Familial hypercholesterolaemia**
  
  - **By Mouth**
  
  - Child 1–12 years: Initially 5 g 1–2 times a day, then increased in steps of 5 g every 1 month, total daily dose may be given in 1–2 divided doses or as a single dose if tolerated; maximum 30 g per day
  
  - Child 13–17 years: 60–90 g once daily, adjusted according to response, total daily dose may be given in 1–2 divided doses or as a single dose if tolerated; maximum 90 g per day

- **Contra-indications**
  
  - Intestinal obstruction
  
  - Other suitable liquid such as fruit juice or skimmed milk; other drugs should be taken at least 1 hour before or 4–6 hours after colestipol to reduce possible interference with absorption.

- **Patient and Carer Advice** Patient counselling on administration is advised for colestipol hydrochloride granules (avoid other drugs at same time).

- **Unlicensed Use** Not licensed for use in children.

- **Interactions** Appendix 1 (colestipol).

- **Directions for Administration** The contents of each sachet should be mixed with at least 100 mL of water or other suitable liquid such as fruit juice or skimmed milk; alternatively it can be mixed with thin soups, cereals, yoghurt, or pulpy fruits containing at least 100 mL of liquid is provided.

- **Other Drugs should be taken at least 1 hour before or 4–6 hours after colestipol to reduce possible interference with absorption.**

- **Monitoring Requirements** A child’s growth and development should be monitored.

- **Unlicensed Use** Not licensed for use in children under 6 years to reduce cholesterol.

- **Contra-indications** Complete biliary obstruction (not likely to be effective).

- **Interactions** Appendix 1 (colestipol).

- **Side-effects**

  - Diarrhoea associated with Crohn’s disease, ileal resection, vagotomy, diabetic vagal neuropathy, and radiation

  - Pruritus associated with partial biliary obstruction and primary biliary cirrhosis

- **Directions for Administration** The contents of each sachet should be mixed with at least 150 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, and pulpy fruits with a high moisture content. Other drugs should be taken at least 1 hour before or 4–6 hours after colestipol to reduce possible interference with absorption.
PATIENT AND CARER ADVICE. Patient counselling on administration is advised for colestyramine powder (avoid other drugs at same time).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution Powder

CAUTIONARY AND ADVISORY LABELS 13
EXCIPIENTS: May contain Aspartame, sucrose

Colestyramine (Non-proprietary)

Colestyramine anhydrous 4 gram Colesyramine 4g oral powder sachets | 50 sachet | no price available
Colestyramine 4g oral powder sachets sugar free | sugar-free | 50 sachet | £30.00–£32.78 DT price = £31.85

Questran (Bristol-Myers Squibb Pharmaceuticals Ltd)
Questran anhydrous 4 gram Questran 4g oral powder sachets | 50 sachet | £10.76

Questran Light (Bristol-Myers Squibb Pharmaceuticals Ltd)
Questramine anhydrous 4 gram Questran Light 4g oral powder sachets sugar-free | 50 sachet | £16.15 DT price = £13.85

LIPID MODIFYING DRUGS > CHOLESTEROL ABSORPTION INHIBITORS

Ezetimibe

DRUG ACTION Ezetimibe inhibits the intestinal absorption of cholesterol.

INDICATIONS AND DOSE
Adjunct to dietary measures and statin treatment in primary hypercholesterolaemia | Adjunct to dietary measures and statin in homozygous familial hypercholesterolaemia | Primary hypercholesterolaemia (if statin inappropriate or not tolerated) | Adjunct to dietary measures in homozygous sitosterolaemia

BY MOUTH
Child 10-17 years: 10 mg daily

INTERACTIONS → Appendix 1 (ezetimibe).

SIDE-EFFECTS

Common or very common Fatigue, gastro-intestinal disturbances, headache, myalgia

Rare Anaphylaxis, angioedema, arthralgia, hepatitis, hypersensitivity reactions, rash

Very rare Cholecystitis, cholelithiasis, myopathy, pancreatitis, raised creatine kinase, rhabdomyolysis, thrombocytopenia

PREGNANCY
Manufacturer advises use only if potential benefit outweighs risk—no information available.

BREAST FEEDING
Manufacturer advises avoid—present in milk in animal studies.

HEPATIC IMPAIRMENT Avoid in severe impairment—may accumulate.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Tablet

Ezetrol (Merck Sharp & Dohme Ltd)
Ezetimibe 10 mg | Ezetrol 10mg tablets | 28 tablet | £26.31 DT price = £26.31

Combinations available: Simvastatin with ezetimibe, p. 125

LIPID MODIFYING DRUGS > FIBRATES

Bezafibrate

DRUG ACTION Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

INDICATIONS AND DOSE

Hyperlipidaemia including familial hypercholesterolaemia (administered on expert advice)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 10–17 years: 200 mg once daily (max. per dose 200 mg 3 times a day), adjusted according to response

UNLICENSED USE Not licensed for use in children.

CONTRA-INDICATIONS Gall bladder disease - hypoaluminaemia - nephrotic syndrome - photosensitivity to fibrates

CAUTIONS Correct hypothyroidism before initiating treatment

INTERACTIONS → Appendix 1 (fibrates).

Combination of a fibrate with a statin increases the risk of muscle effects (especially rhabdomyolysis) and should be used with caution.

SIDE-EFFECTS

Common or very common Abdominal distension - anorexia - diarrhoea - nausea

Uncommon Alopecia - cholestasis - dizziness - erectile dysfunction - headache - myotoxicity (with myasthenia, myalgia, or very rarely rhabdomyolysis) — special risk in renal impairment - photosensitivity reactions - pruritus - rash - renal failure - urticaria

Rare Pancreatitis - peripheral neuropathy

Very rare Anaemia - gallstones - increased platelet count - interstitial lung disease - leucopenia - pancytopenia - Stevens-Johnson syndrome - thrombocytopenic purpura - toxic epidermal necrolysis

PREGNANCY
Manufacturer advises avoid—no information available.

BREAST FEEDING
Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT Avoid in severe liver disease.

RENAL IMPAIRMENT Reduce dose if estimated glomerular filtration rate 15–60 mL/minute/1.73 m². Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

Avoid if estimated glomerular filtration rate less than 15 mL/minute/1.73 m².

MONITORING REQUIREMENTS Consider monitoring of liver function and creatinine kinase when fibrates used in combination with a statin.

PRESCRIBING AND DISPENSING INFORMATION Fibrates are mainly used in those whose serum triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension Tablet

CAUTIONARY AND ADVISORY LABELS 21

Bezafibrate (Non-proprietary)

Bezafibrate 200 mg Bezafibrate 200mg tablets | 100 tablet | £8.50 DT price = £4.51

Bezalol (Actavis UK Ltd)

Bezafibrate 200 mg Bezalol 200mg tablets | 100 tablet | £8.63 DT price = £4.51
Fenofibrate

**DRUG ACTION** Fibrates act by decreasing serum triglycerides; they have variable effect on LDL-cholesterol.

**INDICATIONS AND DOSE**

**Hyperlipidaemias including familial hypercholesterolaemia (administered on expert advice)**

- **BY MOUTH USING CAPSULES**
  - Child 4-14 years: One 67 mg (micronised) capsule per 20 kg bodyweight daily, maximum four 67 mg capsules daily, or max. three 67 mg capsules daily with concomitant statin
  - Child 15-17 years: Initially 3 capsules daily, then increased if necessary to 4 capsules daily, max. 3 capsules daily with concomitant statin, dose relates to 67 mg (micronised) capsules

**UNLICENSED USE** 200 mg and 267 mg capsules not licensed in children.

**CONTRA-INDICATIONS** Gall bladder disease - pancreatitis (unless due to severe hypertriglyceridaemia) - photosensitivity to ketoprofen

**CAUTIONS** Correct hypothyroidism before initiating treatment

**INTERACTIONS** 

Combination of a fibrate with a statin increases the risk of muscle effects (especially rhabdomyolysis) and should be used with caution.

**SIDE-EFFECTS**

- **Common or very common** Abdominal distension - anorexia - diarrhoea - nausea
- **Uncommon** Alopecia - cholestasis - dizziness - erectile dysfunction - headache - myotoxicity (with myasthenia, myalgia, or very rarely rhabdomyolysis) - special risk in renal impairment - pancreatitis - photosensitivity reactions - pruritus - pulmonary embolism - rash - renal failure - urticaria
- **Rare** Hepatitis - peripheral neuropathy
- **Very rare** Anaemia - gallstones - increased platelet count - interstitial lung disease - leucopenia - pancytopenia - Stevens-Johnson syndrome - thrombocytopenic purpura - toxic epidermal necrolysis
- **Frequency not known** Intestinal pneumopathies
- **PREGNANCY** Avoid—embryotoxicity in animal studies.
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Reduce dose if estimated glomerular filtration rate less than 60 mL/minute/1.73 m². Avoid if estimated glomerular filtration rate less than 15 mL/minute/1.73 m².

Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly.

**MONITORING REQUIREMENTS**

- Liver function tests recommended every 3 months for first year (discontinue treatment if significantly raised).
- Consider monitoring liver function and creatine kinase when fibrates used in combination with a statin.

**PRESCRIBING AND DISPENSING INFORMATION** Fibrates are mainly used in those whose serum-triglyceride concentration is greater than 10 mmol/litre or in those who cannot tolerate a statin (specialist use).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**CAUTIONARY AND ADVISORY LABELS 21**

- **Fenofibrate (Non-proprietary)**
  - Fenofibrate micronised 67 mg. Fenofibrate micronised 67 mg capsules | 90 capsule [P](BGP Products Ltd) £23.30 DT price = £22.37
  - Fenofibrate micronised 200 mg. Fenofibrate micronised 200 mg capsules | 28 capsule [P] £21.75 DT price = £19.03
  - Fenofibrate micronised 267 mg. Fenofibrate micronised 267 mg capsules | 28 capsule [P] £21.75 DT price = £19.03
- **Lipantil Micro** (BGP Products Ltd)
  - Fenofibrate micronised 67 mg. Lipantil Micro 67 capsules | 90 capsule [P] £23.30 DT price = £22.37
  - Fenofibrate micronised 200 mg. Lipantil Micro 200 capsules | 28 capsule [P] £14.23 DT price = £12.01
  - Fenofibrate micronised 267 mg. Lipantil Micro 267 capsules | 28 capsule [P] £21.75 DT price = £19.03

**LIPID MODIFYING DRUGS > STATINS**

Statins

**DRUG ACTION** Statins competitively inhibit 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase, an enzyme involved in cholesterol synthesis, especially in the liver.

**CAUTIONS**

- **Alcohol intake** - history of liver disease - hypothyroidism - patients at increased risk of muscle toxicity, including myopathy or rhabdomyolysis (e.g. those with a personal or family history of muscular disorders, previous history of muscular toxicity and a high alcohol intake)

**CAUTIONS, FURTHER INFORMATION**

- **Muscle effects** Muscle toxicity can occur with all statins, however the likelihood increases with higher doses and in certain patients (see below). Statins should be used with caution in patients at increased risk of muscle toxicity, including those with a personal or family history of muscular disorders, previous history of muscular toxicity, a high alcohol intake, renal impairment or hypothyroidism.

  In patients at increased risk of muscle effects, a statin should not usually be started if the baseline creatine kinase concentration is more than 5 times the upper limit of normal (some patients may present with an extremely elevated baseline creatine kinase concentration, for example because of a physical occupation or rigorous exercise—specialist advice should be sought regarding consideration of statin therapy in these patients).

- **Hypothyroidism** Hypothyroidism should be managed adequately before starting treatment with a statin.

**INTERACTIONS** 

- Liver function tests recommended every 3 months for first year (discontinue treatment if significantly raised).
- Consider monitoring liver function and creatine kinase when fibrates used in combination with a statin.

There is an increased incidence of myopathy if a statin is given with a fibrate (the combination of a statin and gemfibrozil should preferably be avoided), with lipid-lowering doses of nicotinic acid, with fusidic acid (risk of rhabdomyolysis—the combination of a statin and fusidic acid should be avoided; temporarily discontinue statin and restart 7 days after last fusidic acid dose), or with drugs that increase the plasma-statin concentration, such as macrolide antibiotics, imidazole and triazole antifungals, and ciclosporin; close monitoring of liver function and, if muscular symptoms occur, of creatine kinase is necessary.

**SIDE-EFFECTS**

- **Rare** Hepatitis - jaundice
- **Very rare** Hepatic failure. - interstitial lung disease - lupus erythematosus-like reactions - pancreatitis
- **Frequency not known** Alopecia - altered liver function tests - anemia - arthralgia - asthenia - depression - dizziness - fatigue - gastrointestinal disturbances - headache - hyperglycaemia - hypersensitivity reactions - may be
associated with the development of diabetes mellitus (particularly in those already at risk of the condition) - myalgia - myopathy - myositis - paraesthesia - peripheral neuropathy - pruritus - rash - rhabdomyolysis - sexual dysfunction - sleep disturbance - thrombocytopenia - urticaria - visual disturbance

SID Effects Further Information

▶ Muscle effects The risk of myopathy, myositis, and rhabdomyolysis associated with statin use is rare. Although myalgia has been reported commonly in patients receiving statins, muscle toxicity truly attributable to statin use is rare. Muscle toxicity can occur with all statins, however the likelihood increases with higher doses. If muscular symptoms or raised creatine kinase occur during treatment, other possible causes (e.g. rigorous physical activity, hypothyroidism, infection, recent trauma, and drug or alcohol addiction) should be excluded before statin therapy is implicated, particularly if statin treatment has previously been tolerated for more than 3 months. When a statin is suspected to be the cause of myopathy, and creatine kinase concentration is markedly elevated (more than 5 times upper limit of normal), or if muscular symptoms are severe, treatment should be discontinued. If symptoms resolve and creatine kinase concentrations return to normal, the statin should be reintroduced at a lower dose and the patient monitored closely; an alternative statin should be prescribed if unacceptable side-effects are experienced with a particular statin. Statins should not be discontinued in the event of small, asymptomatic elevations of creatine kinase. Routine monitoring of creatine kinase is unnecessary in asymptomatic patients.

▶ Interstitial lung disease If patients develop symptoms such as dyspnoea, cough, and weight loss, they should seek medical attention.

Conception and Contraception Adequate contraception is required during treatment and for 1 month afterwards.

Pregnancy Statins should be avoided in pregnancy (discontinue 3 months before attempting to conceive) as congenital abnormalities have been reported and the decreased synthesis of cholesterol possibly affects fetal development.

Hepatic Impairment Statins should be used with caution in those with a history of liver disease. Avoid in active liver disease or when there are unexplained persistent elevations in serum transaminases.

Monitoring Requirements

▶ Before starting treatment with statins, at least one full lipid profile (non-fasting) should be measured, including total cholesterol, HDL-cholesterol, non-HDL-cholesterol (calculated as total cholesterol minus HDL-cholesterol), and triglyceride concentrations, thyroid-stimulating hormone, and renal function should also be assessed.

▶ Liver function There is little information available on a rational approach to liver-function monitoring; however, NICE suggests that liver enzymes should be measured before treatment, and repeated within 3 months and at 12 months of starting treatment, unless indicated at other times by signs or symptoms suggestive of hepatotoxicity (NICE clinical guideline 181 (July 2014). Lipid Modification—Cardiovascular risk assessment and the modification of blood lipids for the primary and secondary prevention of cardiovascular disease).

Those with serum transaminases that are raised, but less than 3 times the upper limit of the reference range, should not be routinely excluded from statin therapy. Those with serum transaminases of more than 3 times the upper limit of the reference range should discontinue statin therapy.

▶ Creatine kinase Creatine kinase concentration should be measured in children before treatment and if unexplained muscle pain occurs.

Patient and Carer Advice Advise patients to report promptly unexplained muscle pain, tenderness, or weakness.

Atorvastatin

Indications and Dose

Hyperlipidaemia including familial hypercholesterolaemia

▶ By Mouth

▶ Child 10-17 years: Initially 10 mg once daily, then increased if necessary up to 20 mg once daily, dose to be adjusted at intervals of at least 4 weeks

Homozygous familial hypercholesterolaemia

▶ By Mouth

▶ Child 10-17 years: Initially 10 mg once daily, then increased if necessary up to 80 mg once daily, dose to be adjusted at intervals of at least 4 weeks

Dose Adjustments Due to Interactions

Reduced dose required (max. 10 mg daily) with concomitant ciclosporin, or tipranavir combined with ritonavir—seek specialist advice.

Caution Haemorrhagic stroke

Side-Effects

▶ Common or very common Back pain - epistaxis - hyperglycaemia - nasopharyngitis - pharyngolaryngitis - pain

▶ Uncommon Anorexia - blurred vision - chest pain - hypoglycaemia - malaise - neck pain - peripheral oedema - pyrexia - rashes - weight gain

▶ Rare Cholestasis - Stevens-Johnson syndrome - toxic epidermal necrolysis

▶ Very rare Gynaecomastia - hearing loss

Breast Feeding Manufacturer advises avoid—no information available.

Patient and Carer Advice Patient counselling is advised for atorvastatin tablets (muscle effects). Medicines for Children leaflet: Atorvastatin for high cholesterol www.medicinesforchildren.org.uk/atorvastatin-high-cholesterol-0

**PATIENT AND CARER ADVICE**

- **RENAL IMPAIRMENT**
  - Very rare
  - No information available.

**SIDE-EFFECTS**

- **Very rare** Vasculitis
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAI IMPAIRMENT** Manufacturer advises doses above 40 mg daily should be initiated with caution if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE** Patient counselling is advised for fluvastatin tablets/capsules (muscle effects).

---

### Fluvastatin

#### INDICATIONS AND DOSE

- **Heterozygous familial hypercholesterolaemia**
  - By mouth using immediate-release medicines
  - Child 9-17 years: Initially 20 mg daily, dose if necessary up to 40 mg daily may be given twice daily, adjusted at intervals of at least 6 weeks; maximum 80 mg per day.
  - By mouth using modified-release medicines
  - Child 9-17 years: 80 mg daily, dose form is not appropriate for initial dose titration.

#### SIDE-EFFECTS

- Very rare
- **Vasculitis**
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAI IMPAIRMENT** Manufacturer advises doses above 40 mg daily should be initiated with caution if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².
- **PATIENT AND CARER ADVICE** Patient counselling is advised for fluvastatin tablets/capsules (muscle effects).

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder tablet.

- **Fluvastatin (Non-proprietary)**
  - Fluvastatin (as Fluvastatin sodium) 80 mg | Fluvastatin 80mg modified-release tablets | 28 tablet | £19.20
  - Dorisin XL (Aspire Pharma Ltd)
  - Fluvastatin (as Fluvastatin sodium) 80 mg | Dorisin XL 80mg tablets | 28 tablet | £19.20

---

### Pravastatin sodium

#### INDICATIONS AND DOSE

- **Hyperlipidaemia including familial hypercholesterolaemia**
  - By mouth
  - Child 6-13 years: 10 mg daily, then increased if necessary up to 20 mg daily, dose to be taken at night, dose to be adjusted at intervals of at least 4 weeks.
  - Child 14-17 years: 10 mg daily, then increased if necessary up to 40 mg daily, dose to be taken at night, dose to be adjusted at intervals of at least 4 weeks.

- **SIDE-EFFECTS**
  - Uncommon
  - Abnormal urination - dysuria - nocturia - urinary frequency
  - Very rare
  - Fulminant hepatic necrosis
  - **BREAST FEEDING** Manufacturer advises avoid—small amount of drug present in breast milk.
  - **RENAI IMPAIRMENT** Start with lower doses in moderate to severe impairment.
  - **PATIENT AND CARER ADVICE** Patient counselling is advised for pravastatin tablets (muscle effects).

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, powder tablet.
  - **Pravastatin sodium (Non-proprietary)**
  - Pravastatin sodium 10 mg | Pravastatin 10mg tablets | 28 tablet | £16.10 DT price = £0.91
  - Pravastatin sodium 20 mg | Pravastatin 20mg tablets | 28 tablet | £29.60 DT price = £1.08
  - Pravastatin sodium 40 mg | Pravastatin 40mg tablets | 28 tablet | £59.60 DT price = £1.37

---

### Rosuvastatin

#### INDICATIONS AND DOSE

- **Hyperlipidaemia including familial hypercholesterolaemia**
  - By mouth
  - Child 10-17 years: Initially 5 mg once daily, then increased if necessary up to 20 mg once daily, dose to be increased at intervals of at least 4 weeks, using lowest max. dose in children with risk factors for myopathy or rhabdomyolysis (including personal or family history of muscular disorders or toxicity)

- **DOSE ADJUSTMENTS DUE TO INTERACTIONS**
  - Reduced dose required with concomitant atazanavir, darunavir, ezetimibe, itraconazole, lopinavir, or tipranavir—seek specialist advice.

#### CAUTIONS

- Patients of Asian origin

#### SIDE-EFFECTS

- **Common or very common** Proteinuria
- **Very rare** Gynaecomastia - haematuria
- **Frequency not known** Oedema - Stevens-Johnson syndrome
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

#### REHAL IMPAIRMENT

- Reduce dose if estimated glomerular filtration rate less than 60 mL/minute/1.73 m². Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

- **PATIENT AND CARER ADVICE** Patient counselling is advised for rosuvastatin tablets (muscle effects).
Medicinal forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, tablets, and by mouth.

Tablet
- Crestor (AstraZeneca UK Ltd)
  - Rosuvastatin (as Rosuvastatin calcium) 5 mg [28 tablet] £18.03 DT price = £18.03
  - Rosuvastatin (as Rosuvastatin calcium) 10 mg [28 tablet] £18.03 DT price = £18.03
  - Rosuvastatin (as Rosuvastatin calcium) 20 mg [28 tablet] £26.02 DT price = £26.02
- Simvastatin (Non-proprietary)
  - Tablet
  - Simvastatin 20 mg [28 tablet] £29.69 DT price = £29.69
  - Simvastatin 40 mg [28 tablet] £39.69 DT price = £39.67

Indications and dose
Hyperlipidaemia including familial hypercholesterolaemia

- By mouth
- Child 5–9 years: Initially 10 mg once daily, then increased if necessary up to 20 mg once daily, dose to be taken at night, increased at intervals of at least 4 weeks.
- Child 10–17 years: Initially 10 mg once daily, then increased if necessary up to 40 mg once daily, dose to be taken at night, increased at intervals of at least 4 weeks.

Dose adjustments due to interactions
Reduced dose required with concomitant amiodarone, bezafibrate, amiodipine, diltiazem, or verapamil—seek specialist advice.

Unlicensed use
Not licensed for use in children under 10 years.

Side-effects
- Rare: Anaemia
- Frequency not known: Tendinopathy
- Breast feeding: Manufacturer advises avoid—no information available.

Renal impairment
Doses above 10 mg daily should be used with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

Patient and carer advice
Patient counselling is advised for simvastatin tablets/oral suspension (muscle effects).

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, and by mouth.

Tablet
- Simvastatin (Non-proprietary)
  - Simvastatin 10 mg [28 tablet] £18.03 DT price = £18.03
  - Simvastatin 20 mg [28 tablet] £29.69 DT price = £29.67
  - Simvastatin 40 mg [28 tablet] £39.69 DT price = £39.67
  - Simvastatin 80 mg [28 tablet] £59.69 DT price = £59.67

Simvastatin with ezetimibe

The properties listed below are those particular to the combination only. For the properties of the components please consider, simvastatin above, ezetimibe p. 121.

Indications and dose
Homozgyous familial hypercholesterolaemia, primary hypercholesterolaemia, and mixed hyperlipidaemia in patients over 10 years stabilised on the individual components in the same proportions, or for patients not adequately controlled by statin alone.

- By mouth
- Child (initiated by a specialist): (consult product literature)

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

Tablet
- Inegy (Merck Sharp & Dohme Ltd)
  - Ezetimibe 10 mg, Simvastatin 20 mg [28 tablet] £33.42 DT price = £33.42
  - Ezetimibe 10 mg, Simvastatin 40 mg [28 tablet] £38.98 DT price = £38.98
  - Ezetimibe 10 mg, Simvastatin 80 mg [28 tablet] £41.21 DT price = £41.21

7 Myocardial ischaemia

Antithrombotic drugs

Fibrinolytic drugs

Overview
Alteplase p. 126, streptokinase p. 126 and urokinase p. 81 are used in children to dissolve intravascular thrombi and unblock occluded arteriovenous shunts, catheters, and indwelling central lines blocked with fibrin clots. Treatment should be started as soon as possible after a clot has formed and discontinued once a pulse in the affected limb is detected, or the shunt or catheter unblocked.

The safety and efficacy of treatment remains uncertain, especially in neonates. A fibrinolytic drug is probably only appropriate where arterial occlusion threatens ischaemic damage; an anticoagulant may stop the clot getting bigger. Alteplase is the preferred fibrinolytic in children and neonates; there is less risk of adverse effects including allergic reactions.
Fibrinolytics

**DRUG ACTION** Fibrinolytic drugs act as thrombolytics by activating plasminogen to form plasmin, which degrades fibrin and so breaks up thrombi.

**CONTRA-INDICATIONS** Acute pancreatitis - aneurysm - arteriovenous malformation - bacterial endocarditis - bleeding diatheses - coagulation defects - neoplasm with risk of haemorrhage - pericarditis - recent haemorrhage - recent surgery (including dental extraction) - recent trauma - severe hypertension

**CAUTIONS** Conditions with an increased risk of haemorrhage - hypertension - risk of bleeding (including that from venepuncture or invasive procedures)

**INTERACTIONS** Caution with recent or concomitant use of drugs that increase the risk of bleeding.

**SIDE-EFFECTS** Allergic reactions - anaphylaxis - back pain - bleeding - bleeding (usually limited to the site of injection, but can occur from other sites) - cerebral oedema (caused by reperfusion) - convulsions - fever - flushing - hypotension - intracerebral haemorrhage - nausea - pulmonary oedema (caused by reperfusion) - rash - uveitis - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION** Bleeding Serious bleeding calls for discontinuation of the thrombolytic and may require administration of coagulation factors and antifibrinolytic drugs (e.g. tranexamic acid). Rarely further embolism may occur (either due to clots that break away from the original thrombus or to cholesterol crystal emboli).

Hypotension Hypotension can usually be controlled by raising the patient’s legs, or by reducing the rate of infusion or stopping it temporarily.

**PREGNANCY** Thrombolytic drugs can possibly lead to premature separation of the placenta in the first 18 weeks of pregnancy. There is also a risk of maternal haemorrhage throughout pregnancy and post-partum, and also a theoretical risk of fetal haemorrhage throughout pregnancy.

**HEPATIC IMPAIRMENT** Avoid in severe hepatic impairment as there is an increased risk of bleeding.

Alteplase
(rt-PA; Tissue-type plasminogen activator)

**INDICATIONS AND DOSE**

**Intravascular thrombosis**

**BY INTRAVENOUS INFUSION**

- Neonate: 100–500 micrograms/kg/hour for 3–6 hours, use ultrasound assessment to monitor effect before considering a second course of treatment (consult local protocol).

- Child: 100–500 micrograms/kg/hour for 3–6 hours, use ultrasound assessment to monitor effect before considering a second course of treatment; maximum 100 mg per day

**ACTILYSE CATHFLO®**

Thrombolytic treatment of occluded central venous access devices (including those used for haemodialysis)

**BY INTRAVENOUS INJECTION**

- Child: (consult product literature)

**UNLICENSED USE** Actilyse ® not licensed for use in children.

**CONTRA-INDICATIONS** Oesophageal varices - recent delivery - recent ulcerative gastro-intestinal disease - stroke

**INTERACTIONS** Contra-indicated if concomitant treatment with oral anticoagulants.

**SIDE-EFFECTS** Risk of cerebral bleeding increased in acute stroke

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to gentamicin (residue from manufacturing process).

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, reconstitute with Sodium Chloride 0.9%, then dilute further with Glucose 5% or Sodium Chloride 0.9% after reconstitution. Monitor fibrinogen concentration closely; if fibrinogen concentration less than 1 g/litre, stop streptokinase infusion and start unfractionated heparin;

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Powder and solvent for solution for injection**

- Actilyse (Boehringer Ingelheim Ltd)
  - Alteplase 10 mg Actilyse 10mg powder and solvent for solution for injection vials | 1 vial £144.00
  - Alteplase 20 mg Actilyse 20mg powder and solvent for solution for injection vials | 1 vial £216.00
- Actilyse Cathflo (Boehringer Ingelheim Ltd)
  - Alteplase 2 mg Actilyse Cathflo 2mg powder and solvent for solution for injection vials | 5 vial pack £225.00 (Hospital only)

**Powder and solvent for solution for infusion**

- Actilyse (Boehringer Ingelheim Ltd)
  - Alteplase 50 mg Actilyse 50mg powder and solvent for solution for infusion vials | 1 vial (Hospital only) £360.00

**Streptokinase**

**INDICATIONS AND DOSE**

**Intravascular thrombosis**

**INITIALLY BY INTRAVENOUS INFUSION**

- Child 1 month-11 years: Initially 2500–4000 units/kg, dose to be given over 30 minutes, followed by (by continuous intravenous infusion) 500–1000 units/kg/hour for up to 3 days until reperfusion occurs

- Child 12-17 years: Initially 250 000 units, dose to be given over 30 minutes, followed by (by continuous intravenous infusion) 100 000 units/hour for up to 3 days until reperfusion occurs

**UNLICENSED USE** Not licensed for use in children.

**CONTRA-INDICATIONS** Avoid in children who have had streptococcal infection in the last 12 months

**CAUTIONS** Atrial fibrillation - cavernous pulmonary disease - cerebrovascular disease - mitral valve defect - recent delivery or abortion - septic thrombotic disease

**INTERACTIONS** Contra-indicated if concomitant treatment with oral anticoagulants.

**SIDE-EFFECTS**

- Rare Guillain–Barré syndrome

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if previous allergic reaction to either streptokinase or anistreplase (no longer available). Prolonged persistence of antibodies to streptokinase and anistreplase (no longer available) can reduce the effectiveness of subsequent treatment; therefore, streptokinase should not be used again beyond 4 days of first administration of either streptokinase or anistreplase.

**DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, reconstitute with Sodium Chloride 0.9%, then dilute further with Glucose 5% or Sodium Chloride 0.9% after reconstitution. Monitor fibrinogen concentration closely; if fibrinogen concentration less than 1 g/litre, stop streptokinase infusion and start unfractionated heparin;
NITRATES

Glyceryl trinitrate

Overview

Nitrates are potent coronary vasodilators, but their principal benefit follows from a reduction in venous return which reduces left ventricular work. Unwanted effects such as flushing, headache, and postural hypotension may limit therapy, especially if the child is unusually sensitive to the effects of nitrates or is hypovolaemic. Glyceryl trinitrate below is also used in extravasation.

Nitrates

- CONTRA-INDICATIONS Aortic stenosis · cardiac tamponade · constrictive pericarditis · hypertrophic cardiomyopathy · hypotensive conditions · hypovolaemia · marked anaemia · mitral stenosis · raised intracranial pressure due to cerebral haemorrhage · raised intracranial pressure due to head trauma · toxic pulmonary oedema

- CAUTIONS Heart failure due to obstruction · hypothermia · hypothyroidism · hypoxaemia · malnutrition · metal-containing transfusional systems should be removed before magnetic resonance imaging procedures, cardiovascular, or diathermy · recent history of myocardial infarction · susceptibility to angle-closure glaucoma · tolerance · ventilation and perfusion abnormalities

- TOLERANCE Children receiving nitrates continuously throughout the day can develop tolerance (with reduced therapeutic effects). Reduction of blood-nitrate concentrations to low levels for 4 to 8 hours each day usually maintains effectiveness in such patients.

- INTERACTIONS Appendix 1 (nitrate).

- SIDE-EFFECTS

  GENERAL SIDE-EFFECTS

  - Common or very common Dizziness · postural hypotension · tachycardia · throbbing headache

  - Uncommon Flushing · heartburn · nausea · rash · syncope · temporary hypoxaemia · vomiting

  - Very rare Angle-closure glaucoma

  - Frequency not known Paradoxical bradycardia

  SPECIFIC SIDE-EFFECTS

  - With intravenous use Abdominal pain · apprehension · diaphoresis · muscle twitching · palpitation · prolonged administration has been associated with methaemoglobinemia · restlessness · retrosternal discomfort · severe hypotension

  SIDE-EFFECTS, FURTHER INFORMATION

  - With intravenous use Specific side-effects following injection (particularly if given too rapidly) include severe hypotension, diaphoresis, apprehension, restlessness, muscle twitching, retrosternal discomfort, palpitation, abdominal pain; prolonged administration has been associated with methaemoglobinemia.

  - ALLERGY AND CROSS-SENSITIVITY Contra-indicated in nitrate hypersensitivity.

  - BREAST FEEDING No information available—manufacturers advise use only if potential benefit outweighs risk.

  - HEPATIC IMPAIRMENT Caution in severe impairment.

  - RENAL IMPAIRMENT Manufacturers advise use with caution in severe impairment.

  - MONITORING REQUIREMENTS Monitor blood pressure and heart rate during intravenous infusion.

  - TREATMENT CESSATION Avoid abrupt withdrawal.

- MEDICINAL FORMS

  There can be variation in the licensing of different medicines containing the same drug.

- Powder for solution for infusion

  Streptokinase (Non-proprietary)

  Streptokinase 1.5 mega unit [Biofactor Streptokinase 1.5 million unit powder for solution for infusion vials] 1 vial (P) £83.44

  Streptokinase 250000 unit [Biofactor Streptokinase 250,000 unit powder for solution for infusion vials] 1 vial (P) £15.91

  Streptokinase 750000 unit [Biofactor Streptokinase 750,000 unit powder for solution for infusion vials] 1 vial (P) £41.72

- DIRECTIONS FOR ADMINISTRATION

  - With intravenous use

    - For continuous intravenous infusion, dilute to max. concentration of 400 micrograms/mL (but concentration of 1 mg/mL has been used via a central venous catheter) with Glucose 5% or Sodium Chloride 0.9%. Neonatal intensive care, dilute 3 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 1 mL/hour provides a dose of 1 microgram/kg/minute; max. concentration of 400 micrograms/mL (but concentration of 1 mg/mL has been used via a central venous catheter).

    - With intravenous use Glass or polyethylene apparatus is preferable; loss of potency will occur if PVC is used. Glyceryl trinitrate 1 mg/mL to be diluted before use or given undiluted with syringe pump. Glyceryl trinitrate 5 mg/mL to be diluted before use.

- UNLICENSED USE Not licensed for use in children.

- PREGNANCY Not known to be harmful.

- DIRECTIONS FOR ADMINISTRATION

  - With intravenous use For continuous intravenous infusion, dilute to max. concentration of 400 micrograms/mL (but concentration of 1 mg/mL has been used via a central venous catheter) with Glucose 5% or Sodium Chloride 0.9%. Neonatal intensive care, dilute 3 mg/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 1 mL/hour provides a dose of 1 microgram/kg/minute; max. concentration of 400 micrograms/mL (but concentration of 1 mg/mL has been used via a central venous catheter).

    - With intravenous use Glass or polyethylene apparatus is preferable; loss of potency will occur if PVC is used. Glyceryl trinitrate 1 mg/mL to be diluted before use or given undiluted with syringe pump. Glyceryl trinitrate 5 mg/mL to be diluted before use.

- MEDICINAL FORMS

  There can be variation in the licensing of different medicines containing the same drug.

- Solution for infusion

  EXCIPIENTS: May contain ethanol, propylene glycol

  - Glyceryl trinitrate (Non-proprietary)

    - Glyceryl trinitrate 1 mg per 1 mL Glyceryl trinitrate 50mg/50ml solution for infusion vials | 1 vial (P) £15.90 25 vial (P) no price available

    - Glyceryl trinitrate 5 mg per 1 mL Glyceryl trinitrate 50mg/10ml solution for infusion ampoules | 5 ampoule (P) £64.90

    - Glyceryl trinitrate 25mg/5ml solution for infusion ampoules | 5 ampoule (P) £32.45

    - Nitrocine (UCB Pharma Ltd)

    - Glyceryl trinitrate 1 mg per 1 mL Nitrocine 10mg/10ml solution for infusion ampoules | 10 ampoule (P) £58.75 (Hospital only)

    - Nitronal (Merck Serono Ltd)

    - Glyceryl trinitrate 1 mg per 1 mL Nitronal 5mg/5ml solution for infusion ampoules | 10 ampoule (P) £18.04

    - Nitronal 50mg/50ml solution for infusion vials | 1 vial (P) £14.76
7.1 Cardiac arrest

Cardiopulmonary resuscitation

Overview

The algorithms for cardiopulmonary resuscitation (Life support algorithm (see inside back cover)) reflect the recommendations of the Resuscitation Council (UK); they cover paediatric basic life support, paediatric advanced life support, and newborn life support. The guidelines are available at www.resus.org.uk.

Paediatric advanced life support

Cardiopulmonary (cardiac) arrest in children is rare and frequently represents the terminal event of progressive shock or respiratory failure.

During cardiopulmonary arrest in children without intravenous access, the intravenous route is chosen because it provides rapid and effective response; if circulatory access cannot be gained, the endotracheal tube can be used. When the endotracheal route is used ten times the intravenous dose should be used; the drug should be injected quickly down a narrow bore suction catheter beyond the tracheal end of the tube and then flushed in with 1 or 2 mL of sodium chloride 0.9%. The endotracheal route is useful for lipid-soluble drugs, including lidocaine hydrochloride p. 70, adrenaline/epinephrine below, atropine sulfate p. 764, and naloxone hydrochloride p. 796. Drugs that are not lipid-soluble (e.g. sodium bicarbonate p. 544 and calcium chloride p. 553) should not be administered by this route because they will injure the airways.

For the management of acute anaphylaxis, see allergic emergencies under Antihistamines, allergen immunotherapy and allergic emergencies p. 162.

SYMPATHOMIMETICS ➔ VASOCONSTRICTOR

Adrenaline/epinephrine

- **DRUG ACTION** Acts on both alpha and beta receptors and increases both heart rate and contractility (beta, effects); it can cause peripheral vasodilation (a beta, effect) or vasoconstriction (an alpha effect).
- **INDICATIONS AND DOSE**

  **Acute hypotension**
  - By continuous intravenous infusion
    - Neonate: Initially 100 nanograms/kg/minute, adjusted according to response, higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension.
    - Child: Initially 100 nanograms/kg/minute, adjusted according to response, higher doses up to 1.5 micrograms/kg/minute have been used in acute hypotension.
  - Croup (when not effectively controlled with corticosteroid treatment)
    - By inhalation of nebulised solution
      - Child 1 month–11 years: 400 micrograms/kg (max. per dose 5 mg), dose to be repeated after 30 minutes if necessary

  **PHARMACOKINETICS**
  The effects of nebulised adrenaline for the treatment of croup lasts for 2–3 hours.

Emergency treatment of acute anaphylaxis (under expert supervision) ➔ Angioedema (if laryngeal oedema is present) (under expert supervision)

- By intramuscular injection
  - Child 1 month–5 years: 150 micrograms, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, suitable syringe to be used for measuring small volume; injected preferably into the anterolateral aspect of the middle third of the thigh
  - Child 6–11 years: 300 micrograms, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function, to be injected preferably into the anterolateral aspect of the middle third of the thigh
  - Child 12–17 years: 500 micrograms, to be injected preferably into the anterolateral aspect of the middle third of the thigh, doses may be repeated several times if necessary at 5 minute intervals according to blood pressure, pulse, and respiratory function
  - 300 micrograms (0.3 mL) to be administered if child small or prepubertal

Acute anaphylaxis when there is doubt as to the adequacy of the circulation (specialist use only) ➔ Angioedema (if laryngeal oedema is present) (specialist use only)

- By slow intravenous injection
  - Child: 1 microgram/kg (max. per dose 50 micrograms), using dilute 1 in 10 000 adrenaline injection, dose to be repeated according to response, if multiple doses required, adrenaline should be given as a slow intravenous infusion stopping when a response has been obtained

**EMERADE® 150 MICROGRAMS**

Acute anaphylaxis (for self-administration)

- By intramuscular injection
  - Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
  - Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg; 300 micrograms may be more appropriate for some children

**EMERADE® 300 MICROGRAMS**

Acute anaphylaxis (for self-administration)

- By intramuscular injection
  - Child (body-weight 30 kg and above): 300 micrograms, then 300 micrograms after 5–15 minutes as required

**EMERADE® 500 MICROGRAMS**

Acute anaphylaxis (for self-administration for patients at risk of severe anaphylaxis)

- By intramuscular injection
  - Child 12–17 years: 500 micrograms, then 500 micrograms after 5–15 minutes as required

**EPIPEN® AUTO-INJECTOR 0.3MG**

Acute anaphylaxis (for self-administration)

- By intramuscular injection
  - Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
  - Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg; 300 micrograms may be more appropriate for some children

**EPIPEN® JR AUTO-INJECTOR 0.15MG**

Acute anaphylaxis (for self-administration)

- By intramuscular injection
  - Child (body-weight up to 15 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required
  - Child (body-weight 15–30 kg): 150 micrograms, then 150 micrograms after 5–15 minutes as required, on the basis of a dose of 10 micrograms/kg; 300 micrograms may be more appropriate for some children
Chloride 0.9% and give through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. *Neonatal intensive care*, dilute 3 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 100 nanograms/kg/minute; infuse through a central venous catheter. Incompatible with bicarbonate and alkaline solutions. These infusions are usually made up with adrenaline 1 in 1000 (1 mg/mL) solution.

When used by inhalation For nebulisation in croup, adrenaline 1 in 1000 solution may be diluted with sterile sodium chloride 0.9% solution.

**PRESCRIBING AND DISPENSING INFORMATION** It is important, in acute anaphylaxis where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

Great vigilance is needed to ensure that the correct strength of adrenaline injection is used; anaphylactic shock kits need to make a very clear distinction between the 1 in 10 000 strength and the 1 in 1000 strength.

Patients with severe allergy should be instructed in the self-administration of adrenaline by intramuscular injection.

Packs for self-administration need to be clearly labelled with instructions on how to administer adrenaline (intramuscularly, preferably at the midpoint of the outer thigh, through light clothing if necessary) so that in the case of rapid collapse someone else is able to give it. It is important to ensure individuals at risk and their carers understand that:

- two injection devices should be carried at all times to treat symptoms until medical assistance is available; if, after the first injection, the individual does not start to feel better, the second injection should be given 5 to 15 minutes after the first;
- an ambulance should be called after every administration, even if symptoms improve;
- the individual should lie down with their legs raised (unless they have breathing difficulties, in which case they should sit up) and should not be left alone.

Adrenaline for administration by intramuscular injection is available in ‘auto-injectors’ (e.g. Emerade®, EpiPen®, or Jext®), pre-assembled syringes fitted with a needle suitable for very rapid administration (if necessary by a bystander or a healthcare provider if it is the only preparation available); injection technique is device specific.

To ensure patients receive the auto-injector device that they have been trained to use, prescribers should specify the brand to be dispensed.

**PATTERN AND CARER ADVICE** Individuals at considerable risk of anaphylaxis need to carry (or have available) adrenaline at all times and the patient, or their carers, need to be instructed in advance how to inject it.

**Jext® 300 micrograms** 1.1 mL of the solution remains in the auto-injector device after use.

**Jext® 150 micrograms** 1.25 mL of the solution remains in the auto-injector device after use.

**EpiPen® Jr auto-injector 0.15mg** 1.7 mL of the solution remains in the auto-injector device after use.

**EpiPen® auto-injector 0.3mg** 1.7 mL of the solution remains in the auto-injector device after use.

**Emerade® 300 micrograms** 0.2 mL of the solution remains in the auto-injector device after use.

**Emerade® 500 micrograms** No solution remains in the auto-injector device after use.

**Emerade® 150 micrograms** 0.35 mL of the solution remains in the auto-injector device after use.

**Medicines for Children leaflet: Adrenaline auto-injector for anaphylaxis** www.medicinesforchildren.org.uk/adrenaline-for-anaphylaxis
**Exceptions to Legal Category**  
POM restriction does not apply to the intramuscular administration of up to 1 mg of adrenaline injection 1 in 1000 (1 mg/mL) for the emergency treatment of anaphylaxis.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Solution for injection**

**Excipients**: May contain Sulfites

- **Adrenaline/epinephrine (non-proprietary)**
  - **Adrenaline 100 microgram per 1 ml**  
    Adrenaline (base) 100 micrograms (1 in 10,000) solution for injection ampoules | 10 ampoule £60.09
  - **Adrenaline 100 microgram per 1 ml**  
    Adrenaline (base) 1mg/10ml (1 in 10,000) dilute solution for injection pre-filled syringes | 1 pre-filled disposable injection £6.87
  - **Minitjet pre-filled syringes**  
    Adrenaline (base) 10mg/10ml (1 in 10,000) dilute solution for injection Minitjet pre-filled syringes | 1 pre-filled disposable injection £6.99

- **Adrenaline (as Adrenaline acid tartrate) 100 microgram per 1 ml**  
  Adrenaline (base) 1mg/10ml (1 in 10,000) dilute solution for injection ampoules | 1 ampoule £43.53 | 10 ampoule £60.65

- **Adrenaline 500 micrograms/5ml (1 in 10,000)**  
  Adrenaline (base) 500micrograms/5ml (1 in 10,000) dilute solution for injection ampoules | 10 ampoule £64.02

- **Adrenaline 1 mg per 1 ml**  
  Adrenaline (base) 1mg/1ml (1 in 1,000) solution for injection pre-filled syringes | 1 pre-filled disposable injection £10.40

- **Jext (ALK-Abello Ltd)**

- **Adrenaline 1 mg per 1 ml**  
  Jext 300micrograms/0.3ml (1 in 1,000) solution for injection auto-injectors | 1 pre-filled disposable injection £26.45

- **Adrenaline (as Adrenaline acid tartrate) 1 mg per 1 ml**  
  Jext 150micrograms/0.15ml (1 in 1,000) solution for injection auto-injectors | 1 pre-filled disposable injection £28.45

**Diuretics**

**Overview**

Diuretics are used for a variety of conditions in children including pulmonary oedema (caused by conditions such as respiratory distress syndrome and bronchopulmonary dysplasia), congestive heart failure, and hypertension. Hypertension in children is often resistant to therapy and may require the use of several drugs in combination. Maintenance of fluid and electrolyte balance can be difficult in children on diuretics, particularly neonates whose renal function may be immature.

**Loop diuretics** are used for pulmonary oedema, congestive heart failure, and in renal disease.

**Thiazides** are used less commonly than loop diuretics but are often used in combination with loop diuretics or spironolactone p. 117 in the management of pulmonary oedema and, in lower doses, for hypertension associated with cardiac disease.

Aminophylline p. 158 infusion has been used with intravenous furosemide p. 132 to relieve fluid overload in critically ill children.

**Heart failure**

Heart failure is less common in children than in adults; it can occur as a result of congenital heart disease (e.g. septal defects), dilated cardiomyopathy, myocarditis, or cardiac surgery. Drug treatment of heart failure due to left ventricular systolic dysfunction is covered below; optimal management of heart failure with preserved left ventricular function has not been established.

**Acute heart failure** can occur after cardiac surgery or as a complication in severe acute infections with or without myocarditis. Therapy consists of volume loading, vasodilator or inotropic drugs.

**Chronic heart failure** is initially treated with a loop diuretic, usually furosemide supplemented with spironolactone, amiloride hydrochloride p. 133, or potassium chloride p. 561. If diuresis with furosemide is insufficient, the addition of metolazone p. 134 or a thiazide diuretic can be considered. With metolazone the resulting diuresis can be profound and care is needed to avoid potentially dangerous electrolyte disturbance.

If diuretics are insufficient an ACE inhibitor, titrated to the maximum tolerated dose, can be used. ACE inhibitors are used for the treatment of all grades of heart failure in adults and can also be useful for children with heart failure. Addition of digoxin p. 75 can be considered in children who remain symptomatic despite treatment with a diuretic and an ACE inhibitor.

Some beta-blockers improve outcome in adults with heart failure, but data on beta-blockers in children are limited. Carvedilol p. 116 has vasodilatory properties and therefore (like ACE inhibitors) also lowers afterload.

In children receiving specialist cardiology care, the phosphodiesterase type-3 inhibitor enoximone p. 118 is sometimes used by mouth for its inotropic and vasodilator effects. Spironolactone is usually used as a potassium-sparing drug with a loop diuretic; in adults low doses of spironolactone are effective in the treatment of heart failure. Careful monitoring of serum potassium is necessary if spironolactone is used in combination with an ACE inhibitor.
administered early in the day so that the diuresis does not interfere with sleep.

In the management of hypertension a low dose of a thiazide produces a maximal or near-maximal blood pressure lowering effect, with very little biochemical disturbance. Higher doses cause more marked changes in plasma potassium, sodium, uric acid, glucose, and lipids, with little advantage in blood pressure control. Thiazides also have a role in chronic heart failure.

Bendroflumethiazide p. 102 is licensed for use in children; chlorothiazide p. 103 is also used. Chlorothalidone p. 134, a thiazide-related compound, has a longer duration of action than the thiazides and may be given on alternate days in younger children.

Metolazone is particularly effective when combined with a loop diuretic (even in renal failure) and is most effective when given 30–60 minutes before furosemide profound diuresis can occur and the child should therefore be monitored carefully.

Loop diuretics

Loop diuretics inhibit reabsorption of sodium, potassium, and chloride from the ascending limb of the loop of Henlé in the renal tubule and are powerful diuretics. Furosemide and bumetanide p. 132 are similar in activity; they produce dose-related diuresis. Furosemide is used extensively in children. It can be used for pulmonary oedema (e.g. in respiratory distress syndrome and bronchopulmonary dysplasia), congestive heart failure, and in renal disease.

Potassium-sparing diuretics and aldosterone antagonists

Spironolactone is the most commonly used potassium sparing diuretic in children; it is an aldosterone antagonist and enhances potassium retention and sodium excretion in the distal tubule. Spironolactone is combined with other diuretics to reduce urinary potassium loss. It is also used in nephrotic syndrome, the long-term management of Bartter’s syndrome, and high doses can help to control ascites in babies with chronic neonatal hepatitis. The clinical value of spironolactone in the management of pulmonary oedema in preterm neonates with chronic lung disease is uncertain.

Potassium canrenoate p. 117 given intravenously, is an alternative aldosterone antagonist that may be useful if a potassium-sparing diuretic is required and the child is unable to take oral medication. It is metabolised to canrenone, which is also a metabolite of spironolactone. Amiloride hydrochloride on its own is a weak diuretic. It causes retention of potassium and is therefore given with thiazide or loop diuretics as an alternative to giving potassium supplements.

A potassium-sparing diuretic such as spironolactone or amiloride hydrochloride may also be used in the management of amphotericin-induced hypokalaemia. Potassium supplements must not be given with potassium-sparing diuretics. Administration of a potassium-sparing diuretic to a child receiving an ACE inhibitor or an angiotensin–II receptor antagonist can also cause severe hyperkalaemia.

Potassium-sparing diuretics with other diuretics

Although it is preferable to prescribe diuretics separately in children, the use of fixed combinations may be justified in older children if compliance is a problem. Some preparations may not be licensed for use in children—consult product literature.

Other diuretics

Mannitol p. 133 is used to treat cerebral oedema, raised intraocular pressure, peripheral oedema, and acites. The carbonic anhydrase inhibitor acetazolamide p. 638 is a weak diuretic although it is little used for its diuretic effect. Acetazolamide and eye drops of dorzolamide p. 639 and brinzolamide p. 639 inhibit the formation of aqueous humour and are used in glaucoma. Acetazolamide is also used in the treatment of epilepsy, and raised intracranial pressure.

Diuretics with potassium

Diuretics and potassium supplements should be prescribed separately.

DIURETICS > LOOP DIURETICS

Loop diuretics

▶ DRUG ACTION Loop diuretics inhibit reabsorption from the ascending limb of the loop of Henlé in the renal tubule and are powerful diuretics.

▶ CONTRA-INDICATIONS Anuria • renal failure due to nephrotoxic or hepatotoxic drugs • severe hypokalaemia • severe hyponatraemia

▶ CAUTIONS Can cause acute urinary retention in children with obstruction of urinary outflow • can exacerbate diabetes (but hyperglycaemia less likely than with thiazides) • can exacerbate gout • comatose and precomatose states associated with liver cirrhosis • hypotension should be corrected before initiation of treatment • hypovolaemia should be corrected before initiation of treatment.

CAUTIONS, FURTHER INFORMATION

▶ Potassium loss Hypokalaemia can occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.

Hypokalaemia is particularly dangerous in children being treated with cardiac glycosides. In hepatic failure hypokalaemia caused by diuretics can precipitate encephalopathy.

The use of potassium-sparing diuretics avoids the need to take potassium supplements.

▶ Urinary retention Loop diuretics can cause acute urinary retention in children with obstruction of urinary outflow, therefore adequate urinary output should be established before initiating treatment.

▶ INTERACTIONS ➔ Appendix 1 (diuretics).

▶ SIDE-EFFECTS

▶ Very rare Hyperuricaemia

▶ Frequency not known Acute urinary retention • blood disorders • bone-marrow depression • deafness (usually with high doses and rapid intravenous administration, and in renal impairment) • electrolyte disturbances • hepatic encephalopathy • hyperglycaemia (less common than with thiazides) • hypersensitivity reactions • hypochloremia • hypokalaemia • hypomagnesaemia • hyponatraemia • increased calcium excretion (nephrocalcinosis and nephrolithiasis reported with long-term use of furosemide in preterm infants) • leukopenia • metabolic alkalosis • mild gastro-intestinal disturbances • pancreatitis • photosensitivity • postural hypotension • rash • temporary increase in serum-cholesterol and triglyceride concentration • thrombocytopenia • tinnitus (usually with high doses and rapid intravenous administration, and in renal impairment) • visual disturbances

▶ HEPATIC IMPAIRMENT Hypokalaemia induced by loop diuretics may precipitate hepatic encephalopathy and coma—potassium-sparing diuretics can be used to prevent this.

▶ RENAL IMPAIRMENT High doses of loop diuretics may occasionally be needed in renal impairment. High doses or
Bumetanide

**INDICATIONS AND DOSE**

*Oedema in heart failure, renal disease, and hepatic disease* | Pulmonary oedema

- **BY MOUTH**
  - Child 1 month-11 years: 15–50 micrograms/kg 1–4 times a day (max. per dose 2 mg); maximum 5 mg per day
  - Child 12–17 years: Initially 1 mg, dose to be taken in the morning, then 1 mg after 6–8 hours if required

*Oedema in heart failure, renal disease, and hepatic disease (severe cases)* | Pulmonary oedema (severe cases)

- **BY MOUTH**
  - Child 12–17 years: Initially 5 mg daily, increased in steps of 5 mg every 12–24 hours, adjusted according to response

**UNLICENSED USE** Not licensed for use in children under 12 years.

**SIDE-EFFECTS**
- Breast pain, gynaecomastia, musculoskeletal pain (associated with high doses in renal failure)
- Pulmonary oedema
- Hypotension
- Hypovolaemia associated with this condition.
- No information available. May inhibit lactation.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Furosemide (Frusemide)

**INDICATIONS AND DOSE**

*Oedema in heart failure, renal disease, and hepatic disease* | Pulmonary oedema

- **BY MOUTH**
  - Neonate: 0.5–2 mg/kg every 12–24 hours, alternatively 0.5–2 mg/kg every 24 hours, if corrected gestational age under 31 weeks.
  - Child 1 month–11 years: 0.5–2 mg/kg 2–3 times a day, alternatively 0.5–2 mg/kg every 24 hours, if corrected gestational age of under 31 weeks, higher doses may be required in resistant oedema; maximum 80 mg per day; maximum 12 mg/kg per day
  - Child 12–17 years: 20–40 mg daily; increased to 80–120 mg daily, in resistant oedema

**SIDE-EFFECTS**
- Tinnitus
- Oliguria
- Oedema
- Pulmonary oedema
- Hepatorenal syndrome
- Hypotension
- Hypovolaemia associated with this condition.
- Glucose solutions unsuitable (infusion pH must be above 5.5).
- Risk of ototoxicity may be reduced by giving high oral doses in 2 or more divided doses.

**PRESCRIBING AND DISPENSING INFORMATION**
- With oral use Some liquid preparations contain alcohol, caution especially in neonates.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**DIURETICS** > **OSMOTIC DIURETICS**

**Mannitol**

- **INDICATIONS AND DOSE**
  - **Cerebral oedema**
    - **BY INTRAVENOUS INFUSION**
      - Child 1 month–11 years: 0.25–1.5 g/kg, repeated if necessary, to be administered over 30–60 minutes, dose may be repeated 1–2 times after 4–8 hours
      - Child 12–17 years: 0.25–2 g/kg, repeated if necessary, to be administered over 30–60 minutes, dose may be repeated 1–2 times after 4–8 hours
  - **Peripheral oedema and ascites**
    - **BY INTRAVENOUS INFUSION**
      - Child: 1–2 g/kg, to be given over 2–6 hours

- **UNLICENSED USE** Not licensed for use in children under 12 years.

- **CONTRA-INDICATIONS** Anuria, intracranial bleeding (except during craniotomy), severe cardiac failure, severe dehydration, severe pulmonary oedema

- **CAUTIONS** Extravasation causes inflammation and thrombophlebitis

- **INTERACTIONS** > Appendix 1 (mannitol).

- **SIDE-EFFECTS**
  - **Uncommon** Electrolyte imbalance, fluid imbalance, hypotension, thrombophlebitis
  - **Rare** Anaphylaxis, arrhythmia, blurred vision, chest pain, chills, convulsions, cramp, dehydration, dizziness, dry mouth, fever, focal oesophageal reflux, headache, hypersensitivity reactions, hypertension, nausea, oedema, pulmonary oedema, raised intracranial pressure, rhabdomyolysis, skin necrosis, thirst, urinary retention, urticaria, vomiting
  - **Very rare** Acute renal failure, congestive heart failure

- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.

- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.

- **RENAL IMPAIRMENT** Use with caution in severe impairment.

- **PRE-TREATMENT SCREENING** Assess cardiac function before treatment.

- **MONITORING REQUIREMENTS**
  - Monitor fluid and electrolyte balance, serum osmolality, and cardiac, pulmonary and renal function.

- **DIRECTIONS FOR ADMINISTRATION**

  - Examine infusion for crystals. If crystals present, dissolve by warming infusion fluid (allow to cool to body temperature before administration).
  - For mannitol 20%, an in-line filter is recommended (15–micron filters have been used).

- **MEDICINAL FORMS**

  - There can be variations in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

9  Patent ductus arteriosus

Drugs affecting the ductus arteriosus

Drugs used for Patent ductus arteriosus not listed below
Ibuprofen p. 608 · Indometacin p. 611

Closure of the ductus arteriosus

Patent ductus arteriosus is a frequent problem in premature neonates with respiratory distress syndrome. Substantial left-to-right shunting through the ductus arteriosus may increase the risk of intraventricular haemorrhage, necrotising enterocolitis, bronchopulmonary dysplasia, and possibly death. Indometacin p. 611 or ibuprofen p. 608 can be used to close the ductus arteriosus. Indometacin has been used for many years and is effective but it reduces cerebral blood flow, and causes a transient fall in renal and gastrointestinal blood flow. Ibuprofen may also be used; it has little effect on renal function (there may be a small reduction in sodium excretion) when used in doses for closure of the ductus arteriosus; gastrointestinal problems are uncommon. If drug treatment fails to close the ductus arteriosus, surgery may be indicated.

Maintenance of patency

In the newborn with duct-dependent congenital heart disease it is often necessary to maintain the patency of the ductus arteriosus whilst awaiting surgery. Alprostadil p. 135 (prostaglandin E1) and dinoprostone p. 135 (prostaglandin E2) are potent vasodilators that are effective for maintaining the patency of the ductus arteriosus. They are usually given by continuous intravenous infusion, but oral dosing of dinoprostone is still used in some centres. During the infusion of a prostaglandin, the newborn requires careful
monitoring of heart rate, blood pressure, respiratory rate, and core body temperature. In the event of complications such as apnoea, profound bradycardia, or severe hypotension, the infusion should be temporarily stopped and the complication dealt with; the infusion should be restarted at a lower dose. Recurrent or prolonged apnoea may require ventilatory support in order for the prostaglandin infusion to continue.

**PROSTAGLANDIN ANALOGUES AND PROSTAMIDES > PROSTAGLANDINS**

### Alprostadil

**INDICATIONS AND DOSE**

**Maintaining patency of the ductus arteriosus**

- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Neonate: Initially 5 nanograms/kg/minute, adjusted according to response, adjusted in steps of 5 nanograms/kg/minute (max. per dose 100 nanograms/kg/minute), maximum dose associated with increased side-effects.

- **BY MOUTH**
  - Neonate: 20–25 micrograms/kg every 1–2 hours, then increased if necessary to 40–50 micrograms/kg every 1–2 hours, if treatment continues for more than 1 week gradually reduce the dose.

**UNLICENSED USE** Not licensed for use in children.

**CONTRA-INDICATIONS** Avoid in hyaline membrane disease

**CAUTIONS** History of haemorrhage

**INTERACTIONS** → Appendix 1 (prostaglandins).

**SIDE-EFFECTS**

- Apnoea (particularly in neonates under 2 kg), bradycardia, cardiac arrest, convulsions, cortical obstruction of long bones, diarrhoea, disseminated intravascular coagulation, fever, flushing, gastric outlet obstruction, hypokalaemia, hypotension, oedema, tachycardia, weakening of the wall of the ductus arteriosus and pulmonary artery (following prolonged use).

**MONITORING REQUIREMENTS**

- During the infusion of a prostaglandin, the newborn requires careful monitoring of heart rate, blood pressure, respiratory rate, and core body temperature.
- Monitor arterial pressure, respiratory rate, heart rate, temperature, and venous blood pressure in arm and leg; facilities for intubation and ventilation must be immediately available.

**DIRECTIONS FOR ADMINISTRATION**

- Dilute 150 micrograms/kg body-weight to a final volume of 50 mL with Glucose 5% or Sodium Chloride 0.9%; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 nanograms/kg/minute. Undiluted solution must not come into contact with the barrel of the plastic syringe; add the required volume of alprostadil to a volume of infusion fluid in the syringe and then make up to final volume.

**MEDICINAL FORMS**

- Dinoprostone 1 mg per 1 ml
  - Prostin VR (Pfizer Ltd)
    - 500 micrograms/1 ml solution for infusion ampoules £3.759.66 (Hospital only)

**PROSTAMIDES > PROSTAGLANDINS**

### Dinoprostone

**INDICATIONS AND DOSE**

**Maintaining patency of the ductus arteriosus**

- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Neonate: Initially 5 nanograms/kg/minute, then increased in steps of 5 nanograms/kg/minute as required; increased to 20 nanograms/kg/minute, doses up to 100 nanogram/kg/minute have been used but are associated with increased side-effects.
  - Neonate: 20–25 micrograms/kg every 1–2 hours, then increased if necessary to 40–50 micrograms/kg every 1–2 hours, if treatment continues for more than 1 week gradually reduce the dose.

- **BY MOUTH**
  - Neonate: 20–25 micrograms/kg every 1–2 hours, then increased if necessary to 40–50 micrograms/kg every 1–2 hours, if treatment continues for more than 1 week gradually reduce the dose.

**UNLICENSED USE** Not licensed for use in children.

**CONTRA-INDICATIONS** Avoid in hyaline membrane disease

**CAUTIONS** History of haemorrhage

**INTERACTIONS** → Appendix 1 (prostaglandins).

**SIDE-EFFECTS**

- Cortical hyperostosis (prolonged use) - apnoea (particularly with high doses and in low birth-weight neonates) - bradycardia - bronchospasm - cardiac arrest - diarrhoea - erythema - flushing - gastric outlet obstruction (if used for longer than 5 days) - hypotension - local reactions - nausea - pyrexia - raised white blood cell count - respiratory depression (particularly with high doses and in low birth-weight neonates) - shivering - temporary pyrexia - vomiting

- **HEPATIC IMPAIRMENT** Manufacturers advise avoid.

- **RENAL IMPAIRMENT** Manufacturers advise avoid.

**MONITORING REQUIREMENTS** Monitor arterial oxygenation, heart rate, temperature, and blood pressure in arm and leg; facilities for intubation and ventilation must be immediately available. During infusion of dinoprostone, the newborn requires careful monitoring of heart rate, blood pressure, respiratory rate and core body temperature.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use. For continuous intravenous infusion, dilute to a concentration of 1 microgram/mL with Glucose 5% or Sodium Chloride 0.9%.
  - With oral use in neonates. For administration by mouth, injection solution can be given orally; dilute with water.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Solution for infusion**
  - Dinoprostone 1 mg per 1 ml
    - Prostin E2 (Pfizer Ltd)
      - Dinoprostone 1 mg per 1 ml solution for infusion ampoules £8.52 (Hospital only)

**Peripheral vascular disease**

Classification and management

Raynaud's syndrome, a vasospastic peripheral vascular disease, consists of recurrent, long-lasting, and episodic vasospasm of the fingers and toes often associated with exposure to cold. Management includes avoidance of exposure to cold and stopping smoking (if appropriate).
More severe symptoms may require vasodilator treatment, which is most often successful in primary Raynaud’s syndrome. Nifedipine p. 100 and diltiazem hydrochloride below are useful for reducing the frequency and severity of vasospastic attacks. In very severe cases, where digital infarction is likely, intravenous infusion of the prostacyclin analogue iloprost p. 110 may be helpful. Vasodilator therapy is not established as being effective for chilblains.

**CALCIUM-CHANNEL BLOCKERS**

**Diltiazem hydrochloride**

**INDICATIONS AND DOSE**

Raynaud’s syndrome

- **BY MOUTH**
  - Child 12–17 years: 30–60 mg 2–3 times a day

**UNLICENSED USE** Not licensed for use in children.

**CAUTIONS** Bradycardia (avoid if severe). First degree AV block. Heart failure. Prolonged PR interval. Significantly impaired left ventricular function

**INTERACTIONS** → Appendix 1 (calcium-channel blockers).

**SIDE-EFFECTS**

- Rare: Erythema multiforme. Exfoliative dermatitis. Photosensitivity. Rashes

**Overdose**

In overdose, diltiazem has a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole.

**PREGNANCY** Avoid.

**BREAST FEEDING** Significant amount present in milk—no evidence of harm but avoid unless no safer alternative.

**HEPATIC IMPAIRMENT** Reduce dose.

**RENAL IMPAIRMENT** Start with smaller dose.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Modified-release tablet**

**CAUTIONARY AND ADVISORY LABELS** 25

- Diltiazem hydrochloride (non-proprietary)
  - Diltiazem hydrochloride 60 mg: Diltiazem 60mg modified-release tablets | 84 tablet | £41.17
  - Diltiazem hydrochloride 90 mg: Diltiazem 90mg modified-release tablets | 56 tablet | £49.40
  - Diltiazem hydrochloride 120 mg: Diltiazem 120mg modified-release tablets | 56 tablet | no price available

- Tildiem (Sanofi)
  - Diltiazem hydrochloride 60 mg: Tildiem 60mg modified-release tablets | 90 tablet | £7.96

**Respiratory system, drug delivery**

**Inhalation**

This route delivers the drug directly to the airways; the dose required is smaller than when given by mouth and side-effects are reduced.

Children and their carers should be advised to follow manufacturers’ instructions on the care and cleansing of inhaler devices.

**Inhaler devices**

A pressurised metered-dose inhaler is an effective method of drug administration in mild to moderate chronic asthma; to deliver the drug effectively, particularly in children under 12 years, a spacer device should also be used (see also NICE guidance). By the age of 3 years, a child can usually be taught to use a spacer device without a mask. As soon as a child is able to use the mouthpiece, then this is the preferred delivery system. When a pressurised metered-dose inhaler is an effective method of drug administration in mild to moderate chronic asthma; to deliver the drug effectively, particularly in children under 12 years, a spacer device should also be used (see also NICE guidance). By the age of 3 years, a child can usually be taught to use a spacer device without a mask. As soon as a child is able to use the mouthpiece, then this is the preferred delivery system. When a pressurised metered-dose inhaler with a spacer is unsuitable or inconvenient, a breath-actuated inhaler or breath-actuated inhaler may be used instead if the child is able to use the device effectively.

Dry powder inhalers may be useful in children over 5 years, who are unwilling or unable to use a pressurised metered-dose inhaler with a spacer device; breath-actuated inhalers may be useful in older children if they are able to use the device effectively. The child or child’s carer should be instructed carefully on the use of the inhaler. It is important to check that the inhaler is being used correctly; poor inhalation technique may be mistaken for a lack of response to the drug.

On changing from a pressurised metered-dose inhaler to a dry powder inhaler, the child may notice a lack of sensation in the mouth and throat previously associated with each actuation; coughing may occur more frequently following use of a dry-powder inhaler.

Spacer devices should be cleaned weekly according to the manufacturer’s instructions.

**Spacer devices**

Spacer devices are particularly useful for infants, for children with poor inhalation technique, or for nocturnal asthma, because the device reduces the need for coordination between actuation of a pressurised metered-dose inhaler and inhalation. The spacer device reduces the velocity of the aerosol and subsequent impaction on the oropharynx and allows more time for evaporation of the propellant so that a larger proportion of the particles can be inhaled and deposited in the lungs. Smaller-volume spacers may be more manageable for pre-school children and infants. The spacer device used must be compatible with the prescribed metered-dose inhaler.

**Use and care of spacer devices**

The suitability of the spacer device should be carefully assessed; opening the one-way valve is dependent on the child’s inspiratory flow. Some devices can be tipped to 45° to open the valve during inhaler actuation and inspiration to assist the child.

Inhalation from the spacer device should follow the actuation as soon as possible because the drug aerosol is very short-lived. The total dose (which may be less than a single puff) should be administered as single actuations (with tidal breathing for 10–20 seconds or 5 breaths for each actuation) for children with good inspiratory flow. Larger doses may be necessary for a child with acute bronchospasm.

The device should be cleansed once a month by washing in mild detergent and then allowed to dry in air without rinsing; the mouthpiece should be wiped clean of detergent before use. Some manufacturers recommend more frequent cleaning, but this should be avoided since any electrostatic charge may affect drug delivery. Spacer devices should be replaced every 6–12 months.

**Nebulisers**

**Solutions for nebulisation** for use in acute severe asthma are administered over 5–10 minutes from a nebuliser, usually driven by oxygen in hospital.

Children with a severe attack of asthma should preferably have oxygen during nebulisation since beta, agonists can increase arterial hypoxaemia.

A nebuliser converts a solution of a drug into an aerosol for inhalation. It is used to deliver higher doses of drug to the airways than is usual with standard inhalers. The main indications for use of a nebuliser are:

- to deliver a beta, agonist or ipratropium bromide p. 143 to a child with an acute exacerbation of asthma or of airways obstruction;
- to deliver prophylactic medication to a child unable to use other conventional devices;
- to deliver an antibacterial (such as colistimethate sodium p. 326 or tobramycin p. 294) to a child with chronic purulent infection (as in cystic fibrosis or bronchiectasis);
- to deliver budesonide p. 151 to a child with severe croup.

The proportion of a nebuliser solution that reaches the lungs depends on the type of nebuliser and although it can be as high as 30% it is more frequently close to 10% and sometimes below 10%. The remaining solution is left in the nebuliser as residual volume or it is deposited in the mouthpiece and tubing. The extent to which the nebulised solution is deposited in the airways or alveoli depends on particle size. Particles with a median diameter of 1–5 microns are deposited in the airways and are therefore appropriate for asthma whereas a particle size of 1–2 microns is needed for alveolar deposition. The type of...
Asthma is a common chronic inflammatory condition of the airways characterised by bronchoconstriction. The most frequent symptoms are cough, wheezing, chest tightness, and shortness of breath. The bronchoconstriction is usually reversible (either spontaneously or with the aid of medication) leading to intermittent symptoms, but in some patients with chronic asthma the inflammation may result in irreversible airway obstruction. Occasionally, asthma symptoms can get gradually or suddenly worse provoking an acute asthma attack that, if severe, may require hospitalisation.

Description of condition
Asthma is a common chronic inflammatory condition of the airways characterised by bronchoconstriction. The most frequent symptoms are cough, wheezing, chest tightness, and shortness of breath. The bronchoconstriction is usually reversible (either spontaneously or with the aid of medication) leading to intermittent symptoms, but in some patients with chronic asthma the inflammation may result in irreversible airway obstruction. Occasionally, asthma symptoms can get gradually or suddenly worse provoking an acute asthma attack that, if severe, may require hospitalisation.
Aims of treatment
In clinical practice, patients may choose to balance the aims of asthma management against the potential side-effects or inconvenience of taking medication necessary to achieve perfect control. Complete control of asthma is defined as no daytime symptoms, no night-time awakening due to asthma, no asthma attacks, no need for rescue medication, no limitations on activity including exercise, and normal lung function (in practical terms FEV₁, and/or peak flow > 80% predicted or best).

Lifestyle changes
Weight loss in overweight patients may lead to an improvement in asthma symptoms. Parents with asthma should be advised about the danger to themselves and to their children with asthma, of smoking, and be offered appropriate support to stop smoking. Breathing exercise programmes (including physiotherapist-taught methods) can be offered as an adjuvant to drug treatment in order to improve quality of life and reduce symptoms.

Management of chronic asthma
A stepwise approach aims to stop symptoms quickly and to improve peak flow. Start at the step most appropriate to initial severity of asthma. The aim is to achieve early control and to maintain it by stepping up treatment as necessary and stepping down treatment when control is good. Before initiating a new drug consider whether diagnosis is correct, check compliance and inhaler technique, and eliminate trigger factors for acute attacks.

Child over 5 years
Step 1—Mild intermittent asthma
Start inhaled short-acting beta, agonist (such as salbutamol p. 146 or terbutaline sulfate p. 148) as required.
Children using more than one short-acting bronchodilator in a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma. Inhaled ipratropium bromide p. 143 also acts as a short-acting bronchodilator but inhaled short-acting beta, agonists are preferred.
Move to step 2 if the child presents with any one of the following features; is using an inhaled beta, agonist three times a week or more, being symptomatic three times a week or more, experiencing night-time symptoms at least once a week, or has had an asthma attack in the last 2 years.

Step 2—Regular preventer therapy
Consider adding regular inhaled standard-dose corticosteroid (alternatives to inhaled corticosteroid are leukotriene receptor antagonists, theophylline p. 159, inhaled sodium cromoglicate p. 157, or inhaled nedocromil sodium p. 157, but are less effective).
Start the inhaled corticosteroid at a dose appropriate to severity of disease and adjust to the lowest effective dose at which control of asthma is maintained. Inhaled corticosteroids (except ciclesonide p. 152) should be initially taken twice daily, however, the same total daily dose can be considered once a day if good control is established.
Note, inhaled standard-dose corticosteroid
Children identified to be using more than one short-acting bronchodilator inhaler a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma.
Move to step 2 if the child presents with any one of the following features; is using an inhaled beta, agonist three times a week or more, being symptomatic three times a week or more, experiencing night-time symptoms at least once a week.

Step 3—Persistent poor control
Consider the following options:
Increase dose of inhaled corticosteroid (a spacer should be used), or
Add a leukotriene receptor antagonist, modified-release theophylline, or modified-release oral beta, agonist (caution in children already taking a LABA)
Note, increased inhaled corticosteroid dose
Child over 12 years: up to 2000 micrograms/day beclometasone dipropionate or equivalent
Child 5–12 years: up to 800 micrograms/day beclometasone dipropionate or equivalent
Before proceeding to step 5, refer children with inadequately controlled asthma to specialist care.

Step 5—Continuous or frequent use of oral corticosteroids
Add regular oral corticosteroid (prednisolone p. 413, as single daily dose) at lowest dose to provide adequate control; continue high-dose inhaled corticosteroid (in exceptional cases, this may exceed licensed doses).

Child under 5 years
Step 1—Mild intermittent asthma
Inhaled short-acting beta, agonist (such as salbutamol or terbutaline sulfate) as required.
Children identified to be using more than one short-acting bronchodilator inhaler a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma.
Move to step 2 if the child presents with any one of the following features; is using an inhaled beta, agonist three times a week or more, being symptomatic three times a week or more, experiencing night-time symptoms at least once a week.

Step 2—Regular preventer therapy
Consider adding regular inhaled standard-dose corticosteroid (alternatives to inhaled corticosteroid are leukotriene receptor antagonists, theophylline p. 159, inhaled sodium cromoglicate p. 157, or inhaled nedocromil sodium p. 157, but are less effective)
Start the inhaled corticosteroid at a dose appropriate to severity of disease and adjust to the lowest effective dose at which control of asthma is maintained. Inhaled corticosteroids (except ciclesonide p. 152) are approximately equivalent in clinical practice although there may be variations with different drug delivery devices. Fluticasone p. 152 provides equal clinical activity to beclometasone dipropionate and budesonide at half the dosage.
In children, administration of high doses of inhaled corticosteroids may be associated with systemic side-effects, including growth failure, reduced bone mineral density, and adrenal suppression, see individual drug monographs for monitoring information.
If asthma is not adequately controlled, move to step 3.

Step 3—Initial add-on therapy
Consider adding a regular inhaled long-acting beta, agonist (LABA) such as formoterol fumarate p. 144 or salmeterol p. 145 to be used in conjunction with an inhaled corticosteroid (see also CHM advice for formoterol fumarate and salmeterol).
If the child is gaining some benefit from addition of a LABA but control is inadequate then continue the LABA and increase dose of inhaled corticosteroid to top end of inhaled standard-dose corticosteroid range. If there is no response to the LABA, discontinue and increase dose of inhaled corticosteroid. If control is still inadequate, start a trial of either a leukotriene receptor antagonist (montelukast p. 155, or zafirlukast p. 156 if over 12 years) or modified-release theophylline.

Step 4—Persistent poor control
Consider the following options:
Increase dose of inhaled corticosteroid (a spacer should be used), or
Add a leukotriene receptor antagonist, modified-release theophylline, or modified-release oral beta, agonist (caution in children already taking a LABA)
Note, increased inhaled corticosteroid dose
Child over 12 years: up to 2000 micrograms/day beclometasone dipropionate or equivalent
Child 5–12 years: up to 800 micrograms/day beclometasone dipropionate or equivalent
Before proceeding to step 5, refer children with inadequately controlled asthma to specialist care.

Step 5—Continuous or frequent use of oral corticosteroids
Add regular oral corticosteroid (prednisolone p. 413, as single daily dose) at lowest dose to provide adequate control; continue high-dose inhaled corticosteroid (in exceptional cases, this may exceed licensed doses).

Child under 5 years
Step 1—Mild intermittent asthma
Inhaled short-acting beta, agonist (such as salbutamol or terbutaline sulfate) as required.
Children identified to be using more than one short-acting bronchodilator inhaler a month should have their asthma urgently assessed and action taken to improve poorly controlled asthma.
Move to step 2 if the child presents with any one of the following features; is using an inhaled beta, agonist three times a week or more, being symptomatic three times a week or more, experiencing night-time symptoms at least once a week.

Step 2—Regular preventer therapy
Consider adding regular inhaled standard-dose corticosteroid (alternatives to inhaled corticosteroid are leukotriene receptor antagonists, theophylline p. 159, inhaled sodium cromoglicate p. 157, or inhaled nedocromil sodium p. 157, but are less effective)
Start the inhaled corticosteroid at a dose appropriate to severity of disease and adjust to the lowest effective dose at which control of asthma is maintained. Inhaled corticosteroids (except ciclesonide p. 152) are approximately equivalent in clinical practice although there may be variations with different drug delivery devices. Fluticasone p. 152 provides equal clinical activity to beclometasone dipropionate and budesonide at half the dosage.
In children, administration of high doses of inhaled corticosteroids may be associated with systemic side-effects, including growth failure, reduced bone mineral density, and adrenal suppression, see individual drug monographs for monitoring information.
If asthma is not adequately controlled, move to step 3.

Step 3—Initial add-on therapy
Consider adding a regular inhaled long-acting beta, agonist (LABA) such as formoterol fumarate p. 144 or salmeterol p. 145 to be used in conjunction with an inhaled corticosteroid (see also CHM advice for formoterol fumarate and salmeterol).
If the child is gaining some benefit from addition of a LABA but control is inadequate then continue the LABA and increase dose of inhaled corticosteroid to top end of inhaled standard-dose corticosteroid range. If there is no response to the LABA, discontinue and increase dose of inhaled corticosteroid. If control is still inadequate, start a trial of either a leukotriene receptor antagonist (montelukast p. 155, or zafirlukast p. 156 if over 12 years) or modified-release theophylline.

Step 4—Persistent poor control
Consider the following options:
Increase dose of inhaled corticosteroid (a spacer should be used), or
Add a leukotriene receptor antagonist, modified-release theophylline, or modified-release oral beta, agonist (caution in children already taking a LABA)
Note, increased inhaled corticosteroid dose
Child over 12 years: up to 2000 micrograms/day beclometasone dipropionate or equivalent
Child 5–12 years: up to 800 micrograms/day beclometasone dipropionate or equivalent
Before proceeding to step 5, refer children with inadequately controlled asthma to specialist care.

Step 5—Continuous or frequent use of oral corticosteroids
Add regular oral corticosteroid (prednisolone p. 413, as single daily dose) at lowest dose to provide adequate control; continue high-dose inhaled corticosteroid (in exceptional cases, this may exceed licensed doses).
140 Airways disease, obstructive

Beclometasone dipropionate and budesonide are approximately equivalent in clinical practice although there may be variations with different drug delivery devices. Fluticasone provides equal clinical activity to beclometasone dipropionate and budesonide at half the dosage. \( \text{ECG} \)

In children, administration of high doses of inhaled corticosteroids may be associated with systemic side-effects, including growth failure, reduced bone mineral density and adrenal suppression, see individual drug monographs for monitoring information. If asthma is not adequately controlled, move to step 3. \( \text{ECG} \)

Step 3—Initial add-on therapy

- \( \text{ECG} \) In children 2–5 years, add a leukotriene receptor antagonist if not added during step 2. If a leukotriene receptor antagonist was added at step 2, reconsider addition of standard-dose inhaled corticosteroid. \( \text{ECG} \)
- \( \text{ECG} \) In children under 2 years, consider proceeding to step 4. \( \text{ECG} \)

Step 4—Persistent poor control

- \( \text{ECG} \) Refer child to respiratory paediatrician \( \text{ECG} \)

Stepping down

Once asthma is controlled, it is recommended to step down therapy and continue to regularly review the child. When deciding which drug to step down first and at what rate, the severity of asthma, the side-effects of treatment, duration on current dose, the beneficial effects achieved, and the child’s preference, should be considered. The child should be maintained at the lowest possible dose of inhaled corticosteroid. Reductions should be considered every three months, decreasing the dose by approximately 25–50% each time. Reduce the dose slowly as children deteriorate at different rates. \( \text{ECG} \)

Management of acute asthma

Child over 2 years

The nature of treatment required for the management of acute asthma depends on the level of severity, described as follows:

Moderate acute asthma
- Able to talk in sentences
- Arterial oxygen saturation (Sp\( \text{O}_2 \)) ≥ 92%
- Peak flow ≥ 50% best or predicted
- Heart rate ≤ 140/minute in children aged 2–5 years; heart rate ≤ 125/minute in children over 5 years
- Respiratory rate ≤ 40/minute in children aged 2–5 years; respiratory rate ≤ 30/minute in children over 5 years

Severe acute asthma
- Can’t complete sentences in one breath or too breathless to talk or feed
- Sp\( \text{O}_2 \) < 92%
- Peak flow 33–50% best or predicted
- Heart rate > 140/minute in children aged 2–5 years; heart rate > 125/minute in children aged over 5 years
- Respiratory rate > 40/minute in children aged 2–5 years; respiratory rate > 30/minute in children aged over 5 years

Life-threatening acute asthma

Any one of the following in a child with severe asthma:
- Sp\( \text{O}_2 \) < 92%
- Peak flow < 33% best or predicted
- Silent chest
- Cyanosis
- Poor respiratory effort
- Hypotension
- Exhaustion
- Confusion

Following initial assessment, supplementary high flow oxygen should be given to all children with life-threatening acute asthma or Sp\( \text{O}_2 \) < 94% to achieve normal saturations of 94–98%. \( \text{ECG} \)

First-line treatment for acute asthma is an inhaled short-acting beta\(_2\) agonist (salbutamol p. 146 or terbutaline sulfate p. 148) given as soon as possible, ideally via a metered dose inhaler and spacer device in mild to moderate acute asthma. Children with severe or life-threatening acute asthma should be transferred to hospital urgently. \( \text{ECG} \)

In all cases of acute asthma, children should be prescribed an adequate once daily dose of oral prednisolone p. 413. Treatment for up to 3 days is usually sufficient, but the length of course should be tailored to the number of days necessary to bring about recovery. Intravenous hydrocortisone p. 411 should be reserved for severely affected children who are unable to retain oral medication. Nebulised ipratropium bromide p. 143 can be combined with beta, agonist treatment for children with severe or life-threatening acute asthma or in those with a poor initial response to beta, agonist therapy to provide greater bronchodilation. Consider adding magnesium sulfate p. 556 to nebulised salbutamol and ipratropium bromide in the first hour in children with a short duration of acute severe asthma symptoms presenting with an oxygen saturation less than 92%. \( \text{ECG} \)

Children with continuing severe asthma despite frequent nebulised beta\(_2\) agonists and ipratropium bromide plus oral corticosteroids, and those with life-threatening features, need urgent review by a specialist with a view to transfer to a high dependency unit or paediatric intensive care unit (PICU) to receive second-line intravenous therapies.

In a severe asthma attack where the child has not responded to initial inhaled therapy, early addition of a single bolus dose of intravenous salbutamol may be an option. Continuous intravenous infusion of salbutamol, administered under specialist supervision with continuous ECG and electrolyte monitoring, should be considered in patients with unreliable inhalation or severe refractory asthma. Aminophylline p. 158 may be considered in children with severe or life-threatening acute asthma unresponsive to maximal doses of bronchodilators and corticosteroids. Aminophylline is not recommended in children with mild to moderate acute asthma. Intravenous magnesium sulfate has been used for acute asthma [unlicensed use] although its place in management is not yet established. \( \text{ECG} \)

Child under 2 years

Inhaled short-acting beta\(_2\) agonists are the initial treatment of choice for acute asthma in children under 2 years. For mild to moderate acute asthma attacks, a metered-dose inhaler with a spacer and mask is the optimal drug delivery device. In a hospital setting, consider oral prednisolone daily for up to 3 days, early in the management of severe asthma attacks. For more severe symptoms, inhaled ipratropium bromide in combination with an inhaled beta\(_2\) agonist is also an option. \( \text{ECG} \)

Follow up in all cases

Episodes of acute asthma may be a failure of preventative therapy, review is required to prevent further episodes. A careful history should be taken to establish the reason for the asthma attack. Inhaler technique should be checked and regular treatment should be reviewed. Children and their carers should be given a written asthma action plan aimed at preventing relapse, optimising treatment, and preventing delay in seeking assistance in future attacks. It is essential that the child’s GP practice is informed within 24 hours of discharge from the emergency department or hospital following an asthma attack. Children who have had a near-fatal asthma attack should be kept under specialist supervision indefinitely. A respiratory specialist should follow up all patients admitted with a severe asthma attack for at least one year after the admission. \( \text{ECG} \)
Pregnancy and breast-feeding

Women with asthma should be closely monitored during pregnancy. It is particularly important that asthma should be well controlled during pregnancy; when this is achieved asthma has no important effects on pregnancy, labour, or on the fetus. Women planning to become pregnant should be counselled about the importance of taking their asthma medication regularly to maintain good control. Drugs for asthma should preferably be administered by inhalation to minimise exposure of the fetus. Short-acting beta₂ agonists, long-acting beta₂ agonists, oral and inhaled corticosteroids, sodium cromoglicate p. 157, nedocromil sodium p. 157, and oral and intravenous theophyllines can be used as normal during pregnancy. There is limited information on use of leukotriene receptor antagonists during pregnancy, however they may be used if potential benefit outweighs risk. Drugs for asthma, including corticosteroid tablets, can be used as normal and in-line with manufacturers' recommendations in breast-feeding.

Severe acute attacks of asthma can have an adverse effect on pregnancy and should be treated promptly in hospital with conventional therapy, including nebulisation of a beta₂ agonist and oral or parenteral administration of a corticosteroid; prednisolone p. 413 is the preferred corticosteroid for oral administration since very little of the drug reaches the fetus. Oxygen should be given immediately to maintain arterial oxygen saturation of 94–98% and prevent maternal and fetal hypoxia.

Bronchodilators

Beta₂ agonists

Selective beta₂ agonists produce bronchodilation. A short-acting beta₂ agonist is used for immediate relief of asthma symptoms while a long-acting beta₂ agonist is used in addition to an inhaled corticosteroid in children requiring prophylactic treatment.

- The selective beta₂ agonists (selective beta₂-adrenoceptor agonists, selective beta₂ stimulants) such as salbutamol p. 146 or terbutaline sulfate p. 148 are the safest and most effective short-acting beta₂ agonists for the treatment of asthma.
- Adrenaline/epinephrine p. 128 (which has both alpha- and beta₂-adrenoceptor agonist properties) is used in the emergency management of acute allergic and anaphylactic reactions, in angioedema, and in cardiopulmonary resuscitation; it is also used as a nebuliser solution to treat severe croup.

Short-acting beta₂ agonists

Mild to moderate symptoms of asthma respond rapidly to the inhalation of a selective short-acting beta₂ agonist such as salbutamol or terbutaline sulfate. If beta₂ agonist inhalation is needed more often than twice a week, or if night-time symptoms occur at least once a week, or if the patient has suffered an exacerbation in the last 2 years, then prophylactic treatment should be considered using a stepped approach.

A short-acting beta₂ agonist inhaled immediately before exertion reduces exercise-induced asthma; however, frequent exercise-induced asthma probably reflects poor overall control and calls for reassessment of asthma treatment.

Long-acting beta₂ agonists

Formoterol fumarate p. 144 (eformoterol) and salmeterol p. 145 are longer-acting beta₂ agonists which are administered by inhalation. They should be used for asthma only in children who regularly use an inhaled corticosteroid. They have a role in the long-term management of chronic asthma and can be useful in nocturnal asthma.

Salmeterol should not be used for the relief of an asthma attack; it has a slower onset of action than salbutamol or terbutaline sulfate. Formoterol fumarate is licensed for short-term symptom relief and for the prevention of exercise-induced bronchospasm; its speed of onset of action is similar to that of salbutamol.

Vilanterol is a long-acting beta₂ agonist available in a combination inhaler with fluticasone furoate.

Combination inhalers that contain a long-acting beta₂ agonist and a corticosteroid ensure that long-acting beta₂ agonists are not used without concomitant corticosteroids, but reduce the flexibility to adjust the dose of each component.

Oral

Oral preparations of beta₂ agonists may be used for children if an inhaler device cannot be used but inhaled beta₂ agonists are more effective and have fewer side-effects. A modified-release formulation of salbutamol may be of value in nocturnal asthma as an alternative to modified-release theophylline p. 159 preparations, but an inhaled long-acting beta₂ agonist is preferable.

Parenteral

Beta₂ agonists can be given intravenously in children with severe or life-threatening acute asthma. Chronic asthma unresponsive to stepwise treatment may benefit from continuous subcutaneous infusion of a beta₂ agonist, but this should be used only under the supervision of a respiratory specialist; the evidence of benefit is uncertain and it may be difficult to withdraw such treatment once started.

Antimuscarinic bronchodilators

Ipratropium bromide p. 143 by nebulisation can be added to other standard treatment in life-threatening acute asthma or if acute asthma fails to improve with standard therapy. Ipratropium bromide can be used to provide short-term relief in chronic asthma, but short-acting beta₂ agonists act more quickly and are preferred.

The aerosol inhalation of ipratropium bromide has a maximum effect 30–60 minutes after use; its duration of action is 3 to 6 hours.

Theophylline

Theophylline is a xanthine used as a bronchodilator in asthma. It may have an additive effect when used in conjunction with small doses of beta₂ agonists; the combination may increase the risk of side-effects, including hypokalaemia.

Theophylline is given by injection as aminophylline p. 158, a mixture of theophylline with ethylenediamine, which is 20 times more soluble than theophylline alone.

Aminophylline injection is needed rarely for severe acute asthma.

Compound bronchodilator preparations

In general, children are best treated with single-ingredient preparations, such as a selective beta₂ agonist or ipratropium bromide, so that the dose of each drug can be adjusted. This flexibility is lost with compound bronchodilator preparations.
Croup

Management
Mild croup is largely self-limiting, but treatment with a single dose of a corticosteroid (e.g. dexamethasone p. 410) by mouth may be of benefit.

More severe croup (or mild croup that might cause complications) calls for hospital admission; a single dose of a corticosteroid (e.g. dexamethasone or prednisolone p. 413 by mouth) should be administered before transfer to hospital. In hospital, dexamethasone (by mouth or by injection) or budesonide p. 151 (by nebulisation) will often reduce symptoms; the dose may need to be repeated after 12 hours if necessary.

For severe croup not effectively controlled with corticosteroid treatment, nebulised adrenaline/epinephrine solution 1 in 1000 (1 mg/mL) p. 128 should be given with close clinical monitoring; the effects of nebulised adrenaline/epinephrine last 2–3 hours and the child needs to be monitored carefully for recurrence of the obstruction.

Oxygen

Overview
Oxygen should be regarded as a drug. It is prescribed for hypoxaemic patients to increase alveolar oxygen tension and decrease the work of breathing. The concentration of oxygen required depends on the condition being treated; administration of an inappropriate concentration of oxygen may have serious or even fatal consequences. High concentrations of oxygen can cause pulmonary epithelial damage (bronchopulmonary dysplasia), convulsions, and retinal damage, especially in preterm neonates.

Oxygen is probably the most common drug used in medical emergencies. It should be prescribed initially to achieve a normal or near-normal oxygen saturation. In most acutely ill children with an expected or known normal or low arterial carbon dioxide ($P_{\text{aCO}_2}$), oxygen saturation should be maintained above 92%; some clinicians may aim for a target of 94–98%. In some clinical situations, such as carbon monoxide poisoning, it is more appropriate to aim for the highest possible oxygen saturation until the child is stable. Hypercapnic respiratory failure is rare in children; in those children at risk, a lower oxygen saturation target of 88–92% is indicated.

High concentration oxygen therapy is safe in uncomplicated cases of conditions such as pneumonia, pulmonary thromboembolism, pulmonary fibrosis, shock, severe trauma, sepsis, or anaphylaxis. In such conditions low arterial oxygen ($P_{\text{aO}_2}$) is usually associated with low or normal arterial carbon dioxide ($P_{\text{aCO}_2}$), and therefore there is little risk of hypoventilation and carbon dioxide retention.

In severe acute asthma, the arterial carbon dioxide ($P_{\text{aCO}_2}$) is usually subnormal but as asthma deteriorates it may rise steeply (particularly in children). These patients usually require high concentrations of oxygen and if the arterial carbon dioxide ($P_{\text{aCO}_2}$) remains high despite other treatment, intermittent positive-pressure ventilation needs to be considered urgently.

Oxygen should not be given to neonates except under expert supervision. Particular care is required in preterm neonates because of the risk of hyperoxia.

Low concentration oxygen therapy (controlled oxygen therapy) is reserved for children at risk of hypercapnic respiratory failure, which is more likely in children with:

- advanced cystic fibrosis
- advanced non-cystic fibrosis bronchiectasis
- severe kyphoscoliosis or severe ankylosing spondylitis
- severe lung scarring caused by tuberculosis
- musculoskeletal disorders with respiratory weakness, especially if on home ventilation
- an overdose of opioids, benzodiazepines, or other drugs causing respiratory depression.

Until blood gases can be measured, initial oxygen should be given using a controlled concentration of 28% or less, titrated towards a target concentration of 88–92%. The aim is to provide the child with enough oxygen to achieve an acceptable arterial oxygen tension without worsening carbon dioxide retention and respiratory acidosis.

Domiciliary oxygen
Oxygen should only be prescribed for use in the home after careful evaluation in hospital by a respiratory care specialist. Carers and children who smoke should be advised of the risks of smoking when receiving oxygen, including the risk of fire. Smoking cessation therapy should be recommended before home oxygen prescription.

Long-term oxygen therapy
The aim of long-term oxygen therapy is to maintain oxygen saturation of at least 92%. Children (especially those with chronic neonatal lung disease) often require supplemental oxygen, either for 24-hours a day or during periods of sleep; many children are eventually weaned off long-term oxygen therapy as their condition improves.

Long-term oxygen therapy should be considered for children with conditions such as:

- bronchopulmonary dysplasia (chronic neonatal lung disease);
- congenital heart disease with pulmonary hypertension;
- pulmonary hypertension secondary to pulmonary disease;
- idiopathic pulmonary hypertension;
- sickle-cell disease with persistent nocturnal hypoxia;
- interstitial lung disease and obliterative bronchiolitis;
- cystic fibrosis;
- obstructive sleep apnoea syndrome;
- neuromuscular or skeletal disease requiring non-invasive ventilation;
- pulmonary malignancy or other terminal disease with disabling dyspnoea.

Increased respiratory depression is seldom a problem in children with stable respiratory failure treated with low concentrations of oxygen although it may occur during exacerbations; children and their carers should be warned to call for medical help if drowsiness or confusion occurs.

Short-burst oxygen therapy
Oxygen is occasionally prescribed for short-burst (intermittent) use for episodes of breathlessness.

Ambulatory oxygen therapy
Ambulatory oxygen is prescribed for children on long-term oxygen therapy who need to be away from home on a regular basis.

Oxygen therapy equipment
Under the NHS oxygen may be supplied as oxygen cylinders. Oxygen flow can be adjusted as the cylinders are equipped with an oxygen flow meter. Oxygen delivered from a cylinder should be passed through a humidifier if used for long periods.

Oxygen concentrators are more economical for children who require oxygen for long periods, and in England and Wales can be ordered on the NHS on a regional tendering basis. A concentrator is recommended for a child who requires oxygen for more than 8 hours a day (or 21 cylinders per month). Exceptionally, if a higher concentration of oxygen is required the output of 2 oxygen concentrators can be combined using a ‘Y’ connection.

A nasal cannula is usually preferred to a face mask for long-term oxygen therapy from an oxygen concentrator.
Nasal cannulas can, however, cause dermatitis and mucosal drying in sensitive individuals.

Giving oxygen by nasal cannula allows the child to talk, eat, and drink, but the concentration of oxygen is not controlled and the method may not be appropriate for acute respiratory failure. When oxygen is given through a nasal cannula at a rate of 1–2 litres/minute the inspiratory oxygen concentration is usually low, but it varies with ventilation and can be high if the patient is underventilating.

**Arrangements for supplying oxygen**
The following oxygen services may be ordered in England and Wales:
- emergency oxygen;
- short-burst (intermittent) oxygen therapy;
- long-term oxygen therapy;
- ambulatory oxygen.

The type of oxygen service (or combination of services) should be ordered on a Home Oxygen Order Form (HOOF); the amount of oxygen required (hours per day) and flow rate should be specified. The clinician will determine the appropriate equipment to be provided. Special needs or preferences should be specified on the HOOF.

The clinician should obtain the consent of the child or carers to pass on the child's details to the supplier, the fire brigade, and other relevant organisations. The supplier will contact the child or carer to make arrangements for delivery, installation, and maintenance of the equipment. The supplier will also train the child or carer to use the equipment.

The clinician should send the HOOF to the supplier who will continue to provide the service until a revised HOOF is received, or until notified that the child no longer requires the home oxygen service. HOOF and further instructions are available at www.bprs.co.uk/oxygen.html.

- East of England, North East: BOC Medical: Tel: 0800 136 603 Fax: 0800 169 9989
- South West: Air Liquide: Tel: 0808 202 2229 Fax: 0191 497 4340
- London East, Midlands, North West: Air Liquide: Tel: 0500 823 773 Fax: 0800 781 4610
- Yorkshire and Humberside, West Midlands, Wales: Air Products: Tel: 0800 373 580 Fax: 0800 214 709
- South East Coast, South Central: Dolby Vivisol: Tel: 08443 814 402 Fax: 0800 781 4610

In **Scotland** refer the child for assessment by a paediatric respiratory consultant. If the need for a concentrator is confirmed the consultant will arrange for the provision of a concentrator through the Common Services Agency. Prescribers should complete a Scottish Home Oxygen Order Form (SHOOF) and email it to Health Facilities Scotland. Health Facilities Scotland will then liaise with their contractor to arrange the supply of oxygen. Further information can be obtained at www.dolbyvivisol.com/our-services/healthcare-professionals/home-oxygen-services-sco.aspx.

In **Northern Ireland** oxygen concentrators and cylinders should be prescribed on form HS21; oxygen concentrators are supplied by a local contractor. Prescriptions for oxygen cylinders and accessories can be dispensed by pharmacists contracted to provide domiciliary oxygen services.

**ANTIMUSCARINICS**

**Antimuscarinics (inhaled)**

- **Indications and dose**
  - Reversible airflow obstruction
    - **By inhalation of aerosol**
      - Child 1 month–5 years: 20 micrograms 3 times a day
      - Child 6–11 years: 20–40 micrograms 3 times a day
      - Child 12–17 years: 20–40 micrograms 3–4 times a day
  - Acute bronchospasm
    - **By inhalation of nebulised solution**
      - Child 1 month–5 years: 125–250 micrograms as required; maximum 1 mg per day
      - Child 6–11 years: 250 micrograms as required; maximum 1 mg per day
      - Child 12–17 years: 500 micrograms as required, doses higher than max. can be given under medical supervision; maximum 2 mg per day

- **Severe or life-threatening acute asthma**
  - **By inhalation of nebulised solution**
    - Child 1 month–11 years: 250 micrograms every 20–30 minutes for the first 2 hours, then 250 micrograms every 4–6 hours as required
    - Child 12–17 years: 500 micrograms every 4–6 hours as required

**Pharmacokinetics**
The maximal effect of inhaled ipratropium occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

- **Unlicensed use** [See above] The dose of ipratropium for severe or life-threatening acute asthma is unlicensed. [A]

- **Cautions**
  - Cystic fibrosis
  - **Gastro-intestinal motility disorder**
    - **Common or very common** nausea, vomiting
    - **Uncommon** dry mouth
    - **Rare** abdominal pain, constipation
  - **Respiratory system**
    - **Common or very common** bronchospasm, bronchitis, bronchial hyperplasia
    - **Rare** cough

- **Side-effects**
  - **Common** vomiting, diarrhoea, dry mouth
  - **Uncommon** abdominal pain, constipation
  - **Rare** chest pain, throat irritation

- **Pregnancy**
  - Manufacturer advises only use if potential benefit outweighs the risk.

- **Breastfeeding**
  - No information available—manufacturer advises only use if potential benefit outweighs risk.
DIRECTIONS FOR ADMINISTRATION  If dilution of ipratropium bromide nebuliser solution is necessary use only sterile sodium chloride 0.9%.

PATIENT AND CARER ADVICE  Patients or carers should be given advice on appropriate inhaler technique.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

Pressurised inhalation  
- **Ipratropium bromide (Non-proprietary)** 
- **Ipratropium bromide 20 microgram per 1 dose** 
  - Ipratropium bromide 20 micrograms/dose inhaler CFC free | 200 dose PAT £5.00 DT price = £15.56
  - Atrovent (Boehringer Ingelheim Ltd) 
  - Ipratropium bromide 20 microgram per 1 dose 
  - Atrovent 20 micrograms/dose inhaler CFC free | 200 dose PAT £5.56 DT price = £15.56

Nebuliser liquid  
- **Ipratropium bromide (Non-proprietary)** 
- **Ipratropium bromide 250 microgram per 1 ml** 
  - Ipratropium bromide 500micrograms/2ml nebuliser liquid unit dose vials | 20 unit dose PAT £8.93 DT price = £2.95 
  - Ipratropium bromide 250micrograms/1ml nebuliser liquid unit dose vials | 20 unit dose PAT £4.52 DT price = £4.44
  - Ipratropium bromide 1mg/20ml nebuliser liquid Steri-Neb unit dose vials | 20 unit dose PAT £14.99 DT price = £4.44
  - Ipratropium bromide 500micrograms/2ml nebuliser liquid Steri-Neb unit dose vials | 20 unit dose PAT £15.99 DT price = £2.95
  - Atrovent UDV (Boehringer Ingelheim Ltd) 
  - Ipratropium bromide 250 microgram per 1 ml 
    - Atrovent 500micrograms/2ml nebuliser liquid UDVs | 20 unit dose PAT £4.87 DT price = £2.95
    - 60 unit dose PAT £14.59
  - Ipratropium bromide 1mg/20ml nebuliser liquid Steri-Neb unit dose vials | 20 unit dose PAT £4.14 DT price = £4.44 
    - 50 unit dose PAT £12.44
  - Respontin (GlaxoSmithKline UK Ltd) 
  - Ipratropium bromide 250 microgram per 1 ml 
    - Respontin 250micrograms/1ml Nebules | 20 unit dose PAT £4.78 DT price = £4.44
    - Respontin 500micrograms/2ml Nebules | 20 unit dose PAT £5.60 DT price = £2.95

**BETA2-ADRENOCEPTOR AGONISTS, SELECTIVE**

**Beta2-adrenoceptor agonists, selective**

CONTRA-INDICATIONS  Severe pre-eclampsia.

CAUTIONS  Arrhythmias, cardiovascular disease, diabetes (risk of hyperglycaemia and ketoacidosis, especially with intravenous use), high doses of beta2 agonists can be dangerous in some children, hypertension, hyperthyroidism, hypokalaemia, susceptibility to QT-interval prolongation.

CONTRA-INDICATIONS  Severe pre-eclampsia.

CAUTIONS  Arrhythmias, cardiovascular disease, diabetes (risk of hyperglycaemia and ketoacidosis, especially with intravenous use), high doses of beta2 agonists can be dangerous in some children, hypertension, hyperthyroidism, hypokalaemia, susceptibility to QT-interval prolongation.

INTERACTIONS  Appendix 1 (sympathomimetics, beta2). Hypokalaemia may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, diuretics, and by hypoxia.

SIDE-EFFECTS  Angioedema, arrhythmias, behavioural disturbances, collapse, fine tremor (particularly in the hands), headache, hyperglycaemia (especially when given intravenously), hypersensitivity reactions, hypokalaemia (with high doses), hypotension, ketoacidosis (especially when given intravenously), muscle cramps, myocardial ischaemia, nervous tension, palpitation, paradoxical bronchospasm (occasionally severe), peripheral vasodilation, rash, sleep disturbances, tachycardia, urticaria.

PREGNANCY  Women planning to become pregnant should be counselled about the importance of taking their asthma medication regularly to maintain good control.

MONITORING REQUIREMENTS  
- In severe asthma, plasma-potassium concentration should be monitored (risk of hypokalaemia).
- In patients with diabetes, monitor blood glucose (risk of hyperglycaemia and ketoacidosis, especially when beta2 agonist given intravenously).

PATIENT AND CARER ADVICE  When used by inhalation The dose, the frequency, and the maximum number of inhalations in 24 hours of the beta2 agonist should be stated explicitly to the patient or their carer. The patient or their carer should be advised to seek medical advice when the prescribed dose of beta2 agonist fails to provide the usual degree of symptomatic relief because this usually indicates a worsening of the asthma and the patient may require a prophylactic drug. Patients or their carers should be advised to follow manufacturers’ instructions on the care and cleansing of inhaler devices.

BETA2-ADRENOCEPTOR AGONISTS, SELECTIVE > LONG-ACTING

**Formoterol fumarate** (Eformoterol fumarate)

INDICATIONS AND DOSE  Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy / Nightaial asthma in patients requiring long-term regular bronchodilator therapy / Prophylaxis of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy / Chronic asthma in patients who regularly use an inhaled corticosteroid.

BY INHALATION OF POWDER  
- **Child 6–11 years:** 12 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose.
- **Child 12–17 years:** 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose.

BY INHALATION OF AEROSOL  
- **Child 6–11 years:** 12 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 24 micrograms twice daily, a daily dose of 24 micrograms of formoterol should be sufficient for the majority of children, particularly for younger age-groups; higher doses should be used rarely, and only when control is not maintained on the lower dose.

OXIS®  

Chronic asthma  

BY INHALATION OF POWDER  
- **Child 6–17 years:** 6–12 micrograms 1–2 times a day (max. per dose 12 micrograms), occasionally doses up to the maximum daily may be needed, reassess treatment if additional doses required on more than 2 days a week; maximum 48 micrograms per day.

RELIEF OF BRONCHOSPASM  

BY INHALATION OF POWDER  
- **Child 6–17 years:** 6–12 micrograms.
**Prophylaxis of exercise-induced bronchospasm**

- **BY INHALATION OF POWDER**
- Child 6–17 years: 6–12 micrograms, dose to be taken before exercise

**PHARMACOKINETICS**

At recommended inhaled doses, the duration of action of formoterol is about 12 hours.

**IMPORTANT SAFETY INFORMATION**

**CHM ADVICE**

To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta₂ agonist (formoterol) should:

- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
- not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

**SIDE-EFFECTS**

- Very rare QT-interval prolongation
- Frequency not known Dizziness, nausea, pruritus, taste disturbances

**PREGNANCY**

Inhaled drugs for asthma can be taken as normal during pregnancy.

**BREAST FEEDING**

Inhaled drugs for asthma can be taken as normal during breast-feeding.

**PATIENT AND CARER ADVICE**

Advise patients not to exceed prescribed dose, and to follow manufacturer’s directions; if a previously effective dose of inhaled formoterol fails to provide adequate relief, a doctor’s advice should be obtained as soon as possible. Patients should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta₂ agonist. Patient or carer should be given advice on how to administer formoterol fumarate inhalers.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Pressurised inhalation**

- **Atimos Modulite** (Chiesi Ltd)
  - Formoterol fumarate dihydrate 12 microgram per 1 dose | Atimos Modulite 12 micrograms/dose inhaler | 100 dose [PST] £30.06 DT price = £30.06

**Inhalation powder**

- **Easyhaler (formoterol)** (Orion Pharma (UK) Ltd)
  - Formoterol fumarate dihydrate 12 microgram per 1 dose | Formoterol Easyhaler 12 micrograms/dose dry powder inhaler | 120 dose [PST] £23.75 DT price = £23.75

- **Foradil** (Novartis Pharmaceuticals UK Ltd)
  - Formoterol fumarate dihydrate 12 microgram | Foradil 12 microgram inhalation powder capsules with device | 60 capsule [PST] £28.06 DT price = £28.06

- **Oxis Turbohaler** (AstraZeneca UK Ltd)
  - Formoterol fumarate dihydrate 6 microgram per 1 dose | Oxis 6 Turbohaler | 60 dose [PST] £24.80 DT price = £24.80

  - Formoterol fumarate dihydrate 12 microgram per 1 dose | Oxis 12 Turbohaler | 60 dose [PST] £24.80 DT price = £24.80

**Combinations available:**

- **Budesonide with formoterol**, p. 152
- **Fluticasone with formoterol**, p. 153

---

**Salmeterol**

- **INDICATIONS AND DOSE**
  
  Reversible airways obstruction in patients requiring long-term regular bronchodilator therapy / Nighttime asthma in patients requiring long-term regular bronchodilator therapy / Prevention of exercise-induced bronchospasm in patients requiring long-term regular bronchodilator therapy / Chronic asthma only in patients who regularly use an inhaled corticosteroid (not for immediate relief of acute asthma)
  
- **BY INHALATION OF AEROSOL, OR BY INHALATION OF POWDER**
  
  - Child 5–11 years: 50 micrograms twice daily
  - Child 12–17 years: 50 micrograms twice daily, dose may be increased in more severe airway obstruction; increased to 100 micrograms twice daily

**PHARMACOKINETICS**

At recommended inhaled doses, the duration of action of salmeterol is about 12 hours.

**IMPORTANT SAFETY INFORMATION**

**CHM ADVICE**

To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta₂ agonist (salmeterol) should:

- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients with rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
- not be used for the relief of exercise-induced asthma symptoms unless regular inhaled corticosteroids are also used;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

**SIDE-EFFECTS**

- Arthralgia, dizziness, nausea
- PREGNANCY
  
  Inhaled drugs for asthma can be taken as normal during pregnancy.

- BREATFEEDING
  
  Inhaled drugs for asthma can be taken as normal during breast-feeding.

**PATIENT AND CARER ADVICE**

Advise patients that salmeterol should not be used for relief of acute attacks, not to exceed prescribed dose, and to follow manufacturer’s directions; if a previously effective dose of inhaled salmeterol fails to provide adequate relief, a doctor’s advice should be obtained as soon as possible. Patients should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta₂ agonist. Medicines for Children leaflet: Salmeterol inhaler for asthma prevention (prophylaxis) www.medicinesforchildren.org.uk/salmeterol-inhaler-for-asthma-prevention

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Pressurised inhalation**

- **Salmeterol (Non-proprietary)**
  
  Salmeterol (as Salmeterol xinafoate) 25 microgram per 1 dose | Salmeterol 25 micrograms/dose inhaler CFC free | 120 dose [PST] £29.26 DT price = £29.26
**Respiratory system**

**Selective β2-adrenoceptor agonists,**

- **By inhalation of aerosol**
  - **Child:** 2–10 puffs, each puff is to be inhaled separately, repeat every 10–20 minutes or when required, give via large volume spacer (and a close-fitting face mask in children under 3 years), each puff is equivalent to 100 micrograms

**Exacerbation of reversible airways obstruction (including nocturnal asthma): Prophylaxis of allergen-or exercise-induced bronchospasm**

- **By inhalation of aerosol**
  - **Child:** 100–200 micrograms, up to 4 times a day for persistent symptoms

**Short-acting β2-adrenoceptor agonists,**

**Salbutamol** *(Albuterol)*

Prophylaxis of allergen- or exercise-induced bronchospasm
• BY INHALATION OF POWDER
  ▶ Child 6-11 years: 100–200 micrograms
  ▶ Child 12-17 years: 200 micrograms

VENOTOL ACUCHARLER®

Acute bronchospasm
• BY INHALATION OF POWDER
  ▶ Child 5-17 years: Initially 200 micrograms, up to 4 times daily for persistent symptoms

Prophylaxis of allergen- or exercise-induced bronchospasm
• BY INHALATION OF POWDER
  ▶ Child 5-17 years: 200 micrograms

PHARMACOKINETICS
At recommended inhaled doses, the duration of action of salbutamol is about 3 to 5 hours.

- UNLICENSED USE
  Not licensed for use in hyperkalaemia.
  - With intravenous use or subcutaneous use: Injection and solution for intravenous infusion not licensed for use in children under 12 years.
  - With intravenous use: Administration of undiluted salbutamol injection through a central venous catheter is not licensed.

- SIDE-EFFECTS
  Lactic acidosis (with high doses) - nausea

- BREAST FEEDING
  Inhaled drugs for asthma can be taken as normal during breast-feeding.

- DIRECTIONS FOR ADMINISTRATION
  - With intravenous use: For continuous intravenous infusion, dilute to a concentration of 200 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%. If fluid-restricted, can be given undiluted through central venous catheter (unlicensed). For intravenous injection, dilute to a concentration of 50 micrograms/mL with Glucose 5%, Sodium Chloride 0.9%, or Water for injections.
  - When used by inhalation: For nebulisation, dilute nebuliser solution with a suitable volume of sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; salbutamol and ipratropium bromide solutions are compatible and can be mixed for nebulisation.

- PATIENT AND CARER ADVICE
  - Medicines for Children leaflet: Salbutamol inhaler for asthma and wheeze www.medicinesforchildren.org.uk/salbutamol-inhaler-for-asthma-and-wheeze
  - When used by inhalation: For inhalation by aerosol or dry powder, advise patients and carers not to exceed prescribed dose and to follow manufacturer’s directions; if a previously effective dose of inhaled salbutamol fails to provide at least 3 hours relief, a doctor’s advice should be obtained as soon as possible. For inhalation by nebuliser, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

Tablet
  - Salbutamol (Non-proprietary)
    - Salbutamol (as Salbutamol sulfate) 2 mg: 28 tablet (PO) £11.09 DT price = £10.72

Terbutaline sulfate

**INDICATIONS AND DOSE**

**Acute asthma**
- By subcutaneous injection, or by slow intravenous injection
  - Child 2–14 years: 10 micrograms/kg up to 4 times a day (max. per dose 300 micrograms), reserve intravenous beta, agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect
  - Child 15–17 years: 250–500 micrograms up to 4 times a day, reserve intravenous beta, agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

**By continuous intravenous infusion**
- Child: Loading dose 2–4 micrograms/kg, then 1–10 micrograms/kg/hour, dose to be adjusted according to response and heart rate, close monitoring is required for doses above 10 micrograms/kg/hour, reserve intravenous beta, agonists for those in whom inhaled therapy cannot be used reliably or there is no current effect

**Moderate, severe, or life-threatening acute asthma**
- By inhalation of nebulised solution
  - Child 2–14 years: 5 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
  - Child 5–11 years: 5–10 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available
  - Child 12–17 years: 10 mg, repeat every 20–30 minutes or when required, give via oxygen-driven nebuliser if available

**Exacerbation of reversible airways obstruction (including nocturnal asthma)**
- Prevention of exercise-induced bronchospasm
  - By inhalation of powder
  - Child 5–17 years: 500 micrograms up to 4 times a day, for occasional use only

**By mouth**
- Child 1 month–6 years: 75 micrograms/kg 3 times a day (max. per dose 2.5 mg), administration by mouth is not recommended
- Child 7–14 years: 2.5 mg 2–3 times a day, administration by mouth is not recommended
- Child 15–17 years: Initially 2.5 mg 3 times a day, then increased if necessary to 5 mg 3 times a day, administration by mouth is not recommended

**SIDE-EFFECTS**
- Nausea

**UNLICENSED USE**
- With oral use, tablets not licensed for use in children under 7 years.
- With intravenous use or subcutaneous injection, injection not licensed for use in children under 2 years.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use, for continuous intravenous infusion, dilute to a concentration of 5 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%; if fluid-restricted, dilute to a concentration of 100 micrograms/mL.
- When used by inhalation, for nebulisation, dilute nebuliser solution with sterile Sodium Chloride 0.9% solution according to nebuliser type and duration of administration; terbutaline and ipratropium bromide solutions are compatible and may be mixed for nebulisation.

**PATIENT AND CARER ADVICE**
- When used by inhalation, for inhalation by dry powder, advise patients and carers not to exceed prescribed dose and to follow manufacturer’s directions; if a previously effective dose of inhaled terbutaline fails to provide at least 3 hours relief, a doctor’s advice should be obtained as soon as possible. For inhalation by nebuliser, the dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection
  - **Tablet**
    - Bricanyl (AstraZeneca UK Ltd)
      - Terbutaline sulfate 5 mg Bricanyl 5mg tablets | 100 tablet [Pack] £4.91 DT price = £4.91
  - **Oral solution**
    - Bricanyl (AstraZeneca UK Ltd)
      - Terbutaline sulfate 300 microgram per 1 ml Bricanyl 1.5mg/5ml syrup sugar-free | 100 ml [Pack] £2.80 DT price = £2.80

**Solution for injection**
- Bricanyl (AstraZeneca UK Ltd)
  - Terbutaline sulfate 500 microgram per 1 ml Bricanyl 2.5mg/5ml solution for injection ampoules | 10 ampoule [Pack] £16.74
  - Bricanyl 500microgram/1ml solution for injection ampoules | 5 ampoule [Pack] £2.16

**Inhalation powder**
- Bricanyl Turbohaler (AstraZeneca UK Ltd)
  - Terbutaline sulfate 500 microgram per 1 dose Bricanyl 500micrograms/dose Turbohaler | 100 dose [Pack] £6.92 DT price = £6.92

**Nebuliser liquid**
- **Terbutaline sulfate (Non-proprietary)**
  - Terbutaline sulfate 2.5 mg per 1 ml Terbutaline 5mg/2ml nebuliser liquid unit dose vials | 20 unit dose [Pack] £4.04 DT price = £4.04
  - Bricanyl Respules (AstraZeneca UK Ltd)
    - Terbutaline sulfate 2.5 mg per 1 ml Bricanyl 5mg/2ml Respules | 20 unit dose [Pack] £5.82 DT price = £4.04
CORTICOSTEROIDS

Airways disease, use of corticosteroids

Asthma

Inhaled corticosteroids

Corticosteroids are effective in the management of asthma; they reduce airway inflammation.

An inhaled corticosteroid is used regularly for prophylaxis of asthma when a child requires a beta, agonist more than twice a week, or if symptoms disturb sleep at least once a week, or if the child has suffered an exacerbation in the last 2 years requiring a systemic corticosteroid.

Current or previous smoking reduces the effectiveness of inhaled corticosteroids and higher doses may be necessary. Corticosteroid inhalers must be used regularly for maximum benefit; alleviation of symptoms usually occurs 3 to 7 days after initiation but may take longer.

Beclometasone dipropionate p. 150, budesonide p. 151, fluticasone p. 152, and mometasone furoate p. 154 appear to be equally effective. A spacer device should be used for administering inhaled corticosteroids in children under 15 years; a spacer device is also useful in children over 15 years, particularly if high doses are required.

In children 12–18 years using an inhaled corticosteroid and a long-acting beta, agonist for the prophylaxis of asthma, but who are poorly controlled, Symbicort® (budesonide with formoterol p. 152) may be used as a reliever (instead of a short-acting beta, agonist), in addition to its regular use for the prophylaxis of asthma [unlicensed]. Symbicort® can also be used in this way in children 12–18 years using an inhaled corticosteroid with a dose greater than 400 micrograms beclometasone dipropionate daily, but who are poorly controlled [unlicensed] (standard doses of other inhaled corticosteroids can be used). When starting this treatment, the total regular dose of inhaled corticosteroid should not be reduced. Children and their carers must be carefully instructed on the appropriate dose and management of exacerbations before initiating this treatment, preferably by a respiratory specialist. Children using budesonide with formoterol as a reliever once a day or more should have their treatment reviewed regularly. This management approach has not been investigated with combination inhalers containing other corticosteroids and long-acting beta, agonists.

High doses of inhaled corticosteroids can be prescribed for children who respond only partially to standard doses of an inhaled corticosteroid and a long-acting beta, agonist or to other long-acting bronchodilators. High doses should be continued only if there is clear benefit over the lower dose. The recommended maximum dose of an inhaled corticosteroid should not generally be exceeded; however, if a higher dose is required it should be initiated and supervised by a respiratory paediatrician. The use of high doses of an inhaled corticosteroid can minimise the requirement for an oral corticosteroid.

Oral corticosteroids

Systemic therapy may be required during periods of stress, such as during severe infections, or when airways obstruction or mucus prevent drug access to smaller airways.

An acute attack of asthma should be treated with a short course (3–5 days) of oral corticosteroid. The dose can usually be stopped abruptly but it should be reduced gradually in children under 12 years who have taken corticosteroids for more than 14 days. Tapering is not needed in children 12–18 years provided that the child receives an inhaled corticosteroid in an adequate dose (apart from those on maintenance oral corticosteroid treatment or where oral corticosteroids are required for 3 or more weeks).

In chronic continuing asthma, when the response to other drugs has been inadequate, longer term administration of an oral corticosteroid may be necessary; in such cases high doses of an inhaled corticosteroid should be continued to minimise oral corticosteroid requirements.

An oral corticosteroid should normally be taken as a single dose in the morning to reduce the disturbance to circadian cortisol secretion. Dosage should always be titrated to the lowest dose that controls symptoms. Some clinicians use alternate-day dosing of an oral corticosteroid.

Parenteral corticosteroids

Hydrocortisone injection p. 411 has a role in the emergency treatment of acute severe asthma.

Corticosteroids (inhaled)

- INTERACTIONS → Appendix 1 (corticosteroids).
- SIDE-EFFECTS
  - Very rare Paradoxical bronchospasm
  - Frequency not known Adrenal crisis (with prolonged high doses) - adrenal suppression (with prolonged high doses) - aggression - anxiety - behavioural changes - bruising - candidiasis of the mouth - candidiasis of the throat - cataracts - coma (with prolonged high doses) - Cushing’s syndrome (with moon face, striae acnes) - depression - dysphonia - glucoma (with prolonged high doses) - hoarseness - hyperactivity - hyperglycaemia (usually only with high doses) - irritability - reduced growth velocity - reduced mineral bone density (with long-term treatment of high doses) - side-effects applicable to systemic corticosteroids may also apply if absorption occurs following inhaled use - sleep disturbances - throat irritation

SIDE-EFFECTS, FURTHER INFORMATION

- Candidiasis The risk of oral candidiasis can be reduced by using a spacer device with the corticosteroid inhaler; rinsing the mouth with water after inhalation of a dose may also be helpful. An anti-fungal oral suspension or oral gel can be used to treat oral candidiasis without discontinuing corticosteroid therapy.

- Paradoxical bronchospasm The potential for paradoxical bronchospasm (calling for discontinuation and alternative therapy) should be borne in mind – mild bronchospasm may be prevented by inhalation of a short-acting beta, agonist beforehand (or by transfer from an aerosol inhalation to a dry powder inhalation).

- PREGNANCY Inhaled drugs for asthma can be taken as normal during pregnancy.

- BREAST FEEDING Inhaled corticosteroids for asthma can be taken as normal during breast-feeding.

- MONITORING REQUIREMENTS The height and weight of children receiving prolonged treatment with inhaled corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.

- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Inhaled corticosteroids for the treatment of chronic asthma in children under 12 years (November 2007) NICE TA131

For children under 12 years with chronic asthma in whom treatment with an inhaled corticosteroid is considered appropriate, the least costly product that is suitable for an individual child (taking into consideration NICE TAs 38 and 10), within its marketing authorisation, is recommended.

For children under 12 years with chronic asthma in whom treatment with an inhaled corticosteroid and a long-acting beta, agonist is considered appropriate, the following apply:
Beclometasone dipropionate (Beclometasone dipropionate)

**INDICATIONS AND DOSE**

**Prophylaxis of asthma**
- **By Inhalation of Powder**
  - Child 5–11 years: 100–200 micrograms twice daily, dose to be adjusted as necessary
  - Child 12–17 years: 200–400 micrograms twice daily; increased if necessary up to 800 micrograms twice daily, dose to be adjusted as necessary
- **Asmabec Clickhaler®**
  - **Prophylaxis of asthma**
    - **By Inhalation of Powder**
      - Child 6–11 years: 100–200 micrograms twice daily, dose to be adjusted as necessary
      - Child 12–17 years: 100–400 micrograms twice daily (max. per dose 1 mg twice daily), dose to be adjusted as necessary
- **Clenil Modulite®**
  - **Prophylaxis of asthma**
    - **By Inhalation of Aerosol**
      - Child 2–11 years: 100–200 micrograms twice daily
      - Child 12–17 years: 200–400 micrograms twice daily, adjusted according to response; increased if necessary up to 1 mg twice daily

**Qvar® Preparations**

**Prophylaxis of asthma**
- **By Inhalation of Aerosol**
  - Child 12–17 years: 50–200 micrograms twice daily; increased if necessary up to 400 micrograms twice daily

**Potency**

Qvar® has extra-fine particles, is more potent than traditional beclometasone dipropionate CFC-containing inhalers and is approximately twice as potent as Clenil Modulite®.

**DOSE EQUIVALENCE AND CONVERSION**

Dose adjustments may be required for some inhaler devices, see under individual preparations.

**UNLICENSED USE**
Beclometasone Dipropionate is not licensed for use in children under 18 years. Clenil Modulite®-200 and -250 are not licensed for use in children under 12 years. Qvar® is not licensed for use in children under 12 years.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM Advice (July 2008)

Beclometasone dipropionate CFC-free pressurised metered-dose inhalers (Qvar® and Clenil Modulite®) are not interchangeable and should be prescribed by brand name; Qvar® has extra-fine particles, is more potent than traditional beclometasone dipropionate CFC-containing inhalers, and is approximately twice as potent as Clenil Modulite®.

**Prescribing and dispensing information**

The MHRA has advised (July 2008) that beclometasone dipropionate CFC-free inhalers should be prescribed by brand name.

Clenil Modulite® Clenil Modulite®-200 is not interchangeable with other CFC-free beclometasone dipropionate inhalers.

**Qvar® Preparations**

When switching a patient with well-controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of Qvar® should be prescribed for 200–250 micrograms of beclometasone dipropionate or budesonide and for 100 micrograms of fluticasone propionate. When switching a patient with poorly controlled asthma from another corticosteroid inhaler, initially a 100-microgram metered dose of Qvar® should be prescribed for 100 micrograms of beclometasone dipropionate, budesonide, or fluticasone propionate; the dose of Qvar® should be adjusted according to response.

**Patient and Carer Advice**

Steroid card should be issued with high doses of inhaled beclometasone dipropionate. Medicines for Children Leaflet: Budesonide for asthma prevention (prophylaxis) www.medicinesforchildren.org.uk/beclometasone-inhaler-asthma-prevention-prophylaxis-0

**Proession Specific Information**

Dental practitioners’ formulary Clenil Modulite® 50 micrograms/metered inhalation may be prescribed.

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug.

**Pressurised Inhalation**

**Cautionary and Advisory Labels 8, 10**

Budesonide

- **INDICATIONS AND DOSAGE**
  - Bronchopulmonary dysplasia with spontaneous respiration
    - **BY INHALATION OF NEBULISED SUSPENSION**
  - Neonate: 500 micrograms twice daily.
  - Child 1-4 months: 500 micrograms twice daily.
  - **Bronchopulmonary dysplasia with spontaneous respiration (severe symptoms)**
    - **BY INHALATION OF NEBULISED SUSPENSION**
    - Child 1-4 months (body-weight 2.5 kg and above): 1 mg twice daily.
  - **Prophylaxis of mild to moderate asthma (in patients stabilised on twice daily dose)**
    - **BY INHALATION OF POWDER**
    - Child 6-11 years: 200–400 micrograms once daily, dose to be given in the evening.
    - Child 12-17 years: 200–400 micrograms once daily (max. per dose 800 micrograms), to be given in the evening.
  - **Prophylaxis of asthma**
    - **BY INHALATION OF POWDER**
    - Child 6-11 years: 100–400 micrograms twice daily, dose to be adjusted as necessary.
    - Child 12-17 years: 100–800 micrograms twice daily, dose to be adjusted as necessary.
    - **BY INHALATION OF NEBULISED SUSPENSION**
    - Child 6 months-11 years: 125–500 micrograms twice daily, adjusted according to response; maximum 2 mg per day.
    - Child 12-17 years: Initially 0.25–1 mg twice daily, adjusted according to response, doses higher than recommended may be used in severe disease; maximum 2 mg per day.

- **POTENCY**
  - Dose adjustments may be required for some inhaler devices, see under individual preparations.

- **UNLICENSED USE** Pulmicort® nebuliser solution not licensed for use in children under 3 months; not licensed for use in bronchopulmonary dysplasia.

- **DIRECTIONS FOR ADMINISTRATION** Budesonide nebuliser suspension is not suitable for use in ultrasonic nebulisers.

- **PATIENT AND CARER ADVICE** With high doses, a steroid card should be supplied. Patients or carers should be given advice on how to administer budesonide dry powder inhaler and nebuliser suspension.

- **Medicines for Children leaflet: Budesonide inhaler for asthma prevention (prophylaxis)** www.medicinesforchildren.org.uk/budesonide-inhaler-asthma-prevention-prophylaxis

- INDICATIONS AND DOSE
  RELVAR ELLIPTA® 184 MICROGRAMS/22 MICROGRAMS
  Prophylaxis of asthma
  ▶ BY INHALATION OF POWDER
  - Child 12-17 years: 1 inhalation once daily
  RELVAR ELLIPTA® 92 MICROGRAMS/22 MICROGRAMS
  Prophylaxis of asthma
  ▶ BY INHALATION OF POWDER
  - Child 12-17 years: 1 inhalation once daily

DOSE EQUIVALENCE AND CONVERSION

RELVAR ELLIPTA® 184 MICROGRAMS/22 MICROGRAMS
1 inhalation (delivered dose) of fluticasone furoate 184 micrograms once daily is approximately equivalent to fluticasone propionate 500 micrograms twice daily.

RELVAR ELLIPTA® 92 MICROGRAMS/22 MICROGRAMS
1 inhalation (delivered dose) of fluticasone furoate 92 micrograms once daily is approximately equivalent to fluticasone propionate 250 micrograms twice daily.

- SIDE-EFFECTS
  Abdominal pain · back pain

- PREGNANCY
  Manufacturer advises use only if potential benefit outweighs risk.

- BREAST FEEDING
  Manufacturer advises avoid—no information available.

- HEPATIC IMPAIRMENT
  Max. dose fluticasone furoate 92 micrograms, vilanterol 22 micrograms.

RELVAR ELLIPTA®, 184 MICROGRAMS/22 MICROGRAMS
  Avoid in moderate to severe impairment.

- PATIENT AND CARER ADVICE
  A steroid card should be provided.
  Patients or carers should be given advice on how to administer fluticasone with vilanterol powder for inhalation.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

CAUTIONARY AND ADVISORY LABELS 8, 10

- Relvar Ellipta (GlaxoSmithKline UK Ltd)
  - Vilanterol 22 microgram per 1 dose, Fluticasone furoate 92 microgram per 1 dose Relvar Ellipta 92 micrograms/dose / 22 micrograms/dose dry powder inhaler | 30 dose (PFF) £22.00
  - Vilanterol 22 microgram per 1 dose, Fluticasone furoate 184 microgram per 1 dose Relvar Ellipta 184 micrograms/dose / 22 micrograms/dose dry powder inhaler | 30 dose (PFF) £25.50

Mometasone furoate

- INDICATIONS AND DOSE
  Prophylaxis of asthma
  ▶ BY INHALATION OF POWDER
  - Child 12-17 years: Initially 400 micrograms daily in 1–2 divided doses, single dose to be inhaled in the evening, reduced to 200 micrograms once daily, if control maintained
  Prophylaxis of severe asthma
  ▶ BY INHALATION OF POWDER
  - Child 12-17 years: Increased if necessary up to 400 micrograms twice daily

- SIDE-EFFECTS
  - Common or very common: Headache
  - Uncommon: Dyspepsia · palpitation · weight gain

- PATIENT AND CARER ADVICE
  Patients or carers should be given advice on how to administer mometasone by inhaler. With high doses, a steroid card should be supplied.
  Medicines for Children leaflet: Mometasone furoate inhaler for asthma prevention (prophylaxis)
  www.medicinesforchildren.org.uk/mometasone-furoate-inhaler-for-asthma-prevention-prophylaxis

- NATIONAL FUNDING/ACCESS DECISIONS
  Scottish Medicines Consortium (SMC) Decisions
  The Scottish Medicines Consortium has advised (November 2003) that Asmanex® is restricted for use following failure of first-line inhaled corticosteroids.

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

CAUTIONARY AND ADVISORY LABELS 8, 10

- Asmanex Twisthaler (Merck Sharp & Dohme Ltd)

DRUGS FOR RESPIRATORY DISEASES

MONOCOCLAN ANTIBODIES

Omalizumab

- INDICATIONS AND DOSE
  Prophylaxis of severe persistent allergic asthma
  ▶ BY SUBCUTANEOUS INJECTION
  - Child 6-17 years: Dose according to immunoglobulin E concentration and body-weight (consult product literature)
  Add-on therapy for chronic spontaneous urticaria in patients who have had an inadequate response to H1 antihistamine treatment
  ▶ BY SUBCUTANEOUS INJECTION
  - Child 12-17 years: 300 mg every 4 weeks

- CAUTIONS
  Autoimmune disease · susceptibility to helmith infection—discontinue if infection does not respond to anthelmintic

- SIDE-EFFECTS
  - Common or very common: Abdominal pain · arthralgia · headache · injection-site reactions · pyrexia · sinusitis · upper respiratory tract infection
  - Uncommon: Bronchospasm · cough · diarrhoea · dizziness · drowsiness · dyspepsia · flushing · influenza-like illness · malaise · nausea · paraesthesia · pharyngitis ·
photosensitivity - postural hypotension - pruritus - rash - syncope - urticaria - weight gain

- Rare Angioedema - antibody formation - laryngoeesthesia - parasitic infection

- Frequency not known Alopecia - arterial thromboembolic events - Churg-Strauss syndrome - joint swelling - myalgia - serum sickness (including fever and lymphadenopathy) - thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION

- Churg-Strauss syndrome Churg-Strauss syndrome has occurred rarely in patients given omalizumab; the reaction is usually associated with the reduction of oral corticosteroid therapy. Churg-Strauss syndrome can present as eosinophilia, vasculitic rash, cardiac complications, worsening pulmonary symptoms, or peripheral neuropathy.

- Hypersensitivity reactions Hypersensitivity reactions can also occur immediately following treatment with omalizumab or sometimes more than 24 hours after the first injection.

- PREGNANCY Manufacturer advises avoid unless essential—crosses the placenta.

- BREAST FEEDING Manufacturer advises avoid—present in milk in animal studies.

- HEPATIC IMPAIRMENT Manufacturer advises caution—no information available.

- RENAL IMPAIRMENT Manufacturer advises caution—no information available.

- NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Omalizumab for severe persistent allergic asthma (April 2013) NICE TA278

Omalizumab is recommended as an option for treating severe persistent confirmed allergic IgE-mediated asthma as an add-on to optimised standard therapy in patients aged 6 years and over:

- who need continuous or frequent treatment with oral corticosteroids (defined as 4 or more courses in the previous year), and
- only if the manufacturer makes omalizumab available with the discount agreed in the patient access scheme. Optimised standard therapy is defined as a full trial of and, if tolerated, documented compliance with an inhaled high-dose corticosteroid, long-acting beta agonists, leukotriene receptor antagonists, theophyllines, oral corticosteroids, and smoking cessation if clinically appropriate.

Patients currently receiving omalizumab whose disease does not meet the criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA278

- Omalizumab for previously treated chronic spontaneous urticaria (June 2015) NICE TA339

Omalizumab is an option as add-on therapy for the treatment of severe chronic spontaneous urticaria in patients 12 years and over, only if:

- the severity of the condition is assessed objectively, for example, using a weekly urticaria activity score of 28 or more,
- the patient’s condition has not responded to standard treatment with H1-antihistamines and leukotriene receptor antagonists,
- omalizumab is stopped at or before the fourth dose if the condition has not responded,
- omalizumab is stopped at the end of a course of treatment (6 doses) if the condition has responded and is restarted only if the condition relapses,
- omalizumab is administered under the management of a secondary care specialist in dermatology, immunology or allergy,

- the manufacturer provides omalizumab with the discount agreed in the patient access scheme. Patients currently receiving omalizumab whose disease does not meet the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

www.nice.org.uk/TA339

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised that omalizumab (Xolair®) is accepted for restricted use within NHS Scotland for the treatment of chronic spontaneous urticaria in patients aged 12 years and over, who have had an inadequate response to combination therapy with H1-antihistamines, leukotriene receptor antagonists and H2-antihistamines, used according to current treatment guidelines.

- MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- Xolair (Novartis Pharmaceuticals UK Ltd) Omalizumab 150 mg per 1 ml Xolair 150mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £256.15

- Xolair 75mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection £128.07

LEUKOTRIENE RECEPTOR ANTAGONISTS

Leukotriene receptor antagonists

The leukotriene receptor antagonists, montelukast below and zafirlukast p. 156, block the effects of cysteinyl leukotrienes in the airways; they can be used in children for the management of chronic asthma with an inhaled corticosteroid or as an alternative if an inhaled corticosteroid cannot be used.

Montelukast has not been shown to be more effective than a standard dose of inhaled corticosteroid, but the two drugs appear to have an additive effect. The leukotriene receptor antagonists may be of benefit in exercise-induced asthma and in those with concomitant rhinitis, but they are less effective in children with severe asthma who are also receiving high doses of other drugs.

There is some limited evidence to support the intermittent use of montelukast in children under 12 years with episodic wheeze associated with viral infections [unlicensed use]. Treatment is started at the onset of either asthma symptoms or of coryzal symptoms and continued for 7 days; there is no evidence to support this use in moderate or severe asthma.

Montelukast

- INDICATIONS AND DOSE

Prophylaxis of asthma

- BY MOUTH

  - Child 6 months-5 years: 4 mg once daily, dose to be taken in the evening
  - Child 6-14 years: 5 mg once daily, dose to be taken in the evening
  - Child 15-17 years: 10 mg once daily, dose to be taken in the evening

Symptomatic relief of seasonal allergic rhinitis in patients with asthma.

- BY MOUTH

  - Child 15-17 years: 10 mg once daily, dose to be taken in the evening

- INTERACTIONS

  - Appendix 1 (leukotriene receptor antagonists).
AIRWAYS DISEASE, OBSTRUCTIVE

RESPIRATORY SYSTEM

MEDICINAL FORMS

NATIONAL FUNDING/ACCESS DECISIONS

PATIENT AND CARER ADVICE

PRESCRIBING AND DISPENSING INFORMATION

DIRECTIONS FOR ADMINISTRATION

BREAST FEEDING

SIDE-EFFECTS

Common or very common
Abdominal pain, headache, hyperkinesia (in young children), thirst

Uncommon
Abnormal dreams, aggressive behaviour, agitation, anxiety, arthralgia, bruising, depression, dizziness, drowsiness, dry mouth, dyspepsia, epistaxis, hostility, hypoaesthesia, irritability, malaise, muscle cramps, myalgia, oedema, paraesthesia, psychomotor hyperactivity, restlessness, seizures, sleep disturbances, sleep-walking

Rare
Disturbance in attention, increased bleeding tendency, memory impairment, palpitation, tremor

Very rare
Churg-Strauss syndrome, disorientation, erythema multiforme, erythema nodosum, hallucinations, hepatic disorders, hepatitis eosinophilic infiltration, suicidal behaviour, suicidal thoughts

SIDE-EFFECTS, FURTHER INFORMATION

Churg-Strauss syndrome has occurred very rarely in association with the use of montelukast; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. Prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or peripheral neuropathy.

PREGNANCY

Manufacturer advises avoid unless essential. There is limited evidence for the safe use of montelukast during pregnancy; however, it can be taken as normal in women who have shown a significant improvement in asthma not achievable with other drugs before becoming pregnant.

BREAST FEEDING

Manufacturer advises avoid unless essential.

DIRECTIONS FOR ADMINISTRATION

With Oral use
Granules may be swallowed or mixed with cold, soft food (not liquid) and taken immediately.

PRESCRIBING AND DISPENSING INFORMATION

Flavours of chewable tablet formulations may include cherry.

PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer montelukast granules. Medicines for Children leaflet: Montelukast for asthma www.medicinesforchildren.org.uk/montelukast-for-asthma

NATIONAL FUNDING/ACCESS DECISIONS

SINGULAIR® GRANULES

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2007) that Singulair® granules are restricted for use as an alternative to low-dose inhaled corticosteroids for children 2–14 years with mild persistent asthma who have not recently had serious asthma attacks that required oral corticosteroid use and who are not capable of using inhaled corticosteroids; Singulair® granules should be initiated by a specialist in paediatric asthma.

SINGULAIR® CHEWABLE TABLETS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2007) that Singulair® chewable tablets are restricted for use as an alternative to low-dose inhaled corticosteroids for children 2–14 years with mild persistent asthma who have not recently had serious asthma attacks that required oral corticosteroid use and who are not capable of using inhaled corticosteroids; Singulair® chewable tablets should be initiated by a specialist in paediatric asthma.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Montelukast (Non-proprietary)
Montelukast (as Montelukast sodium) 10 mg
28 tablet | £26.97 DT price = £1.54

Montelukast (Merck Sharp & Dohme Ltd)
Montelukast (as Montelukast sodium) 10 mg
Singular 10mg tablets | 28 tablet | £26.97 DT price = £1.54

Chehal tablet

CAUTIONARY AND ADVISORY LABELS

PRESCRIBING AND DISPENSING INFORMATION

DIRECTIONS FOR ADMINISTRATION

BREAST FEEDING

Manufacturer advises avoid unless essential.

INTERACTIONS

By Mouth

Child 12-17 years: 20 mg twice daily

SIDE-EFFECTS

Common or very common
Gastro-intestinal disturbances, headache, respiratory infections

Uncommon
Insomnia, malaise

Very rare
Agranulocytosis, Churg-Strauss syndrome

SIDE-EFFECTS, FURTHER INFORMATION

Hepatic disorder
Patients or their carers should be told how to recognise development of liver disorder and advised to seek medical attention if symptoms or signs such as persistent nausea, vomiting, malaise, or jaundice develop.

Churg-Strauss syndrome has occurred very rarely in association with the use of zafirlukast; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. Prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or peripheral neuropathy.

PREGNANCY

Manufacturer advises use only if potential benefit outweighs risk. There is limited evidence for the safe use of zafirlukast during pregnancy; however, it can be taken as normal in women who have shown a significant improvement in asthma not achievable with other drugs before becoming pregnant.

BREAST FEEDING

Present in milk—manufacturer advises avoid.

HEPATIC IMPAIRMENT

Manufacturer advises avoid.

RENA! IMPAIRMENT

Manufacturer advises caution.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Zafirlukast for asthma prevention (prophylaxis) www.medicinesforchildren.org.uk/zafirlukast-for-asthma-prevention
Sodium cromoglicate
(Sodium cromoglycate)

**INDICATIONS AND DOSE**

**Prophylaxis of asthma**
- **By Inhalation of Aerosol**
  - Child 5–17 years: Initially 10 mg 4 times a day, additional dose may also be taken before exercise, increased if necessary to 10 mg 6–8 times a day; maintenance 5 mg 4 times a day, 5 mg is equivalent to 1 puff

**SIDE-EFFECTS, FURTHER INFORMATION**
- Paradoxical bronchospasm
  - When used by inhalation If paradoxical bronchospasm occurs, a short-acting beta,
  - Food allergy (in conjunction with dietary restriction)
  - **By Mouth**
  - Child 2–13 years: Initially 100 mg 4 times a day for 2–3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals
  - Child 14–17 years: Initially 200 mg 4 times a day for 2–3 weeks, then increased if necessary up to 40 mg/kg daily, then reduced according to response, to be taken before meals

**CAUTIONS**
- When used by inhalation Discontinue if eosinophilic pneumonia occurs

**SIDE-EFFECTS**
- When used by inhalation Bronchospasm - cough - eosinophilic pneumonia - headache - paradoxical bronchospasm - rhinitis - throat irritation
- With oral use Joint pain - occasional nausea - rashes

**PREGNANCY**
- Not known to be harmful. Inhaled drugs can be taken as normal during pregnancy.

**BREAST FEEDING**
- Unlikely to be present in milk. Inhaled drugs can be taken as normal during breast-feeding.

**TREATMENT CESSATION**
- When used by inhalation Withdrawal of sodium cromoglicate should be done gradually over a period of one week—symptoms of asthma may recur.

**DIRECTIONS FOR ADMINISTRATION**
- With oral use Capsules may be swallowed whole or the contents dissolved in hot water and diluted with cold water before taking.

**PATIENT AND CARER ADVICE**
- With oral use Patient counselling is advised for sodium cromoglicate capsules (administration).
- When used by inhalation Patient counselling is advised for sodium cromoglicate pressurised inhalation (administration).
XANTHINES

Aminophylline

**INDICATIONS AND DOSE**

Severe acute asthma in patients not previously treated with theophylline

- **BY SLOW INTRAVENOUS INJECTION**
  - Child: 5 mg/kg (max. per dose 500 mg), to be followed by intravenous infusion

Severe acute asthma

- **BY INTRAVENOUS INFUSION**
  - Child 1 month–11 years: 1 mg/kg/hour, adjusted according to plasma-theophylline concentration
  - Child 12–17 years: 500–700 micrograms/kg/hour, adjusted according to plasma-theophylline concentration

Chronic asthma

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child (body-weight 40 kg and above): Initially 225 mg twice daily for 1 week, then increased if necessary to 450 mg twice daily, adjusted according to plasma-theophylline concentration

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose adjustment may be necessary if smoking started or stopped during treatment.

**DOSES AT EXTREMES OF BODY-WEIGHT**

To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal weight for height.

**PHARMACOKINETICS**

Aminophylline is a stable mixture or combination of theophylline and ethylenediamine; the ethylenediamine confers greater solubility in water. Theophylline is metabolised in the liver. The plasma-theophylline concentration is increased in heart failure, hepatic impairment, and in viral infections. The plasma-theophylline concentration is decreased in smokers, and theophylline concentration is increased in heart failure. Theophylline is metabolised in the liver. The plasma-theophylline concentration is decreased in smokers, and theophylline concentration is increased in heart failure.

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Hypokalaemia** Potentially serious hypokalaemia may result from beta, agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

Overdose

Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

For specific details on the management of poisoning, see Theophylline, under Emergency treatment of poisoning on p. 791.

- **ALLERGY AND CROSS-SENSITIVITY** Allergy to ethylenediamine can cause urticaria, erythema, and exfoliative dermatitis.

- **PREGNANCY** Neonatal irritability and apnoea have been reported. Theophylline can be taken as normal during pregnancy as it is particularly important that asthma should be well controlled during pregnancy.

- **BREAST FEEDING** Present in milk—irritability in infant reported; modified-release preparations preferable. Theophylline can be taken as normal during breast-feeding.

- **HEPATIC IMPAIRMENT** Reduce dose.

- **MONITORING REQUIREMENTS**
  - Aminophylline is monitored therapeutically in terms of plasma-theophylline concentrations.
  - Measurement of plasma-theophylline concentration may be helpful and is essential if a loading dose of intravenous aminophylline is to be given to patients who are already taking theophylline, because serious side-effects such as convulsions and arrhythmias can occasionally precede other symptoms of toxicity.
  - In most individuals, a plasma-theophylline concentration of 10–20 mg/litre (55–110 micromol/litre) is required for satisfactory bronchodilation, although a lower plasma-theophylline concentration of 5–15 mg/litre may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.
  - If aminophylline is given intravenously, a blood sample should be taken 4–6 hours after starting treatment.
  - With oral use Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should usually be taken 4–6 hours after an oral dose of a modified-release preparation (sampling times may vary—consult local guidelines).

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For intravenous infusion, dilute to a concentration of 1 mg/ml with Glucose 5% or Sodium Chloride 0.9%.
  - With intravenous use For intravenous injection, give very slowly over at least 20 minutes (with close monitoring).
  - With intramuscular use Aminophylline is too irritant for intramuscular use.

- **PRESCRIBING AND DISPENSING INFORMATION**

Patients taking oral theophylline or aminophylline should not normally receive a loading dose of intravenous aminophylline.

Consider intravenous aminophylline for treatment of severe and life-threatening acute asthma only after consultation with senior medical staff.
Theophylline

**INDICATIONS AND DOSE**

**NUELIN SA® 175MG TABLETS**

**Chronic asthma**
- **By mouth using modified-release medicines**
- Child 6-11 years: 175 mg every 12 hours
- Child 12-17 years: 212.5-350 mg every 12 hours

**NUELIN SA® 250 TABLETS**
- **Chronic asthma**
  - **By mouth using modified-release medicines**
  - Child 6-11 years: 250-375 mg every 12 hours
  - Child 12-17 years: 500 mg every 12 hours

**SLO-PHYLLIN®**

**Chronic asthma**
- **By mouth using modified-release medicines**
  - Child 6 months-1 year: 12 mg/kg every 12 hours (max. per dose 120 mg)
  - Child 2-5 years: 60-120 mg every 12 hours
  - Child 6-11 years: 125-250 mg every 12 hours
  - Child 12-17 years: 250-500 mg every 12 hours

**UNIPHyllIN CONTINU®**

**Chronic asthma**
- **By mouth using modified-release medicines**
  - Child 2-11 years: 9 mg/kg every 12 hours (max. per dose 200 mg), dose may be increased in some children with chronic asthma; increased to 10-15 mg/kg every 12 hours (max. per dose 400 mg), may be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily dose may be increased by 20 mg every 12 hours or as appropriate
  - Child 12-17 years: 200 mg every 12 hours, adjusted according to response to 400 mg every 12 hours, may be appropriate to give larger evening or morning dose to achieve optimum therapeutic effect when symptoms most severe; in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily dose may be increased by 20 mg every 12 hours

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

**Dose adjustment may be necessary if smoking started or stopped during treatment.**

**Pharmacokinetics**

Theophylline is metabolised in the liver. The plasma-theophylline concentration is increased in heart failure, hepatic impairment, and in viral infections. The plasma-theophylline concentration is decreased in smokers, and by alcohol consumption. Differences in the half-life of theophylline are important because the toxic dose is close to the therapeutic dose.

**UNLICENSED USE**

**SLO-PHYLLIN®** Capsules not licensed for use in children under 2 years.

**Cautions**
- Cardiac arrhythmias or other cardiac disease: epilepsy, fever, hypertension, hyperthyroidism, peptic ulcer, risk of hypokalaemia

**Interactions**
- **Appendix 1 (theophylline).**

**Side-effects**
- Arrhythmias, CNS stimulation, convulsions, diarrhoea, gastric irritation, headache, insomnia, nausea, palpitation, tachycardia, vomiting

**Further Information**
- **Hypokalaemia** Potentially serious hypokalaemia may result from beta, agonist therapy. Particular caution is required in severe asthma, because this effect may be potentiated by concomitant treatment with theophylline and its derivatives, corticosteroids, and diuretics, and by hypoxia. Plasma-potassium concentration should therefore be monitored in severe asthma.

**Overdose**

Theophylline in overdose can cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

For details on the management of poisoning, see Theophylline, under Emergency treatment of poisoning p. 791.

**Pregnancy**

Neonatal irritability and apnoea have been reported. Theophylline can be taken as normal during pregnancy as it is particularly important that asthma should be well controlled during pregnancy.

**Breast feeding**

Present in milk—irritability in infant reported; modified-release preparations preferable. Theophylline can be taken as normal during breast-feeding.

**Hepatic impairment**

Reduce dose.

**Monitoring requirements**
- In most individuals, a plasma-theophylline concentration of 10–20 mg/litre (55–110 micromol/litre) is required for satisfactory bronchodilation, although a lower plasma-theophylline concentration of 5–15 mg/litre may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.
- Plasma-theophylline concentration is measured 5 days after starting oral treatment and at least 3 days after any dose adjustment. A blood sample should be taken 4–6 hours after an oral dose of a modified-release preparation (sampling times may vary—consult local guidelines).

**Directions for administration**

**SLO-PHYLLIN®** Contents of the capsule (enteric-coated granules) may be sprinkled on to a spoonful of soft food (e.g. yoghurt) and swallowed without chewing.
HYPERTONIC SODIUM CHLORIDE SOLUTIONS

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Modified-release tablet

- **Nuelin SA** (Meda Pharmaceuticals Ltd)
  - Theophylline 175 mg Nuelin SA 175mg tablets | 60 tablet [P] £6.38
  - Theophylline 250 mg Nuelin SA 250 tablets | 60 tablet [P] £8.92

  - Theophylline 250 mg Slo-Phyllin 250mg capsules | 56 capsule [P] £4.34

PRESCRIBING AND DISPENSING INFORMATION
The rate of absorption from modified-release preparations can vary between brands. If a prescription for a modified-release oral theophylline preparation does not specify a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.

PATIENT AND CARER ADVICE
**SLO-PHYLLIN®** Patient or carer should be given advice on how to administer theophylline modified release capsules.

INDICATIONS AND DOSE

**NEBUSAL®**
Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis)
- **BY INHALATION OF NEBULISED SOLUTION**
  - Child: 4 ml up to twice daily, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects

Nebusal 7% inhalation solution 4ml vials (Forest Laboratories UK Ltd) Sodium chloride 70 mg per 1 ml | 60 vial • NHS indicative price = £27.00 • Drug Tariff (Part Ixa)

INDICATIONS AND DOSE

**MUCOCLEAR® 3%**
Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis) Mild to moderate acute viral bronchiolitis in infants
- **BY INHALATION OF NEBULISED SOLUTION**
  - Child: 4 ml 2–4 times a day, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects

Mucoclear 3% inhalation solution 4ml ampoules (Pari Medical Ltd) Sodium chloride 30 mg per 1 ml | 20 ampoule • NHS indicative price = £12.98 • Drug Tariff (Part Ixa) | 60 ampoule • NHS indicative price = £270.00 • Drug Tariff (Part Ixa)

INDICATIONS AND DOSE

**MUCOCLEAR® 6%**
Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis)
- **BY INHALATION OF NEBULISED SOLUTION**
  - Child: 4 ml twice daily, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects

- **MINI-WRIGHT® STANDARD RANGE**
  - Range 60–900 litres/minute.

- **MicroPeak peak flow meter standard range** (Micro Medical Ltd) | 1 device • NHS indicative price = £6.50 • Drug Tariff (Part Ixa) price = £4.50

- **Mini-Wright peak flow meter standard range** (Clement Clarke International Ltd) | 1 device • NHS indicative price = £7.08 • Drug Tariff (Part Ixa) price = £4.50

**STANDARD RANGE PEAK FLOW METERS**

- **nSpire Pocket Peak peak flow meter low range** (nSpire Health Ltd) | 1 device • NHS indicative price = £6.50 • Drug Tariff (Part Ixa) price = £6.50

NHS indicative price = £6.50 • Drug Tariff (Part Ixa) price = £6.50

Mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis) Mild to moderate acute viral bronchiolitis in infants
- **BY INHALATION OF NEBULISED SOLUTION**
  - Child: 4 ml 2–4 times a day, temporary irritation, such as coughing, hoarseness, or reversible bronchoconstriction may occur; an inhaled bronchodilator can be used before treatment with hypertonic sodium chloride to reduce the risk of these adverse effects

Mucoclear 3% inhalation solution 4ml ampoules (Pari Medical Ltd) Sodium chloride 30 mg per 1 ml | 20 ampoule • NHS indicative price = £12.98 • Drug Tariff (Part Ixa) | 60 ampoule • NHS indicative price = £270.00 • Drug Tariff (Part Ixa)
PIKO-1®
Range 15–999 litres/minute.

nSpire Piko-1 peak flow meter standard range (nSpire Health Ltd)
| 1 device - NHS indicative price = £9.50 - Drug Tariff (Part IXa) price = £4.50

PINNACLE®
Range 60–900 litres/minute.

Fyne Dynamics Pinnacle peak flow meter standard range (Fyne Dynamics Ltd)
| 1 device - NHS indicative price = £6.50 - Drug Tariff (Part IXa) price = £4.50

POCKETPEAK® STANDARD RANGE
Range 60–800 litres/minute.

nSpire Pocket Peak peak flow meter standard range (nSpire Health Ltd)
| 1 device - NHS indicative price = £6.53 - Drug Tariff (Part IXa) price = £4.50

VITALOGRAPH®
Range 50–800 litres/minute.

Vitalograph peak flow meter standard range (Vitalograph Ltd)
| 1 device - NHS indicative price = £4.83 - Drug Tariff (Part IXa) price = £4.50

Spacers

Spacers

A2A SPACER®
For use with all pressurised (aerosol) inhalers.

A2A Spacer (Clement Clarke International Ltd)
| 1 device - NHS indicative price = £4.15 - Drug Tariff (Part IXa)

A2A Spacer with medium mask (Clement Clarke International Ltd)
| 1 device - NHS indicative price = £6.68 - Drug Tariff (Part IXa)

A2A Spacer with small mask (Clement Clarke International Ltd)
| 1 device - NHS indicative price = £6.68 - Drug Tariff (Part IXa)

ABLE SPACER®
Small-volume device. For use with all pressurised (aerosol) inhalers.

Able Spacer (Clement Clarke International Ltd)
| 1 device - NHS indicative price = £4.39 - Drug Tariff (Part IXa)

Able Spacer with medium mask (Clement Clarke International Ltd)
| 1 device - NHS indicative price = £7.16 - Drug Tariff (Part IXa)

Able Spacer with small mask (Clement Clarke International Ltd)
| 1 device - NHS indicative price = £7.16 - Drug Tariff (Part IXa)

AEROCHAMBER PLUS®
Medium-volume device. For use with all pressurised (aerosol) inhalers.

AeroChamber Plus (GlaxoSmithKline UK Ltd)
| 1 device - NHS indicative price = £4.81 - Drug Tariff (Part IXa)

AeroChamber Plus with adult mask (GlaxoSmithKline UK Ltd)
| 1 device - NHS indicative price = £8.02 - Drug Tariff (Part IXa)

AeroChamber Plus with child mask (GlaxoSmithKline UK Ltd)
| 1 device - NHS indicative price = £8.02 - Drug Tariff (Part IXa)

AeroChamber Plus with infant mask (GlaxoSmithKline UK Ltd)
| 1 device - NHS indicative price = £8.02 - Drug Tariff (Part IXa)

BABYHALER®
For paediatric use with Flixotide®, and Ventolin® inhalers.

PRESCRIBING AND DISPENSING INFORMATION
Not available for NHS prescription.

Babyluer (Allen & Hanburys Ltd)
| 1 device - No NHS indicative price available - Drug Tariff (Part IXa)

HALERAIL®
Device to place over pressurised (aerosol) inhalers to aid when strength in hands is impaired (e.g., in arthritis). For use with Flixotide®, Serevent®, Seretide®, and Ventolin® inhalers.

PRESCRIBING AND DISPENSING INFORMATION
Not available for NHS prescription.

Haleraid-120 (Allen & Hanburys Ltd)
| 1 device - No NHS indicative price available - Drug Tariff (Part IXa)

Haleraid-200 (Allen & Hanburys Ltd)
| 1 device - No NHS indicative price available - Drug Tariff (Part IXa)

VITALOGRAPH®
Range 50–800 litres/minute.

Vitalograph peak flow meter standard range (Vitalograph Ltd)
| 1 device - NHS indicative price = £4.50 - Drug Tariff (Part IXa)

HALERAIL®
Device to place over pressurised (aerosol) inhalers to aid when strength in hands is impaired (e.g., in arthritis). For use with Flixotide®, Serevent®, Seretide®, and Ventolin® inhalers.

PRESCRIBING AND DISPENSING INFORMATION
Not available for NHS prescription.

| 1 device - No NHS indicative price available - Drug Tariff (Part IXa)

Haleraid-200 (Allen & Hanburys Ltd)
| 1 device - No NHS indicative price available - Drug Tariff (Part IXa)

OPITCCHAMBER®
For use with all pressurised (aerosol) inhalers.

OptiChamber (Respironics (UK) Ltd)
| 1 device - NHS indicative price = £4.28 - Drug Tariff (Part IXa)

OPTICCHAMBER® DIAMOND
For use with all pressurised (aerosol) inhalers.

OptiChamber Diamond (Respironics (UK) Ltd)
| 1 device - NHS indicative price = £4.49 - Drug Tariff (Part IXa)

OptiChamber Diamond with large LiteTouch mask 5 years-adult (Respironics (UK) Ltd)
| 1 device - NHS indicative price = £7.49 - Drug Tariff (Part IXa)

OptiChamber Diamond with medium LiteTouch mask 1-5 years (Respironics (UK) Ltd)
| 1 device - NHS indicative price = £7.49 - Drug Tariff (Part IXa)

OptiChamber Diamond with small LiteTouch mask 0-18 months (Respironics (UK) Ltd)
| 1 device - NHS indicative price = £7.49 - Drug Tariff (Part IXa)

POCKET CHAMBER®
Small volume device. For use with all pressurised (aerosol) inhalers.

Pocket Chamber (nSpire Health Ltd)
| 1 device - NHS indicative price = £4.18 - Drug Tariff (Part IXa)

Pocket Chamber with adult mask (nSpire Health Ltd)
| 1 device - NHS indicative price = £9.75 - Drug Tariff (Part IXa)

Pocket Chamber with child mask (nSpire Health Ltd)
| 1 device - NHS indicative price = £9.75 - Drug Tariff (Part IXa)

Pocket Chamber with infant mask (nSpire Health Ltd)
| 1 device - NHS indicative price = £9.75 - Drug Tariff (Part IXa)

Pocket Chamber with teenager mask (nSpire Health Ltd)
| 1 device - NHS indicative price = £9.75 - Drug Tariff (Part IXa)

SPACE CHAMBER PLUS®
For use with all pressurised (aerosol) inhalers.

Space Chamber Plus (Medical Developments International Ltd)
| 1 device - NHS indicative price = £4.26 - Drug Tariff (Part IXa)

Space Chamber Plus with large mask (Medical Developments International Ltd)
| 1 device - NHS indicative price = £6.98 - Drug Tariff (Part IXa)

Space Chamber Plus with medium mask (Medical Developments International Ltd)
| 1 device - NHS indicative price = £6.98 - Drug Tariff (Part IXa)

VOLUMATIC®
Large-volume device. For use with Clenil Modolate®, Flixotide®, Seretide®, Serevent®, and Ventolin® inhalers.

Volumatic (GlaxoSmithKline UK Ltd)
| 1 device - NHS indicative price = £3.81 - Drug Tariff (Part IXa)

Volumatic with paediatric mask (GlaxoSmithKline UK Ltd)
| 1 device - NHS indicative price = £6.70 - Drug Tariff (Part IXa)

VORTEX®
Medium-volume device. For use with all pressurised (aerosol) inhalers.

Vortex Space (Pari Medical Ltd)
| 1 device - NHS indicative price = £6.28 - Drug Tariff (Part IXa)

Vortex with child mask 0-2 years (Pari Medical Ltd)
| 1 device - NHS indicative price = £7.99 - Drug Tariff (Part IXa)

Vortex with child mask 2 years+ (Pari Medical Ltd)
| 1 device - NHS indicative price = £7.99 - Drug Tariff (Part IXa)
2 Allergic conditions

Antihistamines, allergen immunotherapy and allergic emergencies

Antihistamines

Antihistamines (histamine H1-receptor antagonists) are classified as sedating or non-sedating, according to their relative potential for CNS depression. Antihistamines differ in their duration of action, incidence of drowsiness, and antimuscarinic effects; the response to an antihistamine may vary from child to child. Either a sedating or a non-sedating antihistamine may be used to treat an acute allergic reaction; for conditions with more persistent symptoms which require regular treatment, a non-sedating antihistamine should be used to minimise the risk of sedation and psychomotor impairment associated with sedating antihistamines.

Oral antihistamines are used in the treatment of nasal allergies, particularly seasonal allergic rhinitis (hay fever), and may be of some value in vasmotor rhinitis; rhinorrhoea and sneezing is reduced, but antihistamines are usually less effective for nasal congestion. Antihistamines are used topically to treat allergic reactions in the eye and in the nose. Topical application of antihistamines to the skin is not recommended.

An oral antihistamine may be used to prevent urticaria, and for the treatment of acute urticarial rashes, pruritus, insect bites, and stings. Antihistamines are also used in the management of nausea and vomiting, of migraine, and the adjunctive management of anaphylaxis and angioedema.

The non-sedating antihistamine cetirizine hydrochloride p. 164 is safe and effective in children. Other non-sedating antihistamines that are used include acrivastine p. 163, bilastine p. 164, desloratadine p. 165 (an active metabolite of loratadine p. 166), fexofenadine hydrochloride p. 165 (an active metabolite of terfenadine), levocetirizine hydrochloride p. 166 (an isomer of cetirizine hydrochloride), loratadine, and mizolastine p. 167. Most non-sedating antihistamines are long-acting (usually 12–24 hours). There is little evidence that desloratadine or levocetirizine hydrochloride confer any additional benefit—they should be reserved for children who cannot tolerate other therapies.

Sedating antihistamines are occasionally useful when insomnia is associated with urticaria and pruritus. Most of the sedating antihistamines are relatively short-acting, but promethazine may be effective for up to 12 hours.

Allimemazine tartrate p. 167 and promethazine have a more sedative effect than chlorphenamine maleate p. 168 and cyclizine p. 244. Chlorphenamine maleate is used as an adjunct to adrenaline/epinephrine p. 174 in the emergency treatment of anaphylaxis and angioedema.

Allergen immunotherapy

Immunotherapy using allergen vaccines containing house dust mite, animal dander (cat or dog), or extracts of grass and tree pollen can improve symptoms of asthma and allergic rhinoconjunctivitis in children. A vaccine containing extracts of wasp and bee venom is used to reduce the risk of severe anaphylaxis and systemic reactions in children with hypersensitivity to wasp and bee stings. An oral preparation of grass pollen extract (Grazax®) is also licensed for disease-modifying treatment of grass pollen-induced rhinitis and conjunctivitis. Children requiring immunotherapy must be referred to a hospital specialist for accurate diagnosis, assessment, and treatment.

Omalizumab p. 154 is a monoclonal antibody that binds to immunoglobulin E (IgE). It is licensed for use as additional therapy in children over 6 years with proven IgE-mediated sensitivity to inhaled allergens, whose severe persistent allergic asthma cannot be controlled adequately with high-dose inhaled corticosteroid together with a long-acting beta2-agonist. Omalizumab should be initiated by physicians experienced in the treatment of severe persistent asthma. Omalizumab is also indicated as add-on therapy for the treatment of chronic spontaneous urticaria in patients who have had an inadequate response to H1-antihistamine treatment.

Allergic emergencies

Anaphylaxis

Anaphylaxis is a severe, life-threatening, generalised or systemic hypersensitivity reaction. It is characterised by the rapid onset of respiratory and/or circulatory problems and is usually associated with skin and mucosal changes; prompt treatment is required. Children with pre-existing asthma, especially poorly controlled asthma, are at particular risk of life-threatening reactions. Insect stings are a recognised risk (in particular wasp and bee stings). Latex and certain foods, including eggs, fish, cows’ milk protein, peanuts, sesame, shellfish, soy, and tree nuts may also precipitate anaphylaxis. Medicinal products particularly associated with anaphylaxis include blood products, vaccines, allergen immunotherapy preparations, antibacterials, aspirin p. 83 and other NSAIDs, and neuromuscular blocking drugs. In the case of drugs, anaphylaxis is more likely after parenteral administration; resuscitation facilities must always be available for injections associated with special risk. Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergens.

Treatment of anaphylaxis

Adrenaline/epinephrine provides physiological reversal of the immediate symptoms associated with hypersensitivity reactions such as anaphylaxis and angioedema. First-line treatment includes:

- securing the airway, restoration of blood pressure (laying the child flat and raising the legs, or in the recovery position if unconscious or nauseous and at risk of vomiting);
- administering adrenaline/epinephrine by intramuscular injection; the dose should be repeated if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function;
- administering high-flow oxygen and intravenous fluids;
- administering an antihistamine, such as chlorphenamine maleate, by slow intravenous injection or intramuscular injection as adjunctive treatment given after adrenaline.
- Administering an intravenous corticosteroid such as hydrocortisone p. 411 (preferably as sodium succinate) is of secondary value in the initial management of anaphylaxis because the onset of action is delayed for several hours, but should be given to prevent further deterioration in severely affected children.

Continuing respiratory deterioration requires further treatment with bronchodilators including inhaled or intravenous salbutamol p. 146, inhaled ipratropium bromide p. 143, intravenous aminophylline p. 158, or intravenous magnesium sulfate p. 556 [unlicensed indication] (as for acute severe asthma); in addition to oxygen, assisted respiration and possibly emergency tracheotomy may be necessary.

When a child is so ill that there is doubt about the adequacy of the circulation, the initial injection of adrenaline/epinephrine may need to be given as a dilute solution by the intravenous route, or by the intraosseous route if venous access is difficult; for details see adrenaline/epinephrine.
On discharge, child should be considered for further treatment with an oral antihistamine and an oral corticosteroid for up to 3 days to reduce the risk of further reaction. The child, or carer, should be instructed to return to hospital if symptoms recur and to contact their general practitioner for follow-up.

Children who are suspected of having had an anaphylactic reaction should be referred to a specialist for specific allergy diagnosis. Avoidance of the allergen is the principal treatment; if appropriate, an adrenaline/epinephrine auto-injector should be given for self-administration or a replacement supplied.

**Intramuscular adrenaline (epinephrine)**

The intramuscular route is the first choice route for the administration of adrenaline/epinephrine p. 174) in the management of anaphylaxis. Adrenaline/epinephrine is best given as an intramuscular injection into the anterolateral aspect of the middle third of the thigh; it has a rapid onset of action after intramuscular administration and in the shocked patient its absorption from the intramuscular site is faster and more reliable than from the subcutaneous site.

Children with severe allergy, and their carers, should ideally be instructed in the self-administration of adrenaline/epinephrine by intramuscular injection (for details of self-administration).

Prompt injection of adrenaline/epinephrine is of paramount importance. The adrenaline/epinephrine doses recommended for the emergency treatment of anaphylaxis by appropriately trained healthcare professionals are based on the revised recommendations of the Working Group of the Resuscitation Council (UK).

---

**ANTIHISTAMINES > NON-SEDATING**

**Acrivastine**

- **INDICATIONS AND DOSE**
  Symptomatic relief of allergy such as hayfever, chronic idiopathic urticaria
  - By mouth
    - Child 12-17 years: 8 mg 3 times a day

- **CONTRA-INDICATIONS**
  Avoid in Acute porphyrias p. 562 (some antihistamines are thought to be safe)

- **CAUTIONS**
  Epilepsy

- **INTERACTIONS**
  → Appendix 1 (antihistamines).
  Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.

- **SIDE-EFFECTS**
  - Uncommon
    - Antimuscarinic effects - gastro-intestinal disturbances - headache - psychomotor impairment
  - Rare
    - Anaphylaxis - angioedema - arthralgias - blood disorders - bronchospasm - confusion - convulsions - depression - dizziness - extrapyramidal effects - hypersensitivity reactions - hypotension - liver dysfunction - palpitation - photosensitivity reactions - rashes - sleep disturbances - tremor

- **Frequency not known**
  - Blurred vision - drowsiness - dry mouth - urinary retention

**SIDE-EFFECTS, FURTHER INFORMATION**

Non-sedating antihistamines such as acrivastine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

If drowsiness occurs, it may diminish after a few days of treatment.

Children are more susceptible to side-effects.

- **ALLERGY AND CROSS-SENSITIVITY**
  Contra-indicated if history of hypersensitivity to triprolidine.

- **PREGNANCY**
  Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

- **BREAST FEEDING**
  Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **RENAL IMPAIRMENT**
  Avoid in severe impairment.

---

**Dose of intramuscular injection of adrenaline (epinephrine) for the emergency treatment of anaphylaxis by healthcare professionals**

<table>
<thead>
<tr>
<th>Age</th>
<th>Dose</th>
<th>Volume of adrenaline</th>
</tr>
</thead>
<tbody>
<tr>
<td>Child 1 month–5 years</td>
<td>150 micrograms</td>
<td>0.15 mL 1 in 1000 (1 mg/mL) adrenaline</td>
</tr>
<tr>
<td>Child 6–11 years</td>
<td>300 micrograms</td>
<td>0.3 mL 1 in 1000 (1 mg/mL) adrenaline</td>
</tr>
<tr>
<td>Child 12–17 years</td>
<td>500 micrograms</td>
<td>0.5 mL 1 in 1000 (1 mg/mL) adrenaline</td>
</tr>
</tbody>
</table>

These doses may be repeated several times if necessary at 5-minute intervals according to blood pressure, pulse and respiratory function.

1. Use suitable syringe for measuring small volume
2. 300 micrograms (0.3 mL) if child is small or prepubertal

**Intravenous adrenaline (epinephrine)**

Intravenous adrenaline/epinephrine should be given only by those experienced in its use, in a setting where patients can be carefully monitored.

Where the child is severely ill and there is real doubt about adequacy of the circulation and absorption from the intramuscular injection site, adrenaline/epinephrine may be given by slow intravenous injection, repeated according to response; if multiple doses are required consider giving adrenaline by slow intravenous infusion.

It is also important that, where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

Adrenaline/epinephrine is also given by the intravenous route for acute hypotension.

**Angioedema**

Angioedema is dangerous if laryngeal oedema is present. In this circumstance adrenaline/epinephrine injection, oxygen, antihistamines and corticosteroids should be given as described under Anaphylaxis. Tracheal intubation may be necessary. In some children with laryngeal oedema, adrenaline 1 in 1000 (1 mg/mL) solution may be given by nebuliser. However, nebulised adrenaline/epinephrine cannot be relied upon for a systemic effect—intramuscular adrenaline/epinephrine should be used.

**Hereditary angioedema**

The treatment of hereditary angioedema should be under specialist supervision. Unlike allergic angioedema, adrenaline/epinephrine, corticosteroids, and antihistamines should not be used for the treatment of acute attacks, including attacks involving laryngeal oedema, as they are ineffective and may delay appropriate treatment—intubation may be necessary. The administration of C1-esterase inhibitor p. 174 (in fresh frozen plasma or in partially purified form) can terminate acute attacks of hereditary angioedema; it can also be used for short-term prophylaxis before dental, medical, or surgical procedures. Tranexamic acid p. 76 is used for short-term or long-term prophylaxis of hereditary angioedema; short-term prophylaxis is started several days before planned procedures which may trigger an acute attack of hereditary angioedema (e.g. dental work) and continued for 2–5 days afterwards. Danazol [unlicensed indication] is best avoided in children because of its androgenic effects, but it can be used for short-term prophylaxis of hereditary angioedema.

---

**Allergic conditions 163**
Bilastine

- **INDICATIONS AND DOSE**
  Symptomatic relief of allergic rhinoconjunctivitis and urticaria
  - **BY MOUTH**
    - Child 12-17 years: 20 mg once daily

- **CONTRA-INDICATIONS**
  Avoid in Acute porphyrias p. 562 (some antihistamines are thought to be safe)

- **CAUTIONS**
  Epilepsy

- **INTERACTIONS → Appendix 1 (antihistamines).**
  Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - **Common or very common**
    - Headache · malaise
  - **Uncommon**
    - Abdominal pain · anxiety · diarrhoea · dizziness · dyspnoea · gastritis · increased appetite · insomnia · oral herpes · prolongation of the QT interval · pyrexia · thirst · tinnitus · vertigo · weight gain

  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Children are more susceptible to side-effects.
    - Non-sedating antihistamines such as bilastine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

- **PREGNANCY**
  Avoid—limited information available. Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

- **BREAST FEEDING**
  Avoid—no information available. Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **DIRECTIONS FOR ADMINISTRATION**
  Take tablet 1 hour before or 2 hours after food or fruit juice.

- **PATIENT AND CARER ADVICE**
  Patients or carers should be given advice on how to administer bilastine tablets.

- **Driving and skilled tasks**
  Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.
  No licensed medicines listed.

---

**Cetirizine hydrochloride**

- **INDICATIONS AND DOSE**
  Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria, atopic dermatitis
  - **BY MOUTH**
    - Child 1 year: 250 micrograms/kg twice daily
    - Child 2-5 years: 2.5 mg twice daily
    - Child 6-11 years: 5 mg twice daily
    - Child 12-17 years: 10 mg once daily

- **UNLICENSED USE**
  Not licensed for use in children under 2 years.

- **CONTRA-INDICATIONS**
  Avoid in Acute porphyrias p. 562 (some antihistamines are thought to be safe)

- **CAUTIONS**
  Epilepsy

- **INTERACTIONS → Appendix 1 (antihistamines).**
  Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.

- **SIDE-EFFECTS**
  - **Uncommon**
    - Antimuscarinic effects · blurred vision · dry mouth · gastro-intestinal disturbances · headache · psychomotor impairment · urinary retention
  - **Rare**
    - Anaphylaxis · angioedema · arrhythmias · blood disorders · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · liver dysfunction · malaise · palpitation · photosensitivity reactions · rash · sleep disturbances · tremor
  - **Frequency not known**
    - Drowsiness

- **SIDE-EFFECTS, FURTHER INFORMATION**
  Non-sedating antihistamines such as cetirizine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

  If drowsiness occurs, it may diminish after a few days of treatment.
  Children are more susceptible to side-effects.

- **PREGNANCY**
  Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

- **BREAST FEEDING**
  Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **RENAL IMPAIRMENT**
  Use half normal dose if estimated glomerular filtration rate 30–50 mL/minute/1.73 m². Use half normal dose and reduce dose frequency to alternate days if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

- **PATIENT AND CARER ADVICE**
  Driving and skilled tasks
  Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

- **Frequency not known** Drowsiness

**SIDE-EFFECTS, FURTHER INFORMATION**

Non-sedating antihistamines such as fexofenadine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

If drowsiness occurs, it may diminish after a few days of treatment.

Children are more susceptible to side-effects.
Levocetirizine hydrochloride

**INDICATIONS AND DOSE**
Symptomatic relief of allergy such as hay fever, urticaria
- **BY MOUTH**
  - Child 2-5 years: 1.25 mg twice daily
  - Child 6-17 years: 5 mg once daily

**PHARMACOKINETICS**
Levocetirizine is an isomer of cetirizine.

**UNLICENSED USE**
Tablets not licensed for use in children under 6 years.

**CONTRA-INDICATIONS**
Avoid in Acute porphyrias p. 562 (some antihistamines are thought to be safe)

**CAUTIONS**
Epilepsy

**INTERACTIONS** → Appendix 1 (antihistamines).
Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.

**SIDE-EFFECTS**
- **Uncommon** Antimuscarinic effects - blurred vision - dry mouth - gastro-intestinal disturbances - headache - psychomotor impairment - urinary retention
- **Rare** Anaphylaxis - angioedema - arrhythmias - blood disorders - bronchospasm - confusion - convulsions - depression - dizziness - extrapyramidal effects - hypersensitivity reactions - hypotension - liver dysfunction - palpitation - photosensitivity reactions - rash - sleep disturbances - tremor
- **Very rare** Weight gain
- **Frequency not known** Drowsiness

**SIDE-EFFECTS, FURTHER INFORMATION**
Non-sedating antihistamines such as levocetirizine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

If drowsiness occurs, it may diminish after a few days of treatment.

Children are more susceptible to side-effects.

---

Loratadine

**INDICATIONS AND DOSE**
Symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria
- **BY MOUTH**
  - Child 2-11 years (body-weight up to 31 kg): 5 mg once daily
  - Child 2-11 years (body-weight 31 kg and above): 10 mg once daily
  - Child 12-17 years: 10 mg once daily

**CAUTIONS**
Acute porphyrias p. 562 - epilepsy

**INTERACTIONS** → Appendix 1 (antihistamines).
Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.

Interactions do not generally apply to antihistamines used for topical action (including inhalation).

**SIDE-EFFECTS**
- **Uncommon** Antimuscarinic effects - blurred vision - dry mouth - gastro-intestinal disturbances - Headache - psychomotor impairment - urinary retention
- **Rare** Anaphylaxis - angioedema - arrhythmias - blood disorders - bronchospasm - confusion - convulsions - depression - dizziness - extrapyramidal effects - hypersensitivity reactions - hypotension - liver dysfunction - palpitation - photosensitivity reactions - rash - sleep disturbances - tremor
- **Very rare** Weight gain
- **Frequency not known** Drowsiness

**SIDE-EFFECTS, FURTHER INFORMATION**
Non-sedating antihistamines such as loratadine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent.

If drowsiness occurs, it may diminish after a few days of treatment.

Children are more susceptible to side-effects.
Mizolastine

**INDICATIONS AND DOSE**  
Symptomatic relief of allergy such as hay fever, urticaria  
▶ BY MOUTH  
▶ Child 12-17 years: 10 mg once daily

**CONTRA-INDICATIONS**  
Avoid in Acute porphyrias p. 562 (some antihistamines are thought to be safe) · cardiac disease · hypokalaemia · susceptibility to QT-interval prolongation

**CAUTIONS**  
Epilepsy

**INTERACTIONS**  
Appendix 1 (antihistamines). Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.

**SIDE-EFFECTS**  
▶ Common or very common  
Anxiety · asthenia · weight gain  
Uncommon  
Antimuscarinic effects · arthralgia · blurred vision · dry mouth · gastro-intestinal disturbances · headache · myalgia · psychomotor impairment · urinary retention  
Rare  
Anaphylaxis · angioedema · arrhythmias · blood disorders · bronchospasm · confusion · convulsions · depression · dizziness · extrapyramidal effects · hypersensitivity reactions · hypotension · liver dysfunction · palpitation · photosensitivity reactions · rashes · sleep disturbances · tremor  
Frequency not known  
Drowsiness

**SIDE-EFFECTS, FURTHER INFORMATION**  
Non-sedating antihistamines such as mizolastine cause less sedation and psychomotor impairment than the older antihistamines because they penetrate the blood brain barrier only to a slight extent. If drowsiness occurs, it may diminish after a few days of treatment. Children are more susceptible to side-effects.

**PREGNANCY**  
Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity.

**BREAST FEEDING**  
Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**HEPATIC IMPAIRMENT**  
Reduce dose frequency to alternate days in severe impairment.

**PATIENT AND CARER ADVICE**  
Driving and skilled tasks  
Although drowsiness is rare, nevertheless patients and their carers should be advised that it can occur and may affect performance of skilled tasks (e.g. cycling or driving); alcohol should be avoided.

**MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

▶ Loratadine (Non-proprietary)  
Loratadine 10 mg tablets | 14 tablet (SSL) no price available | 30 tablet (P) £ 8.20 DT price = £ 0.86
▶ Claritin (Loratadine) (Bayer Plc)  
Loratadine 10 mg Claritin Allergy 10mg tablets | 60 tablet (P) £ 8.85

**Oral solution**

EXCIPIENTS: May contain Propylene glycol  
▶ Loratadine (Non-proprietary)  
Loratadine 1 mg per 1 ml Loratadine 5mg/5ml oral solution | 100 ml (P) £ 4.85 DT price = £ 1.80 | 100 ml (POD) £ 2.63 DT price = £ 1.80 | 120 ml (P) £ 2.40-2.47 | 120 ml (POD) £ 2.40
▶ Claritin (Loratadine) (Bayer Plc)  
Loratadine 1 mg per 1 ml Claritin Allergy 5mg/5ml syrup | 70 ml (£ 2.43

**Oral lyophilisate**

▶ Claritin (Loratadine) (Bayer Plc)  
Loratadine 10 mg Claritin Rapid Allergy 10mg tablets sugar-free | 10 tablet (£ 5.55) £ 3.24
Chlorphenamine maleate
(Chlorpheniramine maleate)

**INDICATIONS AND DOSE**
Symptomatic relief of allergy such as hay fever, urticaria, food allergy, drug reactions | Relief of itch associated with chicken pox

- **BY MOUTH**
  - Child 1–23 months: 1 mg twice daily
  - Child 2–5 years: 1 mg every 4–6 hours; maximum 6 mg per day
  - Child 6–11 years: 2 mg every 4–6 hours; maximum 12 mg per day
  - Child 12–17 years: 4 mg every 4–6 hours; maximum 24 mg per day

- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
  - Child 1–5 months: 250 micrograms/kg (max. per dose 2.5 mg), repeated if necessary; maximum 4 doses per day
  - Child 6 months–5 years: 2.5 mg, repeated if necessary; maximum 4 doses per day
  - Child 6–11 years: 5 mg, repeated if necessary; maximum 4 doses per day
  - Child 12–17 years: 10 mg, repeated if necessary; maximum 4 doses per day

**Emergency treatment of anaphylactic reactions**
- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
  - Child 1–5 months: 250 micrograms/kg (max. per dose 2.5 mg), repeated if necessary; maximum 4 doses per day
  - Child 6 months–5 years: 2.5 mg, repeated if necessary; maximum 4 doses per day
  - Child 6–11 years: 5 mg, repeated if necessary; maximum 4 doses per day
  - Child 12–17 years: 10 mg, repeated if necessary; maximum 4 doses per day

**IMPORTANT SAFETY INFORMATION**
MHRA/CHM Advice (March 2008 and February 2009) Over-the-counter cough and cold medicines for children. Children under 6 years should not be given over-the-counter cough and cold medicines containing chlorphenamine.

**CONTRA-INDICATIONS** Many antihistamines should be avoided in Acute porphyrias p. 562 but chlorphenamine is thought to be safe - neonate (due to significant antimuscarinic activity)

**CAUTIONS** Epilepsy, pyloroduodenal obstruction - susceptibility to angle-closure glaucoma - urinary retention

**INTERACTIONS** Appendix 1 (antihistamines).

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- **Common or very common** Blurred vision - dry mouth - gastro-intestinal disturbances - headache - psychomotor impairment - urinary retention
- **Rare** Anaphylaxis - angioedema - arrhythmias - bronchospasm - confusion - convulsions - depression - dizziness - extrapyramidal effects - hypersensitivity reactions - hypotension - liver dysfunction - palpitation - photosensitivity reactions - sleep disturbances - tremor
- **Frequency not known** Antimuscarinic effects - blood disorders - exfoliative dermatitis - rashes - tinnitus
Hydroxyzine hydrochloride

22.2.2016

**DRUG ACTION** Hydroxyzine is a sedating antihistamine which exerts its actions by antagonising the effects of histamine.

**INDICATIONS AND DOSE**

- **Pruritus**
  - **By mouth**
    - Child 6 months–5 years: 5–15 mg daily in divided doses, dose adjusted according to weight; maximum 2 mg/kg per day.
    - Child 6–17 years (body-weight up to 40 kg): Initially 15–25 mg daily in divided doses, dose increased as necessary, adjusted according to weight; maximum 2 mg/kg per day.
    - Child 6–17 years (body-weight 40 kg and above): Initially 15–25 mg daily in divided doses, increased if necessary to 50–100 mg daily in divided doses, dose adjusted according to weight.

**UNLICENSED USE** *Ucerax®* preparations not licensed for use in children under 1 year.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE: RISK OF QT-INTERVAL PROLONGATION AND TORSADE DE POINTES (APRIL 2015)

Following concerns of heart rhythm abnormalities, the safety and efficacy of hydroxyzine has been reviewed by the European Medicines Agency. The review concludes that hydroxyzine is associated with a small risk of QT-interval prolongation and torsade de pointes; these events are most likely to occur in patients who have risk factors for QT prolongation, e.g. concomitant use of drugs that prolong the QT-interval, cardiovascular disease, family history of sudden cardiac death, significant electrolyte imbalance (low plasma-potassium or plasma-magnesium concentrations), or significant bradycardia.

To minimise the risk of such adverse effects, the following dose restrictions have been made and new cautions and contra-indications added:

- **Hydroxyzine is contra-indicated in patients with prolonged QT-interval or who have risk factors for QT-interval prolongation;**
- **Consider the risks of QT-interval prolongation and torsade de pointes before prescribing to patients taking drugs that lower heart rate or plasma-potassium concentration;**
- **In children with body-weight up to 40 kg, the maximum daily dose is 2 mg/kg;**
- **The lowest effective dose for the shortest period of time should be prescribed.**

**CONTRA-INDICATIONS** Acquired or congenital QT interval prolongation - avoid in Acute porphyrias p. 562 (some antihistamines are thought to be safe) - predisposition to QT interval prolongation

**CONTRA-INDICATIONS, FURTHER INFORMATION**

- **QT interval prolongation** Risk factors for QT interval prolongation include significant electrolyte imbalance, bradycardia, cardiovascular disease, and family history of sudden cardiac death.

**CAUTIONS** Bladder outflow obstruction - breathing problems - cardiovascular disease - children - decreased gastrointestinal motility - dementia - epilepsy -
Respiratory system

**MEDICINAL FORMS**

**EFFECT ON LABORATORY TESTS**

**RENAL IMPAIRMENT**

**HEPATIC IMPAIRMENT**

**BREAST FEEDING**

**PREGNANCY**

- Rare
- Uncommon
- Common or very common

**INTERACTIONS**

Appendix 1 (antihistamines).

**SIDE-EFFECTS**

Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

**ALLERGY AND CROSS-SENSITIVITY**

Manufacturers advise hydroxyzine should be avoided in patients with previous hypersensitivity to cetirizine or other piperazine derivatives, and aminophylline.

**PREGNANCY**

Manufacturers advise avoid—toxicity in animal studies with higher doses. Use in the latter part of the third trimester may cause irritability, paradoxical excitability, and tremor in the neonate.

**BREAST FEEDING**

Manufacturers advise avoid—expected to be present in milk but effect unknown.

**HEPATIC IMPAIRMENT**

Manufacturers advise reduce daily dose by one-third. Manufacturer advises avoid in severe liver disease—increased risk of coma.

**RENAL IMPAIRMENT**

Manufacturers advise reduce daily dose by half in moderate to severe renal impairment.

**EFFECT ON LABORATORY TESTS**

May interfere with methacholine test—manufacturer advises stop treatment 96 hours prior to test. May interfere with skin testing for allergy—manufacturer advises stop treatment one week prior to test.

**PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

Drowsiness may affect performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

**INDICATIONS AND DOSE**

**Allergic rhinitis**

- By mouth
- Child 3-17 years: 1 mg twice daily

**CONTRA-INDICATIONS**

Avoid in Acute porphyrias p. 562 (some antihistamines are thought to be safe)

**CAUTIONS**

Epilepsy · pyloroduodenal obstruction · susceptibility to angle-closure glaucoma · urinary retention

**INTERACTIONS**

Appendix 1 (antihistamines). Sedative antihistamine interactions apply to a lesser extent to the non-sedating antihistamines.

**SIDE-EFFECTS**

- Common or very common Irritability · nervousness
- Uncommon Cystitis
- Rare Weight gain
- Very rare Stevens-Johnson syndrome

**Frequency not known**

Anaphylaxis · angioedema · antimuscarinic effects · arhythmias · blood disorders · blurred vision · bronchospasm · confusion · convulsions · depression · dizziness · dry mouth · extrapyramidal effects · gastro-intestinal disturbances · headache · hypersensitivity reactions · hypotension · liver dysfunction · palpitation · photosensitivity reactions · psychomotor impairment · rashes · sleep disturbances · tremor · urinary retention

**SIDE-EFFECTS, FURTHER INFORMATION**

Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely, especially with high doses. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

**Pregnancy**

Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

**Breast Feeding**

Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**Hepatic Impairment**

Avoid in severe liver disease—increased risk of coma.

**Patient and Carer Advice**

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving or cycling); sedating effects enhanced by alcohol.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.
Promethazine hydrochloride

**INDICATIONS AND DOSE**
Symptomatic relief of allergy such as hay fever and urticaria | Insomnia associated with urticaria and pruritus

- **BY MOUTH**
  - Child 2-4 years: 5 mg twice daily, alternatively 5–15 mg once daily, dose to be taken at night
  - Child 5-9 years: 5–10 mg twice daily, alternatively 10–25 mg once daily, dose to be taken at night
  - Child 10-17 years: 10–20 mg 2–3 times a day, alternatively 25 mg once daily, dose to be taken at night, increased if necessary to 25 mg twice daily

**SIDE-EFFECTS, FURTHER INFORMATION**

Children are more susceptible to side-effects. Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely in children, especially with high doses. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

**SIDE-EFFECTS**
- **Unlicensed Use**
  - Not licensed for use for sedation in children under 2 years.

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM Advice (March 2008 and February 2009) Over-the-counter cough and cold medicines for children
- Children under 6 years should not be given over-the-counter cough and cold medicines containing promethazine.

**CONTRA-INDICATIONS**
Many antihistamines should be avoided in Acute porphyrias p. 562 but promethazine is thought to be safe: neonate (due to significant antimuscarinic activity), should not be given to children under 2 years, except on specialist advice, because the safety of such use has not been established

**CAUTIONS**
GENERAL CAUTIONS
- Epilepsy • pyloroduodenal obstruction • severe coronary artery disease • susceptibility to angle-closure glaucoma • urinary retention

**SPECIFIC CAUTIONS**
- With intravenous use Avoid extravasation with intravenous injection

**INTERACTIONS**
- Appendix 1 (antihistamines).

**SIDE-EFFECTS**
- Rare Anaphylaxis • angioedema • angle-closure glaucoma • arrhythmias • blood disorders • bronchospasm • confusion • convulsions • depression • dizziness • extrapyramidal effects • hypersensitivity reactions • hypotension • liver dysfunction • palpitation • photosensitivity reactions • rashes • sleep disturbances • tremor
- Frequency not known Antimuscarinic effects • blurred vision • drowsiness • dry mouth • gastro-intestinal disturbances • headache • psychomotor impairment • restlessness • urinary retention

**Sedation (short-term use)**

- **BY MOUTH**
  - Child 2-4 years: 15–20 mg
  - Child 5-9 years: 20–25 mg
  - Child 10-17 years: 25–50 mg

**Sedation in intensive care**

- **By mouth, or by slow intravenous injection, or by deep intramuscular injection**
  - Child 1 month-11 years: 0.5–1 mg/kg/4 times a day (max. per dose 25 mg), adjusted according to response
  - Child 12-17 years: 25–50 mg 4 times a day, adjusted according to response

**Nausea • Vomiting • Vertigo • Labyrinthine disorders • Motion sickness**

- **BY MOUTH**
  - Child 2-4 years: 5 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
  - Child 5-9 years: 10 mg, to be taken at bedtime on night before travel, repeat following morning if necessary
  - Child 10-17 years: 20–25 mg, to be taken at bedtime on night before travel, repeat following morning if necessary

**EXCEPTIONS TO LEGAL CATEGORY**
Prescription only medicine restriction does not apply to promethazine hydrochloride injection where administration is for saving life in emergency.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**
- Promethazine hydrochloride (Non-proprietary)
  - Promethazine hydrochloride 10 mg Promethazine hydrochloride 10 mg tablets | 56 tablet £3.30 DT price + £2.96
  - Phenergan (Sanofi)
  - Promethazine hydrochloride 10 mg Phenergan 10mg tablets | 56 tablet £2.96 DT price + £2.96

**Oral solution**
- Promethazine hydrochloride 25 mg Phenergan 25mg tablets | 56 tablet £4.65 DT price + £4.65

**EXCIPIENTS**
- May contain Sulphites
- May contain Sodium

**Solution for injection**
- Phenergan (Sanofi)
  - Promethazine hydrochloride 1 mg per 1 ml Phenergan 5mg/5ml elixir sugar-free | 100 ml £2.85 DT price + £2.85
- Promethazine hydrochloride 25 mg per 1 ml Phenergan 25mg/1ml solution for injection ampoules | 10 ampoule £6.74

**CONTRA-INDICATIONS**
Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

**BREAST FEEDING**
Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**HEPATIC IMPAIRMENT**
Avoid in severe liver disease—increased risk of coma.

**RENAL IMPAIRMENT**
Use with caution.

**PATIENT AND CARER ADVICE**
Driving and skilled tasks
- Drowsiness may affect the performance of skilled tasks (e.g. cycling or driving); sedating effects enhanced by alcohol.

**PROFESSION SPECIFIC INFORMATION**
Dental practitioners’ formulary
- Promethazine Hydrochloride Tablets 10 mg or 25 mg may be prescribed.
- Promethazine Hydrochloride Oral Solution (elixir) 5 mg/5 mL may be prescribed.

- LESS SUITABLE FOR PRESCRIBING Promethazine is less suitable for prescribing for sedation.

**IMPORTANT SAFETY INFORMATION**

**DESENSITISING VACCINES**

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:

- Seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
- Hypersensitivity to wasp and bee venoms.

**CONTRA-INDICATIONS**

Children under 5 years - consult product literature

**CAUTIONS**

Consult product literature

**INTERACTIONS**

Appendix 1 (bee venom extracts).

Contra-indicated in patients taking beta-blockers (adrenaline may be ineffective in case of a hypersensitivity reaction).

**SIDE-EFFECTS**

**SIDE-EFFECTS, FURTHER INFORMATION**

Consult product literature.

- Hypersensitivity reactions
  - Hypersensitivity reactions to immunotherapy (especially to wasp and bee venom extracts) can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore, cardiopulmonary resuscitation must be immediately available and patients need to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), even when mild, the patient should be observed until these have resolved completely.

**PREGNANCY**

Avoid.

**PRESCRIBING AND DISPENSING INFORMATION**

Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hypersensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

Hypersensitivity reactions to immunotherapy (especially to wasp and bee venom extracts) can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore, cardiopulmonary resuscitation must be immediately available and patients need to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), even when mild, the patient should be observed until these have resolved completely.

PREGNANCY

Avoid.

PRESCRIBING AND DISPENSING INFORMATION

Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hypersensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

IMPORTANT SAFETY INFORMATION

DESENSITISING VACCINES

In view of concerns about the safety of desensitising vaccines, it is recommended that they are used by specialists and only for the following indications:

- seasonal allergic hay fever (caused by pollen) that has not responded to anti-allergic drugs;
- hypersensitivity to wasp and bee venoms. Desensitising vaccines should generally be avoided or used with particular care in patients with asthma.

CONTRA-INDICATIONS

Children under 5 years - consult product literature

CAUTIONS

Consult product literature

INTERACTIONS

REFERENCES

Appendix (wasp venom extracts).

Contra-indicated in patients taking beta-blockers (adrenaline may be ineffective in case of a hypersensitivity reaction).

SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION

Consult product literature.

Hypersensitivity reactions

Hypersensitivity reactions to immunotherapy (especially to wasp and bee venom extracts) can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore, cardiopulmonary resuscitation must be immediately available and patients need to be monitored for at least 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), even when mild, the patient should be observed until these have resolved completely.

PREGNANCY

Avoid.

3 Conditions affecting sputum viscosity

Mucolytics for cystic fibrosis

Overview

Mucolytics, such as carbocisteine p. 175 are used to facilitate mucociliary clearance and expectoration by reducing sputum viscosity but evidence of efficacy is limited.

Dornase alfa p. 175 is used to reduce sputum viscosity in children with cystic fibrosis.

Nebulised hypertonic sodium chloride (3–7%) is used to mobilise lower respiratory tract secretions in mucus consolidation (e.g cystic fibrosis). Nebulised hypertonic sodium chloride solution (3%) is used for mild to moderate acute viral bronchiolitis in infants.

Mesna p. 515 (Mistabron®) is used in some children with cystic fibrosis when other mucolytics have failed to reduce sputum viscosity.

Acetylcysteine p. 797 has been used to treat meconium ileus in neonates and distal intestinal obstruction syndrome in children with cystic fibrosis, but evidence of efficacy is lacking. Gastrografin®, or a bowel cleansing preparation containing macrogols, is usually more effective. Acetylcysteine may be used as a mucolytic to prevent further obstruction.
**MUCOLYTICS**

### Carbocisteine

#### INDICATIONS AND DOSE

**Reduction of sputum viscosity**
- **BY MOUTH**
  - Child 2–4 years: 62.5–125 mg 4 times a day
  - Child 5–11 years: 250 mg 3 times a day
  - Child 12–17 years: Initially 2.25 g daily in divided doses, then reduced to 1.5 g daily in divided doses, as condition improves

### CONTRA-INDICATIONS
- Active peptic ulceration

### CAUTIONS
- History of peptic ulceration (may disrupt the gastric mucosal barrier)

### SIDE-EFFECTS
- Rare: Gastro-intestinal bleeding
- Frequency not known: Erythema multiforme, Stevens-Johnson syndrome

### PREGNANCY
- Manufacturer advises avoid in first trimester.

### BREAST FEEDING
- No information available.

### PRESCRIBING AND DISPENSING INFORMATION
- Flavours of oral liquid formulations may include cherry, raspberry, cinnamon, or rum.

### MEDICINAL FORMS
- There can be variation in the licensing of different medicines containing the same drug.

#### Capsule
- Carbocisteine (Non-proprietary)
  - Carbocisteine 375 mg: Carbocisteine 375mg capsules | 120 capsule [POD] £18.98 DT price = £11.50
- Mucodyne (Sanofi)
  - Carbocisteine 375 mg: Mucodyne 375mg capsules | 120 capsule [POD] £18.98 DT price = £11.50

#### Oral solution
- Carbocisteine (Non-proprietary)
  - Carbocisteine 75 mg per 1 ml: Carbocisteine 750mg/10ml oral solution 10ml sachets sugar free sugar-free | 15 sachet [POD] £3.85
  - Mucodyne (Sanofi)
  - Carbocisteine 50 mg per 1 ml: Mucodyne 250mg/5ml syrup | 300 ml [POD] £8.39 DT price = £8.39

### Ivacaftor

#### INDICATIONS AND DOSE
- Treatment of cystic fibrosis in patients who have a G551D mutation in the cystic fibrosis transmembrane conductance regulator (CFTR) gene (under expert supervision)
  - **BY MOUTH**
  - Child 6–17 years: 150 mg every 12 hours

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS
- Reduce dose to 150 mg twice a week with concomitant use of itraconazole, ketoconazole, posaconazole, voriconazole, telithromycin, and clarithromycin.
- Reduce dose to 150 mg once daily with concomitant use of fluconazole and erythromycin.

### CONTRA-INDICATIONS
- Organ transplantation (no information available)

### INTERACTIONS
- Avoid grapefruit and Seville oranges.

### SIDE-EFFECTS
- Abdominal pain, diarrhoea, dizziness, ear discomfort, headache, nasal congestion, nasopharyngitis, oropharyngeal pain, pharyngeal oedema, rash, rhinitis, tinnitus, upper respiratory-tract infection
- Gynaecomastia, vestibular disorder

### PREGNANCY
- Manufacturer advises use only if potential benefit outweighs risk—no information available.

### BREAST FEEDING
- Manufacturer advises use only if potential benefit outweighs risk—no information available.

### HEPATIC IMPAIRMENT
- Max. 150 mg once daily in moderate impairment; in severe impairment, manufacturer recommends use only if potential benefit outweighs risk—starting dose 150 mg on alternate days, dosing interval adjusted according to clinical response and tolerability.

### RENAL IMPAIRMENT
- Caution in severe impairment.

### PRE-TREATMENT SCREENING
- If the patient’s genotype is unknown, a validated genotyping method should be performed to confirm the presence of the G551D mutation in at least one allele of the CFTR gene before starting treatment.

---

### 3.1 Cystic fibrosis

#### MUCOLYTICS

### Dornase alfa

*(Phosphorylated glycosylated recombinant human deoxyribonuclease 1 (rhDNase))*

#### DRUG ACTION
- Dornase alfa is a genetically engineered version of a naturally occurring human enzyme which cleaves extracellular deoxyribonucleic acid (DNA).

#### INDICATIONS AND DOSE
- Management of cystic fibrosis patients with a forced vital capacity (FVC) of greater than 40% of predicted to improve pulmonary function
  - **BY INHALATION OF NEBULISED SOLUTION**
  - Child 6–17 years: 2500 units once daily, administered by jet nebuliser

#### DOSE EQUIVALENCE AND CONVERSION
- Dornase alfa 1000 units is equivalent to 1 mg

#### SIDE-EFFECTS
- Rare: Chest pain, conjunctivitis, dyspepsia, dysphonia, dysphoea, laryngitis, pharyngitis, pyrexia, rash, rhinitis, urticaria
Respiratory system

MONITORING REQUIREMENTS  Test liver function before treatment, every 3 months during the first year of treatment, then annually thereafter.

DIRECTIONS FOR ADMINISTRATION  Tablets should be taken with fat-containing food.

PRESCRIBING AND DISPENSING INFORMATION  Ivcacofor should be prescribed by a physician experienced in the treatment of cystic fibrosis.

PATIENT AND CARER ADVICE  Patients or carers should be given advice on how to administer ivacaftor tablets.

MEDICINAL FORMS  There can be variation in the licensing of different medicines containing the same drug.

## 4  Cough and congestion

**Aromatic inhalations, cough preparations and systemic nasal decongestants**

### Aromatic inhalations

Inhalations containing volatile substances such as eucalyptus oil are traditionally used to relieve congestion and ease breathing. Although the vapour may contain little of the additive it encourages deliberate inspiration of warm moist air which is often comforting. Boiling water should not be used owing to the risk of scalding.

Strong aromatic decongestants (applied as rubs or to pillows) are not recommended for infants under the age of 3 months. Sodium chloride 0.9% solution given as nasal drops can be used to liquefy mucus secretions and relieve nasal congestion in infants and young children; administration before feeds may ease feeding difficulties caused by nasal congestion.

### Cough preparations

#### Cough suppressants

Cough may be a symptom of an underlying disorder such as asthma, gastro-oesophageal reflux disease, or rhinitis, which should be addressed before prescribing cough suppressants. Cough may be associated with smoking or environmental pollutants. Cough can also result from bronchiectasis including that associated with cystic fibrosis; cough can also have a significant habit component. There is little evidence of any significant benefit from the use of cough suppressants in children with acute cough in ambulatory settings. Cough suppressants may cause pruritus retention and this can be harmful in children with bronchiectasis.

The use of cough suppressants containing pholcodine below or similar opioid analgesics is not generally recommended in children and should be avoided in children under 6 years; the use of over-the-counter cough suppressants containing codeine phosphate p. 259 should be avoided in children under 12 years and in children of any age known to be CYP2D6 ultra-rapid metabolisers.

**Sedating antihistamines** are used as the cough suppressant component of many compound cough preparations on sale to the public; all tend to cause drowsiness which may reflect their main mode of action.

**Demulcent and expectorant cough preparations**

**Simple linctus** and other demulcent cough preparations containing soothing substances, such as syrup or glycerol, may temporarily relieve a dry irritating cough. These preparations have the advantage of being harmless and inexpensive and sugar-free versions are available.

**Expectorants** are claimed to promote expulsion of bronchial secretions, but there is no evidence that any drug can specifically facilitate expectoration.

**Compound cough preparations** for children are on sale to the public but should not be used in children under 6 years; the rationale for some is dubious. Care should be taken to give the correct dose and to not use more than one preparation at a time.

**MHRA/CHM advice (March 2008 and February 2009)**

Children under 6 years should not be given over-the-counter cough and cold medicines containing the following ingredients:

- brompheniramine, chlorphenamine maleate p. 168, diphenhydramine, doxylamine, promethazine, or tripolidine (antihistamines);
- dextromethorphan or pholcodine (cough suppressants);
- guaifenesin or ipecacuanha (expectorants);

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to five days or less. Children should not be given more than one cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

**Systemic nasal decongestants**

Nasal congestion in children due to allergic or vasomotor rhinitis should be treated with oral antihistamines, topical nasal preparations containing corticosteroids, or topical decongestants.

There is little evidence to support the use of systemic decongestants in children. Pseudoephedrine hydrochloride has few sympathomimetic effects, and is commonly combined with other ingredients (including antihistamines) in preparations intended for the relief of cough and cold symptoms.

**COUGH AND COLD PREPARATIONS > COUGH SUPPRESSANTS**

### Pholcodine

#### INDICATIONS AND DOSE

**Dry cough**

- **BY MOUTH USING LINCTUS**
- **Child 6–11 years:** 2–5 mg 3–4 times a day
- **Child 12–17 years:** 5–10 mg 3–4 times a day

**IMPORTANT SAFETY INFORMATION**

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN

Children under 6 years should not be given over-the-counter cough and cold medicines containing pholcodine (cough suppressant).

Over-the-counter cough and cold medicines can be considered for children aged 6–12 years after basic principles of best care have been tried, but treatment should be restricted to 5 days or less. Children should...
not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

- CONTRA-INDICATIONS Bronchiectasis · bronchiolitis · chronic bronchitis · patients at risk of respiratory failure
- CAUTIONS Asthma · chronic cough · persistent cough · productive cough
- INTERACTIONS → Appendix 1 (pholcodine).
- SIDE-EFFECTS Confusion · constipation · dizziness · drowsiness · excitement · nausea · rash · sputum retention · vomiting
- PREGNANCY Manufacturer advises avoid unless benefit outweighs risk.
- BREAST FEEDING Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- HEPATIC IMPAIRMENT Avoid in hepatic impairment.
- RENAL IMPAIRMENT Use with caution in renal impairment. Avoid in severe renal impairment.
- PRESCRIBING AND DISPENSING INFORMATION Pholcodine is not generally recommended for children.

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**
- Pholcodine sodium 0.625 mg per 5 ml · Simple linctus paediatric sugar-free · 2000 ml free
- Simple linctus paediatric · 200 ml £1.01 DT price = £1.01
- Simple linctus monohydrate 25 mg per 5 ml · Simple linctus sugar-free · 2000 ml £0.89 sugar-free
- 2000 ml £8.40

### MENTHOL AND DERIVATIVES

#### Eucalyptus with menthol

**INDICATIONS AND DOSE**
- Aromatic inhalation for relief of nasal congestion
  - **BY INHALATION**
  - Child: Add one teaspoonful to a pint of hot, not boiling, water and inhale the vapour

**PRESCRIBING AND DISPENSING INFORMATION**

When prepared extemporaneously, the BP states Menthol and Eucalyptus Inhalation, BP 1980 consists of racementhol or levomenthol 2 g, eucalyptus oil 10 ml, light magnesium carbonate 7 g, water to 100 ml.

Not recommended (applied as a rub or to pillows) for infants under the age of 3 months.

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary Menthol and Eucalyptus Inhalation BP, 1980 may be prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Inhalation vapour**
- Eucalyptus with menthol (Non-proprietary)
  - Eucalyptus oil 100 microlitre per 1 ml, Menthol 20 mg per 1 ml, Magnesium carbonate light 70 mg per 1 ml
  - Menthol and Eucalyptus inhalation · 100 ml £1.34-1.36 DT price = £1.35

### RESINS

#### Benzoïn tincture

(Friars’ Balsam)

**INDICATIONS AND DOSE**
- Aromatic inhalation for relief of nasal congestion
  - **BY INHALATION**
  - Child: Add 5 ml to a pint of hot, not boiling, water and inhale the vapour; repeat after 4 hours if necessary

**SIDE-EFFECTS** Allergic contact dermatitis

**PRESCRIBING AND DISPENSING INFORMATION**

Not recommended (applied as a rub or to pillows) for infants under 3 months.

When prepared extemporaneously, the BP states Benzoïn Tincture, Compound, BP consists of balsamic acids approx. 4.5%.
Respiratory system

Respiratory depression, respiratory distress syndrome and apnoea

Respiratory stimulants

Respiratory stimulants (anaesthetic drugs), such as caffeine citrate p. 179, reduce the frequency of neonatal apnoea, and the need for mechanical ventilation during the first 7 days of treatment. They are typically used in the management of very preterm neonates, and continued until a corrected gestational age of 34 to 35 weeks is reached (or longer if necessary). They should only be given under expert supervision in hospital; it is important to rule out any underlying disorder, such as seizures, hypoglycaemia, or infection, causing respiratory exhaustion before starting treatment with a respiratory stimulant.

Pulmonary surfactants

Pulmonary surfactants derived from animal lungs, beractant below and poractant alfa below are used to prevent and treat respiratory distress syndrome (hyaline membrane disease) in neonates and preterm neonates. Prophylactic use of a pulmonary surfactant may reduce the need for mechanical ventilation and is more effective than ‘rescue treatment’ in preterm neonates of 29 weeks or less corrected gestational age. Pulmonary surfactants may also be of benefit in neonates with meconium aspiration syndrome or intrapartum streptococcal infection. Pulmonary immaturity with surfactant deficit is the commonest reason for respiratory failure in the neonate, especially in those of less than 30 weeks corrected gestational age. Betamethasone p. 409 given to the mother (at least 12 hours but preferably 48 hours) before delivery substantially enhances pulmonary maturity in the neonate.

PULMONARY SURFACTANTS

Beractant

Treatment of respiratory distress syndrome in preterm neonates, birth-weight over 700 g (specialist use only)

- Preterm neonate: 100 mg/kg, preferably administer within 8 hours of birth; dose may be repeated within 48 hours at intervals of at least 6 hours for up to 4 doses.

Prophylaxis of respiratory distress syndrome in preterm neonates (specialist use only)

- Neonate up to 32 weeks corrected gestational age: 100 mg/kg, preferably administer within 15 minutes of birth; dose may be repeated within 48 hours at intervals of at least 6 hours for up to 4 doses.

Poractant alfa

Treatment of respiratory distress syndrome in neonates, birth weight over 700 g (specialist use only)

- Neonate: 100–200 mg/kg, then 100 mg/kg every 12 hours if required, maximum 300–400 mg/kg per course.

Prophylaxis of respiratory distress syndrome (specialist use only)

- Neonate 24 weeks to 31 weeks corrected gestational age: 100–200 mg/kg, administer soon after birth, preferably within 15 minutes, then 100 mg/kg after 6–12 hours if required, then 100 mg/kg after 12 hours if required, and if neonate still intubated. Max 300–400 mg/kg per course.

Cautions

Consult product literature

Side-effects

- Rare: Bradycardia, decreased oxygen saturation, pulmonary haemorrhage
- Frequency not known: Hyperoxia, intracranial haemorrhage, obstruction of the endotracheal tube by mucus secretions

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Liquid

- Survanta (AbbVie Ltd) Phospholipids (as Beractant) 25 mg per 1 ml Survanta 200mg/8ml endotracheopulmonary suspension bottles | 1 bottle £306.43

Dose equivalence and conversion

Phospholipid 100 mg/kg is equivalent to a volume of 4 mL/kg.

Cautions

Consult product literature

Side-effects

- Rare: Bradycardia, decreased oxygen saturation, hypotension, pulmonary haemorrhage
- Frequency not known: Hyperoxia, intracranial haemorrhage, obstruction of the endotracheal tube by mucus secretions

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

Liquid

- Curosurf (Chiesi Ltd) Phospholipids (as Poractant alfa) 80 mg per 1 ml Curosurf 240mg/3ml endotracheopulmonary suspension vials | 1 vial £202.78

Notes:
5.1 Neonatal apnoea

XANTHINES

Caffeine citrate

24.2.2016

- **INDICATIONS AND DOSE**
  - Neonatal apnoea (specialist supervision in hospital)
    - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
      - **Neonate:** Initially 20 mg/kg, administered over 30 minutes if given by intravenous infusion, then 5 mg/kg once daily, administered over 10 minutes if given by intravenous infusion, started 24 hours after initial dose; increased if necessary to 10 mg/kg daily.

DOSE EQUIVALENCE AND CONVERSION
Caffeine citrate 2 mg = caffeine base 1 mg

PHARMACOKINETICS
Caffeine citrate is well absorbed when given orally.

- **UNLICENSED USE** Caffeine citrate loading doses in the BNF for children may differ to those in product literature.

IMPORTANT SAFETY INFORMATION
MHRA/CHM ADVICE: SAFE PRACTICE
From August 2013, all licensed preparations of caffeine are required to be labelled as caffeine citrate. To minimise the risk of dosing errors, **always state dose in terms of caffeine citrate when prescribing caffeine**. Some stock packaged as caffeine base.

- **CAUTIONS** Cardiovascular disease, gastro-oesophageal reflux, rhythm disorder, seizure disorders
- **INTERACTIONS** Appendix 1 (caffeine citrate).
- **SIDE-EFFECTS**
  - **Common or very common** Fluid and electrolyte imbalance, hyperglycaemia, hypertension, hypoglycaemia, irritability, restlessness, tachycardia
  - **Frequency not known** Gastro-oesophageal reflux
- **HEPATIC IMPAIRMENT** Manufacturer advises caution with impaired hepatic function.
- **RENAL IMPAIRMENT** Reduced daily maintenance dose required—consult product literature. Manufacturer advises caution with impaired renal function—potential for accumulation of caffeine.
- **MONITORING REQUIREMENTS**
  - The therapeutic range for plasma-caffeine concentration is usually 10–20 mg/litre (50–100 micromol/litre), but a concentration of 25–35 mg/litre (130–180 micromol/litre) may be required. Signs of toxicity only normally occur at concentrations greater than 50 mg/litre (260 micromol/litre).
  - Monitor for recurrence of apnoea for 1 week after stopping treatment.
- **DIRECTIONS FOR ADMINISTRATION** Caffeine citrate injection may be administered by mouth or by intravenous infusion.

NATIONAL FUNDING/ACCESS DECISIONS
Scottish Medicines Consortium (SMC) Decisions
The Scottish Medicines Consortium has advised (September 2013) that Peyona® is accepted for use within NHS Scotland for the treatment of primary apnoea of premature newborns only whilst Peyona® is available at the price agreed in the patient access scheme.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution
    - **Oral solution**
      - Caffeine citrate (Non-proprietary)
        - Caffeine citrate 10 mg per 1 ml: Caffeine citrate 50 mg/5 ml oral solution | 5 ml (£24.41)
      - **Solution for injection**
        - Caffeine citrate (Non-proprietary)
          - Caffeine citrate 10 mg per 1 ml: Caffeine citrate 10 mg/1 ml solution for injection ampoules | 10 ampoule (£48.82)
      - **Solution for infusion**
        - Peyona (Chiesi Ltd)
          - Peyona 20 mg/ml solution for infusion ampoules | 10 ampoule (Hospital only) £172.50

1 Epilepsy and other seizure disorders

Epilepsy

Control of the epilepsies

The object of treatment is to prevent the occurrence of seizures by maintaining an effective dose of one or more antiepileptic drugs. Careful adjustment of doses is necessary, starting with low doses and increasing gradually until seizures are controlled or there are significant adverse effects.

When choosing an antiepileptic drug, the presenting epilepsy syndrome should first be considered. If the syndrome is not clear, the seizure type should determine the choice of treatment. Concomitant medication, co-morbidity, age, and sex should also be taken into account.

The frequency of administration is often determined by the plasma-drug half-life, and should be kept as low as possible to encourage better adherence. Most antiepileptics, when used in usual dosage, can be given twice daily.

Lamotrigine p. 189, perampanel p. 193, phenobarbital p. 203 and phenytoin p. 193, which have long half-lives, can be given as a daily dose at bedtime. However, with large doses, some antiepileptics may need to be given three times daily to avoid adverse effects associated with high peak plasma-drug concentrations. Young children metabolise some antiepileptics more rapidly than adults and therefore may require more frequent doses and a higher amount per kilogram body-weight.

Management

When monotherapy with a first-line antiepileptic drug has failed, monotherapy with a second drug should be tried; the diagnosis should be checked before starting an alternative drug if the first drug showed lack of efficacy. The change from one antiepileptic drug to another should be cautious, slowly withdrawing the first drug only when the new regimen has been established. Combination therapy with two or more antiepileptic drugs may be necessary, but the concurrent use of antiepileptic drugs increases the risk of adverse effects and drug interactions. If combination therapy does not bring about worthwhile benefits, revert to the regimen (monotherapy or combination therapy) that provided the best balance between tolerability and efficacy. A single antiepileptic drug should be prescribed wherever possible and will achieve seizure control for the majority of children.

MHRA/CHM advice: Antiepileptic drugs: new advice on switching between different manufacturers’ products for a particular drug (November 2013)

The CHM has reviewed spontaneous adverse reactions received by the MHRA and publications that reported potential harm arising from switching of antiepileptic drugs in patients previously stabilised on a branded product to a generic. The CHM concluded that reports of loss of seizure control and/or worsening of side-effects around the time of switching between products could be explained as chance associations, but that a causal role of switching could not be ruled out in all cases. The following guidance has been issued to help minimise risk:

• Different antiepileptic drugs vary considerably in their characteristics, which influences the risk of whether switching between different manufacturers’ products of a particular drug may cause adverse effects or loss of seizure control;
• Antiepileptic drugs have been divided into three risk-based categories to help healthcare professionals decide whether it is necessary to maintain continuity of supply of a specific manufacturer’s product. These categories are listed below;
• If it is felt desirable for a patient to be maintained on a specific manufacturer’s product this should be prescribed either by specifying a brand name, or by using the generic drug name and name of the manufacturer (otherwise known as the Marketing Authorisation Holder);
• This advice relates only to antiepileptic drug use for treatment of epilepsy; it does not apply to their use in other indications (e.g. mood stabilisation, neuropathic pain);
• Please report on a Yellow Card any suspected adverse reactions to antiepileptic drugs;
• Dispensing pharmacists should ensure the continuity of supply of a particular product when the prescription specifies it. If the prescribed product is unavailable, it may be necessary to dispense a product from a different manufacturer to maintain continuity of treatment of that antiepileptic drug. Such cases should be discussed and agreed with both the prescriber and patient (or carer);
• Usual dispensing practice can be followed when a specific product is not stated.
Epilepsy and other seizure disorders 181

Category 1
Phenytin, carbamazepine p. 184, phenobarbital, primidone p. 204. For these drugs, doctors are advised to ensure that their patient is maintained on a specific manufacturer’s product.

Category 2
Valproate, lamotrigine, perampanel, retigabine, rufinamide, clobazam p. 205, clobazepam p. 206, oxcarbazepine p. 192, eslicarbazepine acetate, zonisamide p. 202, topiramate p. 199. For these drugs, the need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient and/or carer taking into account factors such as seizure frequency and treatment history.

Category 3
Levetiracetam p. 191, lamotrigine p. 188, tiagabine p. 199, gabapentin p. 187, pregabalin, ethosuximide p. 186, vigabatrin p. 201. For these drugs, it is usually unnecessary to ensure that patients are maintained on a specific manufacturer’s product unless there are specific concerns such as patient anxiety, and risk of confusion or dosing errors.

Interactions
Interactions between antiepileptics are complex and may increase toxicity without a corresponding increase in antiepileptic effect. Interactions are usually caused by hepatic enzyme induction or inhibition; displacement from protein binding sites is not usually a problem. These interactions are highly variable and unpredictable.

Withdrawal
Antiepileptic drugs should be withdrawn under specialist supervision. Avoid abrupt withdrawal, particularly of barbiturates and benzodiazepines, because this can precipitate severe rebound seizures. Reduction in dosage should be gradual and, in the case of barbiturates, withdrawal of the drug may take months.

The decision to withdraw antiepileptic drugs from a seizure-free child, and its timing, is often difficult and depends on individual circumstances. Even in children who have been seizure-free for several years, there is a significant risk of seizure recurrence on drug withdrawal.

Drugs should be gradually withdrawn over at least 2–3 months by reducing the daily dose by 10–25% at intervals of 1–2 weeks. Benzodiazepines may need to be withdrawn over 6 months or longer.

In children receiving several antiepileptic drugs, only one drug should be withdrawn at a time.

Monitoring
Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma-drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected non-compliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should not be undertaken unless clinically indicated.

Plasma concentration of some medications may change during pregnancy and monitoring may be required (see under Pregnancy).

Driving
Older children with epilepsy may drive a motor vehicle (but not a large goods or passenger carrying vehicle) provided that they have been seizure-free for one year or, if subject to attacks only while asleep, have established a 3-year period of asleep attacks without awake attacks. Those affected by drowsiness should not drive or operate machinery.

Guidance issued by the Drivers Medical Unit of the Driver and Vehicle Licensing Agency (DVLA) recommends that patients should be advised not to drive during medication changes or withdrawal of antiepileptic drugs, and for 6 months afterwards.

Patients who have had a first or single epileptic seizure must not drive for 6 months (5 years in the case of large goods or passenger carrying vehicles) after the event; driving may then be resumed, provided the patient has been assessed by a specialist as fit to drive because no abnormality was detected on investigation.

Pregnancy
Young women of child-bearing potential should discuss with a specialist the impact of both epilepsy, and its treatment, on the outcome of pregnancy.

There is an increased risk of teratogenicity associated with the use of antiepileptic drugs (especially if used during the first trimester and particularly if the patient takes two or more antiepileptic drugs). Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term developmental disorders. There is also an increased risk of teratogenicity with phenytoin, primidone, phenobarbital, lamotrigine, and carbamazepine. Topiramate carries an increased risk of cleft palate if taken in the first trimester of pregnancy. There is not enough evidence to establish the risk of teratogenicity with other antiepileptic drugs.

Prescribers should also consider carefully the choice of antiepileptic therapy in pre-pubescent girls who may later become pregnant. Young women of child-bearing potential who take antiepileptic drugs should be given advice about the need for an effective contraception method to avoid unplanned pregnancy. Some antiepileptic drugs can reduce the efficacy of hormonal contraceptives, and the efficacy of some antiepileptics may be affected by hormonal contraceptives.

Young women who want to become pregnant should be referred to a specialist for advice in advance of conception. For some women, the severity of seizure or the seizure type may not pose a serious threat, and drug withdrawal may be considered; therapy may be resumed after the first trimester. If treatment with antiepileptic drugs must continue throughout pregnancy, then monotherapy is preferable at the lowest effective dose.

Once an unplanned pregnancy is discovered it is usually too late for changes to be made to the treatment regimen; the risk of harm to the mother and fetus from convulsive seizures outweighs the risk of continued therapy. The likelihood of a woman who is taking antiepileptic drugs having a baby with no malformations is at least 90%, and it is important that women do not stop taking essential treatment because of concern over harm to the fetus. To reduce the risk of neural tube defects, folic acid supplementation is advised before conception and throughout the first trimester. In the case of sodium valproate p. 155 and valproic acid p. 200 an urgent...
consultation is required to reconsider the benefits and risks of valproate therapy.

The concentration of antiepileptic drugs in the plasma can change during pregnancy. Doses of phenytoin, carbazepine, and lamotrigine should be adjusted on the basis of plasma-drug concentration monitoring; the dose of other antiepileptic drugs should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. Plasma-drug concentration monitoring during pregnancy is also useful to check compliance.

Additionally, in patients taking topiramate or levetiracetam, it is recommended that fetal growth should be monitored. Withdrawal effects in the newborn may occur with some antiepileptic drugs, in particular benzodiazepines and phenobarbital, and can take several days to diminish.

**Epilepsy and Pregnancy Register**
All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify the UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

**Breast-feeding**
Young women taking antiepileptic monotherapy should generally be encouraged to breast-feed; if a woman is on combination therapy or if there are other risk factors, such as premature birth, specialist advice should be sought.

All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones. Infants should also be monitored for adverse effects associated with the antiepileptic drug particularly with drugs that induce and inhibit enzymes. Withdrawal effects in the newborn may occur; if the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status epilepticus should be treated according to the standard protocol.

Routine injection of vitamin K at birth minimises the risk of neonatal haemorrhage associated with antiepileptics.

Withdrawal effects in the newborn may occur in infants if a mother stops breast-feeding in the second half of pregnancy. This drug exposure, its effect on the breast-fed infant, and the need for complementary feeding should be considered if these are unsuitable, ineffective or not tolerated. Sodium valproate should be used as the first choice if there is a high risk of generalised tonic-clonic seizures. A combination of any two of these drugs may be used if monotherapy is ineffective. Second-line therapy includes clonazepam, lamotrigine, and zonisamide which should be prescribed under the supervision of a tertiary specialist.

**Myoclonic seizures**
Myoclonic seizures (myoclonic jerks) occur in a variety of syndromes, and response to treatment varies considerably. Sodium valproate is the drug of choice (except in female patients, see Valproate below); consider levetiracetam or topiramate if sodium valproate is unsuitable (but consider the less favourable side-effect profile of topiramate). A combination of two of these drugs may be used if monotherapy is ineffective or poorly tolerated. Second-line therapy includes clonazepam, lamotrigine, and vigabatrin which should be prescribed under the supervision of a tertiary specialist. Carbamazepine, gabapentin, oxcarbazepine, phenytoin, pregabalin, tiagabine, and vigabatrin are not recommended in absence seizures or syndromes.

**Tonic and atonic seizures**
Tonic or atonic seizures can be treated with sodium valproate (except in female patients, see Valproate below); lamotrigine can be considered as adjunctive treatment if sodium valproate is ineffective or not tolerated. If adjunctive treatment fails, a tertiary specialist should be consulted who may consider rufinamide p. 195 or topiramate.

Carbamazepine, gabapentin, oxcarbazepine, phenytoin, pregabalin, tiagabine, and vigabatrin are not recommended in tonic or atonic seizures.

**Epilepsy syndromes**

**Infantile spasms**
Vigabatrin is the drug of choice for infantile spasms associated with tuberous sclerosis. Corticosteroids, such as prednisolone p. 413 or tetracosactide p. 441, are second-line options if vigabatrin is ineffective. In spasms of other causes, vigabatrin, prednisolone or tetracosactide can be considered as first-line options. A tertiary specialist should be consulted before treating infantile spasms.

**Dravet syndrome**
Sodium valproate (except in female patients, see Valproate below) or topiramate is the treatment of choice in Dravet syndrome. Clonazepam or stiripentol p. 198 may be considered as adjunctive treatment. Carbamazepine, gabapentin, lamotrigine, oxcarbazepine, phenytoin, pregabalin, tiagabine, and vigabatrin should not be used as they may exacerbate myoclonic seizures. A tertiary specialist should be involved in decisions regarding treatment of Dravet syndrome.

**Lennox-Gastaut syndrome**
Sodium valproate is the first-line drug for treating Lennox-Gastaut syndrome (except in female patients, see Valproate below); lamotrigine can be used as adjunctive treatment if
sodium valproate is ineffective or not tolerated. Rufinamide and topiramate may be considered by tertiary epilepsy specialists. Carbamazepine, gabapentin, oxcarbazepine, pregabalin, tiagabine, and vigabatrin should not be used. Felbamate [unlicensed] may be used in tertiary specialist centres when all other treatment options have failed.

**Landau-Kleffner syndrome**

Always discuss with or refer to tertiary epilepsy specialists.

**Neonatal seizures**

Seizures can occur before delivery, but they are most common up to 24 hours after birth. Seizures in neonates occur as a result of biochemical disturbances, inborn errors of metabolism, hypoxic ischaemic encephalopathy, drug withdrawal, meningitis, stroke, cerebral haemorrhage or malformation, or severe jaundice (kernicterus).

Seizures caused by biochemical imbalance and those in neonates with inherited abnormal pyridoxine or biotin metabolism should be corrected by treating the underlying cause. Seizures caused by drug withdrawal following intrauterine exposure are treated with a drug withdrawal regimen.

Phenobarbital can be used to manage neonatal seizures where there is a risk of recurrence; phenytoin is an alternative. Midazolam p. 210 and rectal paraldehyde p. 208 may also be useful in the management of acute neonatal seizures. Lidocaine hydrochloride p. 70 may be used if other treatments are unsuccessful; lidocaine hydrochloride should not be given to neonates who have received phenytoin infusion because of the risk of cardiac toxicity.

**Antiepileptic drugs**

### Carbamazepine and related antiepileptics

Carbamazepine is a drug of choice for simple and complex focal seizures and is a first-line treatment option for generalised tonic-clonic seizures. It can be used as adjunctive treatment for focal seizures when monotherapy has been ineffective. It is essential to initiate carbamazepine therapy at a low dose and build this up slowly in small increments every 3–7 days. Carbamazepine may exacerbate tonic, atonic, myoclonic and absence seizures and is therefore not recommended if these seizures are present.

Oxcarbazepine is not recommended in tonic, atonic, absence or myoclonic seizures due to the risk of seizure exacerbation.

### Ethosuximide

Ethosuximide is a first-line treatment option for absence seizures, and may be used as adjunctive treatment when monotherapy has failed.

### Gabapentin

Gabapentin is used as adjunctive therapy for the treatment of focal seizures with or without secondary generalisation; it is licensed as monotherapy in children over 12 years. It is not recommended if tonic, atonic, absence or myoclonic seizures are present.

### Lamotrigine

Lamotrigine is an antiepileptic drug recommended as a first-line treatment for focal seizures and primary and secondary generalised tonic-clonic seizures. It is also licensed as monotherapy for typical absence seizures in children (but efficacy may not be maintained in all children). It may be tried as an adjunctive treatment for atonic and tonic seizures if first-line treatment has failed [unlicensed]. Myoclonic seizures may be exacerbated by lamotrigine and it can cause serious rashes; dose recommendations should be adhered to closely.

Lamotrigine is used either as sole treatment or as an adjunct to treatment with other antiepileptic drugs. Valproate increases plasma-lamotrigine concentration, whereas the enzyme-inducing antiepileptics reduce it; care is therefore required in choosing the appropriate initial dose and subsequent titration. When the potential for interaction is not known, treatment should be initiated with lower doses, such as those used with valproate.

### Levetiracetam

Levetiracetam p. 191 is used for monotherapy and adjunctive treatment of focal seizures with or without secondary generalisation, and for adjunctive treatment of myoclonic seizures in children with juvenile myoclonic epilepsy and primary generalised tonic-clonic seizures. Levetiracetam may be prescribed alone and in combination for the treatment of myoclonic seizures, and under specialist supervision for absence seizures [both unlicensed].

### Phenobarbital and primidone

Phenobarbital p. 203 is effective for tonic-clonic, focal seizures and neonatal seizures but may cause behavioural disturbances and hyperkinesia. It may be tried for atypical absence, atonic, and tonic seizures. For therapeutic purposes phenobarbital and phenobarbital sodium should be considered equivalent in effect. Rebound seizures may be a problem on withdrawal.

Primidone p. 204 is largely converted to phenobarbital and this is probably responsible for its antiepileptic action. It is used rarely in children. A low initial dose of primidone is essential.

### Phenytoin

Phenytoin p. 193 is licensed for tonic-clonic and focal seizures but may exacerbate absence or myoclonic seizures and should be avoided if these seizures are present. It has a narrow therapeutic index and the relationship between dose and plasma-drug concentration is non-linear; small dosage increases in some patients may produce large increases in plasma concentration with acute toxic side-effects. Similarly, a few missed doses or a small change in drug absorption may result in a marked change in plasma-drug concentration. Monitoring of plasma-drug concentration improves dosage adjustment.

When only parenteral administration is possible, fosphenytoin sodium p. 187, a pro-drug of phenytoin, may be convenient to give. Whereas phenytoin should be given intravenously only, fosphenytoin sodium may also be given by intramuscular injection.

### Rufinamide

Rufinamide p. 195 is licensed for the adjunctive treatment of seizures in Lennox-Gastaut syndrome. It may be considered by a tertiary specialist for the treatment of refractory tonic or atonic seizures [unlicensed].

### Topiramate

Topiramate p. 199 can be given alone or as adjunctive treatment in generalised tonic-clonic seizures or focal seizures. It can also be used for absence, tonic and atonic seizures under specialist supervision and as an option in myoclonic seizures [all unlicensed]. Topiramate is also licensed for prophylaxis of migraine.

### Valproate

Valproate (as either sodium valproate p. 195 or valproic acid p. 200) is effective in controlling tonic-clonic seizures, particularly in primary generalised epilepsy. It is a drug of choice in primary generalised tonic-clonic seizures, focal seizures, generalised absences and myoclonic seizures, and can be tried in atypical absence seizures. It is recommended as a first-line option in atonic and tonic seizures. Valproate should generally be avoided in children under 2 years especially with other antiepileptics, but it may be required in infants with continuing epileptic tendency. Sodium valproate has widespread metabolic effects, and monitoring of liver function tests and full blood count is essential. Valproate should not be used in female children, in females of childbearing potential, and pregnant females, unless alternative treatments are ineffective or not tolerated, because of its high teratogenic potential; the benefits and
risks of valproate therapy should be carefully reconsidered at regular treatment reviews, see Important safety information in the sodium valproate and valproic acid drug monographs. Plasma-valproate concentrations are not a useful index of efficacy, therefore routine monitoring is unhelpful.

Zonisamide
Zonisamide p. 202 can be used as an adjunctive treatment for refractory focal seizures with or without secondary generalisation in children and adolescents aged 6 years and above. It can also be used under the supervision of a specialist for refractory absence and myoclonic seizures [unlicensed indications].

Benzodiazepines
Clobazam p. 205 may be used as adjunctive therapy in the treatment of generalised tonic-clonic and refractory focal seizures. It may be prescribed under the care of a specialist for refractory absence and myoclonic seizures. Clonazepam p. 206 may be prescribed by a specialist for refractory absence and myoclonic seizures, but its sedative side-effects may be prominent.

Other drugs
Acetazolamide p. 638, a carbonic anhydrase inhibitor, has a specific role in treating epilepsy associated with menstruation. Piracetam is used as adjunctive treatment for cortical myoclonus.

Status epilepticus
Convulsive status epilepticus
Immediate measures to manage status epilepticus include positioning the child to avoid injury, supporting respiration including the provision of oxygen, maintaining blood pressure, and the correction of any hypoglycaemia. Pyrithione hydrochloride p. 585 should be administered if the status epilepticus is caused by pyrithione deficiency.

Seizures lasting 5 minutes should be treated urgently with buccal midazolam p. 210 or intravenous lorazepam p. 209 (repeated once after 10 minutes if seizures recur or fail to respond). Intravenous diazepam p. 207 is effective but it carries a high risk of venous thromboembolism (reduced by using an emulsion formulation of diazepam injection). Patients should be monitored for respiratory depression and hypotension.

Important
If, after initial treatment with benzodiazepines, seizures recur or fail to respond 25 minutes after onset, phenytoin sodium should be used, or if the child is on regular phenytoin, give phenobarbital sodium intravenously over 5 minutes; the paediatric intensive care unit should be contacted. Paraldehyde p. 208 can be given after starting phenytoin infusion.

If these measures fail to control seizures 45 minutes after onset, anaesthesia with thiopental sodium p. 209 should be instituted with full intensive care support.

Phenytoin sodium can be given by intravenous infusion over 20 minutes, followed by the maintenance dosage if appropriate.

Paraldehyde given rectally causes little respiratory depression and is therefore useful where facilities for resuscitation are poor.

Non-convulsive status epilepticus
The urgency to treat non-convulsive status epilepticus depends on the severity of the child’s condition. If there is incomplete loss of awareness, oral antiepileptic therapy should be continued or restarted. Children who fail to respond to oral antiepileptic therapy or have complete lack of awareness can be treated in the same way as for convulsive status epilepticus, although anaesthesia is rarely needed.

Febrile convulsions
Brief febrile convulsions need no specific treatment; antipyretic medication (e.g. paracetamol p. 254), is commonly used to reduce fever and prevent further convulsions but evidence to support this practice is lacking. Prolonged febrile convulsions (those lasting 5 minutes or longer), or recurrent febrile convulsions without recovery must be treated actively (as for convulsive status epilepticus). Long-term anticonvulsant prophylaxis for febrile convulsions is rarely indicated.

ANTIEPILEPTICS

Carbamazepine

- INDICATIONS AND DOSE

Trigeminal neuralgia
- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Child 1 month–11 years: Initially 5 mg/kg once daily, dose to be taken at night, alternatively initially 2.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 5 mg/kg 2–3 times a day, increased if necessary up to 20 mg/kg daily
  - Child 12–17 years: Initially 100–200 mg 1–2 times a day, then increased to 200–400 mg 2–3 times a day, increased if necessary up to 1.8 g daily, dose should be increased slowly

Prophylaxis of bipolar disorder
- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Child 1 month–11 years: Initially 5 mg/kg once daily, dose to be taken at night, alternatively initially 2.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 5 mg/kg 2–3 times a day, increased if necessary up to 20 mg/kg daily
  - Child 12–17 years: Initially 100–200 mg 1–2 times a day, then increased to 200–400 mg 2–3 times a day, increased if necessary up to 1.8 g daily, dose should be increased slowly

Focal and generalised tonic-clonic seizures
- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Child 1 month–11 years: Initially 5 mg/kg once daily, dose to be taken at night, alternatively initially 2.5 mg/kg twice daily, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 5 mg/kg 2–3 times a day, increased if necessary up to 20 mg/kg daily
  - Child 12–17 years: Initially 100–200 mg 1–2 times a day, then increased to 200–400 mg 2–3 times a day, increased if necessary up to 1.8 g daily, dose should be increased slowly
  - BY RECTUM
    - Child: Up to 250 mg up to 4 times a day, to be used for short-term use (max. 7 days) when oral therapy temporarily not possible, use approx. 25% more than the oral dose

DOSE EQUIVALENCE AND CONVERSION
Suppositories of 125 mg may be considered to be approximately equivalent in therapeutic effect to tablets of 100 mg but final adjustment should always depend on clinical response (plasma concentration monitoring recommended).

CABBAGEN® SR

Trigeminal neuralgia
- BY MOUTH
  - Child 5–11 years: Initially 5 mg/kg daily in 1–2 divided doses, then increased in steps of 2.5–5 mg/kg every
3–7 days as required; maintenance 10–15 mg/kg daily in 1–2 divided doses, increased if necessary up to 20 mg/kg daily in 1–2 divided doses

- Child 12–17 years: Initially 100–400 mg daily in 1–2 divided doses, then increased to 400–1200 mg daily in 1–2 divided doses, increased if necessary up to 1.8 g daily in 1–2 divided doses, dose should be increased slowly

**Focal and generalised tonic-clonic seizures | Prophylaxis of bipolar disorder**

- **BY MOUTH**

  - Child 5–11 years: Initially 5 mg/kg daily in 1–2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required, dose should be increased slowly; maintenance 10–15 mg/kg daily in 1–2 divided doses, increased if necessary up to 20 mg/kg daily in 1–2 divided doses

  - Child 12–17 years: Initially 100–400 mg daily in 1–2 divided doses, increased if necessary up to 1.8 g daily in 1–2 divided doses, dose should be increased slowly

**Focal and generalised tonic-clonic seizures | Prophylaxis of bipolar disorder**

- **PROLONGED RELEASE**

  - **BY MOUTH**

    - Child 5–11 years: Initially 5 mg/kg daily in 2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 10–15 mg/kg daily in 2 divided doses, increased if necessary up to 20 mg/kg daily in 2 divided doses

    - Child 12–17 years: Initially 100–400 mg daily in 2 divided doses, dose should be increased slowly; maintenance 400–1200 mg daily in 2 divided doses, increased if necessary up to 1.8 g daily in 2 divided doses

**Trigeminal neuralgia**

- **BY MOUTH**

  - Child 5–11 years: Initially 5 mg/kg daily in 2 divided doses, then increased in steps of 2.5–5 mg/kg every 3–7 days as required; maintenance 10–15 mg/kg daily in 2 divided doses, increased if necessary up to 20 mg/kg daily in 2 divided doses

  - Child 12–17 years: Initially 100–400 mg daily in 2 divided doses, dose should be increased slowly; maintenance 400–1200 mg daily in 2 divided doses, increased if necessary up to 1.8 g daily in 2 divided doses, dose should be increased slowly

- **CONTRA-INDICATIONS** Acute porphyrias p. 562 - AV conduction abnormalities (unless paced), history of bone-marrow depression

- **CAUTIONS** Cardiac disease - history of haematological reactions to other drugs - may exacerbate absence and myoclonic seizures - skin reactions - susceptibility to angle-closure glaucoma

**CAUTIONS, FURTHER INFORMATION**

Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

- Blood, hepatic, or skin disorders Carbamazepine should be withdrawn immediately in cases of aggravated liver dysfunction or acute liver disease. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).

- **INTERAKTIONS** Appendix 1 (carbamazepine).

- **SIDE-EFFECTS**

  - **Common or very common** Allergic skin reactions - aplastic anaemia - ataxia - blood disorders - blurring of vision - dermatitis - dizziness - drowsiness - dry mouth - eosinophilia - fatigue - haemolytic anaemia - headache - hypotension (leading in rare cases to water intoxication) - leucopenia - nausea - oedema - thrombocytopenia - unsteadiness - urticaria - vomiting

  - **Uncommon** Constipation - diaphoresis - involuntary movements (including myasthenia) - visual disturbances

  - **Frequency not known** Suicidal ideation

  - **SIDE-EFFECTS, FURTHER INFORMATION** Some side-effects (such as headache, ataxia, drowsiness, nausea, vomiting, blurring of vision, dizziness, unsteadiness, and allergic skin reactions) are dose-related, and may be dose-limiting. These side-effects are more common at the start of treatment. Children should be offered a modified-release preparation to reduce the risk of side-effects; altering the timing of medication may also be beneficial.

  - **Overdose** For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 786.

  - **ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with carbamazepine. See under Epilepsy p. 180 for more information. Caution—cross-sensitivity reported with oxcarbazepine and with phenytoin.

  - **PREGNANCY**

    - **Monitoring** Doses should be adjusted on the basis of plasma-drug concentration monitoring.

    - **BREAST FEEDING** Amount probably too small to be harmful.

    - **Monitor infant for possible adverse reactions.**

    - **HEPATIC IMPAIRMENT** Metabolism impaired in advanced liver disease.

    - **RENAL IMPAIRMENT** Use with caution.

    - **PRE-TREATMENT SCREENING** Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele).

    - **MONITORING REQUIREMENTS**

      - Plasma concentration for optimum response 4–12 mg/litre (20–50 micromol/litre) measured after 1–2 weeks.

      - Manufacturer recommends blood counts and hepatic and renal function tests (but evidence of practical value uncertain).

    - **TREATMENT CESSATION** When stopping treatment with carbamazepine for bipolar disorder, reduce the dose gradually over a period of at least 4 weeks.
**186 Epilepsy and other seizure disorders**

**Nervous system**

**PROFESSION SPECIFIC INFORMATION**

**PATIENT AND CARER ADVICE**

Switching between formulations. Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product.

**PRESCRIBING AND DISPENSING INFORMATION**

Manufacturer preparations may vary in bioavailability. Patients being prescribed Carbamazepine Tablets may be prescribed.

**INTERACTIONS**

Blood, hepatic, or skin disorders. Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop.

**PROFESSIONAL INFORMATION**

Dental practitioners’ formulary. Carbamazepine Tablets may be prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order BNFC.

**Ethosuximide**

**INDICATIONS AND DOSE**

Absence seizures ▶ Myoclonic seizures

**CAUTIONARY AND ADVISORY LABELS**

**SIDE-EFFECTS**

**INTERACTIONS** → Appendix 1 (ethosuximide).

**SIDE-EFFECTS, FURTHER INFORMATION**

**CAUTIONS** Avoid in Acute porphyrias p. 562.

**RECOMMENDED DOSAGE**

- **Ethosuximide**
  - **Oral suspension**
    - Carbamazepine 20 mg per 1 ml
    - Carbamazepine 100 mg/5 ml

**BNFC 2016–2017**

- **Tegretol** (Novartis Pharmaceuticals UK Ltd)
  - Carbamazepine 20 mg per 1 ml: Tegretol 100 mg/5 ml
  - Carbamazepine 200 mg per 1 ml: Tegretol 200 mg/5 ml

**Suppository**

- **Carbamazepine 250 mg**
  - Carbamazepine 500 mg
  - Carbamazepine 750 mg

**CAUTIONARY AND ADVISORY LABELS 3, 8**

**Tegretol Retard** (Novartis Pharmaceuticals UK Ltd)

- Carbamazepine 125 mg
  - Carbamazepine 250 mg

**Oral suspension**

- Carbamazepine 20 mg per 1 ml: Carbamazepine 100 mg/5 ml

**Tegretol® PROLONGED RELEASE** Tegretol® Prolonged Release tablets can be halved but should not be chewed.
Fosphenytoin sodium

**DRUG ACTION** Fosphenytoin is a pro-drug of phenytoin.

**INDICATIONS AND DOSE**

**Status epilepticus**
- **BY INTRAVENOUS INFUSION**
  - Child ≤ 5 years: Initially 20 mg(PE)/kg, dose to be administered at a rate of 2–3 mg(PE)/kg/minute, maximum 150 mg(PE)/minute, then 4–5 mg(PE)/kg daily in 1–4 divided doses, dose to be administered at a rate of 1–2 mg(PE)/kg/minute, maximum 100 mg (PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration

**Prophylaxis or treatment of seizures associated with neurosurgery or head injury**
- **BY INTRAVENOUS INFUSION**
  - Child ≤ 5 years: Initially 10–15 mg(PE)/kg, then 4–5 mg(PE)/kg daily in 1–4 divided doses, dose to be administered at a rate of 1–2 mg(PE)/kg/minute, maximum 100 mg(PE)/minute, dose to be adjusted according to response and trough plasma-phenytoin concentration

**Temporary substitution for oral phenytoin**
- **BY INTRAVENOUS INFUSION**
  - Child ≤ 5 years: Same dose and same dosing frequency as oral phenytoin therapy, intravenous infusion to be administered at a rate of 1–2 mg(PE)/kg/minute, maximum 100 mg(PE)/minute

**DOSE EQUIVALENCE AND CONVERSION**

Doses are expressed as phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg = phenytoin sodium 1 mg.

**UNLICENSED USE** Fosphenytoin sodium doses in BNFC may differ from those in product literature.

**CONTRA-INDICATIONS** Acute porphyrias p. 562. second-degree heart block - sino-atrial block - sinus bradycardia - Stokes- Adams syndrome - third-degree heart block

**CAUTIONS** Heart failure - hypotension - injection solutions alkaline (irritant to tissues) - respiratory depression - resuscitation facilities must be available

**INTERACTIONS** → Appendix 1 (phenytoin).

**SIDE-EFFECTS**
- **Common or very common** Alterations in respiratory function - arrhythmias - asthenia - cardiovascular collapse - cardiovascular depression (particularly if injection too rapid) - chills - CNS depression (particularly if injection too rapid) - dry mouth - dysarthria - e cachexia - euphoria - hypotension - incoordination - pruritus - respiratory arrest - taste disturbance - tinnitus - vasodilatation - visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Cardiovascular reactions** Intravenous infusion of fosphenytoin has been associated with severe cardiovascular reactions including asystole, ventricular fibrillation, and cardiac arrest. Hypotension, bradycardia, and heart block have also been reported. The following are recommended:
  - monitor heart rate, blood pressure, and respiratory function for duration of infusion;
  - observe patient for at least 30 minutes after infusion;
  - if hypotension occurs, reduce infusion rate or discontinue;
  - reduce dose or infusion in renal or hepatic impairment.

**ALLERGY AND CROSS-SENSITIVITY** Cross-sensitivity reported with carbamazepine.

**PREGNANCY** Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult - monitor unbound fraction. The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING** Small amounts present in milk, but not known to be harmful.

**HEPATIC IMPAIRMENT** Consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus).

**RENAL IMPAIRMENT** Consider 10–25% reduction in dose or infusion rate (except initial dose for status epilepticus).

**PRE-TREATMENT SCREENING** HLA-B*1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).

**MONITORING REQUIREMENTS**
- Manufacturer recommends blood counts (but evidence of practical value uncertain).
- With intravenous use Monitor heart rate, blood pressure, ECG, and respiratory function for during infusion.

**DIRECTIONS FOR ADMINISTRATION** For intermittent intravenous infusion (Pro-Epanutin®), give in Glucose 5% or Sodium chloride 0.9%; dilute to a concentration of 1.5–25 mg (phenytoin sodium equivalent (PE))/ml.

**PRESCRIBING AND DISPENSING INFORMATION**

Prescriptions for fosphenytoin sodium should state the dose in terms of phenytoin sodium equivalent (PE); fosphenytoin sodium 1.5 mg = phenytoin sodium 1 mg.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- **ELECTROLYTES:** May contain Phosphate
- **Pro-Epanutin (Pfizer Ltd)**
  - Fosphenytoin sodium 75 mg per 1 ml Pro-Epanutin 750mg/10ml concentrate for solution for injection vials | 10 vial | £400.00 (hospital only)

**Gabapentin**

**INDICATIONS AND DOSE**

Adjunctive treatment of focal seizures with or without secondary generalisation

- **BY MOUTH**
  - Child 2–5 years: 10 mg/kg once daily on day 1, then 10 mg/kg twice daily on day 2, then 10 mg/kg 3 times a day on day 3, then increased to 30–70 mg/kg daily in 3 divided doses, adjusted according to continued →
response, some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate
  - Child 6–11 years: 10 mg/kg once daily (max. per dose 300 mg) on day 1, then 10 mg/kg twice daily (max. per dose 300 mg) on day 2, then 10 mg/kg 3 times a day (max. per dose 300 mg) on day 3; usual dose 25–35 mg/kg daily in 3 divided doses, some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate, daily dose maximum to be given in 3 divided doses; maximum 70 mg/kg per day
  - Child 12–17 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate

**Monotherapy for focal seizures with or without secondary generalisation**

- **BY MOUTH**
  - Child 12–17 years: Initially 300 mg once daily on day 1, then 300 mg twice daily on day 2, then 300 mg 3 times a day on day 3, alternatively initially 300 mg 3 times a day on day 1, then increased in steps of 300 mg every 2–3 days in 3 divided doses, adjusted according to response; usual dose 0.9–3.6 g daily in 3 divided doses (max. per dose 1.6 g 3 times a day), some children may not tolerate daily increments; longer intervals (up to weekly) may be more appropriate

**UNLICENSED USE** Not licensed for use in children under 6 years. Not licensed at doses over 50 mg/kg daily in children under 12 years.

**IMPORTANT SAFETY INFORMATION**

The levels of propylene glycol, acesulfame K and saccharin sodium may exceed the recommended WHO daily intake limits if high doses of gabapentin oral solution (Rosenmont brand) are given to adolescents or adults with low body-weight (39–50 kg)—consult product literature.

**CAUTIONS** Diabetes mellitus - high doses of oral solution in adolescents and adults with low body-weight - history of psychotic illness - mixed seizures (including absences)

**INTERACTIONS** → Appendix 1 (gabapentin).

**SIDE-EFFECTS**

- Uncommon Palpitations

**PREGNANCY**

- Monitoring
  - The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING** Present in milk—manufacturer advises use only if potential benefit outweighs risk.

**RENAL IMPAIRMENT** Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m²; consult product literature.

**EFFECT ON LABORATORY TESTS** False positive readings with some urinary protein tests.

**DIRECTIONS FOR ADMINISTRATION** Capsules can be opened but the bitter taste is difficult to mask.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Gabapentin for preventing seizures www.medicinesforchildren.org.uk/gabapentin-for-preventing-seizures

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, tablet.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS** 3, 5, 8
- **Gabapentin (Non-proprietary)**
  - Gabapentin 600 mg Gabapentin 600mg tablets | 100 tablet P(39) £106.00 DT price = £7.62
  - Gabapentin 800 mg Gabapentin 800mg tablets | 100 tablet P(39) £98.13 DT price = £25.93
  - Gabapentin 800 mg Neurontin 800mg tablets | 100 tablet P(39) £84.80 DT price = £7.62
  - Gabapentin 100 mg Neurontin 800mg tablets | 100 tablet P(39) £98.13 DT price = £25.93

**Capsule**

- **CAUTIONARY AND ADVISORY LABELS** 3, 5, 8
- **Gabapentin (Non-proprietary)**
  - Gabapentin 100 mg Gabapentin 100mg capsules | 100 capsule P(39) £22.00 DT price = £2.12
  - Gabapentin 300 mg Gabapentin 300mg capsules | 100 capsule P(39) £42.40 DT price = £3.47
  - Gabapentin 400 mg Gabapentin 400mg capsules | 100 capsule P(39) £40.60 DT price = £3.62
  - Gabapentin 100 mg Neurontin 100mg capsules | 100 capsule P(39) £18.29 DT price = £2.12
  - Gabapentin 300 mg Neurontin 300mg capsules | 100 capsule P(39) £42.40 DT price = £3.47
  - Gabapentin 400 mg Neurontin 400mg capsules | 100 capsule P(39) £49.06 DT price = £3.62

**Oral solution**

- **CAUTIONARY AND ADVISORY LABELS** 3, 5, 8
- **EXCIPIENTS:** May contain Propylene glycol
- **ELECTROLYTES:** May contain Potassium, sodium
- **Gabapentin (Non-proprietary)**
  - Gabapentin 50 mg per 1 ml Neurontin 250mg/5ml oral solution | 470 ml P(39) no price available
  - Gabapentin 50mg/ml oral solution sugar free sugar-free | 150 ml P(39) £63.00 DT price = £63.00

**Lacosamide**

- **INDICATIONS AND DOSE**
  - Adjunctive treatment of focal seizures with or without secondary generalisation
  - **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Child 16–17 years: Initially 50 mg twice daily, infusion to be administered over 15–60 minutes (for up to 5 days), then increased, if tolerated, in steps of 50 mg twice daily, adjusted according to response, dose to be increased in weekly increments; maintenance 100 mg twice daily (max. per dose 200 mg twice daily)
Adjunctive treatment of focal seizures with or without secondary generalisation (alternative loading dose regimen when it is necessary to rapidly attain therapeutic plasma concentrations) (under close medical supervision)

- **BY MOUTH**
- **BY INTRAVENOUS INFUSION**

Child 16–17 years: Loading dose 200 mg, infusion to be administered over 15–60 minutes (for up to 5 days), followed by maintenance 100 mg twice daily, to be given 12 hours after initial dose, then increased, if tolerated, in steps of 50 mg twice daily (max. per dose 200 mg twice daily), adjusted according to response, dose to be increased in weekly intervals

**Contra-indications** Second- or third-degree AV block

**Caution**

Conduction problems - risk of PR-interval prolongation - severe cardiac disease

**Interactions** → Appendix 1 (lacosamide).

Caution with concomitant use of drugs that prolong PR interval.

**Side-effects**

- Common or very common: Abnormal gait - blurred vision - cognitive disorder - constipation - depression - dizziness - drowsiness - fatigue - flatulence - headache - impaired coordination - nausea - nightmares - pruritus - tremor - vomiting

- Rare: Multi-organ hypersensitivity reaction

**Allergy and cross-sensitivity** Antiepileptic hypersensitivity syndrome associated with lacosamide. See under Epilepsy p. 180 for more information.

**Pregnancy**

Monitoring

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**Breastfeeding**

Manufacturer advises avoid—present in milk in animal studies.

**Hepatic impairment**

Titrates with caution in mild to moderate impairment if co-existing renal impairment. Caution in severe impairment — no information available.

**Renal impairment**

Loading dose regimen can be considered in mild to moderate impairment — titrate above 200 mg with caution. Titrate with caution in severe impairment, max. 250 mg daily.

Consult product literature for loading dose if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².

**Directions for administration**

- With intravenous use → For intravenous infusion, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9%.

**Prescribing and dispensing information**

Flavours of syrup may include strawberry.

**Patient and carer advice**

Medicines for Children leaflet: Lacosamide for preventing seizures www.medicinesforchildren.org.uk/lacosamide-for-preventing-seizures

**National funding/access decisions**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (January 2009) that lacosamide (Vimpat) is accepted for restricted use within NHS Scotland as adjunctive treatment for focal seizures with or without secondary generalisation in patients from 16 years. It is restricted for specialist use in refractory epilepsy.
repeated if restarting after interval of more than 5 days; maximum 200 mg per day
  • Child 12-17 years: Initially 25 mg once daily on alternate days for 14 days, then 25 mg once daily for further 14 days, then increased in steps of up to 75 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

Adjuvtive therapy of focal seizures (with enzyme inducing drugs) without valproate | Adjutivte therapy of primary and secondary generalised tonic-clonic seizures (with enzyme inducing drugs) without valproate | Adjuvtive therapy of seizures associated with Lennox-Gastaut syndromes (with enzyme inducing drugs) without valproate

▶ BY MOUTH
  • Child 2–11 years: Initially 300 micrograms/kg twice daily for 14 days, then 600 micrograms/kg twice daily for further 14 days, then increased in steps of up to 1.2 mg/kg every 7–14 days; maintenance 5–15 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 400 mg per day
  • Child 12-17 years: Initially 50 mg once daily for 14 days, then 50 mg twice daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 200–400 mg daily in 2 divided doses, increased if necessary up to 700 mg daily, dose titration should be repeated if restarting after interval of more than 5 days

Adjuvtive therapy of focal seizures (without enzyme inducing drugs) without valproate | Adjutivte therapy of primary and secondary generalised tonic-clonic seizures (without enzyme inducing drugs) without valproate | Adjuvtive therapy of seizures associated with Lennox-Gastaut syndromes (without enzyme inducing drugs) without valproate

▶ BY MOUTH
  • Child 2–11 years: Initially 300 micrograms/kg daily in 1–2 divided doses for 14 days, then 600 micrograms/kg daily in 1–2 divided doses for further 14 days, then increased in steps of up to 600 micrograms/kg every 7–14 days; maintenance 1–10 mg/kg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days; maximum 200 mg per day
  • Child 12-17 years: Initially 25 mg once daily for 14 days, then increased to 50 mg once daily for further 14 days, then increased in steps of up to 100 mg every 7–14 days; maintenance 100–200 mg daily in 1–2 divided doses, dose titration should be repeated if restarting after interval of more than 5 days

IMPORTANT SAFETY INFORMATION
SAFE PRACTICE
Do not confuse the different combinations or indications.

• CAUTIONS Myoclonic seizures (may be exacerbated)
• INTERACTIONS → Appendix 1 (lamotrigine).
• SIDE-EFFECTS
  • Common or very common Blurred vision · aggression · agitation · arthralgia · ataxia · back pain · diarrhoea · diplopia · dizziness · drowsiness · dry mouth · headache · insomnia · nausea · nyctagmus · rash · tremor · vomiting
  • Rare Conjunctivitis
  • Very rare Anaemia · blood disorders · confusion · hallucination · hepatic failure · hypersensitivity syndrome · increase in seizure frequency · leucopenia · lupus erythematosus-like reactions · movement disorders · pancytopenia · thrombocytopenia · unsteadiness

> Frequency not known Aseptic meningitis · suicidal ideation

SIDE-EFFECTS, FURTHER INFORMATION

• Skin reaction Serious skin reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis have developed (especially in children); most rashes occur in the first 8 weeks. Rash is sometimes associated with hypersensitivity syndrome and is more common in patients with history of allergy or rash from other antiepileptic drugs. Consider withdrawal if rash or signs of hypersensitivity syndrome develop. Factors associated with increased risk of serious skin reactions include concomitant use of valproate, initial lamotrigine dosing higher than recommended, and more rapid dose escalation than recommended.

• ALLERGY AND CROSS-SENSITIVITY Antiepileptic hypersensitivity syndrome associated with lamotrigine. See under Epilepsy p. 180 for more information.

• PREGNANCY

Monitoring
Doses should be adjusted on the basis of plasma–drug concentration monitoring.

• BREAST Feeding

Present in milk, but limited data suggest no harmful effect on infant.

• HEPATIC IMPAIRMENT

Half dose in moderate impairment. Quarter dose in severe impairment.

• RENAL IMPAIRMENT

Consider reducing maintenance dose in significant impairment. Caution in renal failure; metabolite may accumulate.

• TREATMENT CESSATION

Avoid abrupt withdrawal (taper off over 2 weeks or longer) unless serious skin reaction occurs.

• PRESCRIBING AND DISPENSING INFORMATION

Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic lamotrigine product. Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

• PATIENT AND CARER ADVICE

Medicines for Children leaflet: Lamotrigine for preventing seizures www.medicinesforchildren.org.uk/lamotrigine-for-preventing-seizures Medicines for Children leaflet: Lamotrigine for preventing seizures

Skin reactions Warn patients and carers to see their doctor immediately if rash or signs or symptoms of hypersensitivity syndrome develop.

Blood disorders Patients and their carers should be alert for symptoms and signs suggestive of bone-marrow failure, such as anaemia, bruising, or infection. Aplastic anaemia, bone-marrow depression, and pancytopenia have been associated rarely with lamotrigine.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

| CAUTIONARY AND ADVISORY LABELS 8 |

**INDICATIONS AND DOSE**

*Monotherapy of focal seizures with or without secondary generalisation*

- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Child 16-17 years: Initially 250 mg once daily for 1 week, then increased to 250 mg twice daily, then increased in steps of 250 mg twice daily (max. per dose 1.5 g twice daily), adjusted according to response, dose to be increased every 2 weeks

*Adjunctive therapy of focal seizures with or without secondary generalisation*

- **BY MOUTH**
  - Child 1-5 months: Initially 7 mg/kg once daily, then increased in steps of up to 7 mg/kg twice daily (max. per dose 21 mg/kg twice daily), dose to be increased every 2 weeks
  - Child 6 months-17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
  - Child 12-17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks

- **BY INTRAVENOUS INFUSION**
  - Child 4-17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
  - Child 12-17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks

*Adjunctive therapy of myoclonic seizures and tonic-clonic seizures*

- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Child 12-17 years (body-weight up to 50 kg): Initially 10 mg/kg once daily, then increased in steps of up to 10 mg/kg twice daily (max. per dose 30 mg/kg twice daily), dose to be increased every 2 weeks
  - Child 12-17 years (body-weight 50 kg and above): Initially 250 mg twice daily, then increased in steps of 500 mg twice daily (max. per dose 1.5 g twice daily), dose to be increased every 2 weeks

**PRESCRIBING AND DISPENSING INFORMATION**

- If switching between oral therapy and intravenous therapy (for those temporarily unable to take oral medication), the intravenous dose should be the same as the established oral dose.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - aggression - anorexia - anxiety - ataxia - convulsion - cough - depression - diarrhoea - dizziness - drowsiness - dyspepsia - headache - insomnia - irritability - malaise - nasopharyngitis - nausea - rash - tremor - vertigo - vomiting

- **Uncommon** Agitation - alopecia - amnesia - blurred vision - confusion - diplopia - eczema - impaired attention - leucopenia - myalgia - paraesthesia - pruritus - psychosis - suicidal ideation - thrombocytopenia - weight changes

- **Rare** Agranulocytosis - choreoathetosis - drug reaction with eosinophilia and systemic symptoms (DRESS) - dyskinesia - erythema multiforme - hepatic failure - hypernatraemia - neutropenia - pancreatitis - pancyclopaenia - Stevens-Johnson syndrome - toxic epidermal necrolysis

**DIRECTIONS FOR ADMINISTRATION**

- **RENAL IMPAIRMENT**
  - Frequency not known

- **HEPATIC IMPAIRMENT**
  - Frequency not known

**PREGNANCY**

**Monitoring**

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis. It is recommended that the fetal growth should be monitored.

**NEAEST FEEDING**

Present in milk — manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

Halve dose in severe hepatic impairment if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².

**RENAL IMPAIRMENT**

Reduce dose if estimated glomerular filtration rate less than 80 mL/minute/1.73 m² (consult product literature).

**DIRECTIONS FOR ADMINISTRATION**

- **With intravenous use** For intravenous infusion (Keprota®), dilute requisite dose with at least 100 mL of glucose 5% or Sodium Chloride 0.9%; give over 15 minutes.

**PRESENTING AND DISPENSING INFORMATION**

- If switching between oral therapy and intravenous therapy (for those temporarily unable to take oral medication), the intravenous dose should be the same as the established oral dose.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Levetiracetam for preventing seizures www.medicinesforchildren.org.uk/levetiracetam-for-preventing-seizures

**UNLICENSED USE**

- With oral use Granules not licensed for use in children under 6 years, for initial treatment in children with body-weight less than 25 kg, or for the administration of doses below 250 mg.

**INTERACTIONS**

- + Appendix 1 (levetiracetam).

**DOSAGE**

Oxcarbazepine

**INDICATIONS AND DOSE**

Monotherapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures

▶ BY MOUTH

Child 6–17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maximum 46 mg/kg per day

Adjuvative therapy for the treatment of focal seizures with or without secondary generalised tonic-clonic seizures

▶ BY MOUTH

Child 6–17 years: Initially 4–5 mg/kg twice daily (max. per dose 300 mg), then increased in steps of up to 5 mg/kg twice daily, adjusted according to response, dose to be adjusted at weekly intervals; maintenance 15 mg/kg twice daily; maximum 46 mg/kg per day

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

In adjuvative therapy, the dose of concomitant antiepileptics may need to be reduced when using high doses of oxcarbazepine.

**CAUTIONS**

Avoid in Acute porphyrias p. 562 cardiac conduction disorders · heart failure · hyponatraemia

**INTERACTIONS** → Appendix 1 (oxcarbazepine).

**SIDE-EFFECTS**

Common or very common Abdominal pain · acne · agitation · alopecia · anemia · asthenia · ataxia · confusion · constipation · depression · diarrhea · diplopia · dizziness · drowsiness · headache · hyponatraemia · impaired concentration · nausea · systagmus · rash · tremor · visual disorders · vomiting

Uncommon Leucopenia · urticaria

Very rare Arrhythmias · atroventricular block · hepatitis · multi-organ hypersensitivity disorders · pancreatitis · Stevens–Johnson syndrome · systemic lupus erythematosus · thrombocytopenia · toxic epidermal necrolysis

**FREQUENCY NOT KNOWN**

Aplastic anaemia · bone marrow depression · hypertension · hypothyroidism · neutropenia · osteoporotic bone disorders · pancytopenia · suicidal ideation

**ALLERGY AND CROSS-SENSITIVITY**

Caution in patients with hypersensitivity to carbamazepine. Antiepileptic hypersensitivity syndrome associated with oxcarbazepine. See under Epilepsy p. 180 for more information.

**PREGNANCY**

Monitoring

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING**

Amount probably too small to be harmful but manufacturer advises avoid.

**HEPATIC IMPAIRMENT**

Caution in severe impairment—no information available.

**RENAL IMPAIRMENT**

Halve initial dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m², increase according to response at intervals of at least 1 week.

**PRE-TREATMENT SCREENING**

Test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin (avoid unless no alternative—risk of Stevens–Johnson syndrome in presence of HLA-B*1502 allele).

**MONITORING REQUIREMENTS**

Monitor plasma-sodium concentration in patients at risk of hyponatraemia.

Monitor body-weight in patients with heart failure.

**PRESCRIBING AND DISPENSING INFORMATION**

Patients may need to be maintained on a specific manufacturer’s branded or generic oxcarbazepine product. Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

**PATIENT AND CARER ADVICE**

Medicines for Children: Oxcarbazepine for preventing seizures www.medicinesforchildren.org.uk/oxcarbazepine-for-preventing-seizures Blood, hepatic, or skin disorders Patients or their carers should be told how to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as lethargy, confusion, muscular twitching, fever, rash, blistering, mouth ulcers, bruising, or bleeding develop.
**Phenytoin**

**INDICATIONS AND DOSE**

Tonic-clonic seizures / Focal seizures / Prevention and treatment of seizures during or following neurosurgery or severe head injury

**BY MOUTH**

- Child 1 month–11 years: Initially 1.5–2.5 mg/kg twice daily, then adjusted according to response to 2.5–5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), dose also adjusted according to plasma-phenytoin concentration; maximum 300 mg per day.
- Child 12–17 years: Initially 75–150 mg twice daily, then adjusted according to response to 150–200 mg twice daily (max. per dose 300 mg twice daily), dose also adjusted according to plasma-phenytoin concentration.

**INITIALLY BY SLOW INTRAVENOUS INJECTION**

- Neonate: Loading dose 18 mg/kg, dose to be administered over 20–30 minutes, then (by mouth) 2.5–5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), adjusted according to response, dose also adjusted according to plasma-phenytoin concentration.

**Status epilepticus / Acute symptomatic seizures associated with head trauma or neurosurgery**

**INITIALLY BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**

- Neonate: Loading dose 20 mg/kg, then (by slow intravenous injection or by intravenous infusion) 2.5–5 mg/kg twice daily, to be given with blood pressure and ECG monitoring.
- Child 1 month–11 years: Loading dose 20 mg/kg, then (by slow intravenous injection or by intravenous infusion) 2.5–5 mg/kg twice daily, to be given with blood pressure and ECG monitoring.
- Child 12–17 years: Loading dose 20 mg/kg, then (by intravenous infusion or by slow intravenous injection) up to 100 mg 3–4 times a day, to be given with blood pressure and ECG monitoring.

**DOSE EQUIVALENCY AND CONVERSION**

Preparations containing phenytoin sodium are not bioequivalent to those containing phenytoin base (such as Epanutin Infatabs® and Epanutin® suspension); 100 mg of phenytoin sodium is approximately equivalent in therapeutic effect to 92 mg phenytoin base. The dose is the same for all phenytoin products when initiating therapy. However, if switching between these products the difference in phenytoin content may be clinically significant. Care is needed when making changes between formulations and plasma-phenytoin concentration monitoring is recommended.

**UNLICENSED USE**

- With oral use: Licensed for use in children (age range not specified by manufacturer).

---

**Epilepsy and other seizure disorders 193**

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

  - Oxcarbazepine 60 mg per 1 ml Trileptal 60mg/ml oral suspension sugar-free | 250 ml POM £48.96

**Perampanel**

**INDICATIONS AND DOSE**

Adjunctive treatment of focal seizures with or without secondary generalised seizures

**BY MOUTH**

- Child 12–17 years: Initially 2 mg once daily, dose to be taken before bedtime, then increased, if tolerated, in steps of 2 mg at intervals of at least every 2 weeks, adjusted according to response; maintenance 4–8 mg once daily; maximum 12 mg per day

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Titrated at intervals of at least 1 week with concomitant carbamazepine, fosphenytoin, oxcarbazepine, or phenytoin.

**INTERACTIONS**

- **Aggression / anxiety / ataxia / back pain / blurred vision / changes in appetite / confusion / diplopia / dizziness / drowsiness / dysarthria / gait disturbance / irritability / malaise / nausea / suicidal behaviour / suicidal ideation / vertigo / weight increase**

**PREGNANCY**

Manufacturer advises avoid.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING**

Avoid—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Increase at intervals of at least 2 weeks, up to max. 8 mg daily in mild or moderate impairment. Avoid in severe impairment.

**RENAL IMPAIRMENT**

Avoid in moderate or severe impairment.

**PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations. Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients may need to be maintained on a specific manufacturer’s branded or generic perampanel product.

---

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Epilepsy and other seizure disorders

With intravenous use Phenytoin doses in BNF publications may differ from those in product literature.

**CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS**
Acute porphyrias p. 562

**SPECIFIC CONTRA-INDICATIONS**
- With intravenous use Second- and third-degree heart block - sino-atrial block - sinus bradycardia - Stokes-Adams syndrome

**CAUTIONS**

**GENERAL CAUTIONS**
Enteral feeding (interrupt feeding for 2 hours before and after dose; more frequent monitoring may be necessary)

**SPECIFIC CAUTIONS**
- With intravenous use Heart failure - hypotension - injection solutions alkaline (irritant to tissues) - respiratory depression - resuscitation facilities must be available

**INTERACTIONS**

**GENERAL SIDE-EFFECTS**
- **Common or very common** Acne - anorexia - coarsening of facial appearance - constipation - dizziness - drowsiness - gingival hypertrophy and tenderness (maintain good oral hygiene) - headache - hirsutism - insomnia - nausea - paraesthesia - rash - transient nervousness - tremor - vomiting
- **Rare** Leucopenia - aplastic anaemia - blood disorders - dyskinesia - hepatotoxicity - lupus erythematosus - lymphadenopathy - megaloblastic anaemia - osteomalacia - peripheral neuropathy - polyarteritis nodosa - Stevens-Johnson syndrome - thrombocytopenia - toxic epidermal necrolysis
- **Frequency not known** Hypersensitivity syndrome - interstitial nephritis - pneumonitis - polyarthropathy - suicidal ideation

**SPECIFIC SIDE-EFFECTS**
- **Common or very common** With intravenous use Alterations in respiratory function - arrhythmias - cardiovascular collapse - cardiovascular depression (particularly if injection too rapid) - CNS depression (particularly if injection too rapid) - hypotension - respiratory arrest
- **Frequency not known** With intravenous use Purple glove syndrome - tonic seizures

**SIDE-EFFECTS, FURTHER INFORMATION**
- Hepatotoxicity Discontinue immediately and do not re-administer.
- Rash Discontinue; if mild re-introduce cautiously but discontinue immediately if recurrence.
- Use in adolescents Phenytoin may cause coarsening of the facial appearance, acne, hirsutism, and gingival hyperplasia and so may be particularly undesirable in adolescent patients.
- Bradycardia and hypotension
- With intravenous use Reduce rate of administration if bradycardia or hypotension occurs.

**Overdose**

Symptoms of phenytoin toxicity include nystagmus, diplopia, slurred speech, ataxia, confusion, and hyperglycaemia.

**ALLERGY AND CROSS-SENSITIVITY** Cross-sensitivity reported with carbamazepine. Antiepileptic hypersensitivity syndrome associated with phenytoin. See under Epilepsy p. 180 for more information.

**PREGNANCY** Changes in plasma-protein binding make interpretation of plasma-phenytoin concentrations difficult—monitor unbound fraction. Doses should be adjusted on the basis of plasma-drug concentration monitoring.

**BREAST FEEDING** Small amounts present in milk, but not known to be harmful.

**HEPATIC IMPAIRMENT** Reduce dose to avoid toxicity.

**PRE-TREATMENT SCREENING** HLA*B 1502 allele in individuals of Han Chinese or Thai origin—avoid unless essential (increased risk of Stevens-Johnson syndrome).

**MONITORING REQUIREMENTS**
- Therapeutic plasma-phenytoin concentrations reduced in first 3 months of life because of reduced protein binding.
- Trough plasma concentration for optimum response: neonate – 3 months, 6–15 mg/litre (25–50 micromol/litre); child 3 months–18 years, 10–20 mg/litre (40–80 micromol/litre).
- Manufacturer recommends blood counts (but evidence of practical value uncertain).
- With intravenous use Monitor ECG and blood pressure.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use Before and after administration flush intravenous line with Sodium Chloride 0.9%. For *intravenous injection*, give into a large vein at rate not exceeding 1 mg/kg/minute (max. 50 mg/minute). For *intravenous infusion*, dilute to a concentration not exceeding 10 mg/mL with Sodium Chloride 0.9% and give into a large vein through an in-line filter (0.22–0.50 micron) at a rate not exceeding 1 mg/kg/minute (max. 50 mg/minute); complete administration within 1 hour of preparation.

**PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients being treated for epilepsy should be maintained on a specific manufacturer’s product.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Phenytoin for preventing seizures www.medicinesforchildren.org.uk/phenytoin-for-preventing-seizures

Blood or skin disorders Patients or their carers should be told how to recognise signs of blood or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, rash, mouth ulcers, bruising, or bleeding develop. Leucopenia that is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of a suitable alternative).

Rufinamide

INDICATIONS AND DOSE

Adjunctive treatment of seizures in Lennox-Gastaut syndrome

- BY MOUTH
  - Child 4–17 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 500 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
  - Child 4–17 years (body-weight 30–49 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 900 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
  - Child 4–17 years (body-weight 50–69 kg): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.2 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days
  - Child 4–17 years (body-weight 70 kg and above): Initially 200 mg twice daily, then increased in steps of 200 mg twice daily (max. per dose 1.6 g twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

Adjunctive treatment of seizures in Lennox-Gastaut syndrome with valproate

- BY MOUTH
  - Child 4–17 years (body-weight up to 30 kg): Initially 100 mg twice daily, then increased in steps of 100 mg twice daily (max. per dose 300 mg twice daily), adjusted according to response, dose to be increased at intervals of not less than 2 days

INTERACTIONS

Appendix 1 (rufinamide).

SIDE-EFFECTS

Abdominal pain, acne, anorexia, anxiety, back pain, blurred vision, constipation, diarrhoea, diplopia, dizziness, drowsiness, dyspepsia, epistaxis, fatigue, gait disturbances, headache, hyperactivity, hypersensitivity syndrome, impaired coordination, increased in seizure frequency, influenza-like symptoms, insomnia, nausea, myasthenia, oligomenorrhea, rash, rhinitis, tremor, vomiting, weight loss

ALLERGY AND CROSS-SENSITIVITY

Antiepileptic hypersensitivity syndrome associated with rufinamide. See under Epilepsy p. 180 for more information.

PREGNANCY

Monitoring

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

BREAST FEEDING

Manufacturer advises avoid—no information available.

HEPATIC IMPAIRMENT

Caution and careful dose titration in mild to moderate impairment. Avoid in severe impairment.

DIRECTIONS FOR ADMINISTRATION

Tablets may be crushed and given in half a glass of water.

PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history. Patients may need to be maintained on a specific manufacturer’s branded or generic rufinamide product.

PATIENT AND CARER ADVICE

Counselling on antiepileptic hypersensitivity syndrome is advised. Medicines for Children leaflet: Rufinamide for preventing seizures www.medicinesforchildren.org.uk/rufinamide-for-preventing-seizures

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (October 2008) that rufinamide (Inovelon®) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of seizures associated with Lennox-Gastaut syndrome in patients 4 years and above. It is restricted for use when alternative traditional antiepileptic drugs are unsatisfactory.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 8, 21

- Inovelon (Eisai Ltd)
  - Rufinamide 100 mg | Inovelon 100mg tablets | 10 tablet | £5.15

  - Rufinamide 40 mg per 1 ml | Inovelon 40mg/ml oral suspension sugar-free | 460 ml | £94.71

Sodium valproate

INDICATIONS AND DOSE

All forms of epilepsy

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
  - Neonate: Initially 20 mg/kg once daily; maintenance 10 mg/kg twice daily.
  - Child 1 month–11 years: Initially 10–15 mg/kg daily in 1–2 divided doses (max. per dose 600 mg); maintenance 25–30 mg/kg daily in 2 divided doses, doses up to 60 mg/kg daily in 2 divided doses may be used in infantile spasms; monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily
  - Child 12–17 years: Initially 600 mg daily in 1–2 divided doses, increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily in 2 divided doses; maximum 25 g per day

continued ➔
Nervous system

Epilepsy and other seizure disorders

By mouth

All forms of epilepsy

Child: Total daily dose to be given in 1–2 divided doses (consult product literature)

By rectum

All forms of epilepsy

Initiation of valproate treatment

Initial dose: 20 mg/kg daily; maintenance dose 10 mg/kg daily.

Child 1–11 years: Initially 10–15 mg/kg daily in 1–2 divided doses (max. per dose 600 mg); maintenance 25–30 mg/kg daily in 2 divided doses; doses up to 60 mg/kg daily in 2 divided doses may be used in infantile spasms; monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily.

Child 12–17 years: Initially 600 mg daily in 1–2 divided doses, increased in steps of 150–300 mg every 3 days; maintenance 1–2 g daily in 2 divided doses; maximum 2.5 g per day.

Continuation of valproate treatment

Initial dose: 10–15 mg/kg daily, then (by intravenous infusion or by intravenous injection) increased to 20–40 mg/kg daily in 2–4 divided doses, alternatively (by continuous intravenous infusion) increased to 20–40 mg/kg daily, monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily.

Child 12–17 years: Initially 10 mg/kg, followed by (by intravenous infusion or by intravenous injection) up to 2.5 g daily in 2–4 divided doses, alternatively (by continuous intravenous infusion) up to 2.5 g daily; (by intravenous injection or by intravenous infusion or by continuous intravenous infusion) usual dose 1–2 g daily, alternatively (by intravenous injection or by intravenous infusion or by continuous intravenous infusion) usual dose 20–30 mg/kg daily, intravenous injection to be administered over 3–5 minutes.

EPILIM CHRONOSPHERE®

All forms of epilepsy

Child: Total daily dose to be given in 1–2 divided doses (consult product literature)

EPILIM CHRONO®

All forms of epilepsy

Child (body-weight 20 kg and above): Total daily dose to be given in 1–2 divided doses (consult product literature)

EPISENTA® capsules

All forms of epilepsy

Child: Total daily dose to be given in 1–2 divided doses (consult product literature)

EPISENTA® granules

All forms of epilepsy

Child: Total daily dose to be given in 1–2 divided doses (consult product literature)

EPIVAL®

All forms of epilepsy

Child: Total daily dose to be given in 1–2 divided doses (consult product literature)

Important safety information

Mhra/chm advice: valproate and risk of abnormal pregnancy outcomes

Infants exposed to valproate in utero are at a high risk of serious developmental disorders (up to 30–40% risk) and congenital malformations (approx. 11% risk). Valproate should not be used in female children, females of childbearing potential or during pregnancy unless alternative treatments are ineffective or not tolerated.

Contra-indications

Acute porphyrias p. 562 - known or suspected mitochondrial disorders (higher rate of acute liver failure and liver-related deaths) - personal or family history of severe hepatic dysfunction

Caution

Systemic lupus erythematosus

Caution, further information

Consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

Liver toxicity

Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

Interactions

Appendix 1 (sodium valproate).

Side-effects

Common or very common

Aggression - anaemia - confusion - convulsion - deafness - diarrhoea - extrapyramidal disorders - gastric irritation - haemorrhage - headache - hyponatraemia - memory impairment - menstrual disturbance - nausea - nystagmus - somnolence - stupor - thrombocytopenia - transient hair loss (regrowth may be curly) - tremor - weight gain

Uncommon

Angioedema - ataxia - coma - encephalopathy - increased alertness - lethargy - leucopenia - pancytopenia - paraesthesia - peripheral oedema - rash - reduced bone mineral density - syndrome of inappropriate secretion of antidiuretic hormone - vasculitis

Rare

Very rare

Acne - gynaecomastia - hepatic dysfunction - hirsutism - increase in bleeding time - pancreatitis

Frequency not known

Hypersensitivity reactions - suicidal ideation

Side-effects, further information

Hepatic dysfunction

Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.
Epilepsy and other seizure disorders

Prescribing and dispensing information

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral sodium valproate product.

**Epilim Chronosphere®** Prescribe dose to the nearest whole 50-mg sachet.

**Patient and carer advice**

Risk of abnormal pregnancy outcomes A patient guide and card should be provided to all female patients.

Medicines for Children leaflet: Sodium valproate for preventing seizures www.medicinesforchildren.org.uk/sodium-valproate-for-preventing-seizures

Blood or hepatic disorders Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.

Pancreatitis Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms develop.

**Mhra advice: Valproate and risk of abnormal pregnancy outcomes**

Female patients and their carers should be counselled on the risk of valproate treatment during pregnancy. Ensure female patients are provided with relevant resources, to support their understanding of the risks. In particular the prescriber must ensure the patient understands:

- the risks associated with valproate during pregnancy;
- the need to use effective contraception;
- the need for regular review of treatment;
- the need to rapidly consult if she is planning a pregnancy or becomes pregnant.

**Episenta® capsules** Patients and carers should be counselled on the administration of capsules.

**Episenta® granules** Patients and carers should be counselled on the administration of granules.

**Epilim Chronosphere®** Patients and carers should be counselled on the administration of granules.

Medicinal forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository.

Pancreatitis Discontinue treatment if symptoms of pancreatitis develop.

**Conception and contraception** Valproate is associated with teratogenic risks and should not be used in females of child-bearing potential unless there is no safer alternative—this should be fully considered and discussed before prescribing for females of child-bearing age.

Exclude pregnancy before treatment—effective contraception advised in females of child-bearing potential. In females planning to become pregnant, all efforts should be made to switch to appropriate alternative treatment prior to conception.

**Pregnancy** Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term neurodevelopmental effects. Valproate should not be used during pregnancy unless there is no safer alternative and only after a careful discussion of the risks. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses or as modified-release tablets to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Neonatal bleeding (related to hypofibrininaemia) reported. Neonatal hepatotoxicity also reported.

Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**Breast feeding** Present in milk—risk of haematological disorders in breast-fed newborns and infants.

**Hepatic impairment** Avoid if possible—hepatotoxicity and hepatic failure may occasionally occur (usually in first 6 months). Avoid in active liver disease.

**Renal impairment** Reduce dose.

**Monitoring requirements**

- Plasma-valproate concentrations are not a useful index of efficacy, therefore routine monitoring is unhelpful.
- Monitor liver function before therapy and during first 6 months especially in patients most at risk.
- Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.

**Effect on laboratory tests** False-positive urine tests for ketones.

**Treatment cessation** Avoid abrupt withdrawal; if treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks.

**Directions for administration**

- With intravenous use For *intravenous injection*, may be diluted at Glucose 5% or Sodium Chloride 0.9% and given over 3–5 minutes. For *intravenous infusion*, dilute injection solution with Glucose 5% or Sodium Chloride 0.9%.
- With rectal use For *rectal administration*, sodium valproate oral solution may be given rectally and retained for 15 minutes (may require dilution with water to prevent rapid expulsion).

**Epival®** Tablets may be halved but not crushed or chewed.

**Episenta® capsules** Contents of capsule may be mixed with soft food or drink that is cold or at room temperature, and swallowed immediately without chewing.

**Epilim syrup** May be diluted, preferably in Syrup BP, use within 14 days.

**Episenta® granules** Granules may be mixed with soft food or drink that is cold or at room temperature, and swallowed immediately without chewing.

**Epilim Chronosphere®** Granules may be mixed with soft food or drink that is cold or at room temperature, and swallowed immediately without chewing.
**Gastro-resistant tablet**

**Stiripentol**

- **INDICATIONS AND DOSE**
  - Adjunctive therapy of refractory generalised tonic-clonic seizures in children with severe myoclonic epilepsy in infancy (Dravet Syndrome) in combination with clonazepam and valproate (under expert supervision)
  - **BY MOUTH**
    - Child 3-17 years: Initially 10 mg/kg daily in 2–3 divided doses, increased to up to 50 mg/kg daily in 2–3 divided doses, titrated over minimum of 3 days

- **CONTRA-INDICATIONS**
  - History of psychosis

- **INTERACTIONS**
  - **Appendix 1 (stiripentol).**
  - **SIDE-EFFECTS**
    - Common or very common: Aggression, anorexia, ataxia, drowsiness, dystonia, hyperventilation, hyperkinesia, hypotonia, irritability, nausea, neutropenia, sleep disorders, vomiting, weight loss
  - Uncommon: Fatigue, photosensitivity, rash, urticaria

- **ALLERGY AND CROSS-SENSITIVITY**
  - Antiepileptic hypersensitivity syndrome theoretically associated with stiripentol. See under Epilepsy p. 180 for more information.

- **PREGNANCY**
  - Monitoring
  - The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING**
  - Avoid—no information available.

- **RENAL IMPAIRMENT**
  - Avoid—no information available.

- **MONITORING REQUIREMENTS**
  - Perform full blood count and liver function tests prior to initiating treatment and every 6 months thereafter.

- **DIRECTIONS FOR ADMINISTRATION**
  - Do not take with milk, dairy products, carbonated drinks, fruit juice, or with food or drinks that contains caffeine.

- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Stiripentol for preventing seizures www.medicinesforchildren.org.uk/stiripentol-for-preventing-seizures

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 1, 8, 21

- Diacomit (Alan Pharmaceuticals) Stiripentol 250 mg Diacomit 250mg capsules | 60 capsule (Pot) £294.00 DT price + £284.00
  - Stiripentol 500 mg Diacomit 500mg capsules | 60 capsule (Pot) £493.00

**Powder**

CAUTIONARY AND ADVISORY LABELS 1, 8, 13, 21

- Diacomit (Alan Pharmaceuticals) Stiripentol 250 mg Diacomit 250mg oral powder sachets | 60 sachet (Pot) £284.00
  - Stiripentol 500 mg Diacomit 500mg oral powder sachets | 60 sachet (Pot) £493.00
### Tiagabine

**INDICATIONS AND DOSE**

Adjunctive treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics (with enzyme-inducing drugs)

- **BY MOUTH**
  - Child 12-17 years: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every 1 week; maintenance 30–45 mg daily in 2–3 divided doses

Adjunctive treatment for focal seizures with or without secondary generalisation that are not satisfactorily controlled by other antiepileptics (without enzyme-inducing drugs)

- **BY MOUTH**
  - Child 12-17 years: Initially 5–10 mg daily in 1–2 divided doses, then increased in steps of 5–10 mg/24 hours every 1 week; maintenance 15–30 mg daily in 2–3 divided doses

**CAUTIONS**

Avoid in Acute porphyrias p. 562

CAUTIONS, FURTHER INFORMATION

Tiagabine should be avoided in absence, myoclonic, tonic andatomic seizures due to risk of seizure exacerbation.

**INTERACTIONS** → Appendix 1 (tiagabine).

**SIDE-EFFECTS**

- Common or very common Diarrhoea, dizziness, emotional lability, impaired concentration, nervousness, speech impairment, tremor

- Rare Bruising, confusion, depression, drowsiness, non-convulsive status epilepticus, psychosis, suicidal ideation, visual disturbances

- Frequency not known Leucopenia

**PREGNANCY**

Monitoring

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**HEPATIC IMPAIRMENT**

In mild to moderate impairment reduce dose, prolong the dose interval, or both. Avoid in severe impairment.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Tiagabine for preventing seizures www.medicinesforchildren.org.uk/tiagabine-for-preventing-seizures

Driving and skilled tasks

May impair performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21

- Gabitril (Teva UK Ltd)
  - Tiagabine (as Tiagabine hydrochloride monohydrate)
    - 5 mg Gabitril 5mg tablets | 100 tablet [PGD] £52.04
    - Tiagabine (as Tiagabine hydrochloride monohydrate)
      - 10 mg Gabitril 10mg tablets | 100 tablet [PGD] £104.09
  - Tiagabine (as Tiagabine hydrochloride monohydrate)
    - 15 mg Gabitril 15mg tablets | 100 tablet [PGD] £156.13

### Topiramate

**INDICATIONS AND DOSE**

Monotherapy of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation

- **BY MOUTH**
  - Child 6–17 years: Initially 0.5–1 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 250–500 micrograms/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 50 mg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate titration regimens recommended above then smaller steps or longer interval between steps may be used; maximum 500 mg per day

Adjunctive treatment of generalised tonic-clonic seizures or focal seizures with or without secondary generalisation | Adjunctive treatment for seizures associated with Lennox-Gastaut syndrome

- **BY MOUTH**
  - Child 2–17 years: Initially 1–3 mg/kg once daily (max. per dose 25 mg) for 1 week, dose to be taken at night, then increased in steps of 0.5–1.5 mg/kg twice daily, dose to be increased by a maximum of 25 mg twice daily at intervals of 1–2 weeks; usual dose 2.5–4.5 mg/kg twice daily (max. per dose 7.5 mg/kg twice daily), if child cannot tolerate recommended titration regimen then smaller steps or longer interval between steps may be used; maximum 400 mg per day

**Migraine prophylaxis**

- **BY MOUTH**
  - Child 16–17 years: Initially 25 mg once daily for 1 week, dose to be taken at night, then increased in steps of 25 mg every 1 week; usual dose 50–100 mg daily in 2 divided doses, if child cannot tolerate recommended titration regimen then smaller steps or longer interval between steps may be used; maximum 200 mg per day

**UNLICENSED USE**

Not licensed for use in children for migraine prophylaxis.

**CAUTIONS**

Avoid in Acute porphyrias p. 562 - risk of metabolic acidosis - risk of nephrolithiasis—ensure adequate hydration (especially in strenuous activity or warm environment)

**INTERACTIONS** → Appendix 1 (topiramate).

**SIDE-EFFECTS**

- Common or very common Abdominal pain, aggression, agitation, alopecia, anaemia, anxiety, appetite changes, arthralgia, cognitive impairment, confusion, constipation, depression, diarrhoea, dizziness, drowsiness, dry mouth, dyspepsia, dysphagia, epistaxis, gastritis, impaired attention, impaired coordination, irritability, malaise, mood changes, movement disorders, muscle spasms, muscular weakness, myalgia, nausea, nephrolithiasis, nystagmus, paraesthesia, pruritus, rash, seizures, sleep disturbance, speech disorder, taste disturbance, tinnitus, tremor, urinary disorders, visual disturbances, vomiting

- Uncommon Abdominal distension, altered sense of smell, blepharospasm, blood disorders, bradycardia, dry eye, flatulence, flushing, gingival bleeding, glossodynia, haematuria, halitosis, hearing loss, hypokalaemia, hypotension, increased lacrimation, influenza-like symptoms, leucopenia, metabolic acidosis, mydriasis, neutropenia, palpitation, pancreatitis, panic attack, peripheral neuropathy, photophobia, postural hypotension, psychosis, reduced sweating, salivation, sexual dysfunction, skin discoloration, suicidal ideation, thirst, thrombocytopenia, urinary calculus
Rare Abnormal skin odour ‐ calcinosis ‐ hepatic failure ‐ hepatitis ‐ periorbital oedema ‐ Raynaud’s syndrome ‐ Stevens‐Johnson syndrome ‐ unilateral blindness

Very rare Angle‐glaucoma

Frequency not known Encephalopathy ‐ hyperammonaemia ‐ maculopathy ‐ toxic epidermal necrolysis

Nervous system

MEDICINAL FORMS

PRESCRIBING AND DISPENSING INFORMATION

RENAL IMPAIRMENT

HEPATIC IMPAIRMENT

Increased risk of cleft palate if taken in the rst trimester of pregnancy.

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

It is recommended that the fetal growth should be monitored.

BREAST FEEDING

Manufacturer advises avoid—present in milk.

HEPATIC IMPAIRMENT

Use with caution in moderate to severe impairment—clearance may be reduced.

RENAL IMPAIRMENT

Half usual starting and maintenance dose if estimated glomerular filtration less than 70 mL/minute/1.73 m²—reduced clearance and longer time to steady-state plasma concentration. Use with caution.

DIRECTIONS FOR ADMINISTRATION

TOPAMAX® CAPSULES

Swallow whole or sprinkle contents of capsule on soft food and swallow immediately without chewing.

PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic topiramate product.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Topiramate for preventing seizures www.medicinesforchildren.org.uk/topiramate‐for‐preventing‐seizures

TOPAMAX® CAPSULES Patients or carers should be given advice on how to administer Topamax® capsules.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special‐order manufacturers include: oral suspension, oral solution

Tablet

Valproic acid

INDICATIONS AND DOSE

CONVULEX®

Epilepsy

BY MOUTH

Child 1 month–11 years: Initially 10–15 mg/kg daily in 2–4 divided doses, max. 600 mg/day; usual maintenance 25–30 mg/kg daily in 2–4 divided doses, doses up to 60 mg/kg daily in 2–4 divided doses in infantile spasms; monitor clinical chemistry and haematological parameters if dose exceeds 40 mg/kg daily

Child 12–17 years: Initially 600 mg daily in 2–4 divided doses, increased in steps of 150–300 mg every 3 days; usual maintenance 1–2 g daily in 2–4 divided doses, max. 2.5 g daily in 2–4 divided doses

DOSE EQUIVALENCE AND CONVERSION

Convulex® has a 1:1 dose relationship with products containing sodium valproate, but nevertheless care is needed if switching or making changes.

Important safety information

Mhra/chim advice: Valproate and risk of abnormal pregnancy outcomes

Infants exposed to valproate in utero are at a high risk of serious developmental disorders (up to 30–40% risk) and congenital malformations (approx. 11% risk). Valproate should not be used in female children, females of childbearing potential or during pregnancy unless alternative treatments are ineffective or not tolerated.

Contra-indications

Acute porphyrias p. 562 - known or suspected mitochondrial disorders (higher rate of acute liver failure and liver-related deaths) - personal or family history of severe hepatic dysfunction

Caution

Systemic lupus erythematosus

Cautions, further information

Consider vitamin D supplementation in patients that are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

Liver toxicity

Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but
patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormally prolonged prothrombin time (particularly in association with other relevant abnormalities).

- **INTERACTIONS** → Appendix 1 (valproic acid).

- **SIDE-EFFECTS**
  - **Common or very common** Diarrhoea; gastric irritation; hyperammonaemia; nausea; thrombocytopenia; transient hair loss (regrowth may be curable); weight gain
  - **Uncommon** Aggression; ataxia; behavioural disturbances; hyperactivity; increased alertness; tremor; vasculitis
  - **Rare** Anaemia; blood disorders; confusion; drowsiness; hallucinations; hearing loss; hepatic dysfunction; lethargy; leukopenia; pancreatitis; rash; stupor
  - **Very rare** Acne; coma; dementia; encephalopathy; enuresis; extrapyramidal symptoms; Fanconi’s syndrome; gynaecomastia; hirsutism; hypopatraemia; increase in bleeding time; pancreatitis; peripheral oedema; reduced bone mineral density; Stevens-Johnson syndrome; suicidal ideation; toxic epidermal necrolysis

- **FREQUENCY NOT KNOWN** Drug rash with eosinophilia and systemic symptoms (DRESS) syndrome; hypersensitivity reactions; male infertility; menstrual disturbances; syndrome of inappropriate secretion of antidiuretic hormone

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - **Hepatic dysfunction** Withdraw treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control.
  - **Pancreatitis** Discontinue treatment if symptoms of pancreatitis develop.

- **CONCEPTION AND CONTRACEPTION** Valproate is associated with teratogenic risks and should not be used in females of child-bearing potential unless there is no safer alternative—this should be fully considered and discussed before prescribing for females of child-bearing age. Effective contraception advised in females of child-bearing potential. In females planning to become pregnant, all efforts should be made to switch to appropriate alternative treatment prior to conception.

- **PREGNANCY** Valproate is associated with the highest risk of major and minor congenital malformations (in particular neural tube defects), and long-term neurodevelopmental effects. Valproate should not be used during pregnancy unless there is no safer alternative and only after a careful discussion of the risks. If valproate is to be used during pregnancy, the lowest effective dose should be prescribed in divided doses to avoid peaks in plasma-valproate concentrations; doses greater than 1 g daily are associated with an increased risk of teratogenicity. Neonatal bleeding (related to hypofibrininaemia). Neonatal hepatoxicity also reported. Specialist prenatal monitoring should be instigated when valproate has been taken in pregnancy.

  The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Present in milk—risk of haematological disorders in breast-fed newborns and infants.

- **HEPATIC IMPAIRMENT** Avoid if possible—hepatotoxicity and hepatic failure may occasionally occur (usually in first 6 months). Avoid in active liver disease.

- **RENAL IMPAIRMENT** Reduce dose.

- **MONITORING REQUIREMENTS**
  - Monitor closely if dose greater than 45 mg/kg daily.
  - Monitor liver function before therapy and during first 6 months especially in patients most at risk.
  - Measure full blood count and ensure no undue potential for bleeding before starting and before surgery.

- **EFFECT ON LABORATORY TESTS** False-positive urine tests for ketones.

- **TREATMENT CESSATION** Avoid abrupt withdrawal; if treatment with valproate is stopped, reduce the dose gradually over at least 4 weeks.

- **PRESCRIBING AND DISPENSING INFORMATION**

  - **CONVULSEX®** Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic oral valproic acid product.

  - **PATIENT AND CARER ADVICE**
    - Risk of abnormal pregnancy outcomes. A patient guide and card should be provided to all female patients.
    - Blood or hepatic disorders. Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop.

  - **Pancreatitis** Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea, or vomiting develop.

  - **Appendix**

  - **Dosing Information**
    - **Neonate:** Initially 15–20 mg/kg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg).
    - **Child 1–2 months:** Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 75 mg/kg).
    - **Child 2–11 years:** Initially 15–20 mg/kg twice daily (max. per dose 250 mg), to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 30–40 mg/kg twice daily (max. per dose 1.5 g).
    - **Child 12–17 years:** Initially 250 mg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 1–1.5 g twice daily continued →
202 Epilepsy and other seizure disorders

BNFC 2016–2017

Nervous system

Frequency not known

▶ Very rare

SIDE-EFFECTS

Monotherapy in the management of infantile spasms in West's syndrome (under expert supervision)

▶ BY MOUTH

- Neonate: Initially 15–25 mg/kg twice daily, to be adjusted according to response over 7 days to usual maintenance dose; usual maintenance 40–50 mg/kg twice daily (max. per dose 75 mg/kg).
- Child 1 month–1 year: Initially 15–25 mg/kg twice daily, to be adjusted according to response over 7 days to usual maintenance dose; usual maintenance 40–50 mg/kg twice daily (max. per dose 75 mg/kg).
- Child 1–2 years: Initially 25 mg/kg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 50–75 mg/kg twice daily (max. per dose 150 mg/kg).
- Child 2–6 years: Initially 30 mg/kg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 60–100 mg/kg twice daily (max. per dose 200 mg/kg).
- Child 6–17 years: Initially 50 mg/kg twice daily, to be increased over 2–3 weeks to usual maintenance dose, usual maintenance 75–100 mg/kg twice daily (max. per dose 300 mg/kg).

UNLICENSED USE

Granules not licensed for rectal use. Tablets not licensed to be crushed and dispersed in liquid. Vigabatrin doses in BNF publications may differ from those in product literature.

CONTRA-INDICATIONS

Visual field defects

CAUTIONS

History of behavioural problems; history of depression - history of psychosis

CAUTIONS, FURTHER INFORMATION

Vigabatrin may worsen absence, myoclonic, tonic and atonic seizures.

Visual field defects. Vigabatrin is associated with visual field defects. The onset of symptoms varies from 1 month to several years after starting. In most cases, visual field defects have persisted despite discontinuation, and further deterioration after discontinuation cannot be excluded. Product literature advises visual field testing before treatment and at 6-month intervals. Patients and their carers should be warned to report any new visual symptoms that develop and those with symptoms should be referred for an urgent ophthalmological opinion. Gradual withdrawal of vigabatrin should be considered.

INTERACTIONS

▶ Appendix 1 (vigabatrin).

SIDE-EFFECTS

- Common or very common
- Uncommon
  - Ataxia - mania - occasional increase in seizure frequency (especially if myoclonic) - psychosis - rash
- Rare
  - Perinatal retinal neuropathy - retinal disorders - suicidal ideation
- Very rare
  - Hepatitis - optic atrophy - optic neuritis
- Frequency not known

SIDE-EFFECTS, FURTHER INFORMATION

Encephalopathic symptoms including marked sedation, stupor, and confusion with non-specific slow wave EEG can occur rarely—reduce dose or withdraw.

Visual field defects

About one-third of patients treated with vigabatrin have suffered visual field defects; counselling and careful monitoring for this side-effect are required.

PREGNANCY

Monitoring

The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

BREAST FEEDING

Present in milk—manufacturer advises avoid.

RENAL IMPAIRMENT

Consider reduced dose or increased dose interval if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².

MONITORING REQUIREMENTS

Closely monitor neurological function.

DIRECTIONS FOR ADMINISTRATION

- With oral use
  - The contents of a sachet should be dissolved in water or a soft drink immediately before taking. Tablets may be crushed and dispersed in liquid.
  - With rectal use
  - Dissolve contents of sachet in small amount of water and administer rectally [unlicensed use].

PATIENT AND CARER ADVICE

Patients and their carers should be warned to report any new visual symptoms that develop. Medicines for Children leaflet: Vigabatrin for preventing seizures www.medicinesforchildren.org.uk/vigabatrin-for-preventing-seizures

MEDIcular FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Zonisamide

INDICATIONS AND DOSE

Adjunctive treatment for refractory focal seizures with or without secondary generalisation

▶ BY MOUTH

- Child 6–17 years (body-weight 20–54 kg): Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 6–8 mg/kg once daily (max. per dose 500 mg once daily), dose to be increased at 2-week intervals in patients who are not receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4
- Child 6–17 years (body-weight 55 kg and above): Initially 1 mg/kg once daily for 7 days, then increased in steps of 1 mg/kg every 7 days, usual maintenance 300–500 mg once daily, dose to be increased at 2-week intervals in patients who are not receiving concomitant carbamazepine, phenytoin, phenobarbital or other potent inducers of cytochrome P450 enzyme CYP3A4

CAUTIONS

Low body-weight or poor appetite—monitor weight throughout treatment (fatal cases of weight loss reported in children) - metabolic acidosis—monitor serum bicarbonate concentration in children and those with other risk factors (consider dose reduction or discontinuation if metabolic acidosis develops) - risk factors for renal stone formation (particularly predisposition to nephrolithiasis)
Epilepsy and other seizure disorders

**PRESCRIBING AND DISPENSING INFORMATION**

Avoid overheating and ensure adequate hydration especially in children, during strenuous activity or if in warm environment (fatal cases of heat stroke reported in children).

**INTERACTIONS** → Appendix 1 (zonisamide).

Caution with concomitant use of drugs that increase risk of nephrotoxicity. Contra-indicated with use of drugs that increase risk of hyperthermia or metabolic acidosis.

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - agitation - alopecia - anorexia - ataxia - confusion - constipation - depression - diarrhoea - diplopia - dizziness - drowsiness - eccymosis - fatigue - impaired attention - impaired memory - insomnia - irritability - nausea - nystagmus - paraesthesia - peripheral oedema - pruritus - psychosis - pyrexia - rash (consider withdrawal) - speech disorder - tremor - weight loss

- **Uncommon** Aggression - cholecystitis - cholelithiasis - dyspepsia - hypokalaemia - pneumonia - seizures - suicidal ideation - urinary calculus - urinary tract infection - vomiting

**ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in sulfonamide hypersensitivity.

Antiepileptic hypersensitivity syndrome theoretically associated with zonisamide. See under Epilepsy p. 180 for more information.

**CONCEPTION AND CONTRACEPTION** Manufacturer advises women of childbearing potential should use adequate contraception during treatment and for 4 weeks after last dose.

**PREGNANCY**

- **Monitoring** The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

- **BREAST FEEDING** Manufacturer advises avoid for 4 weeks after last dose.

- **HEPATIC IMPAIRMENT** Initially increase dose at 2-week intervals if mild or moderate impairment. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Initially increase dose at 2-week intervals; discontinue if renal function deteriorates.

- **TREATMENT CESSATION** Avoid abrupt withdrawal (consult product literature for recommended withdrawal regimens in children).

**PRESCRIBING AND DISPENSING INFORMATION**

Switching between formulations Care should be taken when switching between oral formulations. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history. Patients may need to be maintained on a specific manufacturer’s branded or generic zonisamide product.

**PATIENT AND CARER ADVICE**

Children and their carers should be made aware of how to prevent and recognise overheating and dehydration.

Medicines for Children leaflet: Zonisamide for preventing seizures www.medicinesforchildren.org.uk/zonisamide-for-preventing-seizures

**NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The Scottish Medicines Consortium has advised (February 2014) that zonisamide (Zonegran ™) is accepted for restricted use within NHS Scotland as adjunctive treatment of focal seizures, with or without secondary generalisation, in adolescents and children aged 6 years and above. It is restricted to use on advice from specialists in paediatric neurology or epilepsy.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

  - Zonisamide 50 mg Zonegran 50mg capsules | 56 capsule PSTM £47.04 DT price = £47.04
  - Zonisamide 100 mg Zonegran 100mg capsules | 56 capsule PSTM £62.72 DT price = £62.72

**ANTIEPILEPTICS** → BARBITURATES

**Phenobarbital**

(Phenobarbitone)

**INDICATIONS AND DOSE**

All forms of epilepsy except typical absence seizures

- **BY MOUTH**
  - Child 1 month–11 years: Initially 1–1.5 mg/kg twice daily, then increased in steps of 2 mg/kg daily as required; maintenance 2.5–4 mg/kg 1–2 times a day
  - Child 12–17 years: 60–180 mg once daily
  - **INITIALLY BY SLOW INTRAVENOUS INJECTION**
  - Neonate: Initially 20 mg/kg, then (by slow intravenous injection or by mouth) 2.5–5 mg/kg once daily, adjusted according to response.

**Status epilepticus**

- **BY SLOW INTRAVENOUS INJECTION**
  - Neonate: Initially 20 mg/kg, dose to be administered at a rate no faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day.
  - Child 1 month–11 years: Initially 20 mg/kg, dose to be administered at a rate no faster than 1 mg/kg/minute, then 2.5–5 mg/kg 1–2 times a day
  - Child 12–17 years: Initially 20 mg/kg (max. per dose 1 g), dose to be administered at a rate no faster than 1 mg/kg/minute, then 300 mg twice daily

**DOSE EQUIVALENCE AND CONVERSION**

For therapeutic purposes phenobarbital and phenobarbital sodium may be considered equivalent in effect.

**CAUTIONS**

Avoid in Acute porphyrias p. 562 · children · debilitated · history of alcohol abuse · history of drug abuse · respiratory depression (avoid if severe)
Nervous system

**INTERACTIONS** → Appendix 1 (phenobarbital).

**SIDE-EFFECTS**
- **Common or very common** Agranulocytosis - allergic skin reactions - ataxia - behavioural disturbances - cholestasis - depression - drowsiness - hallucinations - hepatitis - hyperactivity - hypotension - impaired cognition - impaired memory - irritability - lethargy - megaloblastic anaemia (may be treated with folic acid) - nystagmus - osteomalacia - respiratory depression - thrombocytopenia
- **Very rare** Antiepileptic Hypersensitivity Syndrome - Stevens-Johnson syndrome - suicidal ideation - toxic epidermal necrolysis
- **Frequency not known** Hyperkinesia

**SIDE-EFFECTS**

Overdose
For details on the management of poisoning, see Active elimination techniques, under Emergency treatment of poisoning p. 786.

**ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with phenobarbital. See under Epilepsy p. 180 for more information.

**PREGNANCY**

Monitoring
The dose should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

**BREAST FEEDING** Avoid if possible; drowsiness may occur.

**HEPATIC IMPAIRMENT** May precipitate coma. Avoid in severe impairment.

**RENAL IMPAIRMENT** Use with caution.

**MONITORING REQUIREMENTS**
- Plasma-phenobarbital concentration for optimum response is 15–40 mg/litre (60–180 micromol/litre); however, monitoring the plasma-drug concentration is less useful than with other drugs because tolerance occurs.

**TREATMENT CESSATION** Avoid abrupt withdrawal (dependence with prolonged use).

**DIRECTIONS FOR ADMINISTRATION**
- With oral use For administration by mouth, tablets may be crushed.
- With intravenous use For intravenous injection, dilute to a concentration of 20 mg/mL with Water for Injections; give over 20 minutes (no faster than 1 mg/kg/minute).

**PRESCRIBING AND DISPENSING INFORMATION**

Some hospitals supply alcohol-free formulations of varying phenobarbital strengths. Switching between formulations Different formulations of oral preparations may vary in bioavailability. Patients should be maintained on a specific manufacturer’s product.

**PATIENT AND CARER ADVICE**

Medicines for children leaflet: Phenobarbital for preventing seizures www.medicinesforchildren.org.uk/phenobarbital-for-preventing-seizures

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 2, 8
- **Phenobarbital (Non-proprietary)**
  - Phenobarbital 15 mg Phenobarbital 15mg tablets | 28 tablet [PAX] £24.95 DT price | £22.14 [CD3]
  - Phenobarbital 30 mg Phenobarbital 30mg tablets | 28 tablet [PAX] £5.99 DT price | £5.79 [CD3]
  - Phenobarbital 60 mg Phenobarbital 60mg tablets | 28 tablet [PAX] £7.99 DT price | £6.07 [CD3]

  - Phenobarbital 3 mg per 1 ml Phenobarbital 15mg/5ml elixir | 500 ml [PAX] £83.00 DT price | £83.00 [CD3]

**Solution for injection**

EXCIPIENTS: May contain Propylene glycol
- **Phenobarbital (Non-proprietary)**
  - Phenobarbital sodium 15 mg per 1 ml Phenobarbital sodium 15mg/1ml solution for injection ampoules | 10 ampoule [PAX] £13.68 [CD3]
  - Phenobarbital sodium 30 mg per 1 ml Phenobarbital sodium 30mg/1ml solution for injection ampoules | 10 ampoule [PAX] £20.88–£76.87 [CD3]

**Primingone**

**INDICATIONS AND DOSE**

All forms of epilepsy except typical absence seizures
- **BY MOUTH**
  - Child 1 month-1 year: Initially 125 mg daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 125–250 mg twice daily
  - Child 2-4 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 250–375 mg twice daily
  - Child 5-8 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, adjusted according to response; maintenance 375–500 mg twice daily
  - Child 9-17 years: Initially 125 mg once daily, dose to be taken at bedtime, then increased in steps of 125 mg every 3 days, increased to 250 mg twice daily, then increased in steps of 250 mg every 3 days (max. per dose 750 mg twice daily), adjusted according to response

**CAUTIONS** Avoid in acute porphyria - children - debilitated - history of alcohol abuse - history of drug abuse - respiratory depression (avoid if severe)

**CAUTIONS, FURTHER INFORMATION**

Consider vitamin D supplementation in patients who are immobilised for long periods or who have inadequate sun exposure or dietary intake of calcium.

**INTERACTIONS** → Appendix 1 (primidone).

**SIDE-EFFECTS**
- **Common or very common** Agranulocytosis - allergic skin reactions - ataxia - behavioural disturbances - cholestasis - depression - drowsiness - hallucinations - hepatitis - hyperactivity - hypotension - impaired cognition - impaired memory - irritability - lethargy - megaloblastic anaemia (may be treated with folic acid) - nystagmus - osteomalacia - respiratory depression - thrombocytopenia - visual disturbances
- **Uncommon** Dizziness - headache - vomiting
- **Rare** Arthralgia - lupus erythematosus - psychosis
- **Very rare** Antiepileptic Hypersensitivity Syndrome - Stevens-Johnson syndrome - suicidal ideation - toxic epidermal necrolysis
- **Frequency not known** Dupuytren’s contracture

**ALLERGY AND CROSS-SENSITIVITY** Antiepileptic hypersensitivity syndrome associated with primidone. See under Epilepsy p. 180 for more information.
Epilepsy and other seizure disorders

Benzodiazepines

**CONTRA-INDICATIONS** Acute pulmonary insufficiency - marked neuromuscular respiratory weakness - sleep apnoea syndrome - unstable myasthenia gravis

**CAUTIONS** Avoid prolonged use (and abrupt withdrawal thereafter) - history of alcohol dependence or abuse - history of drug dependence or abuse - myasthenia gravis - respiratory disease

**CAUTIONS, FURTHER INFORMATION**

- **Paradoxical effects** A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from tautness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

**INTERACTIONS** Appendix 1 (anxiolytics and hypnotics).

**SIDE-EFFECTS**

Overdose

Benzodiazepines taken alone cause drowsiness, ataxia, dysarthria, nystagmus, and occasionally respiratory depression, and coma. For details on the management of poisoning, see Benzodiazepines, under Emergency treatment of poisoning p. 786.

**PREGNANCY** Risk of neonatal withdrawal symptoms when used during pregnancy. Avoid regular use and use only if there is a clear indication such as seizure control. High doses administered during late pregnancy or labour may cause neonatal hypothermia, hypotonia, and respiratory depression.

**RENAL IMPAIRMENT** Increased cerebral sensitivity to benzodiazepines.

**PATIENT AND CARER ADVICE**

**Driving and skilled tasks** Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including benzodiazepines, see Drugs and driving under Guidance on prescribing p. 1.

**INDICATIONS AND DOSE**

**Adjunct in epilepsy**

- **BY MOUTH**
  - Child 1 month-5 years: Initially 125 micrograms/kg twice daily, dose to be increased if necessary every 5 days, maintenance 250 micrograms/kg twice daily (max. per dose 500 micrograms/kg twice daily); maximum 30 mg per day
  - Child 6-17 years: Initially 5 mg daily, dose to be increased if necessary at intervals of 5 days, maintenance 0.3–1 mg/kg daily, daily doses of up to 30 mg may be given as a single dose at bedtime, higher doses should be divided; maximum 60 mg per day

**Monotherapy for catamenial (menstruation) seizures (usually for 7–10 days each month, just before and during menstruation) (under expert supervision)**

- **CLUSTER SEIZURES**
  - **BY MOUTH**
    - Child 1 month-5 years: Initially 125 micrograms/kg twice daily, dose to be increased if necessary every 5 days, maintenance 250 micrograms/kg twice daily (max. per dose 500 micrograms/kg twice daily); maximum 30 mg per day
    - Child 6-17 years: Initially 5 mg daily, dose to be increased if necessary at intervals of 5 days, maintenance 0.3–1 mg/kg daily, daily doses of up to 30 mg may be given as a single dose at bedtime, higher doses should be divided; maximum 60 mg per day

**UNLICENSED USE** Not licensed for use in children under 6 years. Not licensed as monotherapy.

**CONTRA-INDICATIONS** Hyperkinesia - obsessional states - phobic states - respiratory depression

**CAUTIONS** Muscle weakness - organic brain changes - personality disorder (within the fearful group—dependent, avoidant, obsessive-compulsive) may increase risk of dependence

**CAUTIONS, FURTHER INFORMATION**

The effectiveness of clobazam may decrease significantly after weeks or months of continuous therapy.

**SIDE-EFFECTS**

- **Common or very common** Amnesia - ataxia - confusion - dependence - drowsiness the next day - lightheadedness the next day - muscle weakness - paradoxical increase in aggression
- **Uncommon** Dizziness - dysarthria - gastro-intestinal disturbances - gynaecomastia - incontinence - salivation changes - tremor - visual disturbances
- **Rare** Apnoea - blood disorders - changes in libido - headache - hypotension - jaundice - respiratory depression - skin reactions - urinary retention - vertigo
- **Frequency not known** Delusions - excitement - hallucinations - irritability - psychosis - restless sleep

**BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones.
PATIENT AND CARER ADVICE

PRESCRIBING AND DISPENSING INFORMATION

RENAL IMPAIRMENT

HEPATIC IMPAIRMENT

HAEMATOLOGICAL AND BIOCHEMICAL MONITORING should not be undertaken unless clinically indicated.

MONITORING REQUIREMENTS
Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected noncompliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should not be undertaken unless clinically indicated.

PRESCRIBING AND DISPENSING INFORMATION

Switching between formulations. Care should be taken when switching between oral formulations in the treatment of epilepsy. The need for continued supply of a particular manufacturer’s product should be based on clinical judgement and consultation with the patient or their carer, taking into account factors such as seizure frequency and treatment history.

Patients being treated for epilepsy may need to be maintained on a specific manufacturer’s branded or generic clobazam product.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Clobazam for preventing seizures www.medicinesforchildren.org.uk/clobazam-preventing-seizures-0

NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Clobazam is not prescribable under the NHS except for epilepsy and endorsed 'SLS'.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 19, 8

Clobazam (Non-proprietary)

Clobazam 10 mg Clobazam 10mg tablets | 30 tablet [POM] £3.59 DT price = £3.29 (C4-1)

Frisium (Sanofi)

Clobazam 10 mg Frisium 10mg tablets | 30 tablet [POM] £2.51 DT price = £3.29 (C4-1)

Oral suspension

CAUTIONARY AND ADVISORY LABELS 2, 19, 8

Clobazam (Non-proprietary)

Clobazam 1 mg per 1 ml Clobazam 5mg/5ml oral suspension sugar free | 150 ml [POM] £90.00 DT price = £90.00 (C4-1) sugar-free | 250 ml [POM] £150.00 (C4-1)

Clobazam 2 mg per 1 ml Clobazam 10mg/5ml oral suspension sugar free | 150 ml [POM] £95.00-£97.50 DT price = £95.00 (C4-1) sugar-free | 250 ml [POM] £162.50 (C4-1)

Perizam (Rosemont Pharmaceuticals Ltd)

Clobazam 1 mg per 1 ml Perizam 1mg/ml oral suspension sugar-free | 150 ml [POM] £90.00 DT price = £90.00 (C4-1)

Clobazam 2 mg per 1 ml Perizam 2mg/ml oral suspension sugar-free | 150 ml [POM] £95.00 DT price = £95.00 (C4-1)

Taplob (Martindale Pharmaceuticals Ltd)

Clobazam 1 mg per 1 ml Taplob 5mg/5ml oral suspension sugar-free | 150 ml [POM] £90.00 DT price = £90.00 (C4-1) sugar-free | 250 ml [POM] £150.00 (C4-1)

Clobazam 2 mg per 1 ml Taplob 10mg/5ml oral suspension sugar-free | 150 ml [POM] £95.00 DT price = £95.00 (C4-1) sugar-free | 250 ml [POM] £158.34 (C4-1)

SIDE-EFFECTS

The effectiveness of clonazepam may decrease significantly after weeks or months of continuous therapy.

SIDE-EFFECTS

Rare Aggression - anxiety - blood disorders - dysarthria - gastro-intestinal symptoms - headache - paradoxical effects - pruritus - respiratory depression - reversible hair loss - sexual dysfunction - skin pigmentation changes - urinary incontinence - urticaria - visual disturbances on long-term treatment

Very rare Increase in seizure frequency

BREAST FEEDING Present in milk, and should be avoided if possible during breast-feeding. All infants should be monitored for sedation, feeding difficulties, adequate weight gain, and developmental milestones.

Hepatic impairment Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

Renal impairment Start with small doses in severe impairment.

Monitoring requirements Routine measurement of plasma concentrations of antiepileptic drugs is not usually justified, because the target concentration ranges are arbitrary and often vary between individuals. However, plasma drug concentrations may be measured in children with worsening seizures, status epilepticus, suspected noncompliance, or suspected toxicity. Similarly, haematological and biochemical monitoring should not be undertaken unless clinically indicated.

Prescribing and dispensing information Switching between formulations. Care should be taken when switching between oral formulations in the treatment of
Diazepam

**INDICATIONS AND DOSE**

**Tetanus**
- **BY INTRAVENOUS INJECTION**
  - Child: 100–300 micrograms/kg every 1–4 hours
  - **BY INTRAVENOUS INFUSION, OR BY NASODUODENAL TUBE**
  - Child: 3–10 mg/kg, adjusted according to response, to be given over 24 hours

**Muscle spasm in cerebral spasticity or in postoperative skeletal muscle spasm**
- **BY MOUTH**
  - Child 1-11 months: Initially 250 micrograms/kg twice daily
  - Child 1-4 years: Initially 2.5 mg twice daily
  - Child 5-11 years: Initially 5 mg twice daily
  - Child 12-17 years: Initially 10 mg twice daily; maximum 40 mg per day

**Status epilepticus / Febrile convulsions / Convulsions due to poisoning**
- **BY INTRAVENOUS INJECTION**
  - Neonate: 300–400 micrograms/kg, then 300–400 micrograms/kg after 10 minutes if required, to be given over 3–5 minutes.
  - Child 1 month-11 years: 300–400 micrograms/kg (max. per dose 10 mg), then 300–400 micrograms/kg after 10 minutes if required, to be given over 3–5 minutes
  - Child 12-17 years: 10 mg, then 10 mg after 10 minutes if required, to be given over 3–5 minutes

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- **Common or very common** Amnesia, ataxia, confusion, dependence, drowsiness, excitement, lightheadedness, the next day, muscle weakness, paradoxical increase in aggression
- **Uncommon** Dizziness, dysarthria, gastrointestinal disturbances, gynaecomastia, incontinence, salivation changes, tremor, visual disturbances
- **Rare** Apnoea, blood disorders, changes in libido, headache, hypotension, jaundice, respiratory depression, skin reactions, urinary retention, vertigo
- **Frequency not known** Delusions, excitement, hallucinations, hypotonia (when used for muscle spasm), irritability, marked respiratory depression, particularly with high dose (facilities for its treatment are essential), psychosis, restlessness

**SPECIFIC SIDE-EFFECTS**
- **With intravenous use** Pain, thrombophlebitis
- **PREGNANCY** Women who have seizures in the second half of pregnancy should be assessed for eclampsia before any change is made to antiepileptic treatment. Status
epileptics should be treated according to the standard protocol. Epilepsy and Pregnancy Register. All pregnant women with epilepsy, whether taking medication or not, should be encouraged to notify UK Epilepsy and Pregnancy Register (Tel: 0800 389 1248).

- **BREAST FEEDING** Present in milk, and should be avoided if possible during breast-feeding.

- **HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. For intravenous benzodiazepines the risk of undertaking skilled tasks (e.g. driving) following day.

- **RENAL IMPAIRMENT** Start with small doses in severe impairment.

### PATIENT AND CARER ADVICE

- **Driving and skilled tasks** May impair judgement and increase reaction time, and so affect ability to drive or perform skilled tasks; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair performance on the following day. Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

- **Dental practitioners’ formulary** Diazepam Tablets may be prescribed. Diazepam Oral Solution 2 mg/5 mL may be prescribed.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

#### Tablet

### 1.1 Status epilepticus

### Paraldehyde

#### INDICATIONS AND DOSE

**Status epilepticus**

- **BY RECTUM**

  - Neonate: 0.8 mL/kilogram for 1 dose, the dose is based on the use of a premixed solution of paraldehyde in olive oil in equal volumes.

  - Child: 0.8 mL/kilogram (max. per dose 20 mL) for 1 dose, the dose is based on the use of a premixed solution of paraldehyde in olive oil in equal volumes.

#### UNLICENSED USE

- Not licensed for use in children as an enema.

#### CONTRA-INDICATIONS

- Gastric disorders - rectal administration in colitis

#### CAUTIONS

- Bronchopulmonary disease

#### INTERACTIONS

- → Appendix 1 (paraldehyde).

#### SIDE-EFFECTS

- Rash

#### PREGNANCY

- Avoid unless essential—crosses placenta.

#### BREAST FEEDING

- Avoid unless essential—present in milk.

#### HEPATIC IMPAIRMENT

- Use with caution.

#### PATIENT AND CARER ADVICE

- Medicines for Children leaflet: Paraldehyde for seizures www.medicinesforchildren.org.uk/paraldehyde-for-seizures

#### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: enema
ANTIEPILEPTICS > BARBITURATES

**Thiopental sodium**  
(Thiopentone sodium)

- **INDICATIONS AND DOSE**
  - **Prolonged status epilepticus**
    - **INITIALLY BY SLOW INTRAVENOUS INJECTION**
    - Neonate: Initially up to 2 mg/kg, then (by continuous intravenous infusion) up to 8 mg/kg/hour, adjusted according to response.
    - Child: Initially up to 4 mg/kg, then (by continuous intravenous infusion) up to 8 mg/kg/hour, adjusted according to response.
  - **Induction of anaesthesia**
    - Neonate: Initially up to 2 mg/kg, then 1 mg/kg, repeated if necessary; maximum 4 mg/kg per course.
    - Child: Initially up to 4 mg/kg, then 1 mg/kg, repeated if necessary; maximum 7 mg/kg per course.

- **UNLICENSED USE** Not licensed for use in status epilepticus. Not licensed for use by intravenous infusion.

**IMPORTANT SAFETY INFORMATION**
Thiopental sodium should only be administered by, or under the direct supervision of, personnel experienced in its use, with adequate training in anaesthesia and airway management, and when resuscitation equipment is available.

- **CONTRA-INDICATIONS** Acute porphyrias p. 562 - myotonic dystrophy
- **CAUTIONS** Acute circulatory failure (shock) - avoid intravenous injection - cardiovascular disease - fixed cardiac output - hypovolaemia - reconstituted solution is highly alkaline (extravasation causes tissue necrosis and severe pain)
- **INTERACTIONS** Appendix 1 (anaesthetics, general).
- **SIDE-EFFECTS** Arrhythmias - cough - headache - hypersensitivity reactions - hypotension - laryngeal spasm - myocardial depression - rash - sneezing
- **PREGNANCY** May depress neonatal respiration when used during delivery.
- **BREAST FEEDING** Breast-feeding can be resumed as soon as mother has recovered sufficiently from anaesthesia.
- **HEPATIC IMPAIRMENT** Use with caution - reduce dose.
- **RENAL IMPAIRMENT** Caution in severe impairment.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection, reconstitute 500-mg vial with 20 mL Water for Injections to give 25 mg/mL solution; give over at least 10–15 seconds; for intravenous infusion reconstituted solution may be further diluted with Sodium Chloride 0.9%.
- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks** Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risk of driving or undertaking skilled tasks afterwards. For a short general anaesthetic the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home. The dangers of taking alcohol should also be emphasised.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Powder for solution for injection**
- Thiopental sodium (Non-proprietary)
  - Thiopental sodium 500 mg Thiopental 500mg powder for solution for injection vials | 25 vial pack £172.50

**HYPNOTICS, SEDATIVES AND ANXIOLYTICS**

**Benzodiazepines**

- **Lorazepam**
  - **INDICATIONS AND DOSE**
    - **Premedication**
      - **BY MOUTH**
        - Child 1 month–11 years: 50–100 micrograms/kg (max. per dose 4 mg), to be given at least 1 hour before procedure, same dose may be given the night before procedure in addition to, or to replace, dose before procedure.
        - Child 12–17 years: 1–4 mg, to be given at least 1 hour before procedure, same dose may be given the night before procedure in addition to, or to replace, dose before procedure.

  - **BY INTRAVENOUS INJECTION**
    - Child: 50–100 micrograms/kg (max. per dose 4 mg), to be administered 30–45 minutes before procedure.

  - **Status epilepticus | Febrile convulsions | Convulsions caused by poisoning**
    - **BY SLOW INTRAVENOUS INJECTION**
      - Neonate: 100 micrograms/kg for 1 dose, then 100 micrograms/kg after 10 minutes if required for 1 dose, to be administered into a large vein.
      - Child 1 month–11 years: 100 micrograms/kg (max. per dose 4 mg) for 1 dose, then 100 micrograms/kg after 10 minutes (max. per dose 4 mg) if required for 1 dose, to be administered into a large vein.
      - Child 12–17 years: 4 mg for 1 dose, then 4 mg after 10 minutes if required for 1 dose, to be administered into a large vein.

- **UNLICENSED USE** Not licensed for use in febrile convulsions. Not licensed for use in convulsions caused by poisoning.
  - **With intravenous use** Not licensed for use as intravenous premedication in children under 12 years.
  - **With oral use** Not licensed for use as oral premedication in children under 5 years.

**IMPORTANT SAFETY INFORMATION**
Benzodiazepines should only be administered for anaesthesia by, or under the direct supervision of, personnel experienced in their use, with adequate training in anaesthesia and airway management.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates - CNS depression - compromised airway - hyperkinesia - obsessional states - phobic states - respiratory depression
- **CAUTIONS** Personality disorder (within the fearful group—dependent, avoidant, obsessive–compulsive) may increase risk of dependence - muscle weakness - organic brain changes - parental administration
- **CAUTIONS, FURTHER INFORMATION**
  - **Paradoxical effects** A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment
of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects.

- Special precautions for parenteral administration
- With intramuscular use or intravenous use When given parenterally, facilities for managing respiratory depression with mechanical ventilation must be available. Close observation required until full recovery from sedation.

**SIDE-EFFECTS**

- Common or very common Amnesia - ataxia - confusion - dependence - drowsiness the next day - lightheadedness the next day - muscle weakness - paradoxical increase in aggressiveness
- Uncommon Dizziness - dysarthria - gastro-intestinal disturbances - gynaecomastia - incontinence - salivation changes - tremor - visual disturbances
- Rare Apnoea - blood disorders - changes in libido - headache - hypotension - jaundice - respiratory depression - skin reactions - urinary retention - vertigo
- Frequency not known Delusions - excitement - hallucinations - irritability - marked respiratory depression, particularly with high dose and intravenous use (facilities for its treatment are essential) - pain (on intravenous injection) - psychosis - restlessness - thrombophlebitis (on intravenous injection)

**BREAST FEEDING** Benzodiazepines are present in milk, and should be avoided if possible during breast-feeding.

**HEPATIC IMPAIRMENT** Start with smaller initial doses or reduce dose. Can precipitate coma. Avoid in severe impairment.

**RENAL IMPAIRMENT** Start with small doses in severe impairment.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous injection, dilute with an equal volume of Sodium Chloride 0.9% (for neonates, dilute injection solution to a concentration of 100 micrograms/mL). Give over 3–5 minutes; max. rate 50 micrograms/kg over 3 minutes.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks
May impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day.

Patients given sedatives and analgesics during minor outpatient procedures should be very carefully warned about the risks of undertaking skilled tasks (e.g. driving) afterwards. For intravenous benzodiazepines the risk extends to at least 24 hours after administration. Responsible persons should be available to take patients home afterwards. The dangers of taking alcohol should be emphasised.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

### Midazolam

**INDICATIONS AND DOSE**

**Status epilepticus | Febrile convulsions**

- **BY BUCCAL ADMINISTRATION**
  - Neonate: 300 micrograms/kg, then 300 micrograms/kg after 10 minutes if required.

- **BY INTRAVENOUS INJECTION**
  - Child 1-2 months: 300 micrograms/kg (max. per dose 2.5 mg), then 300 micrograms/kg after 10 minutes (max. per dose 2.5 mg) if required.
  - Child 3-11 months: 2.5 mg, then 2.5 mg after 10 minutes if required.
  - Child 1-4 years: 5 mg, then 5 mg after 10 minutes if required.
  - Child 5-9 years: 7.5 mg, then 7.5 mg after 10 minutes if required.
  - Child 10-17 years: 10 mg, then 10 mg after 10 minutes if required.

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Neonate: Initially 150–200 micrograms/kg, followed by (by continuous intravenous infusion) 60 micrograms/kg/hour, by (by continuous intravenous infusion) increased in steps of 60 micrograms/kg/hour every 15 minutes (max. per dose 300 micrograms/kg/hour) until seizure controlled.
  - Child: Initially 150–200 micrograms/kg, followed by (by continuous intravenous infusion) 60 micrograms/kg/hour, by (by continuous intravenous infusion) increased in steps of 60 micrograms/kg/hour every 15 minutes (max. per dose 300 micrograms/kg/hour) until seizure controlled.

**Conscious sedation for procedures**

- **BY MOUTH**
  - Child: 500 micrograms/kg (max. per dose 20 mg), to be administered 30–60 minutes before procedure.

- **BY BUCCAL ADMINISTRATION**
  - Child 6 months–9 years: 200–300 micrograms/kg (max. per dose 5 mg).
  - Child 10–17 years (body-weight up to 70 kg): 6–7 mg.
  - Child 10–17 years (body-weight 70 kg and above): 6–7 mg (max. per dose 8 mg).

- **BY RECTUM**
  - Child 6 months–11 years: 300–500 micrograms/kg, to be administered 15–30 minutes before procedure.

- **BY INTRAVENOUS INJECTION**
  - Child 1 month–5 years: Initially 25–50 micrograms/kg, to be administered over 2–3 minutes, 5–10 minutes before procedure, dose can be increased if necessary in small steps to maximum total dose per course; maximum 6 mg per course.
  - Child 6–11 years: Initially 25–50 micrograms/kg, to be administered over 2–3 minutes, 5–10 minutes before procedure, dose can be increased if necessary in small steps to maximum total dose per course; maximum 10 mg per course.
  - Child 12–17 years: Initially 25–50 micrograms/kg, to be administered over 2–3 minutes, 5–10 minutes before procedure, dose can be increased if necessary in small steps to maximum total dose per course; maximum 7.5 mg per course.

**Premedication**

- **BY MOUTH**
  - Child: 500 micrograms/kg (max. per dose 20 mg), to be taken 15–30 minutes before the procedure.

- **BY RECTUM**
  - Child 6 months–11 years: 300–500 micrograms/kg, to be administered 15–30 minutes before induction.
Induction of anaesthesia (but rarely used)
- **BY SLOW INTRAVENOUS INJECTION**
  - Child 7-17 years: Initially 150 micrograms/kg (max. per dose 7.5 mg), dose to be given in steps of 50 micrograms/kg (max. 2.5 mg) over 2–5 minutes; wait for 2–5 minutes before subsequent dosing, then 50 micrograms/kg every 2 minutes (max. per dose 2.5 mg) if required; maximum 500 micrograms/kg per course; maximum 25 mg per course

Sedation of patient receiving intensive care
- **INITIALLY BY SLOW INTRAVENOUS INJECTION**
  - Child 6 months–11 years: Initially 50–200 micrograms/kg, to be administered over at least 3 minutes, followed by (by continuous intravenous infusion) 30–120 micrograms/kg/hour, adjusted according to response, initial dose may not be required and lower maintenance doses needed if opioid analgesics also used; reduce dose (or reduce or omit initial dose) in hypovolaemia, vasoconstriction, or hypothermia
  - Child 12–17 years: Initially 30–300 micrograms/kg, dose to be given in steps of 1–2.5 mg every 2 minutes, followed by (by continuous intravenous infusion) 30–200 micrograms/kg/hour, adjusted according to response, initial dose may not be required and lower maintenance doses needed if opioid analgesics also used; reduce dose (or reduce or omit initial dose) in hypovolaemia, vasoconstriction, or hypothermia
- **BY CONTINUOUS INTRAVENOUS INFUSION**
  - Neonate up to 32 weeks corrected gestational age: 60 micrograms/kg/hour for 24 hours, then reduced to 30 micrograms/kg/hour, adjusted according to response for maximum treatment duration of 4 days.
  - Neonate 32 weeks corrected gestational age and above: 60 micrograms/kg/hour, adjusted according to response for maximum treatment duration of 4 days.
  - Child 1–5 months: 60 micrograms/kg/hour, adjusted according to response

**SIDE-EFFECTS**
- Amnesia
- Anaphylaxis
- Ataxia
- Blood disorders
- Bronchospasm
- Cardiac arrest
- Confusion
- Convulsions (more common in neonates)
- Depression of consciousness
- Dizziness
- Drowsiness
- Dry mouth
- Dysarthria
- Euphoria
- Fatigue
- Gastro-intestinal disturbances
- Hallucinations
- Headache
- Heart rate changes
- Hiccups
- Hypotension
- Incontinence
- Increased appetite
- Injection-site reactions
- Involuntary movements
- Jaundice
- Laryngospasm
- Muscle weakness
- Paradoxical aggression
- Paradoxical excitement
- Respiratory arrest (particularly with high doses or on rapid injection)
- Respiratory depression (may be severe with sedative and peri-operative use; facilities for its treatment are essential)
- Respiratory depression (particularly with high doses or on rapid injection)
- Restlessness (with sedative and peri-operative use)
- Salvage changes
- Severe disinhibition (with sedative and peri-operative use)
- Skin reactions
- Thrombosis
- Urinary retention
- Vertigo
- Visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**
- Sedation Midazolam is associated with profound sedation when high doses are given or when it is used with certain other drugs. Midazolam is not recommended for prolonged sedation in neonates; drug accumulation is likely to occur.

**Overdose**
- There have been reports of overdosage when high strength midazolam has been used for conscious sedation. The use of high-strength midazolam (5 mg/mL in 2 mL and 10 mL ampoules, or 2 mg/mL in 5 mL ampoules) should be restricted to general anaesthesia, intensive care, palliative care, or other situations where the risk has been assessed. It is advised that flumazenil is available when midazolam is used, to reverse the effects if necessary.

**BREAST FEEDING**
- Small amount present in milk—avoid breast-feeding for 24 hours after administration (although amount probably too small to be harmful after single doses).

**HEPATIC IMPAIRMENT**
- Use with caution particularly in sedative doses; can precipitate coma. For status epilepticus and febrile convulsions: use with caution in mild to moderate impairment; avoid in severe impairment.

**RENAL IMPAIRMENT**
- Use with caution in chronic renal failure.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use. For *intravenous infusion* (*Hypnovel®*), give continuously in Glucose 5% or Sodium Chloride 0.9%. For *intravenous injection* in status epilepticus and febrile convulsions, dilute with Glucose 5% or Sodium Chloride 0.9%; rapid intravenous injection (less than 2 minutes) may cause seizure-like myoclonus in preterm neonate. For neonate and children under 15 kg dilute to a max. concentration of 1 mg/mL. *Neonatal intensive care*, dilute 15 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 30 micrograms/kg/hour.
- With oral use. For administration by mouth for sedation and premedication, injection solution may be diluted with apple or black currant juice, chocolate sauce, or cola.
2 Mental health disorders

2.1 Attention deficit hyperactivity disorder

Attention deficit hyperactivity disorder

Management

CNS stimulants should be prescribed for children with severe and persistent symptoms of attention deficit hyperactivity disorder (ADHD), when the diagnosis has been confirmed by a specialist; children with moderate symptoms of ADHD can be treated with CNS stimulants when psychological interventions have been unsuccessful or are unavailable. Prescribing of CNS stimulants may be continued by general practitioners, under a shared-care arrangement. Treatment of ADHD often needs to be continued into adolescence, and may need to be continued into adulthood.

Drug treatment of ADHD should be part of a comprehensive treatment programme. The choice of medication should take into consideration co-morbid conditions (such as tic disorders, Tourette syndrome, and epilepsy), the adverse effect profile, potential for drug misuse, tolerance and dependence; and preferences of the child and carers. Methylphenidate hydrochloride p. 213 and atomoxetine, below, are used for the management of ADHD; dexamfetamine sulfate p. 215 and lisdexamfetamine mesilate p. 216 are an alternative in children who do not respond to these drugs. Guanfacine p. 217, a non-stimulant alpha2-adrenoceptor agonist, can be used in children for whom stimulants are not suitable, not tolerated, or ineffective. Therapeutic response to guanfacine should be evaluated every 2 months for the first year and then at least yearly, when prescribed for extended periods.

The need to continue drug treatment for ADHD should be reviewed at least annually. This may involve suspending treatment.

Tetracyclic antidepressant such as imipramine hydrochloride p. 226 is sometimes used in the treatment of ADHD; it should not be prescribed concomitantly with a CNS stimulant.

CNS STIMULANTS > CENTRALLY ACTING SYMPATHOMIMETICS

Atomoxetine

INDICATIONS AND DOSE

Attention deficit hyperactivity disorder (initiated by a specialist)

BY MOUTH

Child 6–17 years (body-weight up to 70 kg): Initially 500 micrograms/kg daily for 7 days, dose is increased according to response; maintenance 1.2 mg/kg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 1.8 mg/kg per day; maximum 120 mg per day

Child 6–17 years (body-weight 70 kg and above): Initially 40 mg daily for 7 days, dose is increased according to response; maintenance 80 mg daily, total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening, high daily doses to be given under the direction of a specialist; maximum 120 mg per day
DOSE EQUIVALENCE AND CONVERSION

### METHYLPHENIDATE

- **DOSE EQUIVALENCE**
  - Methylphenidate hydrochloride 10 mg = 13.28 mg
  - Methylphenidate hydrochloride 18 mg = 23.10 mg
  - Methylphenidate hydrochloride 36 mg = 46.18 mg

- **CONVERSION**
  - Methylphenidate hydrochloride 10 mg = 13.28 mg
  - Methylphenidate hydrochloride 18 mg = 23.10 mg
  - Methylphenidate hydrochloride 36 mg = 46.18 mg

### Side Effects

- Common: dizziness, drowsiness, dry mouth, dryness of the skin, flatulence, flu-like symptoms, headache, increased blood pressure, irritability, lethargy, malaise, mydriasis, nausea, palpitation, paraesthesia, pruritus, psychosis, QT interval prolongation, suicidal ideation, syncope, tics
- Uncommon: aggression, cold extremities, drowsiness, eye disturbances, fatigue, fever, headache, insomnia, muscle spasms, paraesthesia, palpitations, pruritus, taste disturbances, urticaria
- Rare: Raynaud's phenomenon, seizures

### INDICATIONS AND DOSE

**Attention deficit hyperactivity disorder (initiated under specialist supervision)**

- **By mouth using immediate-release medicines**
  - Child 4-5 years: Initially 2.5 mg twice daily, increased in steps of 2.5 mg daily if required, at weekly intervals, increased if necessary up to 1.4 mg/kg daily in 2–3 divided doses, discontinue if no response after 1 month, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose).

- **Concerta®**
  - Child 4-5 years: Initially 5 mg once daily, dose to be increased in steps of 5–10 mg daily if required, at weekly intervals, increased if necessary up to 60 mg daily in 2–3 divided doses, increased if necessary up to 2.1 mg/kg daily in 2–3 divided doses, the licensed maximum dose is 60 mg daily in 2–3 doses, higher dose (up to a maximum of 90 mg daily) under the direction of a specialist, discontinue if no response after 1 month, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose).

### Treatment

- **By mouth using immediate-release preparations**
  - Child 6-17 years: Initially 5 mg 1–2 times a day, increased in steps of 5–10 mg daily if required, at weekly intervals, increased if necessary up to 60 mg daily in 2–3 divided doses, increased if necessary up to 2.1 mg/kg daily in 2–3 divided doses, the licensed maximum dose is 60 mg daily in 2–3 doses, higher dose (up to a maximum of 90 mg daily) under the direction of a specialist, discontinue if no response after 1 month, if effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose).

### National Funding/Access Decisions

- **NICE technology appraisals (TAs)**
  - Methylphenidate, atomoxetine and dexamfetamine for attention deficit hyperactivity disorder (ADHD) (March 2006) NICE TA98
  - Atomoxetine is recommended, within its licensed indications, as an option for the management of ADHD in children and adolescents.

www.nice.org.uk/TA98
EQUASYM® XL
Attention deficit hyperactivity disorder
> BY MOUTH
  Child 6-17 years: Initially 10 mg once daily, dose to be taken in the morning before breakfast; increased gradually at weekly intervals if necessary; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day

MEDIKINET® XL
Attention deficit hyperactivity disorder
> BY MOUTH
  Child 6-17 years: Initially 10 mg once daily, dose to be taken in the morning before breakfast; adjusted at weekly intervals according to response; increased if necessary up to 2.1 mg/kg daily, licensed max. dose is 60 mg daily, to be increased to higher dose only under direction of specialist; discontinue if no response after 1 month; maximum 90 mg per day

● UNLICENSED USE
  Doses over 60 mg daily not licensed; doses of Concerta XL over 54 mg daily not licensed. Not licensed for use in children under 6 years.

● CONTRA-INDICATIONS
  Anorexia nervosa, arrhythmias, cardiomyopathy, cardiovascular disease, cerebrovascular disorders, heart failure, hyperthyroidism, phaeochromocytoma, psychosis, severe depression, severe hypertension, structural cardiac abnormalities, suicidal ideation, uncontrolled bipolar disorder, vasculitis

● CAUTIONS
  Agitation, alcohol dependence, anxiety, drug dependence, epilepsy (discontinue if increased seizure frequency), family history of Tourette syndrome, susceptibility to angle-closure glaucoma, tics

CONCERTA® XL
Dysphagia (dose form not appropriate); restricted gastro-intestinal lumen (dose form not appropriate)

● INTERACTIONS
  → Appendix 1 (sympathomimetics)

● SIDE-EFFECTS
  > Common or very common
    - Abdominal pain, agitation, alopecia, anorexia, arrhythmias, arthralgia, ascites, changes in blood pressure, cough, depression, diarrhea, diziness, drowsiness, dry mouth, dyspepsia, fever, gangrene, headache, headache, insomnia, irritability, movement disorders, nasopharyngitis, nausea, nervousness, palpitation, pruritus, rash, reduced weight gain, tachycardia, tics, vomiting
  > Uncommon
    - Abnormal dreams, confusion, constipation, dysphonia, epistaxis, haematuria, muscle cramps, suicidal ideation, urinary frequency
  > Rare
    - Angina, sweating, visual disturbances
  > Very rare
    - Angle-closure glaucoma, blood disorders, cerebral arteritis, dependence, erythema multiforme, exfoliative dermatitis, hepatic dysfunction, leucopenia, myocardial infarction, neuroleptic malignant syndrome, psychosis, seizures, thrombocytopenia, tolerance, Tourette syndrome
  > Frequency not known
    - Bradycardia, convulsions, myoclonus, supraventricular tachycardia
  > PREGNANCY
    - Limited experience—avoid unless potential benefit outweighs risk.
  > BREAST FEEDING
    - Limited information available—avoid.

● MONITORING REQUIREMENTS
  > Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

● TREATMENT CESSATION
  Avoid abrupt withdrawal.

● DIRECTIONS FOR ADMINISTRATION
  MEDIKINET® XL
  Contents of capsule can be sprinkled on a tablespoon of apple sauce or yoghurt (then swallowed immediately without chewing).

EQUASYM® XL
  Contents of capsule can be sprinkled on a tablespoon of apple sauce (then swallowed immediately without chewing).

● PRESCRIBING AND DISPENSING INFORMATION
  Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of methylphenidate, prescribers should specify the brand to be dispensed.

CONCERTA® XL
  Consists of an immediate-release component (22% of the dose) and a modified-release component (78% of the dose).

MEDIKINET® XL
  Consists of an immediate-release component (50% of the dose) and a modified-release component (50% of the dose).

EQUASYM® XL
  Consists of an immediate-release component (30% of the dose) and a modified-release component (70% of the dose).

● PATIENT AND CARER ADVICE
  Driving and skilled tasks

Drugs and Driving
  Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

2015 legislation regarding driving whilst taking certain drugs, may also apply to methylphenidate, see Drugs and driving under Guidance on prescribing p. 1.

CONCERTA® XL
  Tablet membrane may pass through gastro-intestinal tract unchanged.

● NATIONAL FUNDING/ACCESS DECISIONS
  NICE technology appraisals (TAs)

Methylphenidate, atomoxetine and dexamfetamine for attention deficit hyperactivity disorder (ADHD) (March 2006) NICE TA98

Methylphenidate is recommended, within its licensed indications, as an option for the management of ADHD in children and adolescents.
www.nice.org.uk/TA98

● MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet
  > Methylphenidate hydrochloride (Non-proprietary)
    - Methylphenidate hydrochloride 5 mg: Methylphenidate 5mg tablets [30 tablet (Medikinet) £3.05 DT price = £3.03 (C02)]
    - Methylphenidate hydrochloride 10 mg: Methylphenidate 10mg tablets [30 tablet (Medikinet) £5.49 DT price = £5.49 (C02)]
    - Methylphenidate hydrochloride 20 mg: Methylphenidate 20mg tablets [30 tablet (Medikinet) £10.92 DT price = £10.92 (C02)]

  > Medikinet (Fylin Pharma Ltd)
    - Methylphenidate hydrochloride 5 mg: Medikinet 5mg tablets [30 tablet (Medikinet) £3.03 DT price = £3.03 (C02)]

Attention deficit hyperactivity disorder

**CNS STIMULANTS ▶ CENTRALLY ACTING SYMPATHOMIMETICS ▶ AMFETAMINES**

## Dexamfetamine sulfate (Dexamfetamine sulfate)

### INDICATIONS AND DOSE

- **Refractory attention deficit hyperactivity disorder (initiated under specialist supervision)**
  - **BY MOUTH**
    - Child 6–17 years: Initially 2.5 mg 2–3 times a day, increased in steps of 5 mg once weekly if required, increased if necessary up to 1 mg/kg daily, maintenance dose to be given in 2–4 divided doses, up to 20 mg daily (40 mg daily has been required in some children)

- **CONTRA-INDICATIONS**
  - Agitated states, cardiovascular disease, history of alcohol abuse, history of drug abuse, hyperexcitability, hyperthyroidism, moderate hypertension, severe hypertension, structural cardiac abnormalities

- **CAUTIONS**
  - Anorexia, bipolar disorder, history of epilepsy (discontinue if seizures occur), mild hypertension, psychosis, susceptibility to angle-closure glaucoma, tics, Tourette syndrome

- **TREATMENT CESSATION**
  - Avoid abrupt withdrawal.

- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use, tablets can be halved.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Data on safety and efficacy of long-term use not complete.

### SIDE-EFFECTS

- **Common or very common**
  - Abdominal cramps, acidosis, aggression, alopecia, anhedonia, anorexia, anxiety, ataxia, cardiomyopathy, cardiovascular collapse, cerebral vasculitis, chest pain, confusion, depression, diarrhoea, dizziness, dry mouth, dysphoria, euphoria, growth restriction in children, headache, hyperactivity, hyperpyrexia, hyperreflexia, hypertension, hypotension, impaired concentration, irritability, ischaemic colitis, malaise, mydriasis, myocardial infarction, nausea, nervousness, neuroleptic malignant syndrome, obsessive-compulsive behaviour, palpitations, panic attack, paranoia, psychosis, rash, renal impairment, restlessness, rhabdomyolysis, seizures, sexual dysfunction, sleep disturbances, stroke, sweating, tachycardia, taste disturbance, Tourette syndrome (in predisposed individuals), tremor, turticaria, visual disturbances, weight loss

- **Very rare**
  - Angle-closure glaucoma

- **Frequency not known**
  - Choreoathetoid movements (in predisposed individuals), dyskinesia (in predisposed individuals), increased appetite, tics (in predisposed individuals)

### OVERDOSE

Amphetamines cause wakefulness, excessive activity, paraesthesia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. See Stimulants under Emergency treatment of poisoning p. 786.

### PREGNANCY

- Avoid (retrospective evidence of uncertain significance suggesting possible embryotoxicity).

### BREAST FEEDING

- Significant amount in milk—avoid.

### RENAL IMPAIRMENT

- Use with caution.

### MONITORING REQUIREMENTS

- Monitor growth in children.
- Monitor for aggressive behaviour or hostility during initial treatment.

- Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

### TREATMENT CESSATION

- Avoid abrupt withdrawal.

### PATIENT AND CARER ADVICE

- Driving and skilled tasks
- Drugs and Driving

Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

- For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including amphetamines, see Drugs and driving under Guidance on prescribing p. 1.

### NATIONAL FUNDING/ACCESS DECISIONS

**NICE technology appraisals (Tas)**

- Methylenidate, atomoxetine and dexamfetamine for attention deficit hyperactivity disorder (ADHD) (March 2006)
  - NICE TA98

Dexamfetamine is recommended, within its licensed indications, as an option for the management of ADHD in children and adolescents. www.nice.org.uk/TA98

### MODIFIED-RELEASE TABLET

- **CAUTIONARY AND ADVISORY LABELS**
- **SYMPATHOMIMETICS**
  - **CNS STIMULANTS**
    - **Growth restriction may occur during prolonged therapy**
    - **Hypertension**

### MODIFIED-RELEASE CAPSULE

- **CAUTIONARY AND ADVISORY LABELS**
- **SYMPATHOMIMETICS**
### Lisdexamfetamine mesilate

**DRUG ACTION** Lisdexamfetamine is a prodrug of dexamfetamine.

### INDICATIONS AND DOSE

Attention deficit hyperactivity disorder refractory to methylphenidate (initiated by a specialist)

- **BY MOUTH**
  - Child 6–17 years: Initially 30 mg once daily, increased in steps of 20 mg every 1 week if required, dose to be taken in the morning, discontinue if response insufficient after 1 month; maximum 70 mg per day.

### CONTRA-INDICATIONS

- Advanced arteriosclerosis - agitated states - hyperexcitability - hyperthyroidism - moderate hypertension - severe hypertension - symptomatic cardiovascular disease

### CAUTIONS

- Anorexia - bipolar disorder - history of alcohol abuse - history of cardiac abnormalities - history of cardiovascular disease - history of drug abuse - may lower seizure threshold (discontinue if seizures occur) - psychosis - susceptibility to angle-closure glaucoma - tics - Tourette syndrome

### CAUTIONS, FURTHER INFORMATION

- Tics and Tourette syndrome Discontinue use if tics occur.
- Growth restriction in children Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdraw slowly to avoid inducing depression or renewed hyperactivity).

### INTERACTIONS

- Appendix 1 (sympathomimetics).

### SIDE-EFFECTS

- **Common or very common** Abdominal cramps - aggression - decreased appetite - diarrhoea - dizziness - drowsiness - dry mouth - dyspnæa - growth restriction in children - headache - labile mood - malaise - mydriasis - nausea - pyrexia - sleep disturbances - tics - vomiting - weight loss
- **Uncommon** Anorexia - anxiety - depression - dermatillomania - dysphoria - hallucination - hypertension - logorrhea - mania - palpitation - paranoïa - rash - restlessness - sexual dysfunction - sweating - tachycardia - tremor - visual disturbances
- **Very rare** Angle-closure glaucoma
- **Frequency not known** Cardiomyopathy - choreoathetoid movements (in predisposed individuals) - dyskinesia (in predisposed individuals) - euphoria - seizures - Tourette syndrome (in predisposed individuals)
- **Overdose** Amphetamines cause wakefulness, excessive activity, paranoïa, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. See Stimulants under Emergency treatment of poisoning p. 786.

### PREGNANCY

Manufacturer advises use only if potential benefit outweighs risk.

### BREAST FEEDING

Manufacturer advises avoid — present in human milk.

### RENAL IMPAIRMENT

Max. dose 50 mg daily in severe impairment.

### MONITORING REQUIREMENTS

- Monitor for aggressive behaviour or hostility during initial treatment.
- Monitor growth in children.
- Pulse, blood pressure, psychiatric symptoms, appetite, weight and height should be recorded at initiation of therapy, following each dose adjustment, and at least every 6 months thereafter.

### TREATMENT CESSATION

Avoid abrupt withdrawal.

### DIRECTIONS FOR ADMINISTRATION

- **Swallow whole or mix contents of capsule in yoghurt or a glass of water or orange juice; contents should be dispersed completely and consumed immediately.**

### PATIENT AND CARER ADVICE

Patients and carers should be counselled on the administration of capsules.

### DRIVING AND SKILLED TASKS

**Drugs and Driving** Prescribers and other healthcare professionals should advise patients if treatment is likely to affect their ability to perform skilled tasks (e.g. driving). This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including amphetamines, see Drugs and driving under Guidance on prescribing p. 1.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

Guanfacine

**INDICATIONS AND DOSE**

**Attention deficit hyperactivity disorder in children for whom stimulants are not suitable, not tolerated or ineffective (initiated under specialist supervision)**

- **BY MOUTH**
  - Child 6–12 years (body-weight 25 kg and above): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 4 mg), for optimal weight-adjusted dose titrations, consult product literature
  - Child 13–17 years (body-weight 34–41.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 4 mg), for optimal weight-adjusted dose titrations, consult product literature
  - Child 13–17 years (body-weight 41.5–49.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 5 mg), for optimal weight-adjusted dose titrations, consult product literature
  - Child 13–17 years (body-weight 49.5–58.4 kg): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 6 mg), for optimal weight-adjusted dose titrations, consult product literature
  - Child 13–17 years (body-weight 58.5 kg and above): Initially 1 mg once daily; adjusted in steps of 1 mg every week if necessary and if tolerated; maintenance 0.05–0.12 mg/kg once daily (max. per dose 7 mg), for optimal weight-adjusted dose titrations, consult product literature

**CAUTIONS**

- Bradycardia (risk of torsade de pointes) - heart block (risk of torsade de pointes) - history of cardiovascular disease - history of QT-interval prolongation - hypokalaemia (risk of torsade de pointes)

**INTERACTIONS**

Appendix 1 (guanfacine).

Caution with concomitant use of drugs that prolong QT-interval.

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - anxiety - bradycardia - constipation - decreased appetite - depression - diarrhoea - dizziness - dry mouth - enuresis - headache - hypotension - irritability - malaise - mood lability - nausea - rash - sleep disturbance - somnolence - vomiting - weight increase
- **Uncommon** Agitation - chest pain - convulsion - dyspepsia - first-degree AV block - hallucination - pallor - poliakuria - pruritus - sinus arrhythmia - syncope - tachycardia
- **Rare** Hypertension
- **Frequency not known** Suicidal ideation

**SIDE-EFFECTS, FURTHER INFORMATION**

- Somnolence and sedation: Somnolence and sedation may occur, predominantly during the first 2-3 weeks of treatment and with dose increases; manufacturer advises to consider dose reduction or discontinuation of treatment if symptoms are clinically significant or persistent.

**Overdose**

Features may include hypotension, initial hypertension, bradycardia, lethargy, and respiratory depression. Manufacturer advises that patients who develop lethargy should be observed for development of more serious toxicity for up to 24 hours.

**CONCEPTION AND CONTRACEPTION**

Manufacturer recommends effective contraception in females of childbearing potential.

**PREGNANCY**

Manufacturer advises —toxicity in animal studies.

**BREAST FEEDING**

Manufacturer advises—present in milk in animal studies.

**HEPATIC IMPAIRMENT**

Manufacturer advises consider dose reduction.

**RENAL IMPAIRMENT**

Manufacturer advises consider dose reduction in severe impairment and end-stage renal disease.

**MONITORING REQUIREMENTS**

- Manufacturer advises to conduct a baseline evaluation to identify patients at risk of somnolence, sedation, hypotension, bradycardia, QT-prolongation, and arrhythmia; this should include assessment of cardiovascular status. Monitor for signs of these adverse effects weekly during dose titration and then every 3 months during the first year of treatment, and every 6 months thereafter. Monitor BMI prior to treatment and then every 3 months for the first year of treatment, and every 6 months thereafter. More frequent monitoring is advised following dose adjustments.

- Monitor blood pressure and pulse during dose downward titration and following discontinuation of treatment.

**TREATMENT CESSATION**

Manufacturer advises avoid abrupt withdrawal; consider dose tapering to minimise potential withdrawal effects.

**DIRECTIONS FOR ADMINISTRATION**

Manufacturer advises avoid administration with high fat meals (may increase absorption).

**PATIENT AND CARER ADVICE**

Patients or carers should be counselled on administration of guanfacine modified-release tablets.

**Missed doses**

Manufacturer advises that patients and carers should inform their prescriber if more than one dose is missed; consider dose re-titration.

**Driving and skilled tasks**

Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness and syncope.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

**2.2 Bipolar disorder and mania**

**Drugs for mania and hypomania**

Antimanic drugs are used to control acute attacks and to prevent recurrence of episodes of mania or hypomania. Long-term treatment of bipolar disorder should continue for
at least two years from the last manic episode and up to five years if the patient has risk factors for relapse. An antidepressant drug may also be required for the treatment of co-existing depression, but should be avoided in patients with rapid-cycling bipolar disorder, a recent history of hypomania, or with rapid mood fluctuations. **Benzodiazepines** Use of benzodiazepines may be helpful in the initial stages of treatment for behavioural disturbance or agitation; they should not be used for long periods because of the risk of dependence. **Antipsychotic drugs** Antipsychotic drugs (normally olanzapine p. 236, quetiapine p. 238, or risperidone p. 239) are useful in acute episodes of mania and hypomania; if the response to antipsychotic drugs is inadequate, lithium or valproate may be added. An antipsychotic drug may be used concomitantly with lithium or valproate in the initial treatment of severe acute mania.

Atypical antipsychotics are the treatment of choice for the long-term management of bipolar disorder in children and adolescents; if the patient has frequent relapses or continuing functional impairment, consider concomitant therapy with lithium or valproate. An atypical antipsychotic that causes less weight gain and does not increase prolactin levels is preferred.

When discontinuing antipsychotics, the dose should be reduced gradually over at least 4 weeks if the child is continuing on other antimanics; if the child is not continuing on other antimanics, or has a history of manic relapse, a withdrawal period of up to 3 months is required.

**Carbamazepine**
Carbamazepine p. 184 may be used under specialist supervision for the prophylaxis of bipolar disorder (manic-depressive disorder) in children unresponsive to a combination of other prophylactic drugs; it is used in patients with rapid-cycling manic-depressive illness (4 or more affective episodes per year). The dose of carbamazepine should not normally be increased if an acute episode of mania occurs.

**Valproate**
Valproic acid (as the semisodium salt) is licensed in adults for the treatment of manic episodes associated with bipolar disorder. Sodium valproate is unlicensed for the treatment of bipolar disorder. Valproate (valproic acid and sodium valproate) can also be used for the prophylaxis of bipolar disorder [unlicensed use]. It must be started and supervised by a specialist experienced in managing bipolar disorder.

Valproate (valproic acid and sodium valproate) should not be used in female children, in females of childbearing potential and pregnant females. Unless alternative treatments are ineffective or not tolerated, because of its high teratogenic potential; the benefits and risks of valproate therapy should be carefully reconsidered at regular treatment reviews. In patients with frequent relapse or continuing functional impairment, consider switching therapy to lithium or an atypical antipsychotic, or adding lithium or an atypical antipsychotic to valproate. If a patient taking valproate experiences an acute episode of mania that is not ameliorated by increasing the valproate dose, consider concomitant therapy with olanzapine, quetiapine, or risperidone.

**Lithium**
Lithium salts are used in the prophylaxis and treatment of mania, in the prophylaxis of bipolar disorder (manic-depressive disorder), and bipolar depression, and as concomitant therapy with antidepressant medication in children who have had an incomplete response to treatment for acute depression in bipolar disorder [unlicensed indication]. It is also used for the treatment of aggressive or self-harming behaviour [unlicensed indication]. The decision to give prophylactic lithium requires specialist advice, and must be based on careful consideration of the likelihood of recurrence in the individual child, and the benefit of treatment weighed against the risks. The full prophylactic effect of lithium may not occur for six to twelve months after the initiation of therapy. An atypical antipsychotic or valproate (given alone or as adjunctive therapy with lithium) are alternative prophylactic treatments in patients who experience frequent relapses or continued functional impairment.

**Drugs used for Bipolar disorder and mania not listed below**
Aripiprazole, p. 234 - Perphenazine, p. 232

### ANTIPSYCHOTICS › LITHIUM SALTS

#### Lithium salts
- **CONTRA-INDICATIONS**
  - Addison’s disease - cardiac insufficiency - dehydration - family history of Brugada syndrome - low sodium diets - personal history of Brugada syndrome - rhythm disorder - untreated hypothyroidism
- **CAUTIONS**
  - Avoid abrupt withdrawal - cardiac disease - concurrent ECT (may lower seizure threshold) - diuretic treatment (risk of toxicity) - epilepsy (may lower seizure threshold) - myasthenia gravis - psoriasis (risk of exacerbation) - QT interval prolongation - review dose as necessary in diarrhoea - review dose as necessary in intercurrent infection (especially if sweating profusely) - review dose as necessary in vomiting - surgery
- **SIDE-EFFECTS**
  - Very rare: Nystagmus
Lithium carbonate

**INDICATIONS AND DOSE**

**Treatment and prophylaxis of mania** | **Treatment and prophylaxis of bipolar disorder** | **Treatment and prophylaxis of recurrent depression** | **Treatment and prophylaxis of aggressive or self-harming behaviour**
---|---|---|---
**BY MOUTH**
- Child 12-17 years: Initially 1–1.5 g daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dose has remained constant for 4 weeks and every 3 months thereafter, dosages are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised.
- Child 12-17 years: Initially 300–400 mg daily, dose adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dose has remained constant for 4 weeks and every 3 months thereafter, dosages are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised.

**BNFC 2016–2017**

Overdose

Signs of intoxication require withdrawal of treatment and include increasing gastro-intestinal disturbances (vomiting, diarrhoea), visual disturbances, polyuria, muscle weakness, fine tremor increasing to coarse tremor, CNS disturbances (confusion and drowsiness increasing to lack of coordination, restlessneas, stupor); abnormal reflexes, myoclonus, incontinence, hypertension. With severe overdosage seizures, cardiac arrhythmias (including sino-atrial block, bradycardia and first-degree heart block), blood pressure changes, circulatory failure, renal failure, coma and sudden death reported.

For details on the management of poisoning, see Lithium, under Emergency treatment of poisoning p. 786.

- **CONCEPTION AND CONTRACEPTION**
  - Manufacturer advises effective contraception during treatment for women of child bearing potential.

- **PREGNANCY**
  - Dose requirements increased during the second and third trimesters (but on delivery return abruptly to normal). Avoid if possible, particularly in the first trimester (risk of teratogenicity, including cardiac abnormalities).
  - Close monitoring of serum-lithium concentration advised in pregnancy (risk of toxicity in neonate).

- **BREAST FEEDING**
  - Present in milk and risk of toxicity in infant—avoid.

- **RENAL IMPAIRMENT**
  - Caution in mild to moderate impairment. Avoid in severe impairment. In renal impairment monitor serum-lithium concentration closely and adjust dose accordingly.

- **MONITORING REQUIREMENTS**
  - Serum concentrations Lithium salts have a narrow therapeutic/toxic ratio and should therefore not be prescribed unless facilities for monitoring serum-lithium concentrations are available.
  - Samples should be taken 12 hours after the dose to achieve a serum-lithium concentration of 0.4–1 mmol/litre (lower end of the range for maintenance therapy).
  - A target serum-lithium concentration of 0.8–1 mmol/litre is recommended for acute episodes of mania, and for patients who have previously relapsed or have sub-syndromal symptoms. It is important to determine the optimum range for each individual patient.
  - Routine serum-lithium monitoring should be performed weekly after initiation and after each dose change until concentrations are stable, then every 3 months thereafter. Additional serum-lithium measurements should be made if a patient develops significant intercurrent disease or if there is a significant change in a patient’s sodium or fluid intake.
  - Renal function should be monitored at baseline and every 6 months thereafter (more often if there is evidence of deterioration or if the patient has other risk factors, such as starting ACE inhibitors, NSAIDs, or diuretics).
  - Assess cardiac and thyroid function before initiating, and thereafter every 6 months on stabilised regimens.

- **TREATMENT CESSATION**
  - While there is no clear evidence of withdrawal or rebound psychosis, abrupt discontinuation of lithium increases the risk of relapse. If lithium is to be discontinued, the dose should be reduced gradually over a period of at least 4 weeks (preferably over a period of up to 3 months). Patients and their carers should be warned of the risk of relapse if lithium is discontinued abruptly. If lithium is stopped or is to be discontinued abruptly, consider changing therapy to an atypical antipsychotic or valproate.

- **PATIENT AND CARER ADVICE**
  - Patients should be advised to report signs and symptoms of lithium toxicity, hypothyroidism, renal dysfunction (including polyuria and polydipsia), and benign
  - intracranial hypertension (persistent headache and visual disturbance).
  - Maintain adequate fluid intake and avoid dietary changes which reduce or increase sodium intake.

- **Driving and skilled tasks**
  - May impair performance of skilled tasks (e.g. driving, operating machinery).
  - Lithium treatment packs A lithium treatment pack should be given to patients on initiation of treatment with lithium. The pack consists of a patient information booklet, lithium alert card, and a record book for tracking serum-lithium concentration. Packs may be purchased from 3M

**UNLICENSED USE**

Not licensed for use in children.
2.3 Depression

Antidepressant drugs

Overview
Depression in children should be managed by an appropriate specialist and treatment should involve psychological therapy.

Choice
The major classes of antidepressant drugs include the tricyclics and related antidepressant drugs, the selective serotonin re-uptake inhibitors (SSRIs), and the monoamine oxidase inhibitors (MAOIs).

Antidepressant drugs should not be used routinely in mild depression, and psychological therapy should be considered initially; however, a trial of antidepressant therapy may be considered in cases refractory to psychological treatments or in those associated with psychosocial or medical problems. Drug treatment of mild depression may also be considered in children with a history of moderate or severe depression.

Choice of antidepressant drug should be based on the individual child’s requirements, including the presence of concomitant disease, existing therapy, suicide risk, and previous response to antidepressant therapy.

When drug treatment of depression is considered necessary in children, the SSRIs should be considered first-line treatment; following a safety and efficacy review, fluoxetine p. 223 is licensed to treat depression in children.

Tricyclic antidepressant drugs should be avoided for the treatment of depression in children. St John’s wort (Hypericum perforatum) is a popular herbal remedy on sale to the public for treating mild depression in adults. It should not be used for the treatment of depression in children because St John’s wort can induce drug metabolising enzymes and a number of important interactions with conventional drugs, including conventional antidepressants, have been identified. Furthermore, the amount of active ingredient varies between different preparations of St John’s wort and switching from one to another can change the degree of enzyme induction. If a child stops taking St John’s wort, the concentration of interacting drugs may increase, leading to toxicity.

Management
Children should be reviewed every 1–2 weeks at the start of antidepressant treatment. Treatment should be continued for at least 4 weeks before considering whether to switch antidepressant due to lack of efficacy. In cases of partial response, continue for a further 2–4 weeks. Following remission, antidepressant treatment should be continued at the same dose for at least 6 months. Children with a history of recurrent depression should continue treatment for at least 2 years.

Hyponatraemia and antidepressant therapy
Hyponatraemia (possibly due to inappropriate secretion of antidiuretic hormone) has been associated with all types of antidepressants; however, it has been reported more frequently with SSRIs than with other antidepressant drugs. Hyponatraemia should be considered in all children who develop drowsiness, confusion, or convulsions while taking an antidepressant.

Suicidal behaviour and antidepressant therapy
The use of antidepressant drugs has been linked with suicidal thoughts and behaviour. Where necessary, children should be monitored for suicidal behaviour, self-harm, and hostility, particularly at the beginning of treatment or if the dose is changed.

Serotonin syndrome
Serotonin syndrome or serotonin toxicity is a relatively uncommon adverse drug reaction caused by excessive central and peripheral serotonergic activity. Onset of symptoms, which range from mild to life-threatening, can occur within hours or days following the initiation, dose escalation, or overdose of a serotonergic drug, the addition of a new serotonergic drug, or the replacement of one serotonergic drug by another without allowing a long enough washout period in-between, particularly when the first drug is an irreversible MAOI or a drug with a long half-life. Severe toxicity, which is a medical emergency, usually occurs with a combination of serotonergic drugs, one of which is generally an MAOI.

The characteristic symptoms of serotonin syndrome fall into 3 main areas, although features from each group may not be seen in all patients—neuromuscular hyperactivity (such as tremor, hyperreflexia, clonus, myoclonus, rigidity), autonomic dysfunction (tachycardia, blood pressure changes, hyperthermia, diaphoresis, shivering, diarrhoea), and altered mental state (agitation, confusion, mania).

Treatment consists of withdrawal of the serotonergic medication and supportive care; specialist advice should be sought.

Important safety information: Depressive illness in children and adolescents
The balance of risks and benefits for the treatment of depressive illness in individuals under 18 years is considered unfavourable for the SSRIs citalopram, escitalopram, paroxetine, and sertraline, and for mirtazapine and venlafaxine. Clinical trials have failed to show efficacy and have shown an increase in harmful outcomes. However, it is recognised that specialists may sometimes decide to use these drugs in response to individual clinical need; children and adolescents should be monitored carefully for suicidal behaviour, self-harm or hostility, particularly at the beginning of treatment. Only fluoxetine has been shown in clinical trials to be effective for treating depressive illness in children and adolescents. However, it is possible that, in common with the other SSRIs, it is associated with a small risk of self-harm and suicidal thoughts. Overall, the balance of risks and benefits for fluoxetine in the treatment of depressive illness in individuals under 18 years is considered favourable, but children and adolescents must be carefully monitored as above.

Anxiety
Management of acute anxiety in children with drug treatment is contentious. For chronic anxiety (of longer than 4 weeks’ duration), it may be appropriate to use an antidepressant drug before a benzodiazepine.

Tricyclic antidepressants are not effective for treating depression in children.

Some tricyclic antidepressant drugs may have a role in some forms of neuralgia, and in nocturnal enuresis in children.

Dosage
It is important to use doses that are sufficiently high for effective treatment but not so high as to cause toxic effects. Low doses should be used for initial treatment.

In most children the long half-life of tricyclic antidepressant drugs allows once-daily administration,
usually at night; the use of modified-release preparations is therefore unnecessary.

**Drugs used for Depression not listed below** Lithium carbonate, p. 219 · Lithium citrate, p. 220

### Antidepressants > Selective Serotonin Re-uptake Inhibitors

**Selective serotonin re-uptake inhibitors**

- **Drug Action** Selectively inhibit the re-uptake of serotonin (5-HT).
- **Contra-Indications** Poorly controlled epilepsy · SSRI s should not be used if the patient enters a manic phase.
- **Caution** Cardiac disease · concurrent electroconvulsive therapy · diabetes mellitus · epilepsy (discontinue if convulsions develop) · history of bleeding disorders (especially gastro-intestinal bleeding) · history of mania · susceptibility to angle-closure glaucoma
- **Interactions** + Appendix 1 (antidepressants, SSRI). Caution with other drugs that increase the risk of bleeding.
- **Side-effects**
  - **Common or very common** Abdominal pain (dose-related) · constipation (dose-related) · diarrrhoea (dose-related) · dyspepsia (dose-related) · gastro-intestinal effects (dose-related) · nausea (dose-related) · vomiting (dose-related)
  - **Uncommon** Serotonin syndrome
  - **Very rare** Angle-closure glaucoma
  - **Frequency not known** Anaphylaxis · angioedema · anorexia with weight loss · anxiety · arthralgia · asthenia · bleeding disorders · convulsions · dizziness · drowsiness · dry mouth · dyskinesias · ecchymoses · galactorrhoea · hallucinations · headache · hypersensitivity reactions · hypomania · hypotension · increased appetite · insomnia · mania · movement disorders · myalgia · nervousness · photosensitivity · purpura · rash · sexual dysfunction · suicidal behaviour · sweating · tremor · urinary retention · urticaria · visual disturbances · weight gain
- **Side-effects, further information**
  - **Hypersensitivity reactions** If hypersensitivity reactions (including rash) occur, consider discontinuation—may be sign of impending serious systemic reaction, possibly associated with vasculitis.
  - **Overdose** Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic instability; hyperthermia, rhabdomyolysis, renal failure, and coagulopathies may develop.
  - For details on the management of poisoning, see Selective serotonin re-uptake inhibitors, under Emergency treatment of poisoning p. 786.
  - **Pregnancy** Manufacturers advise avoid during pregnancy unless the potential benefit outweighs the risk. There is a small increased risk of congenital heart defects when taken during early pregnancy. If used during the third trimester there is a risk of neonatal withdrawal symptoms, and persistent pulmonary hypertension in the newborn has been reported.
  - **Treatment Cessation** Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, electric shock sensation in the head, neck, and spine, tinnitus, sleep disturbances, fatigue, influenza-like symptoms, and sweating are the most common features of abrupt withdrawal of an SSRI or marked reduction of the dose; palpitation and visual disturbances can occur less commonly. The dose should be tapered over at least a few weeks to avoid these effects. For some patients, it may be necessary to withdraw treatment over a longer period; consider obtaining specialist advice if symptoms persist. Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment).
- **Patient and Carer Advice**
  - **Driving and skilled tasks** May also impair performance of skilled tasks (e.g. driving, operating machinery).

---

## Citalopram

- **Indications and Dose**
  - **Major depression**
    - **By mouth using tablets**
      - Child 12-17 years: Initially 10 mg once daily, increased if necessary to 20 mg once daily, dose to be increased over 2–4 weeks; maximum 40 mg per day
    - **By mouth using oral drops**
      - Child 12-17 years: Initially 8 mg once daily, increased if necessary to 16 mg once daily, dose to be increased over 2–4 weeks; maximum 32 mg per day
  - **Dose equivalence and conversion**
    - 4 oral drops (8 mg) is equivalent in therapeutic effect to 10 mg tablet.
- **Unlicensed Use** Not licensed for use in children.
- **Contra-Indications** QT-interval prolongation
- **Caution** Susceptibility to QT-interval prolongation
- **Interactions** Avoid concomitant administration of drugs that prolong QT interval.
- **Side-effects**
  - **Taste disturbance**
  - **Abnormal dreams**
  - **Aggression**
  - **Anxiety**
  - **Bradycardia**
  - **Confusion**

- **Breast feeding** Present in milk—use with caution.
- **Hepatic Impairment** Use doses at lower end of range; for tablets up to maximum 20 mg; for oral solution up to maximum 16 mg.
- **Renal Impairment** No information available for estimated glomerular filtration rate less than 20 mL/minute/1.73 m².
- **Directions for Administration** Cipramil® oral drops should be mixed with water, orange juice, or apple juice before taking.
- **Patient and Carer Advice** Counselling on administration of oral drops is advised.

---

## Driving and skilled tasks
Patients should be advised of the effects of citalopram on driving and operating machinery.
Fluoxetine

INDICATIONS AND DOSE

Major depression

BY MOUTH

Child 8-17 years: Initially 10 mg daily, increased if necessary up to 20 mg daily, dose to be increased after 1–2 weeks of initial dose, daily dose may be administered as a single or divided dose

PHARMACOKINETICS

Consider the long half-life of fluoxetine when adjusting dosage (or in overdosage).

SIDE-EFFECTS

BREAST FEEDING

Present in milk—avoid.

HEPATIC IMPAIRMENT

Reduce dose or increase dose interval.

DIRECTIONS FOR ADMINISTRATION

Dispersible tablets can be dispersed in water for administration or swallowed whole with plenty of water.

PATIENT AND CARER ADVICE

Patients and carers should be counselled on the administration of dispersible tablets.

Driving and skilled tasks

Patients should be counselled about the effects on driving and skilled tasks.

Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Dispersible tablet

CAUTIONARY AND ADVISORY LABELS

10

Olena (AMCo)

Fluoxetine (as Fluoxetine hydrochloride) 20 mg Olena 20 mg dispersible tablets sugar-free | 28 tablet £3.44 DT price = £3.44

Capsule

Fluoxetine (Non-proprietary)

Fluoxetine (as Fluoxetine hydrochloride) 10 mg Fluoxetine 10mg capsules | 30 capsule £55.00

Fluoxetine (as Fluoxetine hydrochloride) 20 mg Fluoxetine 20mg capsules | 30 capsule £95.00

Fluoxetine (as Fluoxetine hydrochloride) 60 mg Fluoxetine 60mg capsules | 30 capsule £144.00 DT price = £112.26

Oxactin (Discovery Pharmaceuticals)

Fluoxetine (as Fluoxetine hydrochloride) 20 mg Oxactin 20mg capsules | 30 capsule £93.61 DT price = £70.92

Prozac (Eli Lilly and Company Ltd)

Fluoxetine (as Fluoxetine hydrochloride) 20 mg Prozac 20mg capsules | 30 capsule £77.50 DT price = £59.92

Oral solution

Fluoxetine (Non-proprietary)

Fluoxetine (as Fluoxetine hydrochloride) 4 mg per 1 ml Fluoxetine 20mg/5ml oral solution | 70 ml £25.75 DT price = £2.86

Fluoxetine 20mg/5ml oral solution sugar free sugar-free | 70 ml £15.56

Prozac (Eli Lilly and Company Ltd)

Fluoxetine (as Fluoxetine hydrochloride) 4 mg per 1 ml Prozac 20mg/5ml liquid | 70 ml £11.22 DT price = £2.86

Prozep (Chemex Pharma Ltd)

Fluoxetine (as Fluoxetine hydrochloride) 4 mg per 1 ml Prozep 20mg/5ml oral solution sugar-free | 70 ml £12.95

Fluvoxamine maleate

INDICATIONS AND DOSE

Obsessive-compulsive disorder

BY MOUTH

Child 8-17 years: Initially 25 mg daily, then increased in steps of 25 mg every 4–7 days (max. per dose 100 mg twice daily) if required, dose to be increased according to response, doses above 50 mg should be given in 2 divided doses, if no improvement in obsessive-compulsive disorder within 10 weeks, treatment should be reconsidered

SIDE-EFFECTS

Common or very common Malaise - palpitation - tachycardia

Uncommon Ataxia - confusion - postural hypotension

Rare Abnormal liver function, usually symptomatic (discontinue treatment)

Frequency not known Neuroleptic malignant syndrome-like event - paraesthesia - taste disturbance

BREAST FEEDING

Present in milk—avoid.

HEPATIC IMPAIRMENT

Start with low dose.

RENAI IMPAIRMENT

Start with low dose.

PATIENT AND CARER ADVICE

Driving and skilled tasks

Patients should be counselled about the effects on driving and skilled tasks.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

Fluvoxamine maleate (Non-proprietary)

Fluvoxamine maleate 50 mg Fluvoxamine 50mg tablets | 60 tablet £29.99 DT price = £25.57

Fluvoxamine maleate 100 mg Fluvoxamine 100mg tablets | 30 tablet £29.99 DT price = £25.57

Faverin (BGP Products Ltd)

Fluvoxamine maleate 50 mg Faverin 50mg tablets | 60 tablet £17.10 DT price = £14.57

Fluvoxamine maleate 200 mg Faverin 200mg tablets | 30 tablet £57.30 DT price = £47.57

Fluoxetine

INDICATIONS AND DOSE

There can be variation in the licensing of different medicines containing the same drug.
Sertraline

**INDICATIONS AND DOSE**

**Obsessive-compulsive disorder**

- **BY MOUTH**
  - Child 6–11 years: Initially 25 mg daily for 1 week, then increased to 50 mg daily, then increased in steps of 50 mg at intervals of at least 1 week if required; maximum 200 mg per day
  - Child 12–17 years: Initially 50 mg daily, then increased in steps of 50 mg at intervals of at least 1 week if required; maximum 200 mg per day

**Major depression**

- **BY MOUTH**
  - Child 12–17 years: Initially 50 mg once daily, then increased in steps of 50 mg at intervals of at least 1 week if required; maximum 200 mg per day

**UNLICENSED USE**

Not licensed for use in children for depression.

**SIDE-EFFECTS**

- Aggression
- Amnesia
- Bronchospasm
- Hepatotoxicity
- Hyperchloremic acidosis
- Hypertension
- Hypoglycemia
- Hypothyroidism
- Jaundice
- Leucopenia
- Liver failure
- Menstrual irregularities
- Palitation
- Pancreatitis
- Paraeesthesia
- Postural hypotension
- Stomatitis
- Tachycardia
- Tinnitus
- Urinary incontinence

**BREAST FEEDING**

Not known to be harmful but consider discontinuing breast-feeding.

**HEPATIC IMPAIRMENT**

Reduce dose or increase dose interval in mild or moderate impairment. Avoid in severe impairment.

**RENAL IMPAIRMENT**

Use with caution.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks

Patients should be counselled on the effects on driving and skilled tasks.

Medicines for Children leaflet: Sertraline for OCD (obsessive compulsive disorder) and depression

www.medicinesforchildren.org.uk/sertaline-for-ocd-obsessive-compulsive-disorder-and-depression

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

- **Tablet**
  - **Sertraline (Non-proprietary)**
    - Sertraline (as Sertraline hydrochloride) 50 mg
    - Sertraline 50 mg tablets | 28 tablet (Batch) £15.25 DT price = £1.28
  - **Sertraline (as Sertraline hydrochloride) 100 mg**
    - Sertraline 100 mg tablets | 28 tablet (Batch) £20.09 DT price = £1.39
  - **Lustral (Pfizer Ltd)**
    - Sertraline (as Sertraline hydrochloride) 50 mg
      - Lustral 50 mg tablets | 28 tablet (Batch) £17.82 DT price = £1.28
    - **Sertraline (as Sertraline hydrochloride) 100 mg**
      - Lustral 100 mg tablets | 28 tablet (Batch) £29.16 DT price = £1.39

**ANTIDEPRESSANTS**

**Amoterpine**

- **INDICATIONS AND DOSE**
  - **Depressive illness (but not recommended)**
  - **BY MOUTH**
    - Child 16–17 years: Initially 10–25 mg 3 times a day, alternatively initially 30–75 mg once daily, dose to be taken at bedtime, increased if necessary to 150–200 mg daily, dose to be increased gradually

Neuropathic pain

- **BY MOUTH**
  - Child 2–11 years: Initially 200–500 micrograms/kg once daily (max. per dose 10 mg), dose to be taken at night, increased if necessary up to 1 mg/kg twice daily, to be given on specialist advice
  - Child 12–17 years: Initially 10 mg once daily, increased if necessary to 75 mg once daily, dose to be taken at night, dose to be increased gradually, higher doses to be given on specialist advice

**UNLICENSED USE**

Not licensed for use in neuropathic pain.

**CONTRA-INDICATIONS**

Acute porphyrias p. 562 - arrhythmias - during manic phase of bipolar disorder - heart block

**CAUTIONS**

Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - patients with a significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - susceptibility to angle-closure glaucoma - urinary retention

**CAUTIONS, FURTHER INFORMATION**

Treatment should be stopped if the patient enters a manic phase.

**INTERACTIONS**

Appendix 1 (Antidepressants, tricyclic).

**SIDE-EFFECTS**

- Common or very common Abdominal pain - fatigue - hypertension - mydriasis - oedema - palpitation - restlessness - stomatitis

- Rare Dysarthria - extrapyramidal symptoms - paralytic ileus - tremor

- *Very rare* Neuroleptic malignant syndrome - precipitation of angle-closure glaucoma

- *Frequency not known* Agitation - alopecia - anorexia - anxiety - arrhythmia - blurred vision - breast enlargement - changes in blood sugar - chills (on withdrawal) - confusion - constipation - convulsions - delusions - dizziness - drowsiness - dry mouth - ECG changes - galactorrhoea - gynaecomastia - haematological reactions - hallucinations - headache (on withdrawal) - heart block - hepatic reactions - hypomana - hypoaemia - increased appetite - increased intra-ocular pressure - influenza-like symptoms (on withdrawal) - Insomnia (on withdrawal) - irritability - mania - movement disorders (on withdrawal) - myalgia (on withdrawal) - nausea - (on withdrawal) - paraesthesia - photosensitivity - postural hypotension - pruritus - rash - sexual dysfunction - sleep disturbances - sudden death of patients with cardiac disease - suicidal behaviour - sweating - sweating (on withdrawal) - tachycardia - taste disturbance - tinnitus - urinary retention - urticaria - vivid dreams (on withdrawal) - vomiting - weight gain - weight loss

**Overdose**

Overdosage with amitriptyline is associated with a relatively high rate of fatality. Symptoms of overdosage may include dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning, see Tricyclic and related antidepressants, under Emergency treatment of poisoning p. 786.

**PREGNANCY**

Use only if potential benefit outweighs risk.

**BREAST FEEDING**

The amount secreted into breast milk is too small to be harmful.

**HEPATIC IMPAIRMENT**

Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

**TREATMENT CESSATION**

Withdrawal effects may occur within 5 days of stopping treatment with antidepressant
DRUGS; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

**PRESCRIBING AND DISPENSING INFORMATION** Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdose.

**PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

Drowsiness may affect the performance of skilled tasks (e.g. driving).

Effects of alcohol enhanced.

**Medicines for Children leaflet: Amitriptyline for neuropathic pain**

www.medicinesforchildren.org.uk/amitriptyline-for-neuropathic-pain

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

**CAUTIONARY AND ADVISORY LABELS**

  - Amitriptyline hydrochloride 50 mg Amitriptyline 50mg tablets 28 tablet [Pres] £3.60 DT price = £8.92

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS**

- **Amitriptyline hydrochloride (Non-proprietary)**
  - Amitriptyline hydrochloride 2 mg per 1 ml Amitriptyline 10mg/5ml oral solution sugar free sugar-free 150 ml [Pres] £2.60–122.25
  - Amitriptyline hydrochloride 5 mg per 1 ml Amitriptyline 25mg/5ml oral solution sugar free sugar-free 150 ml [Pres] £3.00–172.95
  - Amitriptyline hydrochloride 10 mg per 1 ml Amitriptyline 50mg/5ml oral solution sugar free sugar-free 150 ml [Pres] £18.00 DT price = £18.00
  - Amitriptyline hydrochloride 10 mg per 1 ml Amitriptyline 50mg/5ml oral solution sugar free sugar-free 150 ml [Pres] £19.20 DT price = £19.20

**Doxepin**

**INDICATIONS AND DOSE**

**Depressive illness (particularly where sedation is required)**

- **BY MOUTH**
  - Child 12-17 years: Initially 75 mg daily in divided doses, alternatively 75 mg once daily, adjusted according to response, dose to taken at bedtime; maintenance 25–300 mg daily, doses above 100 mg given in 3 divided doses

**CONTRA-INDICATIONS**

- Acute porphyrias p. 562 - arrhythmias - during manic phase of bipolar disorder - heart block

**CAUTIONS**

- Cardiovacular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - patients with significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - susceptibility to angle-closure glaucoma - urinary retention

**CAUTIONS, FURTHER INFORMATION**

Treatment should be stopped if the patient enters a manic phase.

**INTERACTIONS**

- Appendix 1 (antidepressants, tricyclic).
**Imipramine hydrochloride**

**INDICATIONS AND DOSE**

- **Nocturnal enuresis**
  - **By mouth**
  - Child 6-7 years: 25 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course
  - Child 8-10 years: 25-50 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course
  - Child 11-17 years: 50-75 mg once daily, to be taken at bedtime, initial period of treatment (including gradual withdrawal) 3 months—full physical examination before further course

- **Attention deficit hyperactivity disorder (under expert supervision)**
  - **By mouth**
  - Child 6-17 years: 10-30 mg twice daily

**UNLICENSED USE** Not licensed for use for attention deficit hyperactivity disorder.

**CONTRA-INDICATIONS** Acute porphyrias p. 562 - arrhythmia - during the manic phase of bipolar disorder - heart block

**CAUTIONS** Cardiovascular disease - chronic constipation - diabetes - epilepsy - history of bipolar disorder - history of psychosis - hyperthyroidism (risk of arrhythmias) - patients with a significant risk of suicide - phaeochromocytoma (risk of arrhythmias) - susceptibility to angle-closure glaucoma - urinary retention

**Oral solution**

- **CAUTIONARY AND ADVISORY LABELS 2**
  - Imipramine hydrochloride (Non-proprietary)
  - Imipramine hydrochloride 5 mg per 1 ml Imipramine 25mg/5ml oral solution sugar free sugar-free | 150 ml (£0.39.31)
## Nortriptyline

### Indications and Dose

- **Depressive illness**
  - **By mouth**
  - Child 12-17 years: To be initiated at a low dose, then increased if necessary to 30–50 mg daily in divided doses, alternatively increased if necessary to 30–50 mg once daily; maximum 150 mg per day

### Contra-Indications

- Acute porphyrias p. 562
- Arrhythmias during the manic phase of bipolar disorder
- Heart block

### Cautions

- Cardiovascular disease
- Chronic constipation
- Diabetes
- Epilepsy
- History of bipolar disorder
- History of psychosis
- Hyperthyroidism (risk of arrhythmias)
- Patients with a significant risk of suicide
- Phaeochromocytoma
- (risk of arrhythmias)
- Susceptibility to angle-closure glaucoma
- Urinary retention

### Side-Effects

- Fatigue
- Hypertension
- Mydriasis
- Restlessness
- Extrapyramidal symptoms
- Paralytic ileus

- **Frequency not known**
  - Abdominal pain
  - Agitation
  - Alopecia
  - Anorexia
  - Anxiety
  - Arthralgia
  - Blurred vision
  - Breast enlargement
  - Changes in blood sugar
  - Chills (on withdrawal)
  - Confusion
  - Constipation
  - Convulsions
  - Delusions
  - Diarrhoea
  - Dizziness
  - Drowsiness
  - Dry mouth
  - Dysarthria
  - ECG changes
  - Flushings
  - Galactorrhoea
  - Gynaecomastia
  - Haematological reactions
  - Hallucinations
  - Headache (on withdrawal)
  - Heart block
  - Hepatic reactions
  - Hypomania
  - Hypotension
  - Increased appetite
  - Influenza-like symptoms (on withdrawal)
  - Insomnia (on withdrawal)
  - Irritability
  - Mania
  - Movement disorders (on withdrawal)
  - Myalgia (on withdrawal)
  - Nausea
  - Neuroleptic malignant syndrome
  - Oedema
  - Paraesthesia
  - Photosensitivity
  - Postural hypotension
  - Pruritus
  - Rash
  - Sexual dysfunction
  - Sleep disturbances
  - Stomatitis
  - Sudden death of patients with cardiac disease
  - Suicidal behaviour
  - Sweating (on withdrawal)
  - Tachycardia
  - Taste disturbance
  - Tinnitus
  - Tremor
  - Urinary retention
  - Urticaria
  - Vivid dreams (on withdrawal)
  - Vomiting
  - Weight gain
  - Weight loss

### Overdose

- Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. For details on the management of poisoning see Tricyclic and related antidepressants under Emergency treatment of poisoning p. 786.

### Pregnancy

- Use only if potential benefit outweighs risk.

### Breast Feeding

- The amount secreted into breast milk is too small to be harmful.

### Hepatic Impairment

- Sedative effects are increased in hepatic impairment. Avoid in severe liver disease.

### Monitoring Requirements

- Manufacturer advises plasma-nortriptyline concentration monitoring if dose above 100 mg daily, but evidence of practical value uncertain.

### Treatment Cessation

- Withdrawal effects may occur within 5 days of stopping treatment with antidepressant drugs; they are usually mild and self-limiting, but in some cases may be severe. The risk of withdrawal symptoms is increased if the antidepressant is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). If possible tricyclic and related antidepressants should be withdrawn slowly.

### Prescribing and Dispensing Information

- Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular and epileptogenic effects are dangerous in overdosage.

### Patient and Carer Advice

- Drowsiness may affect the performance of skilled tasks (e.g. driving). Effects of alcohol enhanced.

### Medicinal Forms

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

- **Cautionary and Advisory Labels** 2

### 2.4 Psychoses and Schizophrenia

#### Psychoses and Related Disorders

**Advice on doses of antipsychotic drugs above BNF for Children upper limit**

- Consider alternative approaches including adjuvant therapy.
- Bear in mind risk factors, including obesity. Consider potential for drug interactions—see interactions: Appendix 1 (antipsychotics).
- Carry out ECG to exclude untoward abnormalities such as prolonged QT interval; repeat ECG periodically and reduce dose if prolonged QT interval or other adverse abnormality develops.
- Increase dose slowly and not more often than once weekly.
- Carry out regular pulse, blood pressure, and temperature checks; ensure that patient maintains adequate fluid intake.
- Consider high-dose therapy to be for limited period and review regularly; abandon if no improvement after 3 months (return to standard dosage).

**Important:** When prescribing an antipsychotic for administration on an emergency basis, the intramuscular dose should be lower than the corresponding oral dose (owing to absence of first-pass effect), particularly if the child is very active (increased blood flow to muscle considerably increases the rate of absorption). The prescription should specify the dose for each route and should not imply that the same dose can be given by mouth or by intramuscular injection. The dose of antipsychotic for emergency use should be reviewed at least daily.

### Antipsychotic Drugs

There is little information on the efficacy and safety of antipsychotic drugs in children and adolescents and much of the information available has been extrapolated from adult data; in particular, little is known about the long-term effects of antipsychotic drugs on the developing nervous system. Antipsychotic drugs should be initiated and managed under the close supervision of an appropriate specialist.
Antipsychotic drugs are also known as ‘neuroleptics’ and (misleadingly) as ‘major tranquillisers’.

In the short term they are used to calm disturbed children whatever the underlying psychopathology, which may be schizophrenia, brain damage, mania, toxic delirium, or agitated depression. Antipsychotic drugs are used to alleviate severe anxiety but this too should be a short-term measure.

**Schizophrenia**

The aim of treatment is to alleviate the suffering of the child (and carer) and to improve social and cognitive functioning. Many children require life-long treatment with antipsychotic medication. Antipsychotic drugs relieve positive psychotic symptoms such as thought disorder, hallucinations, and delusions, and prevent relapse; they are usually less effective on negative symptoms such as apathy and social withdrawal. In many patients, negative symptoms persist between episodes of treated positive symptoms, but earlier treatment of psychotic illness may protect against the development of negative symptoms over time. Children with acute schizophrenia generally respond better than those with chronic symptoms.

Long-term treatment of a child with a definitive diagnosis of schizophrenia is usually required after the first episode of illness in order to prevent relapses. Doses that are effective in acute episodes should generally be continued as prophylaxis.

**First-generation antipsychotic drugs**

The first-generation antipsychotic drugs act predominantly by blocking dopamine D2 receptors in the brain. First-generation antipsychotic drugs are not selective for any of the four dopamine pathways in the brain and so can cause a range of side-effects, particularly extrapyramidal symptoms and elevated prolactin. The *phenothiazine* derivatives can be divided into 3 main groups:

- **Group 1**: chlorpromazine hydrochloride p. 230, levomepromazine p. 251, and promazine hydrochloride, generally characterised by pronounced sedative effects and moderate antimuscarinic and extrapyramidal side-effects.
- **Group 2**: pericyazine p. 232, generally characterised by moderate sedative effects, but fewer extrapyramidal side-effects than groups 1 or 3.
- **Group 3**: perphenazine p. 232, prochlorperazine p. 252, and trifluoperazine p. 233, generally characterised by fewer sedative and antimuscarinic effects, but more pronounced extrapyramidal side-effects than groups 1 and 2.

**Butyrophenones** (e.g. haloperidol p. 231) resemble the group 3 phenothiazines in their clinical properties. **Diphenylbutylopiiperidines** (pimozide p. 232) and the **substituted benzamides** (sulpiride p. 233) have reduced sedative, antimuscarinic, and extrapyramidal effects.

**Second-generation antipsychotic drugs**

The second-generation antipsychotic drugs (also referred to as atypical antipsychotic drugs) act on a range of receptors in comparison to first-generation antipsychotic drugs and have more distinct clinical profiles, particularly with regard to side-effects.

**Side effects of antipsychotic drugs**

Side-effects caused by antipsychotic drugs are common and contribute significantly to non-adherence to therapy.

Extrapyramidal symptoms occur most frequently with the piperazine phenothiazines (fluphenazine, perphenazine, prochlorperazine, and trifluoperazine), the butyrophenones (benperidol and haloperidol), and the first-generation depot preparations. They are easy to recognise but cannot be predicted accurately because they depend on the dose, the type of drug, and on individual susceptibility.

Extrapyramidal symptoms consist of:

- parkinsonian symptoms (including tremor), which may appear gradually;
- dystonia (abnormal face and body movements) and dyskinesia, which occur more commonly in children or young adults and appear after only a few doses;
- akathisia (restlessness), which characteristically occurs after large initial doses and may resemble an exacerbation of the condition being treated;
- tardive dyskinesia (rhythmic, involuntary movements of tongue, face, and jaw), which usually develops on long-term therapy or with high dosage, but it may develop on short-term treatment with low doses—short-lived tardive dyskinesia may occur after withdrawal of the drug.

**Parkinsonian symptoms** remit if the drug is withdrawn and may be suppressed by the administration of antimuscarinic drugs. However, routine administration of such drugs is not justified because not all patients are affected and they may unmask or worsen tardive dyskinesia.

**Tardive dyskinesia** is the most serious manifestation of extrapyramidal symptoms; it is of particular concern because it may be irreversible on withdrawing therapy and treatment is usually ineffective. In children, tardive dyskinesia is more likely to occur when the antipsychotic drug is withdrawn.

However, some manufacturers suggest that drug withdrawal at the earliest signs of tardive dyskinesia (fine vermicular movements of the tongue) may halt its full development. Tardive dyskinesia occurs fairly frequently and treatment must be carefully and regularly reviewed.

**Hyperprolactinaemia**

Most antipsychotic drugs, both first- and second-generation, increase prolactin concentration to some extent because dopamine inhibits prolactin release. Aripiprazole reduces prolactin because it is a dopamine-receptor partial agonist. Risperidone, amisulpride, and first-generation antipsychotic drugs are most likely to cause symptomatic hyperprolactinaemia. The clinical symptoms of hyperprolactinaemia include sexual dysfunction, reduced bone mineral density, menstrual disturbances, breast enlargement, and galactorrhoea.

**Sexual dysfunction**

Sexual dysfunction is one of the main causes of non-adherence to antipsychotic medication; physical illness, psychiatric illness, and substance misuse are contributing factors. Antipsychotic-induced sexual dysfunction is caused by more than one mechanism. Reduced dopamine transmission and hyperprolactinaemia decrease libido; antimuscarinic effects can cause disorders of arousal; and alpha-receptor antagonists are associated with erection and ejaculation problems in men. Risperidone and haloperidol commonly cause sexual dysfunction. If sexual dysfunction is thought to be antipsychotic-induced, dose reduction or switching medication should be considered.

**Cardiovascular side-effects**

Antipsychotic drugs have been associated with cardiovascular side-effects such as tachycardia, arrhythmias, and hypotension. QT-interval prolongation is a particular concern with pimozide and haloperidol. There is also a higher probability of QT-interval prolongation in patients using any intravenous antipsychotic drug, or any antipsychotic drug or combination of antipsychotic drugs with doses exceeding the recommended maximum. Cases of sudden death have occurred.

**Hyperglycaemia**

Hyperglycaemia and sometimes diabetes can occur with antipsychotic drugs, particularly clozapine, olanzapine, quetiapine, and risperidone. All antipsychotic drugs may cause weight gain, but the risk and extent varies. Clozapine and olanzapine commonly cause weight gain.
Hypotension and interference with temperature regulation

Hypotension and interference with temperature regulation are dose-related side-effects. Clozapine, chlorpromazine, and quetiapine can cause postural hypotension (especially during initial dose titration) which may be associated with syncope or reflex tachycardia in some children.

Neuroleptic malignant syndrome

Neuroleptic malignant syndrome (hyperthermia, fluctuating level of consciousness, muscle rigidity, and autonomic dysfunction with pallor, tachycardia, labile blood pressure, sweating, and urinary incontinence) is a rare but potentially fatal side-effect of all antipsychotic drugs. Discontinuation of the antipsychotic drug is essential because there is no proven effective treatment, but bromocriptine and dantrolene have been used. The syndrome, which usually lasts for 5–7 days after drug discontinuation, may be unduly prolonged if depot preparations have been used.

Blood dyscrasias

Perform blood counts if unexplained infection or fever develops.

Choice

The antipsychotic drugs most commonly used in children are haloperidol p. 231, risperidone p. 239, and olanzapine p. 236. There is little meaningful difference in efficacy between each of the antipsychotic drugs (other than clozapine p. 235), and response and tolerability to each antipsychotic drug varies. There is no first-line antipsychotic drug which is suitable for all children. Choice of antipsychotic medication is influenced by the child’s medication history, the degree of sedation required (although tolerance to this usually develops), and consideration of individual patient factors such as risk of extrapyramidal side-effects, weight gain, impaired glucose tolerance, QT-interval prolongation, or the presence of negative symptoms.

Negative symptoms

Second generation antipsychotic drugs may be better at treating the negative symptoms of schizophrenia.

Extrapyramidal side-effects

Second-generation antipsychotic drugs may be prescribed if extrapyramidal side-effects are a particular concern. Of these, aripiprazole p. 234, clozapine, olanzapine, and quetiapine p. 238 are least likely to cause extrapyramidal side-effects. Although amisulpride p. 234 is a dopamine-receptor antagonist, extrapyramidal side-effects are less common than with the first-generation antipsychotic drugs because amisulpride selectively blocks mesolimbic dopamine receptors, and extrapyramidal symptoms are caused by blockade of the striatal dopamine pathway.

QT interval

Aripiprazole has negligible effect on the QT interval. Other antipsychotic drugs with a reduced tendency to prolong QT interval include amisulpride, clozapine, olanzapine, perphenazine p. 232, risperidone, and sulphiride p. 233.

Diabetes

Schizophrenia is associated with insulin resistance and diabetes; the risk of diabetes is increased in children with schizophrenia who take antipsychotic drugs. First-generation antipsychotic drugs are less likely to cause diabetes than second-generation antipsychotic drugs, and of the first-generation antipsychotic drugs, haloperidol has the lowest risk. Amisulpride and aripiprazole have the lowest risk of diabetes of the second-generation antipsychotic drugs. Amisulpride, aripiprazole, haloperidol, sulphiride, and trifluoperazine p. 233 are least likely to cause weight gain.

Sexual dysfunction and prolactin

The antipsychotic drugs with the lowest risk of sexual dysfunction are aripiprazole and quetiapine. Olanzapine may be considered if sexual dysfunction is judged to be secondary to hyperprolactinaemia. Hyperprolactinaemia is usually not clinically significant with aripiprazole, clozapine, olanzapine, and quetiapine treatment. When changing from other antipsychotic drugs, a reduction in prolactin concentration may increase fertility.

Children should receive an antipsychotic drug for 4–6 weeks before it is deemed ineffective. Prescribing more than one antipsychotic drug at a time should be avoided except in exceptional circumstances (e.g. clozapine augmentation or when changing medication during titration) because of the increased risk of adverse effects such as extrapyramidal symptoms, QT-interval prolongation, and sudden cardiac death.

Clozapine is used for the treatment of schizophrenia in children unresponsive to, or intolerant of, other antipsychotic drugs. Clozapine should be introduced if schizophrenia is not controlled despite the sequential use of two or more antipsychotic drugs (one of which should be a second-generation antipsychotic drug), each for at least 6–8 weeks. If symptoms do not respond adequately to an optimised dose of clozapine, plasma-clozapine concentration should be checked before adding a second antipsychotic drug to augment clozapine; allow 8–10 weeks’ treatment to assess response. Children must be registered with a clozapine patient monitoring service.

Monitoring

Full blood count, urea and electrolytes, and liver function test monitoring is required at the start of therapy with antipsychotic drugs, and then annually thereafter.

Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly.

Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly.

Before initiating antipsychotic drugs, an ECG may be required, particularly if physical examination identifies cardiovascular risk factors, if there is a personal history of cardiovascular disease, or if the child is being admitted as an inpatient.

Blood pressure monitoring is advised before starting therapy and frequently during dose titration of antipsychotic drugs.

Other uses

Nausea and vomiting, chorea, motor tics, and intractable hiccup.

Equivalent doses of oral antipsychotics

These equivalences are intended only as an approximate guide; individual dosage instructions should also be checked; children should be carefully monitored after any change in medication. Equivalent daily dose of antipsychotic drug:

- Chlorpromazine 100 mg
- Clozapine 50 mg
- Haloperidol 2–3 mg
- Pimozide 2 mg
- Risperidone 0.5–1 mg
- Sulpiride 200 mg
- Trifluoperazine 5 mg

Important: These equivalences must not be extrapolated beyond the maximum dose for the drug. Higher doses require careful titration in specialist units and the equivalences shown here may not be appropriate.

Dosage

After an initial period of stabilisation, the total daily oral dose of antipsychotic drugs can be given as a single dose in many children.

Antipsychotic depot injections

There is limited information on the use of antipsychotic depot injections in children and use should be restricted to specialist centres.
ANTIPSYCHOTICS

Antipsychotic drugs

▶ CAUTIONS Blood dyscrasias - cardiovascular disease - conditions predisposing to seizures - depression - epilepsy - history of jaundice - myasthenia gravis - photosensitisation (may occur with higher dosages) - severe respiratory disease - susceptibility to angle-closure glaucoma

CAUTIONS, FURTHER INFORMATION

▶ Cardiovascular disease An ECG may be required, particularly if physical examination identifies cardiovascular risk factors, personal history of cardiovascular disease, or if the patient is being admitted as an inpatient.

▶ INTERACTIONS → Appendix 1 (antipsychotics). Increased risk of toxicity with myelosuppressive drugs.

▶ SIDE-EFFECTS

▶ Rare Neuroleptic malignant syndrome—discontinue (potentially fatal)

▶ Very rare Precipitation of angle-closure glaucoma

Overdose Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. For details on the management of poisoning see Antipsychotics under Emergency treatment of poisoning p. 786.

▶ PREGNANCY Extrapyramidal effects and withdrawal syndrome have been reported occasionally in the neonate when antipsychotic drugs are taken during the third trimester of pregnancy. Following maternal use of antipsychotic drugs in the third trimester, neonates should be monitored for symptoms including agitation, hypertonia, hypotonia, tremor, drowsiness, feeding problems, and respiratory distress.

▶ BREAST FEEDING There is limited information available on the short- and long-term effects of antipsychotic drugs on the breast-fed infant. Animal studies indicate possible adverse effects of antipsychotic medicines on the developing nervous system. Chronic treatment with antipsychotic drugs whilst breast-feeding should be avoided unless absolutely necessary. Phenothiazine derivatives are sometimes used in breast-feeding women for short-term treatment of nausea and vomiting.

▶ MONITORING REQUIREMENTS

▶ Regular clinical monitoring of endocrine function should be considered when children are taking an antipsychotic drug known to increase prolactin levels; this includes measuring weight and height, assessing sexual maturation, and monitoring menstrual function.

▶ It is advisable to monitor prolactin concentration at the start of therapy, at 6 months, and then yearly. Patients taking antipsychotic drugs not normally associated with symptomatic hyperprolactinaemia should be considered for prolactin monitoring if they show symptoms of hyperprolactinaemia (such as breast enlargement and galactorrhoea).

▶ Patients with schizophrenia should have physical health monitoring (including cardiovascular disease risk assessment) at least once per year.

▶ TREATMENT CESSATION There is a high risk of relapse if medication is stopped after 1–2 years. Withdrawal of antipsychotic drugs after long-term therapy should always be gradual and closely monitored to avoid the risk of acute withdrawal syndromes or rapid relapse. Patients should be monitored for 2 years after withdrawal of antipsychotic medication for signs and symptoms of relapse.

▶ PATIENT AND CARER ADVICE As photosensitisation may occur with higher dosages, patients should avoid direct sunlight.

Driving and skilled tasks Drowsiness may affect performance of skilled tasks (e.g. driving or operating machinery), especially at start of treatment; effects of alcohol are enhanced.

ANTIPSYCHOTICS > FIRST-GENERATION

Chlorpromazine hydrochloride

▶ INDICATIONS AND DOSE

Childhood schizophrenia and other psychoses (under expert supervision)

▶ BY MOUTH

Child 1–5 years: 500 micrograms/kg every 4–6 hours, adjusted according to response; maximum 40 mg per day

Child 6–11 years: 10 mg 3 times a day, adjusted according to response; maximum 75 mg per day

Child 12–17 years: Initially 25 mg 3 times a day, adjusted according to response, alternatively initially 75 mg once daily, adjusted according to response, dose to be taken at night; maintenance 75–300 mg daily, increased if necessary up to 1 g daily

Relief of acute symptoms of psychoses (under expert supervision)

▶ BY DEEP INTRAMUSCULAR INJECTION

Child 1–5 years: 500 micrograms/kg every 6–8 hours; maximum 40 mg per day

Child 6–11 years: 500 micrograms/kg every 6–8 hours; maximum 75 mg per day

Child 12–17 years: 25–50 mg every 6–8 hours

Nausea and vomiting of terminal illness (where other drugs have failed or are not available)

▶ BY MOUTH

Child 1–5 years: 500 micrograms/kg every 4–6 hours; maximum 40 mg per day

Child 6–11 years: 500 micrograms/kg every 4–6 hours; maximum 75 mg per day

Child 12–17 years: 10–25 mg every 4–6 hours

BY DEEP INTRAMUSCULAR INJECTION

Child 1–5 years: 500 micrograms/kg every 6–8 hours; maximum 40 mg per day

Child 6–11 years: 500 micrograms/kg every 6–8 hours; maximum 75 mg per day

Child 12–17 years: Initially 25 mg, then 25–50 mg every 3–4 hours until vomiting stops

DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose adjustment may be necessary if smoking started or stopped during treatment.

DOSE EQUIVALENCE AND CONVERSION

For equivalent therapeutic effect 20–25 mg chlorpromazine hydrochloride by intramuscular injection ≡ 40–50 mg of chlorpromazine base or hydrochloride given by mouth.
## CONTRA-INDICATIONS
- CNS depression - comatose states - hypothyroidism - phaeochromocytoma
- **CAUTIONS**
- Diabetes

## SIDE-EFFECTS

### HANDLING AND STORAGE
- **WITH INTRAMUSCULAR USE**
- **MONITORING REQUIREMENTS**
- Acute dystonic reactions
- **SIDE-EFFECTS, FURTHER INFORMATION**
- Phenothiazines can induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.
- **HEPATIC IMPAIRMENT**
- Can precipitate coma; phenothiazines are hepatotoxic.
- **RENAI IMPAIRMENT**
- Start with small doses in severe renal impairment because of increased cerebral sensitivity.

### MONITORING REQUIREMENTS
- With intramuscular use
- Patients should remain supine, with blood pressure monitoring for 30 minutes after intramuscular injection.

### HANDLING AND STORAGE
- Owing to the risk of contact sensitisation, pharmacists, nurses, and other health workers should avoid direct contact with chlorpromazine; tablets should not be crushed and solutions should be handled with care.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution.

### Tablet

**CAUTIONARY AND ADVISORY LABELS** 2, 11

- Chlorpromazine hydrochloride (Non-proprietary)
- Chlorpromazine hydrochloride 25 mg (Chlorpromazine 25 mg tablets) 28 tablet [PO] £4.92 DT price = £1.84
- Chlorpromazine hydrochloride 50 mg (Chlorpromazine 50 mg tablets) 28 tablet [PO] £5.28 DT price = £1.73
- Chlorpromazine hydrochloride 100 mg (Chlorpromazine 100 mg tablets) 28 tablet [PO] £5.70 DT price = £1.85

### Oral solution

**CAUTIONARY AND ADVISORY LABELS** 2, 11

- Chlorpromazine hydrochloride (Non-proprietary)
- Chlorpromazine hydrochloride 5 mg per 1 ml (Chlorpromazine 25mg/5ml syrup) 150 ml [PO] £2.35 DT price = £2.35
- Chlorpromazine 25mg/5ml oral solution sugar free sugar-free | 150 ml [PO] £2.35
- Chlorpromazine 25mg/5ml oral solution | 150 ml [PO] £2.35 DT price = £2.35
- Chlorpromazine hydrochloride 20 mg per 1 ml (Chlorpromazine 100mg/5ml oral solution) 150 ml [PO] £5.50 DT price = £5.50

### Solution for injection

- Largactil (Sanofi)
- Chlorpromazine hydrochloride 25 mg per 1 ml Largactil 50mg/2ml solution for injection ampoules | 10 ampoule [PO] £7.51

### Haloperidol

#### INDICATIONS AND DOSE

**Schizophrenia (under expert supervision)**

- By mouth
  - Child 3–12 years: Initially 500 micrograms daily in 2–3 divided doses; usual dose 1–4 mg daily in 2–3 divided doses, daily maximum to be given in 2–3 divided doses; maximum 6 mg per day
  - Child 13–17 years: Initially 500 micrograms daily in 2–3 divided doses; usual dose 1–6 mg daily in 2–3 divided doses, daily maximum to be given in 2–3 divided doses; maximum 10 mg per day

### CHILDHOOD BEHAVIOURAL DISORDERS, ESPECIALLY WHEN ASSOCIATED WITH HYPERACTIVITY AND AGGRESSION (UNDER EXPERT SUPERVISION) | Gilles de la Tourette Syndrome (UNDER EXPERT SUPERVISION)

- By mouth
  - Child 3–12 years: Initially 250 micrograms daily in 2–3 divided doses; usual dose 0.5–3 mg daily in 2–3 divided doses, daily maximum to be given in 2–3 divided doses; maximum 3 mg per day
  - Child 13–17 years: Initially 250 micrograms daily in 2–3 divided doses; usual dose 2–6 mg daily in 2–3 divided doses, daily maximum to be given in 2–3 divided doses; maximum 6 mg per day

### Nausea and vomiting in palliative care

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose adjustment may be necessary if smoking started or stopped during treatment.

#### UNLICENSED USE

Not licensed for use in children for nausea and vomiting in palliative care.

### CONTRA-INDICATIONS

- Bradycardia - CNS depression - comatose states - lesions of the basal ganglia - phaeochromocytoma - QT-interval prolongation

### CAUTIONS

- Hypocalcaemia - hypopokalaemia - hypomagnesaemia - metabolic disturbances - subarachnoid haemorrhage

### INTERACTIONS

Avoid concomitant administration of drugs that prolong QT interval.

#### SIDE-EFFECTS

- Common or very common Depression - weight loss
- Uncommon Dyspnoea - oedema
- Rare Bronchospasm - hypoglycaemia - inappropriate antidiuretic hormone secretion
- Frequency not known Stevens-Johnson syndrome - toxic epidermal necrolysis

### SIDE-EFFECTS, FURTHER INFORMATION

Less sedating and fewer antimuscarinic or hypotensive symptoms.

### PREGNANCY

Avoid unless benefits outweigh risks.

### HEPATIC IMPAIRMENT

Can precipitate coma.

### RENAL IMPAIRMENT

Start with small doses in severe renal impairment because of increased cerebral sensitivity.

### MONITORING REQUIREMENTS

Baseline ECG required before treatment—assess need for further ECGs during treatment on an individual basis.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution.

### Tablet

**CAUTIONARY AND ADVISORY LABELS** 2

- Haloperidol (Non-proprietary)
- Haloperidol 500 microgram Haloperidol 500 microgram tablets | 28 tablet [PO] £1.10–£20.05
- Haloperidol 1.5 mg Haloperidol 1.5 mg tablets | 28 tablet [PO] £5.99 DT price = £2.12
Pericyazine (Pericyazine)

**INDICATIONS AND DOSE**

Schizophrenia (under expert supervision) | Psychoses (severe mental or behavioural disorders only) (under expert supervision)

- **BY MOUTH**
  - Child 1-11 years: Initially 500 micrograms daily for 10-kg child, increased by 1 mg for each additional 5 kg; dose may be gradually increased according to response but maintenance should not exceed twice initial dose; maximum 10 mg per day
  - Child 12-17 years: Initially 25 mg 3 times a day, increased in steps of 25 mg every 1 week, adjusted according to response, increased if necessary up to 100 mg 3 times a day, total daily dose may alternatively be given in 2 divided doses

**UNLICENSED USE** Tablets not licensed for use in children.

**CONTRA-INDICATIONS** CNS depression - comatose states - phaeochromocytoma

**SIDE-EFFECTS**

- **Common or very common** Hypotension (when treatment initiated)
- **Frequency not known** Respiratory depression

**SIDE-EFFECTS, FURTHER INFORMATION**

More sedating.

**HEPATIC IMPAIRMENT** Can precipitate coma; phenothiazines are hepatotoxic.

**RENAL IMPAIRMENT** Avoid in renal impairment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension

**Pimozide**

**INDICATIONS AND DOSE**

Schizophrenia

- **BY MOUTH**
  - Child 12-17 years (under expert supervision): Initially 1 mg daily, adjusted according to response, then increased in steps of 2–4 mg at intervals of not less than 1 week; usual dose 2–20 mg daily

Tourette syndrome (under expert supervision)

- **BY MOUTH**
  - Child 2-11 years: 1–4 mg daily
  - Child 12-17 years: 2–10 mg daily

**UNLICENSED USE** Not licensed for use in Tourette syndrome.

**CONTRA-INDICATIONS** CNS depression - comatose states - history of arrhythmias - history or family history of congenital QT prolongation - phaeochromocytoma

**SIDE-EFFECTS**

- **Rare** Hyponatraemia
- **Frequency not known** Glycosuria - serious arrhythmias - venous thromboembolism

**SIDE-EFFECTS, FURTHER INFORMATION**

Less sedating.

**HEPATIC IMPAIRMENT** Can precipitate coma.
**RENAL IMPAIRMENT** Start with small doses in severe renal impairment because of increased cerebral sensitivity.

**MONITORING REQUIREMENTS**
- ECG monitoring: Following reports of sudden unexplained death, an ECG is recommended before treatment. It is also recommended that patients taking pimozide should have an annual ECG (if the QT interval is prolonged, treatment should be reviewed and either withdrawn or dose reduced under close supervision) and that pimozide should not be given with other antipsychotic drugs (including depot preparations), tricyclic antidepressants or other drugs which prolong the QT interval, such as certain antimarialarials, antiarrhythmic drugs and certain antihistamines and should not be given with drugs which cause electrolyte disturbances (especially diuretics).

**HEPATIC IMPAIRMENT**
- Phenothiazines can all induce acute dystonic reactions
- Extrapyramidal symptoms are more frequent, especially at doses exceeding 6 mg daily.
- Phenothiazines can all induce acute dystonic reactions
- Extrapyramidal symptoms are more frequent, especially at doses exceeding 6 mg daily.

**SIDE-EFFECTS**
- Anorexia - dystonic reactions - muscle weakness
- Extrapyramidal symptoms are more frequent, especially at doses exceeding 6 mg daily.

**CONTRA-INDICATIONS**
- CNS depression - comatose states - phaeochromocytoma
- Sleep disturbances
- Aggressive patients (even low doses may aggravate symptoms) - agitation patients (even low doses may aggravate symptoms) - excited patients (even low doses may aggravate symptoms)

**SIDE-EFFECTS**
- Hepatitis - venous thromboembolism
- DIABETES MELLITUS
- CANCER
- CANCER

**HEPATIC IMPAIRMENT**
- Can precipitate coma; phenothiazines are hepatotoxic

**RENA!' IMPAIRMENT**
- Start with small doses in severe renal impairment because of increased cerebral sensitivity.

**MONITORING REQUIREMENTS**
- Trifluoperazine does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
**PRESCRIBING AND DISPENSING INFORMATION**

**PREGNANCY**

**ANTIPSYCHOTICS > SECOND-GENERATION**

**Amisulpride**

**DRUG ACTION**
- Amisulpride is a selective dopamine receptor antagonist with high affinity for mesolimbic D2 and D3 receptors.

**INDICATIONS AND DOSE**

**Acute psychotic episode in schizophrenia**
- **BY MOUTH**
  - Child 15–17 years (under expert supervision): 200–400 mg twice daily, adjusted according to response; maximum 1.2 g per day

**Schizophrenia with predominantly negative symptoms**
- **BY MOUTH**
  - Child 15–17 years (under expert supervision): 50–300 mg daily

**UNLICENSED USE**
- Not licensed for use in children under 18 years.

**CONTRA-INDICATIONS**
- CNS depression - comatose states - phaeochromocytoma - pre-pubertal children - prolactin-dependent tumours

**SIDE-EFFECTS**
- Common or very common Anxiety
- Uncommon Bradycardia
- **PREGNANCY** Avoid.

**BREAST FEEDING**
- Avoid—no information available.

**RENAI IMPAIRMENT**
- Halve dose if estimated glomerular filtration rate 30–60 ml/minute/1.73 m². Use one-third dose if estimated glomerular filtration rate 10–30 ml/minute/1.73 m². No information available if estimated glomerular filtration rate less than 10 ml/minute/1.73 m².

**MONITORING REQUIREMENTS**
- Amisulpride does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.

**PRESCRIBING AND DISPENSING INFORMATION**
- Flavours of oral liquid formulations may include caramel.

**Aripiprazole**

**DRUG ACTION**
- Aripiprazole is a dopamine D2 partial agonist with weak 5-HT₄ partial agonism and 5-HT₃A receptor antagonism.

**INDICATIONS AND DOSE**

**Schizophrenia**
- **BY MOUTH**
  - Child 15–17 years (under expert supervision): Initially 2 mg once daily for 2 days, increased to 5 mg once daily for 2 days, then increased to 10 mg once daily, then increased in steps of 5 mg if required, for dose adjustments due to concomitant use of interacting drugs—consult product literature; maximum 30 mg per day

**Treatment of mania (under expert supervision)**
- **BY MOUTH**
  - Child 13–17 years: Initially 2 mg once daily for 2 days, increased to 5 mg once daily for 2 days, then increased to 10 mg once daily, increased in steps of 5 mg if required, maximum duration of treatment 12 weeks, for dose adjustments due to concomitant use of interacting drugs—consult product literature, doses above 10 mg daily should only be used in exceptional cases; maximum 30 mg per day

**CONTRA-INDICATIONS**
- CNS depression - comatose state - phaeochromocytoma

**CAUTIONS**
- Cerebrovascular disease

**SIDE-EFFECTS**
- Common or very common Anxiety - hypersalivation - malaise
- Uncommon Depression - dry mouth
- Frequency not known Alopecia - anorexia - Bradycardia - hepatitis - hyponatraemia - infection - laryngospasm - myalgia - oedema - oropharyngeal spasm - pancreatitis - pathological gambling - respiratory disorders - rhabdomyolysis - suicidal ideation - sweating - urinary disorders
SECTION: SIDE-EFFECTS, FURTHER INFORMATION

- With oral use: Increased incidence of side-effects associated with doses of 30 mg daily; doses above 10 mg daily should only be used in exceptional cases and with close clinical monitoring.
- PREGNANCY: Use only if potential benefit outweighs risk.
- BREAST FEEDING: Manufacturer advises avoid—in present milk.
- HEPATIC IMPAIRMENT: Use with caution in severe impairment.
- MONITORING REQUIREMENTS: Aripiprazole does not affect blood pressure to the same extent as other antipsychotic drugs and so blood pressure monitoring is not mandatory for this drug.
- DIRECTIONS FOR ADMINISTRATION: Orodispersible tablets should be placed on the tongue and allowed to dissolve, or be dispersed in water and swallowed.
- PATIENT AND CARER ADVICE: Patients or carers should be given advice on how to administer aripiprazole orodospersible tablets.

Medicines for Children leaflet: Aripiprazole for schizophrenia, bipolar disorder and movement disorders

www.medicinesforchildren.org.uk/aripiprazole-schizophrenia-bipolar-disorder-and-movement-disorders

NATIONAL FUNDING/ACCESS DECISIONS:

NICE technology appraisals (TAs):
- Aripiprazole for the treatment of schizophrenia in people aged 15 to 17 years (January 2011) NICE TA213
  Aripiprazole is recommended as an option for the treatment of schizophrenia in adolescents aged 15 to 17 years who have not responded adequately to, or who are intolerant of, risperidone, or for whom risperidone is contra-indicated.
  www.nice.org.uk/TA213
- Aripiprazole for the treatment of moderate to severe manic episodes in adolescents with bipolar I disorder (July 2013) NICE TA292
  Aripiprazole is recommended as an option for the treatment of moderate to severe manic episodes for up to 12 weeks in adolescents aged 13 years with bipolar I disorder.
  www.nice.org.uk/TA292

ABILIFY® ORAL SOLUTION

Scottish Medicines Consortium (SMC) Decisions:
The Scottish Medicines Consortium, has advised (August 2013) that oral aripiprazole (Abilify®) is accepted for restricted use within NHS Scotland for the treatment of moderate to severe manic episodes in Bipolar I Disorder in adolescents aged 13 years and older for a period of up to 12 weeks. It is restricted to initiation and management under the supervision of a child/adolescent psychiatrist.

MEDICINAL FORMS:
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS: 2
- Aripiprazole (Non-proprietary)
  Aripiprazole 5 mg: Aripiprazole 5mg tablets | 28 tablet POM £96.04 DT price = £5.72

DOSE ADJUSTMENTS DUE TO INTERACTIONS:
Dose adjustment may be necessary if smoking started or stopped during treatment.

DRUG ACTION:
Clozapine is a dopamine D2, dopamine D3, 5-HT3α, alpha1-adrenoceptor, and muscarinic-receptor antagonist.

INDICATIONS AND DOSE:
Schizophrenia in patients unresponsive to, or intolerant of, conventional antipsychotic drugs

- BY MOUTH:
  - Child 12–17 years (under expert supervision): 12.5 mg 1–2 times a day for day 1, then 25–50 mg for day 2, then increased, if tolerated, in steps of 25–50 mg daily, dose to be increased gradually over 14–21 days, increased to up to 300 mg daily in divided doses, larger dose to be taken at night, up to 200 mg daily may be taken as a single dose at bedtime; increased in steps of 50–100 mg 1–2 times a week if required, it is preferable to increase once a week; usual dose 200–450 mg daily, max. 900 mg per day, if restarting after interval of more than 48 hours, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing

DOSE REDUCTION DUE TO INTERACTIONS:
Dose adjustment may be necessary if smoking started or stopped during treatment.

UNLICENSED USE:
Not licensed for use in children under 16 years.

CONTRA-INDICATIONS:
Alcoholic and toxic psychoses—bone-marrow disorders—coma—drug intoxication—history of agranulocytosis—history of circulatory collapse—history of neutropenia—paralytic ileus—severe cardiac disorders (e.g. myocarditis)—severe CNS depression—uncontrolled epilepsy

CAUTIONS:
Susceptibility to angle-closure glaucoma—taper off other antipsychotics before starting

CAUTIONS, FURTHER INFORMATION:
Agranulocytosis:
Neutropenia and potentially fatal agranulocytosis reported. Leucocyte and differential blood counts must be normal before starting; monitor counts every week for 18 weeks then at least every 2 weeks and if clozapine continued and blood count stable after 1 year at least every 4 weeks (and 4 weeks after discontinuation); if leucocyte count below 3000/mm3 or if absolute neutrophil count below 1500/mm3 discontinue permanently and refer
to haematologist. Patients who have a low white blood cell count because of benign ethnic neutropenia may be started on clozapine with the agreement of a haematologist. Avoid drugs which depress leucopoiesis; patients should report immediately symptoms of infection, especially influenza-like illness.

- **Myocarditis and cardiomyopathy**: Fatal myocarditis (most commonly in first 2 months) and cardiomyopathy reported.

Perform physical examination and take full medical history before starting.

Specialist examination required if cardiac abnormalities or history of heart disease found—clozapine initiated only in absence of severe heart disease and if benefit outweighs risk

Persistent tachycardia especially in first 2 months should prompt observation for other indicators for myocarditis or cardiomyopathy

If myocarditis or cardiomyopathy suspected clozapine should be stopped and patient evaluated urgently by cardiologist

Discontinue permanently in clozapine-induced myocarditis or cardiomyopathy

- **Intestinal obstruction**: Impairment of intestinal peristalsis, including constipation, intestinal obstruction, faecal impaction, and paralytic ileus, (including fatal cases) reported. Clozapine should be used with caution in patients receiving drugs that may cause constipation (e.g. antimuscarinic drugs) or in those with a history of colonic disease or lower abdominal surgery. It is essential that constipation is recognised and actively treated.

- **INTERACTIONS**: Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis.

- **SIDE-EFFECTS**
  - **Common or very common**: Anorexia, constipation, hypersalivation, malaise, speech disorders, urinary incontinence
  - **Uncommon**: Agranulocytosis
  - **Rare**: Circulatory collapse, dysphagia, hepatitis, myocarditis, pancreatitis, pericarditis, pneumonia, pulmonary aspiration
  - **Very rare**: Cardiomyopathy, hypercholesterolaemia, hypertriglyceridaemia, interstitial nephritis, intestinal obstruction (including fatal cases), myocardial infarction, obsessive compulsive disorder, parotid gland enlargement, respiratory depression
  - **Frequency not known**: Hepatic disorders, hepatic failure, muscle disorders, renal failure

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Hypersalivation: Hypersalivation associated with clozapine therapy can be treated with hyoscine butyrophennol [unlicensed indication], provided that the patient is not at particular risk from the additive antimuscarinic side-effects of hyoscine and clozapine.

- **PREGNANCY**: Use with caution.

- **BREAST FEEDING**: Avoid.

- **RENAL IMPAIRMENT**: Avoid in severe impairment.

- **MONITORING REQUIREMENTS**
  - Monitor leucocyte and differential blood counts. Clozapine requires differential white blood cell monitoring weekly for 18 weeks, then fortnightly for up to one year, and then monthly as part of the clozapine patient monitoring service.

  - Close medical supervision during initiation (risk of collapse because of hypotension and convulsions).

  - Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotics. Patients taking clozapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.

  - Fasting blood glucose should be measured at baseline, at 4–6 months, and then yearly. Patients taking clozapine should have fasting blood glucose tested at baseline, after one month's treatment, then every 4–6 months.

  - Patient, prescriber, and supplying pharmacist must be registered with the appropriate Patient Monitoring Service—it takes several days to do this.

- **TREATMENT CESSATION**: On planned withdrawal reduce dose over 1–2 weeks to avoid risk of rebound psychosis. If abrupt withdrawal necessary observe patient carefully.

- **DIRECTIONS FOR ADMINISTRATION**: Shake oral suspension well for 90 seconds when dispensing or if visibly settled and stand for 24 hours before use; otherwise shake well for 10 seconds before use. May be diluted with water.

- **PRESCRIBING AND DISPENSING INFORMATION**: Clozapine has been used for psychosis in Parkinson’s disease in children aged 16 years and over.

- **PATIENT AND CARER ADVICE**: Patients or carers should be given advice on how to administer clozapine oral suspension.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- **Tablet**
  - **Cautions and Advisory Labels 2, 10**
    - **Clozaril** (Novartis Pharmaceuticals UK Ltd)
      - Clozapine 25 mg: Clozaril 25mg tablets | 28 tablet | £2.95 |
      - 84 tablet | £6.30 (Hospital only) | 100 tablet | £7.50 (Hospital only)
    - **Clozapine 100 mg**
      - Clozapine 100mg tablets | 28 tablet | £11.76 |
      - | 84 tablet | £25.21 (Hospital only) | 100 tablet | £30.01 (Hospital only)
    - **Denzapine** (Britannia Pharmaceuticals Ltd)
      - Clozapine 25 mg: Denzapine 25mg tablets | 84 tablet | £16.64 |
      - | 100 tablet | £19.80 |
    - **Olanzapine** (Novartis Pharmaceuticals UK Ltd)
      - Clozapine 100 mg: Olanzapine 100mg tablets | 84 tablet | £66.53 |
      - | 100 tablet | £79.20 |
    - **Zaponex** (Teva UK Ltd)
      - Clozapine 25 mg: Zaponex 25mg tablets | 84 tablet | £8.28 |
      - | 500 tablet | £48.39 |
    - **Zaponex 100 mg**
      - Zaponex 100mg tablets | 84 tablet | £33.88 |
      - | 500 tablet | £119.43 |

- **Oral suspension**
  - **Cautions and Advisory Labels 2, 10**
    - **Denzapine** (Britannia Pharmaceuticals Ltd)
      - Clozapine 50 mg per 1 ml: Denzapine 50mg/ml oral suspension
        - sugar-free | 100 ml | £39.60 |

- **Olanzapine**
  - **DRUG ACTION**: Olanzapine is a dopamine D1, D2, D4, 5-HT2, histamine-1-, and muscarinic-receptor antagonist.

- **INDICATIONS AND DOSE**
  - **Schizophrenia**: Combination therapy for mania
    - **By mouth**
      - Child 12-17 years (under expert supervision): Initially 5–10 mg daily, adjusted according to response, usual dose 5–20 mg daily, doses greater than 10 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day
Monotherapy for mania

▶ By mouth

▶ Child 12-17 years (under expert supervision): 15 mg daily, adjusted according to response, usual dose 5-20 mg daily, doses greater than 15 mg daily only after reassessment, when one or more factors present that might result in slower metabolism (e.g. female gender, non-smoker) consider lower initial dose and more gradual dose increase; maximum 20 mg per day

Dosage adjustments due to interactions

Dose adjustment may be necessary if smoking started or stopped during treatment.

- Unlicensed use
  Not licensed for use in children.

- Caution
  Bone-marrow depression - diabetes mellitus (risk of exacerbation or ketoacidosis) - hypertensive/hypertensive disorders - low leucocyte count - low neutrophil count - myeloproliferative disease - paralytic ileus

- Side-effects
  Common or very common
  Arthralgia - hypercholesterolaemia - hypertriglyceridaemia - increased appetite - male infertility - oedema

  Uncommon
  Alopecia - anemia - bradycardia - epistaxis

  Rare
  Hepatitis - pancreatitis - rhahdomyolysis

- Pregnancy
  Use only if potential benefit outweighs risk; neonatal lethargy, tremor, and hypertonia reported when used in third trimester.

- Breast feeding
  Avoid—present in milk.

- Hepatic impairment
  Consider initial dose of 5 mg daily.

- Renal impairment
  Consider initial dose of 5 mg daily.

- Monitoring requirements
  Blood lipids and weight should be measured at baseline, at 3 months (weight should be measured at frequent intervals during the first 3 months), and then yearly with antipsychotic drugs. Patients taking olanzapine require more frequent monitoring of these parameters: every 3 months for the first year, then yearly.

  - Fasting blood glucose should be measured at baseline, at 4-6 months, and then yearly. Patients taking olanzapine should have fasting blood glucose tested at baseline, after one months’ treatment, then every 4-6 months.

- Directions for administration
  Olanzapine orodispersible tablet may be placed on the tongue and allowed to dissolve, or dispersed in water, orange juice, apple juice, milk, or coffee.

- Patient and carer advice
  Patients or carers should be given advice on how to administer orodispersible tablets.

- Medicinal forms
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Oral lyophilisate
Quetiapine

**DRUG ACTION** Quetiapine is a dopamine D<sub>2</sub>, dopamine D<sub>4</sub>, 5-HT<sub>2A</sub>, alpha-<sub>1</sub>-adrenoceptor, and histamine-1 receptor antagonist.

**INDICATIONS AND DOSE**

**Schizophrenia**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years (under expert supervision): Initially 25 mg twice daily, adjusted according to response. Adjusted in steps of 25-50 mg; maximum 750 mg per day
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 12-17 years (under expert supervision): Initially 50 mg once daily, adjusted according to response. Adjusted in steps of 50 mg daily, usual dose 400–800 mg once daily; maximum 800 mg per day

**Treatment of mania in bipolar disorder**
- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years (under expert supervision): 25 mg twice daily for day 1, then 50 mg twice daily for day 2, then 100 mg twice daily for day 3, then 150 mg twice daily for day 4, then 200 mg twice daily for day 5, then adjusted in steps of up to 100 mg daily, adjusted according to response, usual dose 400–600 mg daily in 2 divided doses

**DOSE EQUIVALENT AND CONVERSION**

Patients can be switched from immediate-release to modified-release tablets at the equivalent daily dose; to maintain clinical response, dose titration may be required.

**UNLICENSED USE** Not licensed for use in children.

**CAUTIONS** Cerebrovascular disease - patients at risk of aspiration pneumonia - treatment of depression in patients under 25 years (increased risk of suicide)

**SIDE-EFFECTS**
- **Common or very common** Asthenia, dysarthria, dysphonia, elevated plasma-cholesterol concentrations, elevated plasma-triglyceride concentrations, increased appetite, irritability, peripheral oedema, sleep disorders
- **Uncommon** Hypnowatremia, ‘hypothyroidism’-restless legs syndrome
- **Rare** Hepatitis, pancreatitis
- **Very rare** Angioedema, inappropriate secretion of antidiuretic hormone, rhabdomyolysis, Stevens-Johnson syndrome
- **Frequency not known** Suicidal behaviour (particularly on initiation) - toxic epidermal necrolysis

**PREGNANCY** Use only if potential benefit outweighs risk.

**BREAST FEEDING** Manufacturer advises avoid.

**HEPATIC IMPAIRMENT** For immediate-release tablets, initially 25 mg daily, increased daily in steps of 25–50 mg. For modified-release tablets, initially 50 mg daily, increased daily in steps of 50 mg.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

238 Mental health disorders BNFC 2016–2017
Risperidone

**DRUG ACTION** Risperidone is a dopamine D2, 5-HT2A, alpha-1adrenoceptor, and histamine-1 receptor antagonist.

**INDICATIONS AND DOSE**

**Acute and chronic psychosis**
- **BY MOUTH**
  - Child 5–17 years (under expert supervision): 2 mg daily in one divided dose for day 1, then 4 mg daily in 1–2 divided doses for day 2, slower titration is appropriate in some patients; usual dose 4–6 mg daily, doses above 10 mg daily only if benefit considered to outweigh risk; maximum 16 mg per day

**Short-term monotherapy of mania in bipolar disorder (under expert supervision)**
- **BY MOUTH**
  - Child 12–17 years: Initially 500 micrograms once daily, then adjusted in steps of 0.5–1 mg daily, adjusted according to response; usual dose 2.5 mg daily in 1–2 divided doses; maximum 6 mg per day

**Short-term treatment (up to 6 weeks) of persistent aggression in conduct disorder (under expert supervision)**
- **BY MOUTH**
  - Child 5–17 years (body-weight up to 50 kg): Initially 250 micrograms once daily, then increased in steps of 250 micrograms once daily on alternate days, adjusted according to response; usual dose 500 micrograms once daily; maximum 750 micrograms per day
  - Child 5–17 years (body-weight 50 kg and above): Initially 500 micrograms once daily, then increased in steps of 500 micrograms once daily on alternate days, adjusted according to response; usual dose 1 mg once daily; maximum 1.5 mg per day

**Short-term treatment of severe aggression in autism (under expert supervision)**
- **BY MOUTH**
  - Child 5–17 years (body-weight 15–20 kg): Initially 250 micrograms daily for at least 4 days, then increased if necessary to 500 micrograms daily, then increased in steps of 250 micrograms daily, dose to be increased at intervals of 2 weeks, review effectiveness and any side-effects after 3–4 weeks; stop if no response at 6 weeks; maximum 1 mg per day

**INDICATIONS AND DOSE**

**Short-term treatment of severe aggression in autism**
- **BY MOUTH**
  - Child 5–17 years (body-weight 20–45 kg): Initially 500 micrograms daily for at least 4 days, then increased if necessary to 1 mg daily, then increased in steps of 500 micrograms daily, dose to be increased at intervals of 2 weeks, review effectiveness and any side-effects after 3–4 weeks; stop if no response at 6 weeks; maximum 2.5 mg per day
  - Child 5–17 years (body-weight 45 kg and above): Initially 500 micrograms daily for at least 4 days, then increased in steps of 500 micrograms daily, dose to be increased at intervals of 2 weeks, review effectiveness and any side-effects after 3–4 weeks; stop if no response at 6 weeks; maximum 3 mg per day

**SIDE-EFFECTS**

- **Common or very common** Anxiety; appetite changes; arthralgia; depression; diaphoresis; dizziness; dysphoria; dysphoria; dyspepsia; dysuria; edema; hallucinations; headache; increases in body weight; insomnia; irritability; jaw movement disorder; joint pain; leg cramps; nausea; palpitations; paresthesia; pharyngitis; photophobia; pruritus; restlessness; rhinitis; salivation; sweat; tinnitus; urinary disorders

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Tablet**

Dystonias and related disorders

Dystonias may result from conditions such as cerebral palsy or may be related to a deficiency of the neurotransmitter dopamine as in Segawa syndrome.

Dopaminergic drugs used in dystonias

Levodopa, the amino-acid precursor of dopamine, acts by replenishing depleted striatal dopamine. It is given with an extracerebral dopa-decarboxylase inhibitor, which reduces the peripheral conversion of levodopa to dopamine, thereby limiting side-effects such as nausea, vomiting, and cardiovascular effects; additionally, effective brain-dopamine concentrations are achieved with lower doses of levodopa. The extracerebral dopa-decarboxylase inhibitor most commonly used in children is carbidopa (in co-careldopa p. 242).

Levodopa therapy should be initiated at a low dose and increased in small steps; the final dose should be as low as possible. Intervals between doses should be chosen to suit the needs of the individual child.

In severe dystonias related to cerebral palsy, improvement can be expected within 2 weeks. Children with Segawa syndrome are particularly sensitive to levodopa; they may even become symptom free on small doses. Levodopa also has a role in treating metabolic disorders such as defects in tyrosinehydroxylase and dihydroxyphenylalanine reductase deficiency. Tetrahydrobiopterin may have a role in metabolic disorders.

Children may experience nausea within 2 hours of taking a dose; nausea and vomiting with co-careldopa is rarely dose-limiting.

In dystonic cerebral palsy, treatment with larger doses of levodopa is associated with the development of potentially troublesome motor complications (including response fluctuations and dyskinesias). Response fluctuations are characterised by large variations in motor performance, with normal function during the ‘on’ period, and weakness and restricted mobility during the ‘off’ period.

Antimuscarinic drugs used in dystonias

The antimuscarinic drugs procyclidine hydrochloride p. 241 and trihexyphenidyl hydrochloride p. 241 reduce the symptoms of dystonias, including those induced by antipsychotic drugs; there is no justification for giving them routinely in the absence of dystonic symptoms. Tardive dyskinesia is not improved by antimuscarinic drugs and may be made worse.

There are no important differences between the antimuscarinic drugs, but some children tolerate one better than another.

Procyclidine hydrochloride can be given parenterally and is effective emergency treatment for acute drug-induced dystonic reactions.

If treatment with an antimuscarinic is ineffective, intravenous diazepam p. 207 can be given for life-threatening acute drug-induced dystonic reactions.

Drugs used in essential tremor, chorea, tics, and related disorders

Haloperidol p. 231 can also improve motor tics and symptoms of Tourette syndrome and related choreas. Other treatments for Tourette syndrome include pimozide p. 232 [unlicensed indication] (important: ECG monitoring required), and sulpiride p. 233 [unlicensed indication].

Propranolol hydrochloride p. 96 or another beta-adrenoceptor blocking drug may be useful in treating essential tremor or tremor associated with anxiety or thyrotoxicosis.

Botulinum toxin type A p. 243 should be used under specialist supervision. Treatment with botulinum toxin type A can be considered after an acquired non-progressive brain injury if rapid-onset spasticity causes postural or functional difficulties, and in children with spasticity in whom focal dystonia causes postural or functional difficulties or pain.
Procyclidine hydrochloride

**DRUG ACTION** Procyclidine exerts its antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency.

**INDICATIONS AND DOSE**

**Acute dystonia**
- **BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
- Child 1 month-1 year: 0.5–2 mg for 1 dose, dose usually effective in 5–10 minutes but may need 30 minutes for relief
- Child 2-9 years: 2–5 mg for 1 dose, dose usually effective in 5–10 minutes but may need 30 minutes for relief
- Child 10-17 years: 5–10 mg, occasionally, more than 10 mg, dose usually effective in 5–10 minutes but may need 30 minutes for relief

**Dystonia**
- **BY MOUTH**
  - Child 7-11 years: 1.25 mg 3 times a day
  - Child 12 years and over: 2.5 mg 3 times a day

**SIDE-EFFECTS**
- Angle-closure glaucoma
- Anxiety
- Blurred vision
- Confusion
- Constipation
- Dizziness
- Dry mouth
- Euphoria
- Gingivitis
- Hallucinations
- Impaired memory
- Nausea
- Rash
- Restlessness
- Tachycardia
- Urinary retention
- Vomiting

**PREGNANCY** Use only if potential benefit outweighs risk.

**BREAST FEEDING** No information available.

**HEPATIC IMPAIRMENT** Use with caution.

**RENAL IMPAIRMENT** Use with caution.

**TREATMENT CESSATION** Avoid abrupt withdrawal in patients taking long-term treatment.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks
May affect performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**
- **Procyclidine hydrochloride (Non-proprietary)**
  - Procyclidine hydrochloride 5 mg Procyclidine 5mg tablets | 28 tablet POM £17.25 DT price = £11.97 | 100 tablet POM £50.00 | 500 tablet POM £255.00
  - Kemadrin (Aspen Pharma Trading Ltd)
    - Procyclidine hydrochloride 5 mg Kemadrin 5mg tablets | 100 tablet POM £4.72 | 500 tablet POM £23.62

**DOPIAMINERGIC DRUGS ▶ DOPAMINE PRECURSORS**

**Co-careldopa**

**INDICATIONS AND DOSE**

Dopamine-sensitive dystonias including Segawa syndrome and dystonias related to cerebral palsy (dose expressed as levodopa)

- **BY MOUTH**
  - Child 3 months–17 years: Initially 250 micrograms/kg 2–3 times a day, dose to be increased according to response every 2–3 days, increased if necessary up to 1 mg/kg 3 times a day, preparation containing 1:4 ratio of carbidopa:levodopa is to be used

Treatment of defects in tetrahydrobipterin synthesis and dihydrobipterin reductase deficiency (dose expressed as levodopa)

- **BY MOUTH**
  - Neonate: Initially 250–500 micrograms/kg 4 times a day, dose to be increased every 4–5 days according to response, a preparation containing 1:4 carbidopa:levodopa to be administered; maintenance 2.5–3 mg/kg 4 times a day, at higher doses consider preparation containing 1:10 carbidopa:levodopa, review regularly (every 3–6 months)

- Child: Initially 250–500 micrograms/kg 4 times a day, dose to be increased every 4–5 days according to response, a preparation containing 1:4 carbidopa:levodopa to be administered; maintenance 2.5–3 mg/kg 4 times a day, at higher doses consider preparation containing 1:10 carbidopa:levodopa, review regularly (every 3–6 months in early childhood)

**DOSE EQUIVALENT AND CONVERSION**

The proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.

2 tablets Sinemet® 12.5 mg/50 mg is equivalent to 1 tablet Sinemet® Plus 25 mg/100 mg.

**UNLICENSED USE**

Not licensed for use in children.

**CAUTIONS**

Cardiovascular disease • diabetes mellitus • history of myocardial infarction with residual arrhythmia • history of peptic ulcer • history of skin melanoma (risk of activation) • osteomalacia • psychiatric illness (avoid if severe and discontinue if deterioration) • pulmonary disease • susceptibility to angle-closure glaucoma

**INTERACTIONS** ▶ Appendix 1 (co-careldopa, levodopa).

**SIDE-EFFECTS**

- **Common or very common**
  - Agitation • anorexia • arrhythmias • dizziness • insomnia • nausea • postural hypotension • reddish discolouration of urine and other body fluids • tachycardia • vomiting

- **Rare**
  - Abnormal involuntary movements (may be dose-limiting) • Henoch–Schönlein purpura • hypersensitivity • labile hypertension • psychiatric symptoms (including hypomania, may be dose-limiting)

- **Very rare**
  - Angle-closure glaucoma

- **Frequency not known**
  - Depression • drowsiness • flushing • gastro-intestinal bleeding • headache • liver enzyme changes • peripheral neuropathy • pruritus • rash • sweating • syndrome resembling neuroleptic malignant syndrome (on withdrawal) • taste disturbance

**PREGNANCY**

Use with caution—toxicity has occurred in animal studies.

**BREAST FEEDING**

May suppress lactation; present in milk—avoid.

**MONITORING REQUIREMENTS**

In prolonged therapy, psychiatric, hepatic, haematological, renal, and cardiovascular monitoring is advisable; warn patients to resume normal activities gradually.

**EFFECT ON LABORATORY TESTS**

False positive tests for urinary ketones have been reported.

**TREATMENT CESSATION**

Avoid abrupt withdrawal.

**PRESCRIBING AND DISPENSING INFORMATION**

Carbidopa is a mixture of carbidopa and levodopa; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of carbidopa and levodopa respectively.

**PATIENT AND CARER ADVICE**

Driving and skilled tasks

Sudden onset of sleep

Excessive daytime sleepiness and sudden onset of sleep can occur with co-careldopa.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

Warn patients to resume normal activity gradually.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 10, 14

- **Co-careldopa (Non-proprietary)**
  - **Carbidopa (as Carbidopa monohydrate) 10 mg, Levodopa 100 mg** Co-careldopa 10mg/100mg tablets | 100 tablet | £9.38 DT price = £8.68
  - **Carbidopa (as Carbidopa monohydrate) 25 mg, Levodopa 100 mg** Co-careldopa 25mg/100mg tablets | 100 tablet | £26.99 DT price = £14.39
  - **Carbidopa (as Carbidopa monohydrate) 25 mg, Levodopa 250 mg** Co-careldopa 25mg/250mg tablets | 100 tablet | £35.00 DT price = £34.98

## Nausea and labyrinth disorders

### Drug treatment

Antiemetics should be prescribed only when the cause of vomiting is known because otherwise they may delay diagnosis, particularly in children. Antiemetics are unnecessary and sometimes harmful when the cause can be treated, such as in diabetic ketoacidosis, or in digoxin p. 75 or antiepileptic overdose.

If antiemetic drug treatment is indicated, the drug is chosen according to the aetiology of vomiting.

**Antihistamines** are effective against nausea and vomiting resulting from many underlying conditions. There is no evidence that any one antihistamine is superior to another but their duration of action and incidence of adverse effects (drowsiness and antimuscarinic effects) differ.

The **phenothiazines** are dopamine antagonists and act centrally by blocking the chemoreceptor trigger zone. They are of considerable value for the prophylaxis and treatment of nausea and vomiting associated with diffuse neoplastic disease, radiation sickness, and the emesis caused by drugs such as opioids, general anaesthetics, and cytotoxics.

Prochlorperazine p. 252, perphenazine p. 232, and trifluoperazine p. 233 are less sedating than chlorpromazine hydrochloride p. 230; severe dystonic reactions sometimes occur with phenothiazines. Some phenothiazines are available as rectal suppositories, which can be useful in children with persistent vomiting or with severe nausea; for children over 12 years prochlorperazine can also be administered as a buccal tablet which is placed between the upper lip and the gum.

Other antipsychotic drugs including haloperidol p. 231 and levomepromazine p. 251 are used for the relief of nausea in palliative care.

Metoclopramide hydrochloride p. 246 is an effective antiemetic and its activity closely resembles that of the phenothiazines. Metoclopramide hydrochloride also acts directly on the gastrointestinal tract and it may be superior to the phenothiazines for emesis associated with gastroduodenal, hepatic, and biliary disease. Due to the risk of neurological side effects, metoclopramide hydrochloride should only be used in children as second line therapy in postoperative and cytotoxic induced nausea and vomiting.

Domperidone p. 245 acts at the chemoreceptor trigger zone; it has the advantage over metoclopramide hydrochloride and the phenothiazines of being less likely to cause central effects such as sedation and dystonic reactions because it does not readily cross the blood–brain barrier.

Granisetron p. 247 and ondansetron p. 248 are specific 5HT3-receptor antagonists which block 5HT3 receptors in the gastrointestinal tract and in the CNS. They are of value in the management of nausea and vomiting in children receiving cytotoxics and in postoperative nausea and vomiting.

Nabilone p. 245 is a synthetic cannabinoid with antiemetic properties. It may be used for nausea and vomiting caused by...
cytotoxic chemotherapy that is unresponsive to conventional antiemetics. Dexamethasone has antiemetic effects. Dexamethasone may also have a role in cytotoxic-induced nausea and vomiting.

Vomiting during pregnancy
Nausea in the first trimester of pregnancy is generally mild and does not require drug therapy. On rare occasions if vomiting is severe, short-term treatment with an antihistamine, such as promethazine, may be required. Prochlorperazine or metoclopramide hydrochloride are alternatives. If symptoms do not settle in 24 to 48 hours then specialist opinion should be sought. Hyperemesis gravidarum is a more serious condition, which requires regular antiemetic therapy, intravenous fluid and electrolyte replacement and sometimes nutritional support. Supplementation with thiamine p. 586 must be considered in order to reduce the risk of Wernicke’s encephalopathy.

Postoperative nausea and vomiting
The incidence of postoperative nausea and vomiting depends on many factors including the anaesthetic used, and the type and duration of surgery. Other risk factors include female sex, non-smokers, a history of postoperative nausea and vomiting or motion sickness, and intraoperative and postoperative use of opioids. Therapy to prevent postoperative nausea and vomiting should be based on the assessed risk. Drugs used include 5HT1-receptor antagonists, droperidol p. 251, dexamethasone, some antihistamines (e.g. prochlorperazine), and antihistamines (e.g. cyclizine below). A combination of two or more antiemetic drugs that have different mechanisms of action is often indicated in those at high risk of postoperative nausea and vomiting or where postoperative vomiting presents a particular danger (e.g. in some types of surgery). When a prophylactic antiemetic drug has failed, postoperative nausea and vomiting should be treated with one or more drugs from a different class.

Opioid-induced nausea and vomiting
Cyclizine, ondansetron, and prochlorperazine are used to relieve opioid-induced nausea and vomiting; ondansetron has the advantage of not producing sedation.

Motion sickness
Antiemetics should be given to prevent motion sickness rather than after nausea or vomiting has develop. The most effective drug for the prevention of motion sickness is hyoscine hydrobromide p. 250. For children over 10 years old, a transdermal hyoscine patch provides prolonged activity but it needs to be applied several hours before travelling. The sedating antihistamines are slightly less effective against motion sickness, but are generally better tolerated than hyoscine. If a sedative effect is desired promethazine is useful, but generally a slightly less sedating antihistamine such as cyclizine or cinnarizine p. 249 is preferred. Domperidone, metoclopramide hydrochloride, 5HT1-receptor antagonists, and the phenothiazines (except the antihistamine phenothiazine promethazine) are ineffective in motion sickness.

Other vestibular disorders
Management of vestibular diseases is aimed at treating the underlying cause as well as treating symptoms of the balance disturbance and associated nausea and vomiting. Antihistamines (such as cinnarizine), and phenothiazines (such as prochlorperazine) are effective for prophylaxis and treatment of nausea and vertigo resulting from vestibular disorders; however, when nausea and vertigo are associated with middle ear surgery, treatment can be difficult.

Cytotoxic chemotherapy, palliative care, and migraine
Antiemetics have a role in the management of nausea and vomiting induced by cytotoxic chemotherapy, in palliative care, and associated with migraine.

Drugs used for Nausea and labyrinth disorders not listed below Promethazine hydrochloride, p. 171

Antiemetics and Antinauseants

Antihistamines

Cyclizine

- INDICATIONS AND DOSE

Nausea and vomiting of known cause: Nausea and vomiting associated with vestibular disorders and palliative care

- BY MOUTH, OR BY INTRAVENOUS INJECTION
  - Child 1 month–5 years: 0.5–1 mg/kg up to 3 times a day (max. per dose 25 mg), intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure
  - Child 6–11 years: 25 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure
  - Child 12–17 years: 50 mg up to 3 times a day, intravenous injection to be given over 3–5 minutes, for motion sickness, take 1–2 hours before departure

- BY RECTUM
  - Child 2–5 years: 12.5 mg up to 3 times a day
  - Child 6–11 years: 25 mg up to 3 times a day
  - Child 12–17 years: 50 mg up to 3 times a day

- BY CONTINUOUS INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INFUSION
  - Child 1–23 months: 3 mg/kg, dose to be given over 24 hours
  - Child 2–5 years: 50 mg, dose to be given over 24 hours
  - Child 6–11 years: 75 mg, dose to be given over 24 hours
  - Child 12–17 years: 150 mg, dose to be given over 24 hours

- CONTRA-INDICATIONS Avoid in Acute porphyrias p. 562 (some antihistamines are thought to be safe) - neonate (due to significant antimuscarinic activity)

- CAUTIONS Epilepsy, glaucoma, may counteract haemodynamic benefits of opioids - neuromuscular disorders - increased risk of transient paralysis with intravenous use - pyloroduodenal obstruction - severe heart failure - may cause fall in cardiac output and associated increase in heart rate, mean arterial pressure and pulmonary wedge pressure - urinary retention

- INTERACTIONS Appendix 1 (antihistamines).

- SIDE-EFFECTS

  - GENERAL SIDE-EFFECTS
    - Common or very common Drowsiness
    - Rare Anaphylaxis - angioedema - angle-closure glaucoma - arrhythmias - blood disorders - bronchospasm - confusion - convulsions - depression - dizziness - extrapyramidal effects - hypersensitivity reactions - hypotension - liver dysfunction - palpitation - paradoxical stimulation (especially with high doses in children) - photosensitivity reactions - rash - sleep disturbances - tremor
    - Frequency not known Antimuscarinic effects - blurred vision - dry mouth - gastro-intestinal disturbances - hallucinations - headache - hypertension - movement disorders - oculogyric crisis - paraesthesia - psychomotor
Nausea and labyrinth disorders

Some common causes of nausea and vomiting include:
- Gastro-oesophageal reflux disease (but efficacy not proven)
- Gastro-intestinal disturbances
- Nervous system disorders
- Toxicological causes
- Drug-related causes
- Psychological causes

SIDE-EFFECTS
- Common or very common: Ataxia, concentration difficulties, drowsiness, dry mouth, dysphoria, euphoria, headache, hypotension, nausea, sleep disturbance, vertigo, visual disturbance
- Frequency not known: Abdominal pain, confusion, decreased appetite, decreased coordination, depression, disorientation, hallucinations, psychosis, tachycardia, tremors

SIDE-EFFECTS, FURTHER INFORMATION
Drowsiness and dizziness occur frequently with standard doses.

PREGNANCY
Avoid unless essential.

BREAST FEEDING
Avoid—no information available.

HEPATIC IMPAIRMENT
Avoid in severe impairment.

PATIENT AND CARER ADVICE
Driving and skilled tasks
Drowsiness may affect performance of skilled tasks (e.g. driving).
Effects of alcohol enhanced.
For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including nabilone, see Drugs and skilled tasks under Guidance on prescribing p. 1.
Behavioural effects Patients should be made aware of possible changes of mood and other adverse behavioural effects.

ANTIEPIRETICS AND ANTINAUSEANTS
DOPAMINE RECEPTOR ANTAGONISTS

Domperidone

INDICATIONS AND DOSE
Relief of nausea and vomiting
- By mouth
  - Child (body-weight up to 35 kg): 250 micrograms/kg up to 3 times a day; maximum 750 micrograms/kg per day
  - Child 12–17 years (body-weight 35 kg and above): 10 mg up to 3 times a day; maximum 30 mg per day

Gastro-oesophageal reflux disease (but efficacy not proven)
- By mouth
  - Neonate: 250 micrograms/kg 3 times a day, dose can be increased if response inadequate, increased if necessary up to 400 micrograms/kg 3 times a day, interrupt treatment occasionally to assess recurence—consider restarting if symptoms recur, discontinue if response inadequate at higher dose.

  - Child: 250 micrograms/kg 3 times a day (max. per dose 10 mg), dose can be increased if response inadequate, increased if necessary up to 400 micrograms/kg 3 times a day (max. per dose 20 mg), interrupt treatment occasionally to assess recurrence—consider restarting if symptoms recur, discontinue if response inadequate at higher dose.

Nabilone

INDICATIONS AND DOSE
Nausea and vomiting caused by cytotoxic chemotherapy, unresponsive to conventional antiemetics (preferably in hospital setting) (under close medical supervision)
- By mouth
- Child: (consult local protocol)

UNLICENSED USE
Not licensed for use in children.

CAUTIONS
Adverse effects on mental state can persist for 48–72 hours after stopping.

CANNABINOIDS

Nabilone

Nabilone (Non-proprietary)
Nabilone 1 mg Nabilone 1mg capsules | 20 capsule £196.00 (C02)

ANTIEPIRETICS AND ANTINAUSEANTS

CANNABINOIDS
Metoclopramide hydrochloride

**INDICATIONS AND DOSE**
Second-line option for treatment of established postoperative nausea and vomiting | Prevention of delayed chemotherapy-induced nausea and vomiting

- **By mouth, or by intramuscular injection, or by intravenous injection**
- **Child:** 100–150 micrograms/kg up to 3 times a day (max. per dose 10 mg), when administered by slow intravenous injection, to be given over at least 3 minutes

**UNLICENSED USE** Maxolon® tablets not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**
MHRA/CHM ADVICE—METOCLOPRAMIDE: RISK OF NEUROLOGICAL ADVERSE EFFECTS—RESTRICTED DOSE AND DURATION OF USE (AUGUST 2013)

The benefits and risks of metoclopramide have been reviewed by the European Medicines Agency’s Committee on Medicinal Products for Human Use, which concluded that the risk of neurological effects such as extrapyramidal disorders and tardive dyskinesia outweigh the benefits in long-term or high-dose treatment. To help minimise the risk of potentially serious neurological adverse effects, the following restrictions to indications, dose and duration of use have been made:

- In children aged 1–18 years, metoclopramide should only be used as a second-line option for prevention of delayed chemotherapy-induced nausea and vomiting and for treatment of established postoperative nausea and vomiting;
- Use of metoclopramide is contra-indicated in children aged under 1 year;
- Metoclopramide should only be prescribed for short-term use (up to 5 days);
- Recommended dose is 100–150 micrograms/kg (max. 10 mg), repeated up to 3 times daily;
- Intravenous doses should be administered as a slow bolus over at least 3 minutes;
- Oral liquid formulations should be given via an appropriately designed, graduated oral syringe to ensure dose accuracy.

This advice does not apply to unlicensed uses of metoclopramide (e.g. palliative care).
Granisetron

**DRUG ACTION** Granisetron is a specific 5HT3-receptor antagonist which blocks 5HT3 receptors in the gastrointestinal tract and in the CNS.

**INDICATIONS AND DOSE**

**Management of nausea and vomiting induced by cytotoxic chemotherapy**

- **By mouth**
  - Child 12-17 years: 1–2 mg, to be taken within 1 hour before start of treatment, then 2 mg daily in 1–2 divided doses for up to 1 week following chemotherapy
  - **By intravenous infusion**
  - Child 2-17 years: 10–40 micrograms/kg (max. per dose 3 mg), repeated if necessary, to be given before start of chemotherapy, for treatment, dose may be repeated within 24 hours if necessary, not less than 10 minutes after initial dose; maximum 2 doses per day

**SIDE-EFFECTS**

- Rare
- With intravenous use: Cardiac conduction abnormalities

**SPECIFIC SIDE-EFFECTS**

- Acute dystonic reactions
  - With intravenous use: Very rare

**GUARDIAN**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**MEDICINAL FORMS**

**Tablet**

- Metoclopramide hydrochloride (Non-proprietary)
- Metoclopramide hydrochloride 10 mg Metoclopramide 10mg tablets | 10 tablet | £0.75
- Maxonol (AMCo)
- Metoclopramide hydrochloride 10 mg Maxonol 10mg tablets | 84 tablet | £5.24

**Oral solution**

- Metoclopramide hydrochloride (Non-proprietary)
- Metoclopramide hydrochloride 1mg per 1ml Metoclopramide 5mg/5ml oral solution sugar free sugar-free | 150 ml | £12.77

**Solution for injection**

- Metoclopramide hydrochloride (Non-proprietary)
- Metoclopramide hydrochloride 5mg per 1ml Metoclopramide 10mg/2ml solution for injection ampoules | 5 ampoule | £3.03
- Maxonol (AMCo)
- Metoclopramide hydrochloride 5mg per 1ml Maxonol 10mg/2ml solution for injection ampoules | 12 ampoule | £3.21

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- Granisetron (Non-proprietary)
  - Granisetron (as Granisetron hydrochloride) 1mg Granisetron 1mg tablets | 10 tablet | £0.50
  - Granisetron (as Granisetron hydrochloride) 2mg Granisetron 2mg tablets | 5 tablet | no price available

**Solution for injection**

- Granisetron (Non-proprietary)
  - Granisetron (as Granisetron hydrochloride) 1mg per 1ml Granisetron 3mg/3ml concentrate for solution for injection ampoules | 5 ampoule | £24.00
  - Granisetron 1mg/1ml concentrate for solution for injection ampoules | 5 ampoule | £8.00
Ondansetron

**DRUG ACTION** Ondansetron is a specific 5HT3-receptor antagonist which blocks 5HT3 receptors in the gastrointestinal tract and in the CNS.

**INDICATIONS AND DOSE**

**Prevention of postoperative nausea and vomiting**
- **BY SLOW INTRAVENOUS INJECTION**
  - Child: 100 micrograms/kg (max. per dose 4 mg) for 1 dose, dose to be given over at least 30 seconds before, during, or after induction of anaesthesia

**Treatment of postoperative nausea and vomiting**
- **BY SLOW INTRAVENOUS INJECTION**
  - Child: 100 micrograms/kg (max. per dose 4 mg) for 1 dose, dose to be given over at least 30 seconds

**Prevention and treatment of chemotherapy- and radiotherapy-induced nausea and vomiting**
- **BY INTRAVENOUS INFUSION**
  - Child: 6 months-17 years (body surface area up to 1.3 m²): 5 mg/m² for 1 dose then give orally, alternatively 150 micrograms/kg (max. per dose 8 mg), dose to be administered immediately before chemotherapy, then 150 micrograms/kg every 4 hours (max. per dose 8 mg) for 2 further doses then give orally; maximum 32 mg per day
  - Child: 6 months-17 years (body surface area 1.3 m² and above): 8 mg for 1 dose then give orally, alternatively 150 micrograms/kg (max. per dose 8 mg), dose to be administered immediately before chemotherapy, then 150 micrograms/kg every 4 hours (max. per dose 8 mg) for 2 further doses then give orally, intravenous infusion to be administered over at least 15 minutes; maximum 32 mg per day

**Prevention and treatment of chemotherapy- and radiotherapy-induced nausea and vomiting**
- **BY MOUTH**
  - Child: 6 months-17 years (body surface area up to 0.6 m²): 2 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day
  - Child: 6 months-17 years (body surface area 0.6-1.2 m²): 4 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day
  - Child: 6 months-17 years (body surface area 1.3 m² and above): 8 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day

**Prevention and treatment of chemotherapy- and radiotherapy-induced nausea and vomiting**
- **BY MOUTH**
  - Child: 6 months-17 years (body weight up to 10.1 kg): 2 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day
  - Child: 6 months-17 years (body weight 10.1-40 kg): 4 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day
  - Child: 6 months-17 years (body weight 41 kg and above): 8 mg every 12 hours for up to 5 days (dose can be started 12 hours after intravenous administration); maximum 32 mg per day

**UNLICENSED USE** Not licensed for radiotherapy-induced nausea and vomiting in children.

**CONTRA-INDICATIONS** Congenital long QT syndrome

**CAUTIONS** Adenotonsillar surgery • subacute intestinal obstruction • susceptibility to QT-interval prolongation (including electrolyte disturbances)

**INTERACTIONS** → Appendix 1 (5HT3-receptor Antagonists). Caution with concomitant use of drugs that prolong QT interval.

**SIDE-EFFECTS**

**COMMON SIDE-EFFECTS**
- Rare
  - With intravenous use Dizziness • transient visual disturbances
  - Very rare
  - With intravenous use Transient blindness

**PREGNANCY** No information available; avoid unless potential benefit outweighs risk.

**BREAST FEEDING** Present in milk in animal studies—avoid.

**HEPATIC IMPAIRMENT** Reduce dose in moderate or severe impairment.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For intravenous infusion, dilute to a concentration of 320–640 micrograms/ml with Glucose 5% or Sodium Chloride 0.9%; give over at least 15 minutes.
- With oral use Orodispersible films and lyophilisates should be placed on the tongue, allowed to disperse and swallowed.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer orodispersible films and lyophilisates.

**MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

- Ondansetron (Non-proprietary)
  - Ondansetron (as Ondansetron hydrochloride) 4 mg Ondansetron 4mg tablets | 10 tablet (£0.57) £26.46 DT price + £1.22 | 30 tablet (£0.57) £76.38
  - Ondansetron (as Ondansetron hydrochloride) 8 mg Ondansetron 8mg tablets | 10 tablet (£0.57) £47.99 DT price + £2.34
  - Ondemet (Alliance Pharmaceuticals Ltd) Ondansetron (as Ondansetron hydrochloride) 4 mg Ondemet 4mg tablets | 30 tablet (£0.57) £81.15
  - Ondansetron (as Ondansetron hydrochloride) 8 mg Ondemet 8mg tablets | 10 tablet (£0.57) £154.36 DT price + £2.34 (Hospital only)
  - Zofran (Novartis Pharmaceuticals UK Ltd) Ondansetron (as Ondansetron hydrochloride) 4 mg Zofran 4mg tablets | 30 tablet (£0.57) £107.91
  - Ondansetron (as Ondansetron hydrochloride) 8 mg Zofran 8mg tablets | 10 tablet (£0.57) £171.94 DT price + £2.34

**Orodispersible tablet**

- Ondansetron (Non-proprietary)
  - Ondansetron 4 mg Ondansetron 4mg orodispersible tablets | 10 tablet (£0.57) £43.46 DT price + £43.09
  - Ondansetron 8 mg Ondansetron 8mg orodispersible tablets | 10 tablet (£0.57) £85.43 DT price + £85.43

**Orodispersible film**

- Setofilm (Norgine Pharmaceuticals Ltd) Ondansetron 4 mg Setofilm 4mg orodispersible films sugar-free | 10 film (£0.57) £28.50
  - Ondansetron 8 mg Setofilm 8mg orodispersible films sugar-free | 10 film (£0.57) £57.00

**Oral solution**

- Ondansetron (Non-proprietary)
  - Ondansetron (as Ondansetron hydrochloride) 800 microgram per 1 ml Ondansetron 4mg/2ml oral solution sugar free sugar-free | 50 ml (£0.57) £38.08 DT price + £38.02
ANTIHISTAMINES

Cinnarizine

- **INDICATIONS AND DOSE**
  - Relief of symptoms of vestibular disorders, such as vertigo, tinnitus, nausea, and vomiting in Ménière's disease
  - **BY MOUTH**
    - Child 5–11 years: 15 mg 3 times a day
    - Child 12–17 years: 30 mg 3 times a day
  - Motion sickness
    - **BY MOUTH**
      - Child 5–11 years: Initially 15 mg, dose to be taken required, dose to be taken at bedtime on night before travel or bedtime 2 hours before travel, then 7.5 mg every 8 hours if required, dose to be taken during journey
      - Child 12–17 years: Initially 30 mg, dose to be taken required, dose to be taken 2 hours before travel, then 15 mg every 8 hours if required, dose to be taken during journey

- **CONTRA-INDICATIONS** Avoid in Acute porphyrias p. 562 (some antihistamines are thought to be safe) - neonate (due to significant antimuscarinic activity)
- **CAUTIONS** Epilepsy - glaucoma - pyloroduodenal obstruction - urinary retention
- **SIDE-EFFECTS**
  - Common or very common Drowsiness
  - Rare Anaphylaxis - angioedema - angle-closure glaucoma - arrhythmias - blood disorders - bronchospasm - confusion - convulsions - depression - diziness - extrapyramidal effects - hypersensitivity reactions - hypotension - lichen planus - liver dysfunction - lupus-like skin reactions - palpititation - paradoxical stimulation (especially with high doses in children) - photosensitivity reactions - rashes - sleep disturbances - sweating - tremor - weight gain
  - Frequency not known Antimuscarinic effects - blurred vision - dry mouth - gastro-intestinal disturbances - headache - psychomotor impairment - urinary retention

SIDE-EFFECTS, FURTHER INFORMATION

Children are more susceptible to side-effects.

Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely in children, especially with high doses. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

- **PREGNANCY** Manufacturer advises avoid; however, there is no evidence of teratogenicity. The use of sedating antihistamines in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitation, and tremor.

- **BREAST FEEDING** Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease—increased risk of coma.

- **RENAL IMPAIRMENT** Use with caution—no information available.

- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
    - Drowsiness may affect performance of skilled tasks (e.g. cycling, driving); sedating effects enhanced by alcohol.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Promethazine teoclate

- **INDICATIONS AND DOSE**
  - Nausea | Vomiting | Labyrinthine disorders
    - **BY MOUTH**
      - Child 5–9 years: 12.5–37.5 mg daily
      - Child 10–17 years: 25–75 mg daily; maximum 100 mg per day
  - Motion sickness prevention (acts longer than promethazine hydrochloride)
    - **BY MOUTH**
      - Child 5–9 years: 12.5 mg once daily, dose to be taken at bedtime on night before travel or 1–2 hours before travel
      - Child 10–17 years: 25 mg once daily, dose to be taken at bedtime on night before travel or 1–2 hours before travel
  - Motion sickness treatment (acts longer than promethazine hydrochloride)
    - **BY MOUTH**
      - Child 5–9 years: 12.5 mg, dose to be taken at onset of motion sickness, then 12.5 mg daily for 2 days, dose to be taken at bedtime
      - Child 10–17 years: 25 mg, dose to be taken at onset of motion sickness, then 25 mg once daily for 2 days, dose to be taken at bedtime

IMPORATNT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009) OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN

Children under 6 years should not be given over-the-counter cough and cold medicines containing promethazine.
**Nervous system**

ANTIMUSCARINICS

**PATIENT AND CARER ADVICE**

**HEPATIC IMPAIRMENT**

- Frequency not known
- Rare

**INTERACTIONS**

- Disease

**SIDE-EFFECTS**

- Rare Anaphylaxis - angioedema - angle-closure glaucoma - arrhythmias - blood disorders - bronchospasm - confusion - convulsions - depression - diziness - extrapyramidal effects - hypersensitivity reactions - hypotension - liver dysfunction - palpitation - photosensitivity reactions - rashes - sleep disturbances - tremor

- Frequency not known Antimuscarinic effects - blurred vision - drowsiness - dry mouth - gastro-intestinal disturbances - headache - psychomotor impairment - restlessness - urinary retention

**SIDE-EFFECTS, FURTHER INFORMATION**

Children are more susceptible to side-effects. Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely in children, especially with high doses. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

**PREGNANCY**

- Most manufacturers of antihistamines advise avoiding their use during pregnancy; however, there is no evidence of teratogenicity. Use in the latter part of the third trimester may cause adverse effects in neonates such as irritability, paradoxical excitability, and tremor.

**BREAST FEEDING**

- Most antihistamines are present in breast milk in varying amounts; although not known to be harmful, most manufacturers advise avoiding their use in mothers who are breast-feeding.

**HEPATIC IMPAIRMENT**

- Avoid in severe liver disease—increased risk of coma.

**RENAL IMPAIRMENT**

- Use with caution.

**PATIENT AND CARER ADVICE**

- Driving and skilled tasks
  - Drowsiness may affect performance of skilled tasks (e.g., cycling or driving); sedating effects enhanced by alcohol.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.

  - Avomine (Maxin Healthcare Ltd)
  - 10 tablet £1.13 | 28 tablet £3.13 DT price = £3.13

**ANTIMUSCARINICS**

**Hyoscine hydrobromide**

(Scopolamine hydrobromide)

**INDICATIONS AND DOSE**

- Motion sickness
  - By mouth
  - Child 4-9 years: 75–150 micrograms, dose to be taken up to 30 minutes before the start of journey, then 75–150 micrograms every 6 hours if required; maximum 450 micrograms per day
  - Child 10-17 years: 150–300 micrograms, dose to be taken up to 30 minutes before the start of journey, then 150–300 micrograms every 6 hours if required; maximum 900 micrograms per day

**SIDE-EFFECTS, FURTHER INFORMATION**

- Drowsiness is a significant side-effect with most of the older antihistamines although paradoxical stimulation may occur rarely in children, especially with high doses. Drowsiness may diminish after a few days of treatment and is considerably less of a problem with the newer antihistamines.

**SIDE-EFFECTS**

- Hypersensitivity reactions - palpitation - sleep disturbances - tremor

**IMPORTANT SAFETY INFORMATION**

Antimuscarinic drugs used for premedication to general anaesthesia should only be administered by, or under the direct supervision of, personnel experienced in their use.

**CAUTIONS**

- Epilepsy

**CAUTIONS, FURTHER INFORMATION**

- Anticholinergic syndrome

- With systemic use Some children hyoscine may cause the central anticholinergic syndrome (excitement, ataxia, hallucinations, behavioural abnormalities, and drowsiness).

**PREGNANCY**

- Use only if potential benefit outweighs risk.

**BREAST FEEDING**

- Amount too small to be harmful.

**HEPATIC IMPAIRMENT**

- Use with caution.

**BY TRANSDERMAL APPLICATION**

- Child 10-17 years: Apply 1 patch, apply behind ear 5–6 hours before journey, then apply 1 patch after 72 hours if required, remove old patch and site replacement patch behind the other ear

**Hypersalivation associated with clozapine therapy**

- By mouth

**Excessive respiratory secretions**

- By mouth, or by sublingual administration

**Excessive respiratory secretion (in palliative care)**

- By subcutaneous injection, or by intramuscular injection

**Bowel colic pain in palliative care**

- By mouth using sublingual tablets

**Premedication**

- By subcutaneous injection, or by intramuscular injection

**By intravenous injection**

- Child 1-11 years: 15 micrograms/kg (max. per dose 600 micrograms), to be administered 30–60 minutes before induction of anaesthesia

**Child 12-17 years: 200–600 micrograms, to be administered 30–60 minutes before induction of anaesthesia

**Child 12-17 years: 200–600 micrograms, to be administered immediately before induction of anaesthesia

**UNLICENSED USE**

- Not licensed for use in excessive respiratory secretions or hypersalivation associated with clozapine therapy.
**Nausea and labyrinth disorders** 251

- **ANTI-PSYCHOTICS**
  - **PRESCRIBING AND DISPENSING INFORMATION**
  - **PATIENT AND CARER ADVICE**
  - **PRESCRIPTION AND DISPENSING INFORMATION**

- **MEDIcINAL FORMS**
  - Forms available from special-order manufacturers include: oral suspension, oral solution.

- **INDICATIONS AND DOSE**
  - Prevention and treatment of postoperative nausea and vomiting.
  - Prevention and treatment of postoperative vomiting.

- **SIDE-EFFECTS**
  - Anxiety, cardiac arrest, hallucinations, inappropriate antidiuretic hormone secretion.

- **INTERACTIONS**
  - Avoid concomitant administration of drugs that prolong QT interval.

- **RENAI IMPAIRMENT**
  - In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required.

- **CONTRA-INDICATIONS**
  - Bradycardia, CNS depression, comatose states, hypokalaemia, hypomagnesaemia, phaeochromocytoma, QT-interval prolongation.

- **CAUTIONS**
  - Chronic obstructive pulmonary disease, electrolyte disturbances, history of alcohol abuse, respiratory failure.

- **HEPATIC IMPAIRMENT**
  - In postoperative nausea and vomiting, max. 625 micrograms repeated every 6 hours as required.

- **SIDE-EFFECTS**
  - Anxiety, cardiac arrest, hallucinations, inappropriate antidiuretic hormone secretion.

- **CAUTIONARY AND ADVISORY LABELS**
  - Continuous pulse oximetry required if risk of ventricular arrhythmia—continue for 30 minutes following administration.

- **LEBOMAPROMAZINE**
  - Methotrimeprazine.

- **INDICATIONS AND DOSE**
  - Restlessness and confusion in palliative care.

- **CONTRA-INDICATIONS**
  - CNS depression, comatose states, phaeochromocytoma.

- **CAUTIONS**
  - Diabetes, patients receiving large initial doses should remain supine.

- **SIDE-EFFECTS**
  - Raised erythrocyte sedimentation rate.

- **HEPATIC IMPAIRMENT**
  - Can precipitate coma; phenothiazines are hepatotoxic.

- **RENAI IMPAIRMENT**
  - Start with small doses in severe renal impairment because of increased cerebral sensitivity.

- **DIRECTIONS FOR ADMINISTRATION**
  - With subcutaneous use. For administration by subcutaneous infusion dilute with a suitable volume of Sodium Chloride 0.9%.
### Prochlorperazine

#### MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**
- Levomepromazine (Non-proprietary)
  - Levomepromazine hydrochloride 25 mg per 1 ml
  - 1 ml Levomepromazine 25mg/1ml solution for injection ampoules | 10 ampoule [P] £20.13 DT price = £20.13
- Nozinan (Sanofi)
  - Levomepromazine hydrochloride 25 mg per 1 ml
  - Nozinan 25mg/1ml solution for injection ampoules | 10 ampoule [P] £20.13 DT price = £20.13

**Buccal tablet**
- Levomepromazine (Non-proprietary)
  - Levomepromazine maleate 5 mg
  - Prochlorperazine 5mg tablets | 28 tablet [P] £2.65 DT price = £0.93 | 84 tablet [P] £5.94
- Stemetil (Sanofi)
  - Levomepromazine maleate 5 mg
  - Nozinan 3mg tablets | 28 tablet [P] £1.98 DT price = £0.93 | 84 tablet [P] £5.94

**Oral solution**
- Levomepromazine (Non-proprietary)
  - Levomepromazine maleate 3 mg
  - Stemetil 3mg/5ml syrup | 100 ml [P] £3.34 DT price = £3.34

**Solution for injection**
- Levomepromazine (Non-proprietary)
  - Levomepromazine maleate 12.5 mg per 1 ml
  - Stemetil 5mg/5ml syrup | 100 ml [P] £3.34 DT price = £3.34

**CAUTIONARY AND ADVISORY LABELS**
- **2**

#### PROPHYLAXIS AND TREATMENT OF NAUSEA AND VOMITING

- **BY MOUTH**
  - Child 1-11 years (body-weight 10 kg and above): 250 micrograms/kg 2–3 times a day
  - Child 12-17 years: 5–10 mg up to 3 times a day if required

- **BY INTRAMUSCULAR INJECTION**
  - Child 2–4 years: 1.25–2.5 mg up to 3 times a day if required
  - Child 5-11 years: 5–6.25 mg up to 3 times a day if required
  - Child 12-17 years: 12.5 mg up to 3 times a day if required

**NAUSEA AND VOMITING IN PREVIOUSLY DIAGNOSED MIGRAINE**

- **BY MOUTH USING BUCAL TABLET**
  - Child 12-17 years: 3–6 mg twice daily, tablets to be placed high between upper lip and gum and left to dissolve

**DOSE EQUIVALENCE AND CONVERSION**

Doses are expressed as prochlorperazine maleate or mesilate; 1 mg prochlorperazine maleate = 1 mg prochlorperazine mesilate.

**UNLICENSED USE**

- With intramuscular use Injection not licensed for use in children.
- With buccal use Buccal tablets not licensed for use in children.

**CONTRA-INDICATIONS**

- Avoid oral route in child under 10 kg - children in psychotic disorders: CNS depression - comatose states - phaeochromocytoma

**CAUTIONS**

- Hypotension (more likely after intramuscular injection)

**SIDE-EFFECTS**

- Dystonic reactions - respiratory depression may occur in susceptible patients

**SIDE-EFFECTS, FURTHER INFORMATION**

- Acute dystonic reactions Phenothiazines can all induce acute dystonic reactions such as facial and skeletal muscle spasms and oculogyric crises; children (especially girls, young women, and those under 10 kg) are particularly susceptible.

**HEPATIC IMPAIRMENT**

- Can precipitate coma; phenothiazines are hepatotoxic.

**RENAL IMPAIRMENT**

- Start with small doses in severe renal impairment because of increased cerebral sensitivity.

**DIRECTIONS FOR ADMINISTRATION**

- With buccal use Buccal tablets are placed high between upper lip and gum and left to dissolve.

**PATIENT AND CARER ADVICE**

- With buccal use Patients or carers should be given advice on how to administer prochlorperazine buccal tablets.

### Analgesics

#### Drugs used for pain

The non-opioid drugs, paracetamol p. 254 and ibuprofen p. 608 (and other NSAIDs), are particularly suitable for pain in musculoskeletal conditions, whereas the opioid analgesics are more suitable for moderate to severe pain, particularly of visceral origin.

**Pain in sickle-cell disease**

The pain of mild sickle-cell crises is managed with paracetamol, an NSAID, codeine phosphate p. 259, or dihydrocodeine tartrate p. 262. Severe crises may require the use of morphine p. 265 or dexamphetamine hydrochloride p. 261; concomitant use of an NSAID may potentiate analgesia and allow lower doses of the opioid to be used. A mixture of nitrous oxide and oxygen (Entonox® and Equanox®) may also be used.

**Dental and orofacial pain**

Analgesics should be used judiciously in dental care as a temporary measure until the cause of the pain has been dealt with.

Dental pain of inflammatory origin, such as that associated with pulpitis, apical infection, localised osteitis or pericoronitis is usually best managed by treating the infection, providing drainage, restorative procedures, and other local measures. Analgesics provide temporary relief of pain (usually for about 1 to 7 days) until the causative factors have been brought under control. In the case of pulpitis, intra-ossseous infection or abscess, reliance on analgesics alone is usually inappropriate.

Similarly the pain and discomfort associated with acute problems of the oral mucosa (e.g. acute herpetic gingivostomatitis, erythema multiforme) may be relieved by benzylamine hydrochloride p. 660 or topical anaesthetics until the cause of the mucosal disorder has been dealt with.
However, where a child is febrile, the antipyretic action of paracetamol or ibuprofen is often helpful.

The choice of an analgesic for dental purposes should be based on its suitability for the child. Most dental pain is relieved effectively by non-steroidal anti-inflammatory drugs (NSAIDs) e.g. ibuprofen. Paracetamol has analgesic and antipyretic effects but no anti-inflammatory effect.

Analgesic analogues such as dihydrocodeine tartrate act on the central nervous system and are traditionally used for moderate to severe pain. However, opioid analogues are relatively ineffective in dental pain and their side-effects can be unpleasant.

Combining a non-opioid with an opioid analgesic can provide greater relief of pain than either analgesic given alone. However, this applies only when an adequate dose of each analgesic is used. Most combination analgesic preparations have not been shown to provide greater relief of pain than an adequate dose of the non-opioid component alone. Moreover, combination preparations have the disadvantage of an increased number of side-effects.

Any analgesic given before a dental procedure should have a low risk of increasing postoperative bleeding. In the case of pain after the dental procedure, taking an analgesic before the effect of the local anaesthetic has worn off can improve control. Postoperative analgesia with ibuprofen is usually continued for about 24 to 72 hours.

**Dysmenorrhoea**

Paracetamol or a NSAID will generally provide adequate relief of pain from dysmenorrhoea. Alternatively use of a combined hormonal contraceptive in adolescent girls may prevent the pain.

**Non-opioid analgesics and compound analgesic preparations**

Paracetamol has analgesic and antipyretic properties but no demonstrable anti-inflammatory activity; unlike opioid analogues, it does not cause respiratory depression and is less irritant to the stomach than the NSAIDs. Overdosage with paracetamol is particularly dangerous as it may cause hepatic damage which is sometimes not apparent for 4 to 6 days.

**Non-steroidal anti-inflammatory analogues** (NSAIDs) are particularly useful for the treatment of children with chronic disease accompanied by pain and inflammation. Some of them are also used in the short-term treatment of mild to moderate pain including transient musculoskeletal pain but paracetamol is now often preferred. They are also suitable for the relief of pain in dysmenorrhea and to treat pain caused by secondary bone tumours, many of which produce lysis of bone and release prostaglandins. Due to an association with Reye’s syndrome, aspirin p. 83 should be avoided in children under 16 years except in Kawasaki disease or for its antplatelet action. Several NSAIDs are also used for postoperative analgesia.

**Compound analgesic preparations**

Compound analgesic preparations that contain a simple analgesic (such as paracetamol) with an opioid component reduce the scope for effective titration of the individual components in the management of pain of varying intensity. Compound analgesic preparations containing paracetamol with a low dose of an opioid analgesic (e.g. 8 mg of codeine phosphate per compound tablet) may be used in older children but the advantages have not been substantiated. The low dose of the opioid may be enough to cause opioid side-effects (in particular, constipation) and can complicate the treatment of overdosage yet may not provide significant additional relief of pain.

A full dose of the opioid component (e.g. 60 mg codeine phosphate) in compound analgesic preparations effectively augments the analgesic activity but is associated with the full range of opioid side-effects (including nausea, vomiting, severe constipation, drowsiness, respiratory depression, and risk of dependence on long-term administration).

In general, when assessing pain, it is necessary to weigh up carefully whether there is a need for a non-opioid and an opioid analgesic to be taken simultaneously.

**Opioid analgesics**

Opioid analgesics are usually used to relieve moderate to severe pain particularly of visceral origin. Repeated administration may cause tolerance, but this is no deterrent in the control of pain in terminal illness. Regular use of a potent opioid may be appropriate for certain cases of chronic non-malignant pain; treatment should be supervised by a specialist and the child should be assessed at regular intervals.

**Strong opioids**

Morphine remains the most valuable opioid analgesic for severe pain although it frequently causes nausea and vomiting. It is the standard against which other opioid analogues are compared. In addition to relief of pain, morphine also confers a state of euphoria and mental detachment.

Morphine is the opioid of choice for the oral treatment of severe pain in palliative care. It is given regularly every 4 hours (or every 12 or 24 hours as modified-release preparations).

Buprenorphine p. 257 has both opioid agonist and antagonist properties and may precipitate withdrawal symptoms, including pain, in children dependent on other opioids. It has abuse potential and may itself cause dependence. It has a much longer duration of action than morphine and sublingually is an effective analgesic for 6 to 8 hours. Unlike most opioid analgesics, the effects of buprenorphine are only partially reversed by naloxone hydrochloride p. 796. It is rarely used in children.

Diamorphine hydrochloride (heroin) p. 261 is a powerful opioid analgesic. It may cause less nausea and hypotension than morphine p. 265. In palliative care the greater solubility of diamorphine hydrochloride allows effective doses to be injected in smaller volumes and this is important in the emaciated child. Diamorphine hydrochloride is sometimes given by the intranasal route to treat acute pain in children and is available as a nasal spray; intranasal administration of diamorphine injection has been used [unlicensed].

Alfentanil p. 772, fentanyl p. 262 and remifentanil p. 772 are used by injection for intra-operative analgesia. Fentanyl is available in a transdermal drug delivery system as a self-adhesive patch which is changed every 72 hours.

Methadone hydrochloride p. 279 is less sedating than morphine and acts for longer periods. In prolonged use, methadone hydrochloride should not be administered more often than twice daily to avoid the risk of accumulation and opioid overdosage. Methadone hydrochloride may be used instead of morphine when excitation (or exacerbation of pain) occurs with morphine. Methadone hydrochloride may also be used to treat children with neonatal abstinence syndrome.

Papaveretum p. 269 should not be used in children; morphine is easier to prescribe and less prone to error with regard to the strength and dose.

Pethidine hydrochloride p. 269 produces prompt but short-lasting analgesia; it is less constipating than morphine, but even in high doses is a less potent analgesic. Its use in children is not recommended. Pethidine hydrochloride is used for analgesia in labour; however, other opioids, such as morphine or diamorphine hydrochloride, are often preferred for obstetric pain.

Tramadol hydrochloride p. 270 is used in older children and produces analgesia by two mechanisms: an opioid effect and an enhancement of serotonergic and adrenergic pathways. It has fewer of the typical opioid side-effects (notably, less respiratory depression, less constipation and...
less addiction potential; psychiatric reactions have been reported.

**Weak opioids**

Codeine phosphate p. 259 can be used for the relief of short-term acute moderate pain in children older than 12 years where other painkillers such as paracetamol below or ibuprofen p. 608 have proved ineffective.

Dihydrocodeine tartrate p. 262 has an analgesic efficacy similar to that of codeine phosphate.

**Postoperative analgesia**

A combination of opioid and non-opioid analgesics is used to treat postoperative pain. The use of intra-operative opioids affects the prescribing of postoperative analgesics. A postoperative opioid analgesic should be given with care since it may potentiate any residual respiratory depression.

Morphine is used most widely. Tramadol hydrochloride is not as effective in severe pain as other opioid analgesics. Buprenorphine p. 257 may antagonise the analgesic effect of previously administered opioids and is generally not recommended. Pethidine hydrochloride is generally not recommended for postoperative pain because it is metabolised to norpethidine which may accumulate, particularly in neonates and in renal impairment; norpethidine stimulates the central nervous system and may cause convulsions.

Opioids are also given epidurally (unlicensed route) in the postoperative period but are associated with side-effects such as pruritus, urinary retention, nausea and vomiting; respiratory depression can be delayed, particularly with morphine.

Patient-controlled analgesia (PCA) and nurse-controlled analgesia (NCA) can be used to relieve postoperative pain—consult hospital protocols.

**Pain management and opioid dependence**

Although caution is necessary, patients who are dependent on opioids or have a history of drug dependence may be treated with opioid analgesics when there is a clinical need. Treatment with opioid analgesics in this patient group should normally be carried out with the advice of specialists. However, doctors do not require a special licence to prescribe opioid analgesics to patients with opioid dependence for relief of pain due to organic disease or injury.

**Paracetamol**

*Acetaminophen*

### Indications and Dose

**Pain/Pyrexia with discomfort**

*BY MOUTH*

- Neonate 28 weeks to 32 weeks corrected gestational age: 20 mg/kg for 1 dose, then 10–15 mg/kg every 8–12 hours as required, maximum daily dose to be given in divided doses; maximum 30 mg/kg per day. |
- Neonate 32 weeks corrected gestational age and above: 20 mg/kg for 1 dose, then 10–15 mg/kg every 6–8 hours as required, maximum daily dose to be given in divided doses; maximum 60 mg/kg per day. |
- Child 1–2 months: 30–60 mg every 8 hours as required, maximum daily dose to be given in divided doses; maximum 60 mg/kg per day. |
- Child 3–5 months: 60 mg every 4–6 hours; maximum 4 doses per day. |
Child (body-weight 50 kg and above): 1 g every 4–6 hours, dose to be administered over 15 minutes; maximum 3 g per day

**Post-operative pain**

- **BY MOUTH**
  - Child 1 month–5 years: 20–30 mg/kg for 1 dose, then 15–20 mg/kg every 4–6 hours, maximum daily dose to be given in divided doses; maximum 75 mg/kg per day
  - Child 6–11 years: 20–30 mg/kg (max. per dose 1 g) for 1 dose, then 15–20 mg/kg every 4–6 hours, maximum daily dose to be given in divided doses; maximum 75 mg/kg per day; maximum 4 g per day
  - Child 12–17 years: 1 g every 4–6 hours; maximum 4 doses per day

- **BY RECTUM**
  - Child 1–2 months: 30 mg/kg for 1 dose, then 15–20 mg/kg every 4–6 hours, maximum daily dose to be given in divided doses; maximum 75 mg/kg per day
  - Child 3 months–5 years: 30–40 mg/kg for 1 dose, then 15–20 mg/kg every 4–6 hours, maximum daily dose to be given in divided doses; maximum 75 mg/kg per day
  - Child 6–11 years: 30–40 mg/kg (max. per dose 1 g) for 1 dose, then 15–20 mg/kg every 4–6 hours, maximum daily dose to be given in divided doses; maximum 75 mg/kg per day; maximum 4 g per day
  - Child 12–17 years: 1 g every 4–6 hours; maximum 4 doses per day

**Post-immunisation pyrexia in infants**

- **BY MOUTH**
  - Child 2–3 months: 60 mg for 1 dose, then 60 mg after 4–6 hours if required, (dose can be repeated twice for meningococcal B vaccine)
  - Child 4 months: 60 mg for 1 dose, then 60 mg after 4–6 hours; maximum 4 doses per day

**PANADOL OA®**

**Mild to moderate pain | Pyrexia**

- **BY MOUTH**
  - Child 12–17 years: 1 g up to 4 times a day, dose not to be taken more often than every 4 hours

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Rare** Acute generalised exanthematous pustulosis • malaise • skin reactions • Stevens-Johnson syndrome • toxic epidermal necrolysis

**Frequency not known** Blood disorders • leucopenia • neutropenia • thrombocytopenia

**SPECIFIC SIDE-EFFECTS**

- **Rare**
  - With intravenous use Flushing • tachycardia
  - **Frequency not known**
  - With intravenous use Hypotension

**Overdose**

**Important:** Liver damage and less frequently renal damage can occur following overdose.

Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tenderness, usually indicates development of hepatic necrosis.

For specific details on the management of poisoning, see Paracetamol, under Emergency treatment of poisoning p. 786

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Amount too small to be harmful.

**HEPATIC IMPAIRMENT** Dose-related toxicity—avoid large doses.

**RENAL IMPAIRMENT** Increase infusion dose interval to every 5 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For **intravenous infusion** (Perfalgan®), give in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of not less than 1 mg/mL and use within an hour; may also be given undiluted. For children under 33 kg, use 50 mL-vial.

**PRESCRIBING AND DISPENSING INFORMATION** BP directs that when Paediatric Paracetamol Oral Suspension or Paediatric Paracetamol Mixture is prescribed Paracetamol Oral Suspension 120 mg/5 mL should be dispensed.

**PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Paracetamol for mild-to-moderate pain www.medicinesforchildren.org.uk/paracetamol-for-mild-tomoderate-pain

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary Paracetamol Tablets may be prescribed. Paracetamol Soluble Tablets 500 mg may be prescribed. Paracetamol Oral Suspension may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY** Paracetamol capsules or tablets can be sold to the public provided packs contain no more than 32 capsules or tablets; pharmacists can sell multiple packs up to a total quantity of 100 capsules or tablets in justifiable circumstances.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository

**Tablet**

**CAUTIONARY AND ADVISORY LABELS** 29 (does not apply to 1g tablet), 30

- **Paracetamol (Non-proprietary)**
  - Paracetamol 500 mg Paracetamol 500mg caplets | 32 tablet [P] £0.38 DT price = £0.74 | 100 tablet [PHR] £3.18 DT price = £2.31
  - Paracetamol 500mg tablets | 32 tablet [P] £1.24 DT price = £0.74 | 100 tablet [PHR] £3.18 DT price = £2.31 | 1000 tablet [PHR] £25.63 | 5000 tablet [PHR] no price available
  - Mandanol (M & A Pharmachen Ltd)

- **Paracetamol 500 mg** Mandanol 500mg caplets | 32 tablet [P] £0.20 DT price = £0.74
  - Mandanol 500mg tablets | 100 tablet [PHR] £0.33 DT price = £2.31
Paracetamol with tramadol

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 254, tramadol hydrochloride p. 270.

**INDICATIONS AND DOSE**

Moderate to severe pain

- **BY MOUTH**
  - Child 12-17 years: 2 tablets up to every 6 hours; maximum 8 tablets per day

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 2, 25, 29, 30

- Paracetamol with tramadol (Non-proprietary)

**Effervescent tablet**

CAUTIONARY AND ADVISORY LABELS 2, 13, 29, 30

- Tramadol hydrochloride 37.5 mg, Paracetamol 325 mg

**Suppository**

CAUTIONARY AND ADVISORY LABELS 30

- Paracetamol (Non-proprietary)

**Suppository**

- Paracetamol 80 mg
- Paracetamol 120 mg
- Paracetamol 240 mg
- Paracetamol 500 mg
- Calpol Fastmelts (McNeil Products Ltd)
- Paracetamol 250 mg
- Paracetamol 100 mg
- Calpol (McNeil Products Ltd)
- Alvedon (Intrapharm Laboratories Ltd)
- Paracetamol 60 mg
- Paracetamol 125 mg
- Paracetamol 250 mg
- Tablet

CAUTIONARY AND ADVISORY LABELS 2, 25, 29, 30

- Alvedon with tramadol (Non-proprietary)

**Solution for infusion**

- Paracetamol 10 mg per 1 ml
- Paraffalgan (Bristol-Myers Squibb Pharmaceuticals Ltd)
- Paracetamol 10 mg per 1ml

**MENOPAUSAL**

**OPIOIDS**

**Contra-Indications**

- Acute respiratory depression - coma, patients - head injury (opioid analgesics interfere with pupillary responses vital for neurological assessment)
- Raised intracranial pressure (opioid analgesics interfere with pupillary responses vital for neurological assessment)
- Risk of paralytic ileus

**Caution**

Adrenocortical insufficiency (reduced dose is recommended) - asthma (avoid during an acute attack) - convulsive disorders - diseases of the biliary tract - hypotenion - hypothyroidism (reduced dose is recommended) - impaired respiratory function (avoid in chronic obstructive pulmonary disease) - inflammatory
bowel disorders • myasthenia gravis • obstructive bowel disorders • shock

**CAUTIONS, FURTHER INFORMATION**

- **Dependence** Repeated use of opioid analgesics is associated with the development of psychological and physical dependence; although this is rarely a problem with therapeutic use, caution is advised if prescribing for patients with a history of drug dependence.
- **Palliative care** In the control of pain in terminal illness, the cautions listed should not necessarily be a deterrent to the use of opioid analgesics.

**INTERACTIONS** Appendix 1 (opioid analgesics).

**SIDE-EFFECTS**

- **Common or very common** Biliary spasm • bradycardia • confusion • constipation • dependence • difficulty with micturition • dizziness • drowsiness • dry mouth • dysphoria • euphoria • flushing • hallucinations • headache • hypotension (larger doses) • miosis • mood changes • muscle rigidity (larger doses) • nausea (particularly in initial stages) • oedema • palpitation • postural hypotension • pruritus • rash • respiratory depression (larger doses) • sexual dysfunction • sleep disturbances • sweating • tachycardia • urticaria • vertigo • visual disturbances • vomiting (particularly in initial stages)
- **Frequency not known** Adrenal insufficiency (long-term use) • hyperalgesia (long-term use) • hypogonadism (long-term use)

**SIDE-EFFECTS, FURTHER INFORMATION**

**Hypogonadism and adrenal insufficiency** Long-term use of opioid analgesics can cause hypogonadism and adrenal insufficiency in both males and females. This is thought to be dose related and can lead to amenorrhoea, reduced libido, infertility, depression, and erectile dysfunction.
- **Hyperalgesia** Long-term use of opioid analgesics has also been associated with a state of abnormal pain sensitivity (hyperalgesia). Pain associated with hyperalgesia is usually distinct from pain associated with disease progression or breakthrough pain, and is often more diffuse and less defined. Treatment of hyperalgesia involves reducing the dose of opioid medication or switching therapy; cases of suspected hyperalgesia should be referred to a specialist pain team.
- **Respiratory depression** Respiratory depression is a major concern with opioid analgesics; neonates (particularly if pre-term) may be more susceptible. It may be treated by artificial ventilation or be reversed by naloxone.
- **Dependence and withdrawal** Psychological dependence rarely occurs when opioids are used therapeutically (e.g. for pain relief) but tolerance can develop during long-term treatment.

**Overdose** Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. For details on the management of poisoning, see Opioids, under Emergency treatment of poisoning p. 786 and consider the specific antidote, naloxone hydrochloride p. 796.

**PREGNANCY** Respiratory depression and withdrawal symptoms can occur in the neonate if opioid analgesics are used during delivery; also gastric stasis and inhalation pneumonia has been reported in the mother if opioid analgesics are used during labour.

**HEPATIC IMPAIRMENT** Avoid use or reduce dose; may precipitate coma in patients with hepatic impairment.

**TREATMENT CESSATION** Avoid abrupt withdrawal after long-term treatment; they should be withdrawn gradually to avoid abstinence symptoms.

**PATIENT AND CARER ADVICE**

**Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced. Driving at the start of therapy with opioid analgesics, and following dose changes, should be avoided.

For information on 2015 legislation regarding driving whilst taking certain controlled drugs, including opioids, see Drugs and driving under Guidance on prescribing p. 1.

---

### Buprenorphine

**DRUG ACTION** Buprenorphine is an opioid-receptor partial agonist (it has opioid agonist and antagonist properties).

**INDICATIONS AND DOSE**

**Moderate to severe pain**

- **BY SUBLINGUAL ADMINISTRATION**
  - Child (body-weight 16–25 kg): 100 micrograms every 6–8 hours
  - Child (body-weight 25–37.5 kg): 100–200 micrograms every 6–8 hours
  - Child (body-weight 37.5–50 kg): 200–300 micrograms every 6–8 hours
  - Child (body-weight 50 kg and above): 200–400 micrograms every 6–8 hours
- **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION**
  - Child 6 months–11 years: 3–6 micrograms/kg every 6–8 hours (max. per dose 9 micrograms/kg)
  - Child 12–17 years: 300–600 micrograms every 6–8 hours
- **UNLICENSED USE**
  - With oral use Sublingual tablets not licensed for use in children under 6 years.
  - With intramuscular use or intravenous use Injection not licensed for use in children under 6 months.

**CAUTIONS** Impaired consciousness

**INTERACTIONS** Caution with concomitant use of hepatotoxic drugs.

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain • agitation • anorexia • anxiety • asthenia • diarrhoea • dyspepsia • dysphoria • fatigue • mild withdrawal symptoms in patients dependent on opioids • paraesthesia • vasodilatation
- **Uncommon** Cough • depersonalisation • dry eye • dry skin • dysarthria • flattulence • hypertension • hypoaesthesia • hypoxia • impaired memory • influenza-like symptoms • muscle cramp • myalgia • pyrexia • restlessness • rinitis • rigors • syncope • taste disturbance • tinnitus • tremor • wheezing
- **Rare** Diverticulitis • dysphagia • impaired concentration • paralytic ileus • psychosis
- **Very rare** Hiccups • hyperventilation • muscle fasciculation • retching
- **Frequency not known** Hepatic necrosis • hepatitis

**Overdose** The effects of buprenorphine are only partially reversed by naloxone.

**BREAST FEEDING** Present in low levels in breast milk. Neonates should be monitored for drowsiness, adequate weight gain, and developmental milestones.

**RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**PRE-TREATMENT SCREENING** Documentation of viral hepatitis status is recommended before commencing therapy for opioid dependence.

**MONITORING REQUIREMENTS** Monitor liver function; when used in opioid dependence baseline liver function
test is recommended before commencing therapy, and regular liver function tests should be performed throughout treatment.

- **DIRECTIONS FOR ADMINISTRATION**
  - With sublingual use For administration by mouth, tablets may be halved.

- **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug.

  **Sublingual tablet**
  **CAUTIONARY AND ADVISORY LABELS 2, 26**
  - **Buprenorphine (Non-proprietary)**
    - Buprenorphine (as Buprenorphine hydrochloride)
      - 200 microgram Buprenorphine 200 microgram sublingual tablets sugar-free sugar-free | 50 tablet [PDR] £6.05 DT price = £6.04 [CD]
    - Buprenorphine (as Buprenorphine hydrochloride)
      - 400 microgram Buprenorphine 400 microgram sublingual tablets sugar free sugar-free | 7 tablet [PDR] £1.60 DT price = £1.60 [CD]
  - **Temgesic (RB Pharmaceuticals Ltd)**
    - Buprenorphine (as Buprenorphine hydrochloride)
      - 200 microgram Temgesic 200 microgram sublingual tablets sugar-free | 50 tablet [PDR] £5.04 DT price = £5.04 [CD]
    - Buprenorphine (as Buprenorphine hydrochloride)
      - 400 microgram Temgesic 400 microgram sublingual tablets sugar-free | 50 tablet [PDR] £10.07 DT price = £10.07 [CD]
  - **Tephine (Sandoz Ltd)**
    - Buprenorphine (as Buprenorphine hydrochloride)
      - 200 microgram Tephine 200 microgram sublingual tablets sugar-free | 50 tablet [PDR] £4.27 DT price = £4.27 [CD]
    - Buprenorphine (as Buprenorphine hydrochloride)
      - 400 microgram Tephine 400 microgram sublingual tablets sugar-free | 50 tablet [PDR] £8.54 DT price = £8.54 [CD]
  - **Solution for injection**
    - Temgesic (RB Pharmaceuticals Ltd)
      - Buprenorphine (as Buprenorphine hydrochloride)
        - 300 microgram per 1 ml Temgesic 300 microgram/1ml solution for injection ampoules | 5 ampoule [PDR] £2.46 [CD]

**Co-codamol**

- **INDICATIONS AND DOSE**
  Short-term treatment of acute moderate pain (using co-codamol 8/500 preparations only)
  - **BY MOUTH**
    - Child 12-17 years: 8/500–16/1000 mg every 6 hours as required for maximum 3 days; maximum 64/4000 mg per day
  Short-term treatment of acute moderate pain (using co-codamol 15/500 preparations only)
  - **BY MOUTH**
    - Child 12-17 years: 15/500–30/1000 mg every 6 hours as required for maximum 3 days; maximum 120/4000 mg per day
  Short-term treatment of acute moderate pain (using co-codamol 30/500 preparations only)
  - **BY MOUTH**
    - Child 12-17 years: 30/500–60/1000 mg every 6 hours as required for maximum 3 days; maximum 240/4000 mg per day

**KAPAK® 15/500**

Short-term treatment of acute pain
  - **BY MOUTH**
    - Child 12-15 years: 1 tablet every 6 hours as required for maximum 3 days; maximum 4 tablets per day

**IMPORTANT SAFETY INFORMATION**
See codeine phosphate p. 259 for MHRA/CHM advice for restrictions on the use of codeine as an analgesic in children.

- **CONTRA-INDICATIONS**
  - Acute ulcerative colitis - antibiotic-associated colitis - children who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea - conditions where abdominal distention develops - conditions where inhibition of peristalsis should be avoided - known ultra-rapid codeine metabolisers
- **CAUTIONS**
  - Acute abdomen - alcohol dependence - avoid abrupt withdrawal after long-term treatment - cardiac arrhythmias - chronic alcoholism - chronic dehydration - chronic malnutrition - convulsive disorders - gallstones - hepatocellular insufficiency

**CAUTIONS, FURTHER INFORMATION**
- Variation in metabolism The capacity to metabolise codeine to morphine can vary considerably between individuals; there is a marked increase in morphine toxicity in patients who are ultra-rapid codeine metabolisers (CYP2D6 ultra-rapid metabolisers) and a reduced therapeutic effect in poor codeine metabolisers.
- **INTERACTIONS**
  - Appendix 1 (paracetamol).
- **SIDE-EFFECTS**
  - Abdominal pain - anorexia - blood disorders - depression (with larger doses) - hypothermia - leucopenia - malaise - muscle fasciculation - neutropenia - pancreatitis - seizures - thrombocytopenia

**Overdose**
Important: liver damage (and less frequently renal damage) following overdosage with paracetamol.

- **BREAST FEEDING**
  - Avoid—although amount of codeine usually too small to be harmful, mothers vary considerably in their capacity to metabolise codeine—risk of morphine overdose in infant.
- **HEPATIC IMPAIRMENT** Dose-related toxicity with paracetamol—avoid large doses.
- **RENAL IMPAIRMENT** Reduce dose or avoid codeine; increased and prolonged effect; increased cerebral sensitivity.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - Co-codamol is a mixture of codeine phosphate and paracetamol; the proportions are expressed in the form x/y, where x and y are the strengths in milligrams of codeine phosphate and paracetamol respectively.
  - When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and no strength is stated, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed.
  - The Drug Tariff allows tablets of co-codamol labelled ‘dispersible’ to be dispensed against an order for ‘effervescent’ and vice versa.
- **LESS SUITABLE FOR PRESCRIBING**
  - Co-codamol is less suitable for prescribing.
- **EXCEPTIONS TO LEGAL CATEGORY**
  - Co-codamol 8/500 can be sold to the public in certain circumstances; for exemptions see Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).
Pain 259

Codicaine phosphate

INDICATIONS AND DOSE

Acute diarrhoea

BY MOUTH

Child 12–17 years: 30 mg 3–4 times a day; usual dose 15–60 mg 3–4 times a day

Short-term treatment of acute moderate pain

BY MOUTH, OR BY INTRAMUSCULAR INJECTION

Child 12–17 years: 30–60 mg every 6 hours if required for maximum 3 days; maximum 240 mg per day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JULY 2013) CODICINE FOR ANALGESIA: RESTRICTED USE IN CHILDREN DUE TO REPORTS OF MORPHINE TOXICITY

Codicaine should only be used to relieve acute moderate pain in children older than 12 years and only if it cannot be relieved by other painkillers such as paracetamol or ibuprofen alone. A significant risk of serious and life-threatening adverse reactions has been identified in children with obstructive sleep apnoea who received codeine after tonsillectomy or adenoidectomy.

• in children aged 12–18 years, the maximum daily dose of codeine should not exceed 240 mg. Doses may be taken up to four times a day at intervals of no less than 6 hours. The lowest effective dose should be used and duration of treatment should be limited to 3 days
• codeine is contra-indicated in all children (under 18 years) who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea
• codeine is not recommended for use in children whose breathing may be compromised, including those with neuromuscular disorders, severe cardiac or respiratory conditions, respiratory infections, multiple trauma or extensive surgical procedures
• codeine is contra-indicated in patients of any age who are known to be ultra-rapid metabolisers of codeine (CYP2D6 ultra-rapid metabolisers)
● Codeine should not be used in breast-feeding mothers because it can pass to the baby through breast milk.
● Parents and carers should be advised on how to recognise signs and symptoms of morphine toxicity, and to stop treatment and seek medical attention if signs or symptoms of toxicity occur (including reduced consciousness, lack of appetite, somnolence, constipation, respiratory depression, 'pin-point' pupils, nausea, vomiting).

**CONTRA-INDICATIONS**  
Acute ulcerative colitis - antibiotic-associated colitis - children under 18 years who undergo the removal of tonsils or adenoids for the treatment of obstructive sleep apnoea - conditions where abdominal distension develops - conditions where inhibition of peristalsis should be avoided - known ultra-rapid codeine metabolisers.

**CAUTIONS**  
Acute abdomen - cardiac arrhythmias - gallstones - not recommended for adolescents aged 12–18 years with breathing problems.

**PRESCRIBING AND DISPENSING INFORMATION**  
BP directs that when Diabetic Codeine Linctus is prescribed, Codeine Linctus formulated with a vehicle appropriate for oral administration should be dispensed. Diabetic Codeine Linctus is contra-indicated in:

- Children under 12 years old
- Patients of any age known to be CYP2D6 ultra-rapid metabolisers
- Breastfeeding mothers

**SIDE-EFFECTS**  
Abdominal pain - anorexia - antidiuretic effect - hyperthermia - malaise - muscle fasciculation - pancreatitis - seizures

**BREAST FEEDING**  
Avoid—although amount usually too small to be harmful, mothers vary considerably in their capacity to metabolise codeine—risk of morphine overdose in infant.

**RENA L IMPAIRMENT**  
Avoid use or reduce dose; opioid effects increased and prolonged, and increased cerebral sensitivity occurs.

**PRESCRIBING AND DISPENSING INFORMATION**  
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection.

**MEDICINAL FORMS**  
There can be variation in the licensing of different medicines.

**PATIENT AND CARER ADVICE**  
Medicines for Children leaflet: Codeine phosphate for pain www.medicinesforchildren.org.uk/codeine-phosphate-pain-0

**Codeine phosphate 30 mg**  
Codeine 30mg tablets | 28 tablet (POM) £2.50 DT price = £1.10 Schedule 5 (CD Inv) | 30 tablet (POM) no price available Schedule 5 (CD Inv) | 100 tablet (POM) £5.68 DT price = £3.93 Schedule 5 (CD Inv) | 500 tablet (POM) no price available Schedule 5 (CD Inv)

**Codeine phosphate 60 mg**  
Codeine 60mg tablets | 28 tablet (POM) £5.35 DT price = £1.84 Schedule 5 (CD Inv)

**Oral solution**  

- **Codeine phosphate (Non-proprietary)**
- **Codeine phosphate 3 mg per 1 ml**  
  Codeine 15mg/5ml linctus sugar-free | 200 ml (POM) £1.87 DT price = £1.63 Schedule 5 (CD Inv) sugar-free | 2000 ml (POM) £16.30 Schedule 5 (CD Inv)  
  Codeine 15mg/5ml linctus | 200 ml (POM) £1.84 DT price = £1.84 Schedule 5 (CD Inv) | 2000 ml (POM) no price available Schedule 5 (CD Inv)
- **Codeine phosphate 5 mg per 1 ml**  
  Codeine 25mg/5ml oral solution | 500 ml (POM) £6.46 DT price = £6.46 Schedule 5 (CD Inv)
- **Galcodine (Thornton & Ross Ltd)**  
  Codeine phosphate 3 mg per 1 ml  
  Galcodine 15mg/5ml linctus sugar-free | 2000 ml (POM) £3.00 Schedule 5 (CD Inv)

**Solution for injection**  

- **Codeine phosphate (Non-proprietary)**
- **Codeine phosphate 60 mg per 1 ml**  
  Codeine 60mg/1ml solution for injection ampoules | 10 ampoule (POM) £23.70–£25.70 CED

**CO-DYDRAMOL**

**INDICATIONS AND DOSE**  
Mild to moderate pain (using co-dydramol 10/500 preparations only)

- **BY MOUTH**
  - Child 12-17 years: 10/500–20/1000 mg every 4–6 hours as required; maximum 80/4000 mg per day

Severe pain (using co-dydramol 20/500 preparations only)

- **BY MOUTH**
  - Child 12-17 years: 20/500–40/1000 mg every 4–6 hours as required; maximum 160/4000 mg per day

Severe pain (using co-dydramol 30/500 preparations only)

- **BY MOUTH**
  - Child 12-17 years: 30/500–60/1000 mg every 4–6 hours as required; maximum 240/4000 mg per day

**DOSE EQUIVALENCE AND CONVERSION**
A mixture of dihydrocodeine tartrate and paracetamol; the proportions are expressed in the form x/y, where x and y are the strengths in milligrams of dihydrocodeine and paracetamol respectively.

**CAUTIONS**  
Alcohol dependence - before administering, check when paracetamol last administered and cumulative paracetamol dose over previous 24 hours - chronic alcoholism - chronic dehydration - chronic malnutrition - hepato cellular insufficiency - pancreatitis - severe cor pulmonale

**INTERACTIONS**  
Appendix 1 (paracetamol).

**SIDE-EFFECTS**  
Abdominal pain - acute generalised exanthematous pustulosis - blood disorders - leucopenia - malaise - neutropenia - pancreatitis - paraesthesia - paralytic ileus - skin reactions - Stevens-Johnson syndrome - thrombocytopenia - toxic epidermal necrolysis

**Overdose**
Important: liver damage (and less frequently renal damage) following overdosage with paracetamol.

- **BREAST FEEDING**  
  Amount of dihydrocodeine too small to be harmful but use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT**  
  Dose-related toxicity with paracetamol—avoid large doses.

- **RENA L IMPAIRMENT**  
  Reduce dose or avoid dihydrocodeine; increased and prolonged effect; increased cerebral sensitivity.
PAIN

Diamorphine hydrochloride
(Heroin hydrochloride)

• INDICATIONS AND DOSE

Acute or chronic pain
➤ By mouth
  • Child 1 month–11 years: 100–200 micrograms/kg every 4 hours (max. per dose 10 mg), adjusted according to response
  • Child 12–17 years: 5–10 mg every 4 hours, adjusted according to response
➤ By continuous intravenous infusion
  • Child 1 month–11 years: 12.5–25 micrograms/kg/hour, adjusted according to response
  • Child 1–2 months: 20 micrograms/kg every 6 hours, adjusted according to response
  • Child 3–5 months: 25–50 micrograms/kg every 6 hours, adjusted according to response
  • Child 6–11 months: 75 micrograms/kg every 4 hours, adjusted according to response
  • Child 1–11 years: 75–100 micrograms/kg every 4 hours (max. per dose 5 mg), adjusted according to response
  • Child 12–17 years: 2.5–5 mg every 4 hours, adjusted according to response
➤ By intranasal injection, or by subcutaneous injection
  • Child 12–17 years: 5 mg every 4 hours, adjusted according to response

Acute or chronic pain in ventilated neonates
➤ Initially by intravenous injection
  • Neonate: Initially 50 micrograms/kg, dose to be administered over 30 minutes, followed by (by continuous intravenous infusion) 15 micrograms/kg/hour, adjusted according to response.

Acute or chronic pain in non-ventilated neonates
➤ By continuous intravenous infusion
  • Neonate: 2.5–7 micrograms/kg/hour, adjusted according to response.

Acute severe nociceptive pain in an emergency setting (specialist supervision in hospital)
➤ By intranasal administration
  • Child 2–15 years (body-weight 12–17 kg): 1.44 mg for 1 dose, spray into alternate nostrils
  • Child 2–15 years (body-weight 18–23 kg): 2.16 mg for 1 dose, spray into alternate nostrils
  • Child 2–15 years (body-weight 24–29 kg): 2.88 mg for 1 dose, spray into alternate nostrils

• CONTRA-INDICATIONS
  • Delayed gastric emptying - phaeochromocytoma
  • CAUTIONS
  • CNS depression - severe cor pulmonale - severe diarrhoea - toxic psychosis
  • SIDE-EFFECTS
  • Anorexia - asthma - myocardial infarction - raised intracranial pressure - syncope - taste disturbance

• BREAST FEEDING
  • Therapeutic doses unlikely to affect infant; withdrawal symptoms in infants of dependent mothers; breast-feeding not best method of treating dependence in offspring.

• RENAL IMPAIRMENT
  • Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

• DIRECTIONS FOR ADMINISTRATION
  • With intravenous use
    • For intravenous infusion, dilute in Glucose 5% or Sodium Chloride 0.9%; Glucose 5% is preferable as an infusion fluid.
  • With intranasal use
    • Manufacturer advises spray should be directed at the nasal side wall whilst the patient is in a semi-recumbent position.

• PRESCRIBING AND DISPENSING INFORMATION
  • Intranasal administration of diamorphine hydrochloride injection has been used [unlicensed]—no dose recommendation.

• MEDICINAL FORMS
  • There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection, powder for solution for injection

Tablet
CAUTIONARY AND ADVISORY LABELS
  • Diamorphine hydrochloride (Non-proprietary)
  • Diamorphine hydrochloride 10 mg
  • Diamorphine hydrochloride 100 mg

Powder for solution for injection
  • Diamorphine hydrochloride (Non-proprietary)
  • Diamorphine hydrochloride 5 mg
  • Diamorphine hydrochloride 25 mg
  • Diamorphine hydrochloride 50 mg
  • Diamorphine hydrochloride 100 mg

Spray
  • Excipients: May contain benzalkonium chloride, disodium edetate
  • Ayendi (Wockhardt UK Ltd)

Diamorphine (as Diamorphine hydrochloride) 720 microgram per 1 dose
  • Ayendi 720micrograms/actuation nasal spray

Diamorphine (as Diamorphine hydrochloride) 1.6 mg per 1 dose
  • Ayendi 1600micrograms/actuation nasal spray

Co-Dydramol is less suitable for prescribing.
Dihydrocodeine tartrate

- **INDICATIONS AND DOSE**
  - **Moderate to severe pain**
    - BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
      - Child 1-3 years: 500 micrograms/kg every 4–6 hours
      - Child 4-11 years: 0.5–1 mg/kg every 4–6 hours (max. per dose 30 mg)
      - Child 12-17 years: 30 mg every 4–6 hours
    - BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
      - Child 1-3 years: 500 micrograms/kg every 4–6 hours
      - Child 4-11 years: 0.5–1 mg/kg every 4–6 hours (max. per dose 30 mg)
      - Child 12-17 years: 30 mg every 4–6 hours (max. per dose 50 mg)
  - **Chronic severe pain**
    - BY MOUTH USING MODIFIED-RELEASE MEDICINES
      - Child 12-17 years: 60–120 mg every 12 hours

- **UNLICENSED USE** Most preparations not licensed for use in children under 4 years.
- **CAUTIONS** Pancreatitis, severe cor pulmonale
- **SIDE-EFFECTS** Abdominal pain, diarrhoea, paraesthesia, paralytic ileus, seizures
- **BREAST FEEDING** Use only if potential benefit outweighs risk.
- **RENA L IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **PROFESSION SPECIFIC INFORMATION** Dental practitioners’ formulation

Dihydrocodeine tablets 30 mg may be prescribed.

- **MEDICINAL FORMS**

Table CAUTIONARY AND ADVISORY LABELS 2

- **Dihydrocodeine tartrate (Non-proprietary)**
  - **Dihydrocodeine tartrate 30 mg** Dihydrocodeine 30 mg tablets | 28 tablet pack £1.75 DT price = £1.20 Schedule 5 (CD Inv) | 30 tablet pack £1.56 Schedule 5 (CD Inv) | 100 tablet pack £6.81 DT price = £4.29 Schedule 5 (CD Inv) | 500 tablet pack £23.75 Schedule 5 (CD Inv)
  - **DF 118 FORTE** Dihydrocodeine tartrate 40 mg DF 118 Forte 40 mg tablets | 100 tablet pack £9.78 DT price = £9.78 Schedule 5 (CD Inv)

Modified-release tablet

- **Dihydrocodeine tartrate 60 mg** Dihydrocodeine 60 mg tablets | 56 tablet pack £5.20 DT price = £5.20 Schedule 5 (CD Inv)
- **Dihydrocodeine tartrate 90 mg** Dihydrocodeine 90 mg tablets | 56 tablet pack £8.66 DT price = £8.66 Schedule 5 (CD Inv)
- **Dihydrocodeine tartrate 120 mg** Dihydrocodeine 120 mg tablets | 56 tablet pack £10.95 DT price = £10.95 Schedule 5 (CD Inv)

Oral solution

- **Dihydrocodeine tartrate (Non-proprietary)**
  - **Dihydrocodeine tartrate 2 mg per 1 ml** Dihydrocodeine 20 mg/5 ml oral solution | 150 ml pack £7.16 DT price = £7.12 Schedule 5 (CD Inv)

Solution for injection

- **Dihydrocodeine tartrate (Non-proprietary)**
  - **Dihydrocodeine tartrate 50 mg per 1 ml** Dihydrocodeine 50 mg/1 ml solution for injection ampoules | 10 ampoule pack £91.14 DT price = £91.14 (CD Inv)

Fentanyl

- **INDICATIONS AND DOSE**
  - **Chronic intractable pain not currently treated with a strong opioid analgesic**
    - BY TRANSDERMAL APPLICATION
      - Child 2-17 years: Initial dose based on previous 24-hour opioid requirement (consult product literature), for evaluating analgesic efficacy and dose increments, see under *Chronic intractable pain not currently treated with a strong opioid analgesic*, for conversion from long term oral morphine to transdermal fentanyl, see Pain management with opioids p. 18.

  - **Spontaneous respiration: analgesia and enhancement of anaesthesia, during operation**
    - BY INTRAVENOUS INJECTION
      - Child 1 month-11 years: Initially 1–3 micrograms/kg, then 1 microgram/kg as required, dose to be administered over at least 30 seconds
      - Child 12-17 years: Initially 50–100 micrograms (max. per dose 200 micrograms), dose maximum on specialist advice, then 25–50 micrograms as required, dose to be administered over at least 30 seconds

  - **Assisted ventilation: analgesia and enhancement of anaesthesia during operation**
    - **INITIALLY BY INTRAVENOUS INJECTION**
      - Neonate: Initially 1–5 micrograms/kg, then 1–3 micrograms/kg as required, dose to be administered over at least 30 seconds.
      - Child 1 month-11 years: Initially 1–5 micrograms/kg, then 1–3 micrograms/kg as required, dose to be administered over at least 30 seconds
      - Child 12-17 years: Initially 1–5 micrograms/kg, then 50–200 micrograms as required, dose to be administered over at least 30 seconds

  - **Assisted ventilation: analgesia and respiratory depression in intensive care**
    - **INITIALLY BY INTRAVENOUS INJECTION**
      - Neonate: Initially 1–5 micrograms/kg, then (by intravenous infusion) 1.5 micrograms/kg/hour, adjusted according to response.
      - Child: Initially 1–5 micrograms/kg, then (by intravenous infusion) 1–6 micrograms/kg/hour, adjusted according to response.
Breakthrough pain in patients receiving opioid therapy for chronic cancer pain

- **BY BUCCAL ADMINISTRATION USING LOZENGES**
- Child 16–17 years: Initially 200 micrograms, dose to be given over 15 minutes, then 200 micrograms after 15 minutes if required, no more than 2 doses units for each pain episode; if adequate pain relief not achieved with 1 dose unit for consecutive breakthrough pain episodes, increase the strength of the dose unit until adequate pain relief achieved with 4 lozenges or less daily, if more than 4 episodes of breakthrough pain each day, adjust background analgesia

**DOSE EQUIVALENCE AND CONVERSION**
Fentanyl preparations for the treatment of breakthrough pain are not interchangeable; if patients are switched from one fentanyl-containing preparation, a new dose titration is required.

**DOSES AT EXTREMES OF BODY-WEIGHT**
To avoid excessive dosage in obese patients, weight-based doses may need to be calculated on the basis of ideal bodyweight.

- **UNLICENSED USE**
  - With intravenous use Not licensed for use in children under 2 years; infusion not licensed for use in children under 12 years.
  - **CAUTIONS**
    - Cerebral tumour - diabetes mellitus (with Actiq® lozenges) - impaired consciousness
  - **CAUTIONS, FURTHER INFORMATION**
    - With transdermal use Transdermal fentanyl patches are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. Risk of fatal respiratory depression, particularly in patients not previously treated with a strong opioid analgesic; manufacturer recommends use only in opioid tolerant patients.

  - With intravenous use Repeated intra-operative doses should be given with care since the resulting respiratory depression can persist postoperatively and occasionally it may become apparent for the first time postoperatively when monitoring of the patient might be less intensive.

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - **Common or very common** Abdominal pain - aesthenia - anorexia - anxiety - appetite changes - application-site reactions - diarrhoea - dyspepsia - dysphagia - gastrointestinal reflux disease - hypertension - myoclonus - paraesthesia - pharyngitis - rhinitis - stomatitis - tremor - vasodilation
  - **Uncommon** Anamnesis - arthralgia - blood disorders - chills - depressed level of consciousness - dysgeusia - flatulence - hypoventilation - ileus - impaired concentration - impaired coordination - loss of consciousness - malaise - parosmia - ptyalism - seizures - speech disorder - thirst - thrombocytopenia
  - **Rare** Hiccups
  - **Very rare** Apnoea - arrhythmia - ataxia - bladder pain - delusions - haemoptysis
  - **SPECIFIC SIDE-EFFECTS**
    - **Common or very common** In an adverse reaction to fentanyl citrate lozenges, can cause muscle rigidity, particularly of the chest wall or jaw; this can be managed by the use of neuromuscular blocking drugs.

  - **REMEDIES**
    - **INCIDENT/EMERGENCY**
      - **First aid** Monitor patients using patches for the first hour, if more than 3 episodes of breakthrough pain on a different area (avoid using the same area for several days).
      - **With intravenous use** For intravenous infusion, injection solution may be diluted in Glucose 5% or Sodium Chloride 0.9%.
      - **With buccal use** Patients should be advised to place the lozenge in the mouth against the cheek and move it around the mouth using the applicator; each lozenge should be sucked over a 15 minute period. In patients with a dry mouth, water may be used to moisten the buccal mucosa. Patients with diabetes should be advised each lozenge contains approximately 2 g glucose.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - With transdermal use Prescriptions for fentanyl patches can be written to show the strength in terms of the release rate and it is acceptable to write ‘Fentanyl 25 patches’ to prescribe patches that release fentanyl 25 micrograms per hour. The dosage should be expressed in terms of the interval between applying a patch and replacing it with a new one, e.g. ‘one patch to be applied every 72 hours’. The total quantity of patches to be supplied should be written in words and figures.

- **PATIENT AND CARER ADVICE**
  - **MEDICINES FOR CHILDREN**
    - Fentanyl lozenges for pain www.medicinesforchildren.org.uk/fentanyl-lozenges-for-pain
    - Fentanyl patches for pain www.medicinesforchildren.org.uk/fentanyl-patches-for-pain

  - With transdermal use Patients and carers should be informed about safe use, including correct administration and disposal, strict adherence to dosage instructions, and the symptoms and signs of opioid overdose. Patches should be removed immediately in case of breathing difficulties, marked drowsiness, confusion, dizziness, or impaired speech, and patients and carers should seek prompt medical attention.

- **MEDICINAL FORMS**
  - **INDICATIONS**
    - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion
  - **Lozenge**
    - **CAUTIONARY AND ADVISORY LABELS**
      - **2 EXCIPENTS:** May contain Propylene glycol

      - **Actiq (feva Ltd)**
        - **Fentanyl** (as Fentanyl citrate) 200 microgram Actiq 200 microgram lozenges with integral oromucosal applicator | 3 lozene (PRN $21.05) | 30 lozene (PRN $210.44)
        - **Fentanyl** (as Fentanyl citrate) 400 microgram Actiq 400 microgram lozenges with integral oromucosal applicator | 3 lozene (PRN $21.05) | 30 lozene (PRN $210.44)
        - **Fentanyl** (as Fentanyl citrate) 600 microgram Actiq 600 microgram lozenges with integral oromucosal applicator | 3 lozene (PRN $21.05) | 30 lozene (PRN $210.44)
        - **Fentanyl** (as Fentanyl citrate) 800 microgram Actiq 800 microgram lozenges with integral oromucosal applicator | 3 lozene (PRN $21.05) | 30 lozene (PRN $210.44)

  - **Lozenges (GSK)**
    - **Actiq** (feva Ltd)
      - **Fentanyl** (as Fentanyl citrate) 200 microgram Actiq 200 microgram lozenges with integral oromucosal applicator | 3 lozene (PRN $21.05) | 30 lozene (PRN $210.44)

Hydromorphone hydrochloride

**INDICATIONS AND DOSE**

**Severe pain in cancer**
- By mouth using immediate-release medicines
  - Child 12-17 years: 1.3 mg every 4 hours, dose to be increased if necessary according to severity of pain
  - Child 12-17 years: 4 mg every 12 hours, dose to be increased if necessary according to severity of pain

**CONTRA-INDICATIONS** Acute abdomen

**CAUTIONS** Pancreatitis - toxic psychosis

**SIDE-EFFECTS**
- Common or very common Abdominal pain - anorexia - anxiety
- Uncommon Agitation - diarrhoea - dysgeusia - dyskinesia - myoclonus - paraesthesia - paralytic ileus - peripheral oedema - seizures - tremor

**BREAST FEEDING** Avoid — no information available.

**RENAI IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.

**DIRECTIONS FOR ADMINISTRATION** For immediate-release capsules, swallow whole capsule or sprinkle contents on soft food. For modified-release capsules, swallow whole or open capsule and sprinkle contents on soft cold food (swallow the pellets within the capsule whole; do not crush or chew).

**PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer hydromorphone hydrochloride capsules and modified-release capsules.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

**Capsule**

**CAUTIONARY AND ADVISORY LABELS 2**
- Palladone (Napp Pharmaceuticals Ltd)

  - 56 capsule [POM] £5.08 [C12]
  - Hydromorphone hydrochloride 16 mg Palladone SR 16 mg capsules
  - 56 capsule [POM] £10.53 [C12]
  - Hydromorphone hydrochloride 24 mg Palladone SR 24 mg capsules
  - 56 capsule [POM] £15.82 [C12]

**Morphine**

**INDICATIONS AND DOSE**

**Pain**
- By subcutaneous injection
  - Neonate: Initially 100 micrograms/kg every 6 hours, adjusted according to response.
  - Child 1-5 months: Initially 100–200 micrograms/kg every 6 hours, adjusted according to response.
  - Child 6 months-1 year: Initially 100–200 micrograms/kg every 4 hours, adjusted according to response.
  - Child 2-11 years: Initially 200 micrograms/kg every 4 hours, adjusted according to response.
  - Child 12-17 years: Initially 2.5–10 mg every 4 hours, adjusted according to response.
  - Initially by intravenous injection
  - Neonate: 50 micrograms/kg every 6 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 50 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response.
  - Child 1-5 months: 100 micrograms/kg every 6 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 10–30 micrograms/kg/hour, adjusted according to response.
  - Child 6 months-11 years: 100 micrograms/kg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 100 micrograms/kg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response.
  - Child 12-17 years: 5 mg every 4 hours, adjusted according to response, dose to be administered over at least 5 minutes, alternatively (by intravenous injection) initially 5 mg, dose to be administered over at least 5 minutes, followed by (by continuous intravenous infusion) 20–30 micrograms/kg/hour, adjusted according to response.
  - By mouth, or by rectum
  - Child 1-2 months: Initially 50–100 micrograms/kg every 4 hours, adjusted according to response.
  - Child 3-5 months: 100–150 micrograms/kg every 4 hours, adjusted according to response.
  - Child 6-11 months: 200 micrograms/kg every 4 hours, adjusted according to response.
  - Child 1 year: 200–300 micrograms/kg every 4 hours, adjusted according to response.
  - Child 2-11 years: Initially 200–300 micrograms/kg every 4 hours (max. per dose 10 mg), adjusted according to response.
  - Child 12-17 years: Initially 5–10 mg every 4 hours, adjusted according to response.
  - By continuous subcutaneous infusion
  - Child 1-2 months: 10 micrograms/kg/hour, adjusted according to response.
  - Child 3 months-17 years: 20 micrograms/kg/hour, adjusted according to response.

continued →
Pain (with modified-release 12-hourly preparations)
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child: Every 12 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered

Pain (with modified-release 24-hourly preparations)
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child: Every 24 hours, dose adjusted according to daily morphine requirements, dosage requirements should be reviewed if the brand is altered

**Neonatal opioid withdrawal (under expert supervision)**
- **BY MOUTH**
  - Neonate: Initially 40 micrograms/kg every 4 hours until symptoms controlled, dose to be increased if necessary; reduce frequency gradually over 6–10 days, stop when 40 micrograms/kg once daily achieved, dose may vary—consult local guidelines.

**Persistent cyanosis in congenital heart disease when blood glucose less than 3 mmol/litre (following glucose)**
- **BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Child: 100 micrograms/kg

**DOSE EQUIVALENCE AND CONVERSION**
The doses stated refer equally to morphine hydrochloride and sulfate.

- **UNLICENSED USE**
  - With oral use **Oramorph SR and solution and MXT SR** capsules not licensed for use in children under 1 year. **Sevedol®** tablets not licensed for use in children under 3 years. **Oramorph SR® unit** dose vials and Filnarine® SR tablets not licensed for use in children under 5 years. **MST Continus®** preparations licensed to treat children with cancer pain (age-range not specified by manufacturer).
  - With rectal use Suppositories are not licensed for use in children.

**CONTRA-INDICATIONS**
Acute abdomen - delayed gastric emptying - heart failure secondary to chronic lung disease - phaeochromocytoma

**CAUTIONS**
Cardiac arrhythmias - pancreatitis - severe cor pulmonale

**SIDE-EFFECTS**

**BREAST FEEDING**
Therapeutic doses unlikely to affect infant.

**RENA LB IMPAIRMENT**
Avoid use or reduce dose; opioid effects increased and prolonged; increased cerebral sensitivity.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use. For continuous intravenous infusion, dilute with Glucose 5% or 10% or Sodium Chloride 0.9%.
- With intravenous use in neonates. Neonatal intensive care, dilute 2.5 mg/kg body-weight to a final volume of 50 mL with infusion fluid; an intravenous infusion rate of 0.1 mL/hour provides a dose of 5 micrograms/kg/hour.
- With oral use. For modified-release capsules—swallow whole or open capsule and sprinkle contents on soft food.

**PRESCRIBING AND DISPENSING INFORMATION**
Modified-release preparations are available as 12-hourly or 24-hourly formulations; prescribers must ensure that the correct preparation is prescribed. Preparations that should be given 12-hourly include Filnarine® SR, MST Continus®,

Morphgesic® SR and Zomorph® SR Preparations that should be given 24-hourly include MXT SR. Prescriptions must specify the 'form'.

- With oral use Do not confuse modified-release 12-hourly preparations with 24-hourly preparations.
- With rectal use Both the strength of the suppositories and the morphine salt contained in them must be specified by the prescriber.

**PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Morphine for pain www.medicinesforchildren.org.uk/morphine-for-pain

- With oral use Patients or carers should be given advice on how to administer morphine modified-release capsules.

**EXCEPTIONS TO LEGAL CATEGORY**
Morphine Oral Solutions. Prescription-only medicines or schedule 2 controlled drug. The proportion of morphine hydrochloride may be altered when specified by the prescriber; if above 13 mg per 5 mL the solution becomes a schedule 2 controlled drug. It is usual to adjust the strength so that the dose volume is 5 or 10 mL.

**Oroal solutions of morphine can be prescribed by writing the formula:**
Morphine hydrochloride 5 mg Chloroform water to 5 mL.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution, solution for injection, infusion, solution for infusion, suppository

**Tablet**

**Morphine with cyclizine**

The properties listed below are those particular to the combination only. For the properties of the components please consider, morphine p. 265, cyclizine p. 244.

### Indications and dose

#### CYCLIMORPH-10®

**Moderate to severe pain (short-term use only)**

- **By subcutaneous injection, or by intramuscular injection, or by intravenous injection**
  - Child 12-17 years: 1 mL, do not repeat dose more often than every 4 hours; maximum 3 doses per day

#### CYCLIMORPH-15®

**Moderate to severe pain (short-term use only)**

- **By subcutaneous injection, or by intramuscular injection, or by intravenous injection**
  - Child 12-17 years: 1 mL, do not repeat dose more often than every 4 hours; maximum 3 doses per day

### Cautions

Myocardial infarction (cyclizine may aggravate severe heart failure and counteract the haemodynamic benefits of opioids) - not recommended in palliative care

### Medicinal forms

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- **Cyclimorph (AMCo)**
  - Morphine tartrate 15 mg per 1 mL, Cyclizine tartrate 50 mg per 1 mL Cyclimorph 15 solution for injection 1mL ampoules | 5 ampoules (P) £3.12 (Q)
  - Morphine tartrate 10 mg per 1 mL, Cyclizine tartrate 50 mg per 1 mL Cyclimorph 10 solution for injection 1mL ampoules | 5 ampoules (P) £3.77 (Q)

#### Oxycodone hydrochloride

### Indications and dose

#### Moderate to severe pain in palliative care

- **By mouth using immediate-release medicines**
  - Child 1-month to 11 years: Initially 200 micrograms/kg every 4–6 hours (max. per dose 5 mg), dose to be increased if necessary according to severity of pain
  - Child 12-17 years: Initially 5 mg every 4–6 hours, dose to be increased if necessary according to severity of pain
- **By mouth using modified-release medicines**
  - Child 8-11 years: Initially 5 mg every 12 hours, dose to be increased if necessary according to severity of pain
  - Child 12-17 years: Initially 10 mg every 12 hours, dose to be increased if necessary according to severity of pain

#### Dose equivalence and conversion

2 mg oral oxycodone is approximately equivalent to 1 mg parenteral oxycodone.

### Unlicensed use

#### Contra-indications

Acute abdomen - chronic constipation - cor pulmonale - delayed gastric emptying

#### Cautions

Pancreatitis - toxic psychosis

#### Side-effects

Common or very common Abdominal pain - anorexia - anxiety - asthenia - bronchospasm - chills - diarrhoea - dyspepsia - dyspnoea - impaired cough reflex
Nervous System

- **Abtard**
- **Oxycodone hydrochloride 15 mg**
- **Oxycodone hydrochloride 20 mg**
- **Oxycodone hydrochloride 30 mg**
- **Oxycodone hydrochloride 60 mg**
- **Oxycodone hydrochloride 80 mg**

### Medicinal Forms

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

### Modified-release Tablet

#### CAUTIONARY AND ADVISORY LABELS

- **Nervous system**
- **BREAST FEEDING**
- **HEPATIC IMPAIRMENT**
- **RENAI IMPAIRMENT**

#### Pain disturbance

Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

#### Medicinal Forms

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution.

**Papaveretum**

- **INDICATIONS AND DOSE**
  - Postoperative analgesia | Severe chronic pain
    - By Subcutaneous Injection, or By Intramuscular Injection
    - Neonate: 115 micrograms/kg every 4 hours if required.
    - Child 1-11 months: 154 micrograms/kg every 4 hours if required
    - Child 1-5 years: 1.93–3.85 mg every 4 hours if required
    - Child 6-11 years: 3.85–7.7 mg every 4 hours if required
    - Child 12-17 years: 7.7–15.4 mg every 4 hours if required
    - By Intravenous Injection
    - Neonate: 115 micrograms/kg every 4 hours if required.
    - Child 1-11 months: 154 micrograms/kg every 4 hours if required
    - Child 1-5 years: 1.93–3.85 mg every 4 hours if required
    - Child 6-11 years: 3.85–7.7 mg every 4 hours if required
    - Child 12-17 years: 7.7–15.4 mg every 4 hours if required

**IMPORTANT SAFETY INFORMATION**

Do not confuse with papaverine.

- **CONTRA-INDICATIONS**
  - Heart failure secondary to chronic lung disease | Phaeochromocytoma
- **CAUTIONS**
  - Supraventricular tachycardia
- **SIDE-EFFECTS**
  - Hypothermia
- **BREAST FEEDING**
  - Therapeutic doses unlikely to affect infant.
- **RENAL IMPAIRMENT**
  - Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - The name Omnopon® was formerly used for papaveretum preparations.
  - Papaveretum is a mixture of 253 parts of morphine hydrochloride, 23 parts of papaverine hydrochloride and 20 parts of codeine hydrochloride.

**Pethidine hydrochloride**

(Meperidine)

- **INDICATIONS AND DOSE**
  - Obstetric analgesia
    - By Subcutaneous Injection, or By Intramuscular Injection
    - Child 12-17 years: 1 mg/kg (max. per dose 100 mg), then 1 mg/kg after 1-3 hours if required; maximum 400 mg per day
- **CONTRA-INDICATIONS**
  - Phaeochromocytoma
- **CAUTIONS**
  - Accumulation of metabolites may result in neurototoxicity | cardiac arrhythmias; not suitable for severe continuing pain | severe cor pulmonale
- **SIDE-EFFECTS**
  - Hypothermia | restlessness | tremor
- **OVERDOSE**
  - Convulsions reported in overdosage.
- **BREAST FEEDING**
  - Present in milk but not known to be harmful.
- **RENAL IMPAIRMENT**
  - Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection
  - **Solution for injection**
    - Pethidine hydrochloride (Non-proprietary)
      - Pethidine hydrochloride 10 mg per 1 ml Pethidine 50 mg/5 ml solution for injection ampoules | 10 ampoule (PSt) £52.91 (CO)
      - Pethidine hydrochloride 50 mg per 1 ml Pethidine 50 mg/1 ml solution for injection ampoules | 10 ampoule (PSt) £4.97 DT price = £4.97 (CO)
      - Pethidine 100 mg/2 ml solution for injection ampoules | 10 ampoule (PSt) £4.66 DT price = £4.66 (CO)
Tramadol hydrochloride

**INDICATIONS AND DOSE**

- **Moderate to severe pain**
  - By intramuscular injection, or by intravenous injection, or by intravenous infusion
  - Child 12-17 years: Initially 50 mg, then 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes

- **Moderate to severe acute pain**
  - By mouth using immediate-release medicines
  - Child 12-17 years: Initially 50 mg, then adjusted according to response; usual maximum 400 mg per day

- **Moderate to severe chronic pain**
  - By mouth using immediate-release medicines
  - Child 12-17 years: Initially 50 mg, then 50 mg every 10–20 minutes if required up to total maximum 250 mg (including initial dose) in first hour, then 50–100 mg every 4–6 hours, intravenous injection to be given over 2–3 minutes; maximum 600 mg per day

- **Moderate to severe pain (with modified-release 12-hourly preparations)**
  - By mouth using modified-release medicines
  - Child 12-17 years: Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily; usual maximum 400 mg/24 hours

- **Moderate to severe pain (with modified-release 24-hourly preparations)**
  - By mouth using modified-release medicines
  - Child 12-17 years: Initially 100–150 mg once daily, increased if necessary up to 400 mg once daily; usual maximum 400 mg/24 hours

**ZYDOL® XL**

- **Moderate to severe pain**
  - By mouth using modified-release tablets
  - Child 12-17 years: Initially 150 mg once daily, increased if necessary up to 400 mg once daily

**CONTRA-INDICATIONS**

- Acute intoxication with alcohol - acute intoxication with analgesics - acute intoxication with hypnotics - acute intoxication with opioids - not suitable for narcotic withdrawal treatment - uncontrolled epilepsy

**CAUTIONS**

- Excessive bronchial secretions - history of epilepsy - use tramadol only if compelling reasons - impaired consciousness - not suitable as a substitute in opioid-dependent patients - not suitable in some types of general anaesthesia - susceptibility to seizures - use tramadol only if compelling reasons

**CAUTIONS, FURTHER INFORMATION**

- General anaesthesia
- Not recommended for analgesia during potentially light planes of general anaesthesia (possibly increased intra-operative recall reported).

**SIDE-EFFECTS**

- Common or very common
  - Malaise
  - Diarrhoea
  - Flatulence
  - Gastritis
  - Retching
  - Abnormal coordination
  - Anorexia
  - Anxiety
  - Bronchospasm
  - Changes in appetite
  - Delirium
  - Dysphoria
  - Hypertension
  - Muscle weakness
  - Nightmares
  - Paraesthesia
  - Seizures
  - Syncope
  - Tremor
  - Wheezing
- Rare
  - Frequency not known
  - Blood disorders - hypoglycaemia - speech disorders - pregnancy
- Embryotoxic in animal studies - manufacturers advise avoid.
- Breast feeding
  - Amount probably too small to be harmful, but manufacturer advises avoid.

**Hepatic impairment**

- Caution (avoid for oral drops) in severe impairment.

**Renal impairment**

- Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs. Caution (avoid for oral drops) in severe impairment.

**Directions for administration**

- Tramadol hydrochloride orodispersible tablets should be sucked and then swallowed. May also be dispersed in water. Some tramadol hydrochloride modified-release capsule preparations may be opened and the contents swallowed immediately without chewing - check individual preparations.

For intravenous infusion, dilute in Glucose 5% or Sodium Chloride 0.9%.

**Prescribing and dispensing information**

- Modified-release preparations are available as 12-hourly or 24-hourly formulations. Non-proprietary preparations of modified-release tramadol may be available as either 12-hourly or 24-hourly formulations; prescribers and dispensers must ensure that the correct formulation is prescribed and dispensed. Branded preparations that should be given 12-hourly include Invodol® SR, Marbrol®, Maxtrix®, SR, Oldaram®, Zerid® SR, Tramuel® SR, Tradorec®, SR, Zydol® SR. Preparations that should be given 24-hourly include Tradorec XL®, Zadomal® 24hr, and Zydol XL®.

**Patient and carer advice**

- Patients or carers should be given advice on how to administer tramadol hydrochloride orodispersible tablets.

**Combinations available:** Paracetamol with tramadol, p. 256
5.1 Migraine

Migraine

Treatment of acute migraine

Treatment of a migraine attack should be guided by response to previous treatment and the severity of the attacks. A simple analgesic such as paracetamol p. 254 (preferably in a soluble or dispersible form) or an NSAID, usually ibuprofen p. 608, is often effective; concomitant antiemetic treatment may be required. If treatment with an analgesic is inadequate, an attack may be treated with a specific antimigraine compound such as the 5HT_1-receptor agonist sumatriptan p. 273. Ergot alkaloids are associated with many side-effects and should be avoided.

Excessive use of acute treatments for migraine (opioid and non-opioid analgesics, 5HT_1-receptor agonists, and ergotamine) is associated with medication-overuse headache (analgesic-induced headache); therefore, increasing consumption of these medicines needs careful management.

5HT_1-receptor agonists

5HT_1-receptor agonists are used in the treatment of acute migraine attacks; treatment of children should be initiated by a specialist. A 5HT_1-receptor agonist may be used during the established headache phase of an attack and is the preferred treatment in those who fail to respond to conventional analgesics. 5HT_1-receptor agonists are not indicated for the treatment of hemiplegic, basilar, or ophthalmoplegic migraine.

If a child does not respond to one 5HT_1-receptor agonist, an alternative 5HT_1-receptor agonist should be tried. For children who have prolonged attacks that frequently recur despite treatment with a 5HT_1-receptor agonist, combination therapy with an NSAID such as naproxen p. 614 can be considered. Sumatriptan and zolmitriptan p. 273 are used for migraine in children. They may also be of value in cluster headache.

Antiemetics

Antiemetics, including domperidone p. 245, phenothiazines, and antihistamines, relieve the nausea associated with migraine attacks. Antiemetics may be given by intramuscular injection or rectally if vomiting is a problem. Domperidone has the added advantage of promoting gastric emptying and normal peristalsis; a single dose should be given at the onset of symptoms.

Prophylaxis of migraine

Where migraine attacks are frequent, possible provoking factors such as stress should be sought; combined oral contraceptives may also provoke migraine. Preventive treatment should be considered if migraine attacks interfere with school and social life, particularly for children who:

- suffer at least two attacks a month;
- suffer an increasing frequency of headaches;
- suffer significant disability despite suitable treatment for migraine attacks;
- cannot take suitable treatment for migraine attacks.

In children it is often possible to stop prophylaxis after a period of treatment.

Propranolol hydrochloride p. 96 may be effective in preventing migraine in children but it is contra-indicated in those with asthma. Side-effects such as depression and postural hypotension can further limit its use.

Pizotifen below, an antihistamine and a serotonin-receptor antagonist, may also be used but its efficacy in children has not been clearly established. Common side-effects include drowsiness and weight gain.

Topiramate is licensed for migraine prophylaxis.

Cluster headache and the trigeminal autonomic cephalalgias

Cluster headache rarely responds to standard analgesics. Sumatriptan given by subcutaneous injection is the drug of choice for the treatment of cluster headache. If an injection is unsuitable, sumatriptan nasal spray or zolmitriptan nasal spray may be used. Treatment should be initiated by a specialist. Alternatively, 100% oxygen at a rate of 10–15 litres/minute for 10–20 minutes is useful in aborting an attack.

The other trigeminal autonomic cephalalgias, paroxysmal hemicrania (sensitive to indometacin p. 611), and short-lasting unilateral neuralgiform headache attacks with conjunctival injection and tearing, are seen rarely and are best managed by a specialist.

ANTIHISTAMINES > SEDATING

Paracetamol with buclizine hydrochloride and codeine phosphate

The properties listed below are those particular to the combination only. For the properties of the components please consider, paracetamol p. 254, codeine phosphate p. 259.

- **INDICATIONS AND DOSE**
  - **MIGRALEVE®**
    - **Acute migraine**
      - *BY MOUTH*
        - Child 12-14 years: Initially 1 tablet, (pink tablet) to be taken at onset of attack, or if it is imminent, followed by 1 tablet every 4 hours if required, (yellow tablet) to be taken following initial dose; maximum 1 pink and 3 yellow tablets in 24 hours
        - Child 15-17 years: Initially 2 tablets, (pink tablets) to be taken at onset of attack or if it is imminent, followed by 2 tablets every 4 hours if required, (yellow tablets) to be taken following initial dose; maximum 2 pink and 6 yellow tablets in 24 hours

- **LESSE SUITABLE FOR PRESCRIBING**
  - MIGRALEVE® Migralone® is less suitable for prescribing.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

Tablet

Pizotifen

- **INDICATIONS AND DOSE**
  - **Prophylaxis of migraine**
    - *BY MOUTH*
      - Child 5-17 years: Initially 500 micrograms once daily, dose to be taken at night, then increased to up to 1.5 mg daily in divided doses, dose to be increased gradually, max. single dose (at night) 1 mg

- **UNLICENSED USE** 1.5 mg tablets not licensed for use in children.
Migraine 273

Treatment of acute cluster headache

- **BY SUBCUTANEOUS INJECTION**
  - Child 10–17 years (under expert supervision): Initially 6 mg for 1 dose, followed by 6 mg after at least 1 hour if required, to be taken only if headache recurs (patient not responding to initial dose should not take second dose for same attack), dose to be administered using auto-injector; maximum 12 mg per day
  - **BY INTRanasAL ADMINISTRATION**
    - Child 12–17 years (under expert supervision): Initially 10–20 mg for 1 dose, followed by 10–20 mg after at least 2 hours if required, to be taken only if headache recurs (patient not responding to initial dose should not take second dose for same attack); maximum 40 mg per day

- **CONTRA-INDICATIONS** Coronary vasospasm - ischaemic heart disease - mild uncontrolled hypertension - moderate and severe hypertension - peripheral vascular disease - previous cerebrovascular accident - previous myocardial infarction - previous transient ischaemic attack - Prinzmetal’s angina

- **CAUTIONS** Conditions which predispose to coronary artery disease - history of seizures - mild, controlled hypertension - pre-existing cardiac disease - risk factors for seizures

- **INTERACTIONS** → Appendix 1 (SHT, agonists).

- **SIDE-EFFECTS**
  - **GENERAL SIDE-EFFECTS**
    - **Common or very common** Dizziness - drowsiness - dyspnoea - fatigue - flushing - myalgia - nausea - sensory disturbances - transient increase in blood pressure - vomiting - weakness

- **SPECIFIC SIDE-EFFECTS**
  - **Common or very common** With intranasal use Dysgeusia - epistaxis
  - **SIDE-EFFECTS, FURTHER INFORMATION** Sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body may occur (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis).

- **ALLERGY AND CROSS-SENSITIVITY** Caution in patients with sensitivity to sulfonamides.

- **PREGNANCY** There is limited experience of using SHT, receptor agonists during pregnancy; manufacturers advise that they should be avoided unless the potential benefit outweighs the risk.

- **BREAST FEEDING** Present in milk but amount probably too small to be harmful; withhold breast-feeding for 12 hours after treatment.

- **HEPATIC IMPAIRMENT** Reduce dose of oral therapy. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Use with caution.

- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks** Drowsiness may affect performance of skilled tasks (e.g. driving).

</table>

- **INDICATIONS AND DOSE**
  - **TREATMENT OF ACUTE MIGRAINE**
    - **BY MOUTH**
      - Child 6–9 years: Initially 25 mg for 1 dose, followed by 25 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack)
      - Child 10–11 years: Initially 50 mg for 1 dose, followed by 50 mg after at least 2 hours, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack)
    - **BY SUBCUTANEOUS INJECTION**
      - Child 10–17 years: Initially 6 mg for 1 dose, followed by 6 mg after at least 1 hour if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack), dose to be administered using an auto-injector; maximum 12 mg per day
    - **BY INTRanasAL ADMINISTRATION**
      - Child 12–17 years: Initially 10–20 mg for 1 dose, followed by 10–20 mg after at least 2 hours if required, to be taken only if migraine recurs (patient not responding to initial dose should not take second dose for same attack); maximum 40 mg per day
Zolmitriptan

**INDICATIONS AND DOSE**

**Treatment of acute migraine**

- **BY MOUTH**
  - Child 12–17 years: 2.5 mg, followed by 2.5 mg at least 2 hours if required, dose to be taken only if migraine recurs, if response unsatisfactory after 3 attacks consider increasing dose to 5 mg or switching to alternative treatment; maximum 10 mg per day
- **BY INTRanasAL ADMINISTRATION**
  - Child 12–17 years: 5 mg, dose to be administered as soon as possible after onset into one nostril only, followed by 5 mg after at least 2 hours if required, dose to be administered only if migraine recurs; maximum 10 mg per day

**Treatment of acute cluster headache**

- **BY INTRanasAL ADMINISTRATION**
  - Child 12–17 years: 5 mg, dose to be administered as soon as possible after onset into one nostril only, followed by 5 mg after at least 2 hours if required, dose to be administered only if migraine recurs; maximum 10 mg per day

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Max. 5 mg in 24 hours with concomitant cimetidine, fluvoxamine, moclobemide, or quinolone antibiotics.

**DOSE EQUIVALENCE AND CONVERSION**

1 spray of Zomig® nasal spray = 5 mg zolmitriptan.

5.2 Neuropathic pain

Neuropathic pain

Overview and management

Neuropathic pain, which occurs as a result of damage to neural tissue, includes compression neuropathies, peripheral neuropathies (e.g. due to Diabetes, HIV infection, chemotherapy), trauma, idiopathic neuropathy, central pain (e.g. pain following spinal cord injury and syringomyelia), postherpetic neuralgia, and phantom limb pain. The pain may occur in an area of sensory deficit and may be described as burning, shooting or scalding; it may be accompanied by pain that is evoked by a nonnoxious stimulus (allodynia).

Children with chronic neuropathic pain require multidisciplinary management, which may include physiotherapy and psychological support. Neuropathic pain is generally managed with a tricyclic antidepressant such as amitriptyline hydrochloride p. 224 or antiepileptic drugs such as carbamazepine p. 184. Children with localised pain may benefit from topical local anaesthetic preparations, particularly while awaiting specialist review. Neuropathic pain may respond only partially to opioid analgesics. A corticosteroid may help to relieve pressure in compression neuropathy and thereby reduce pain.

Chronic facial pain

Chronic oral and facial pain including persistent idiopathic facial pain (also termed ‘atypical facial pain’) and temporomandibular dysfunction (previously termed temporomandibular joint pain dysfunction syndrome) may call for prolonged use of analgesics or for other drugs. Tricyclic antidepressants may be useful for facial pain [unlicensed indication], but are not on the Dental Practitioners’ List. Disorders of this type require specialist referral and psychological support to accompany drug treatment. Children on long-term therapy need to be monitored both for progress and for side-effects.

6 Sleep disorders

6.1 Insomnia

Hypnotics and anxiolytics

Overview

Most anxiolytics (‘sedatives’) will induce sleep when given at night and most hypnotics will sedate when given during the day. Hypnotics and anxiolytics should be reserved for short courses to alleviate acute conditions after causal factors have been established.

The role of drug therapy in the management of anxiety disorders in children and adolescents is uncertain; drug therapy should be initiated only by specialists after psychosocial interventions have failed. Benzodiazepines and tricyclic antidepressants have been used but adverse effects may be problematic.

Hypnotics

The prescribing of hypnotics to children, except for occasional use such as for sedation for procedures is not justified. There is a risk of habituation with prolonged use. Problems settling children at night should be managed with behavioural therapy.

Dental procedures

Some anxious children may benefit from the use of a hypnotic the night before a dental appointment.

Chloral and derivatives

Chloral hydrate below and derivatives were formerly popular hypnotics for children. Chloral hydrate is now mainly used for sedation during diagnostic procedures.

Antihistamines

Some antihistamines such as promethazine hydrochloride p. 171 are used for occasional insomnia in adults; their prolonged duration of action can often cause drowsiness the following day. The sedative effect of antihistamines may diminish after a few days of continued treatment; antihistamines are associated with headache, psychomotor impairment and antimuscarinic effects. The use of hypnotics in children is not usually justified.

Melatonin

Melatonin p. 276 is a pineal hormone that may affect sleep pattern. Clinical experience suggests that when appropriate behavioural sleep interventions fail, melatonin may be of value for treating sleep onset insomnia and delayed sleep phase syndrome in children with conditions such as visual impairment, cerebral palsy, attention deficit hyperactivity disorder, autism, and learning difficulties. It is also sometimes used before magnetic resonance imaging (MRI), computed tomography (CT), or EEG investigations. Little is known about its long-term effects in children, and there is uncertainty as to the effect on other circadian rhythms including endocrine or reproductive hormone secretion. The need to continue melatonin therapy should be reviewed every 6 months.

Anxiolytics

Anxiolytic treatment should be used in children only to relieve acute anxiety (and related insomnia) caused by fear (e.g. before surgery). Anxiolytic treatment should be limited to the lowest possible dose for the shortest possible time.

Buspirone

Buspirone hydrochloride is thought to act at specific serotonin (5HT1A) receptors; safety and efficacy in children have yet to be determined.

HYPNOTICS, SEDATIVES AND ANXIOLYTICS

NON-BENZODIAZEPINE

Chloral hydrate

Indications and dose

Sedation for painless procedures

- By mouth, or by rectum

- Neonate: 30–50 mg/kg, to be given 45–60 minutes before procedure, doses up to 100 mg/kg may be used with respiratory monitoring, administration by rectum only if oral route not available.

- Child 1 month–11 years: 30–50 mg/kg (max. per dose 1 g), to be given 45–60 minutes before procedure, administration by rectum only if oral route not available, increased if necessary up to 100 mg/kg (max. per dose 2 g)

- Child 12–17 years: 1–2 g, to be given 45–60 minutes before procedure, administration by rectum only if oral route not available

Insomnia (short-term use), using chloral hydrate 143.3 mg/5 ml oral solution

- By mouth using oral solution

- Child 2–11 years: 1–1.75 mL/kilogram, alternatively 30–50 mg/kg once daily, dose to be taken with water or milk at bedtime; maximum 35 mL per day; maximum 1 g per day

- Child 12–17 years: 15–30 mL, alternatively 430–860 mg once daily, dose to be taken with water or...
milk at bedtime; maximum 70 mL per day; maximum 2 g per day

**Insomnia (short-term use), using chloral betaine 707 mg (≡ 414 mg chloral hydrate) tablets**

- **BY MOUTH USING TABLETS**
  - Child 12–17 years: 1–2 tablets, alternatively 414–828 mg once daily, dose to be taken with water or milk at bedtime; maximum 4 tablets per day; maximum 2 g per day
- **UNLICENSED USE** Not licensed for sedation for painless procedures.
- **CONTRA-INDICATIONS** Acute porphyrias p. 562, gastritis—severe cardiac disease
- **CAUTIONS** Avoid contact with mucous membranes—avoid contact with skin—avoid prolonged use (and abrupt withdrawal thereafter)—reduce dose in debilitated
- **INTERACTIONS** → Appendix 1 (anxiolytics and hypnotics).
- **SIDE-EFFECTS** Abdominal distention—delirium (especially on abrupt withdrawal)—dependence—excitement—flatulence—gastric irritation—headache—ketonuria—nausea—rash—tolerance—vomiting
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Risk of sedation in infant—avoid.
- **HEPATIC IMPAIRMENT** Reduce dose in mild to moderate impairment. Can precipitate coma. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
- **DIRECTIONS FOR ADMINISTRATION**
  - With oral use: For administration by mouth dilute liquid with plenty of water or juice to mask unpleasant taste.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include black currant.
  - When prepared extemporaneously, the BP states Chloral hydrate 28.66 mg per 1 ml in a suitable vehicle.
- **PATIENT AND CARER ADVICE**
  - Driving and skilled tasks
  - Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, suppository, enema
  - **Tablet**
    - CAUTIONARY AND ADVISORY LABELS: 19, 27
      - Chloral hydrate (Non-proprietary)
    - Chloral betaine 707 mg Chloral betaine 707 mg tablets | 30 tablet ( BP) £68.00—£138.59 DT price = £138.59
  - **Oral solution**
    - CAUTIONARY AND ADVISORY LABELS: 19 (paediatric solution only), 27
      - Chloral hydrate (Non-proprietary)
    - Chloral hydrate 28.66 mg per 1 ml Chloral hydrate 143.3 mg/5 ml oral solution BP | 150 ml (BP)  £120.00—£244.26 DT price = £244.26

**Melatonin**

- **INDICATIONS AND DOSE**
  - Sleep onset insomnia (initiated under specialist supervision) / Delayed sleep phase syndrome (initiated under specialist supervision)
  - **BY MOUTH USING MODIFIED-RELEASE TABLETS**
  - Child: Initially 2–3 mg daily for 1–2 weeks, then increased if necessary to 4–6 mg daily, dose to be taken before bedtime; maximum 10 mg per day
- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Autoimmune disease (manufacturer advises avoid—no information available)
- **INTERACTIONS** → Appendix 1 (melatonin).
- **SIDE-EFFECTS**
  - **Frequency not known** Galactorrhoea—mouth oedema—tongue oedema
- **PREGNANCY** No information available—avoid.
- **RENAL IMPAIRMENT** No information available—use with caution.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - Treatment with melatonin should be initiated and supervised by a specialist, but may be continued by general practitioners under a shared-care arrangement. The need to continue melatonin therapy should be reviewed every 6 months.
  - Melatonin is available as a modified-release tablet (Circadin ®) and also as unlicensed formulations. **Circadin®** is licensed for the short-term treatment of primary insomnia in adults over 55 years. Unlicensed immediate-release preparations are available; the manufacturer should be specified in the shared-care guideline because of variability in clinical effect of unlicensed formulations.
- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Melatonin for sleep problems
    - www.medicinesforchildren.org.uk/melatonin-for-sleep-problems
  - **MEDICINAL FORMS**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Modified-release tablet**
      - CAUTIONARY AND ADVISORY LABELS: 2, 21, 25
        - Melatonin (Non-proprietary)
      - Melatonin 3 mg Melatonin 3 mg modified-release tablets | 120 tablet (BP) no price available
        - Circadin (Flynn Pharma Ltd)
      - Melatonin 2 mg Circadin 2 mg modified-release tablets | 30 tablet (BP)  £15.39 DT price = £15.39

**7 Substance dependence**

**Substance dependence**

**Guidance on treatment of drug misuse**

**Nicotine dependence**

Smoking cessation interventions are cost-effective way of reducing ill health and prolonging life. Smokers should be
advised to stop and offered help with follow-up when appropriate. If possible, smokers should have access to smoking cessation services for behavioural support.

Therapy to aid smoking cessation is chosen according to the smoker’s likely adherence, availability of counselling and support, previous experience of smoking-cessation aids, contra-indications and adverse effects of the preparations, and the smoker’s preferences. Nicotine replacement therapy is an effective aid to smoking cessation. The use of nicotine below replacement therapy in an individual who is already accustomed to nicotine introduces few new risks and it is widely accepted that there are no circumstances in which it is safer to smoke than to use nicotine replacement therapy.

Some individuals benefit from having more than one type of nicotine replacement therapy prescribed, such as a combination of transdermal and oral preparations.

Concomitant medication
Cigarette smoking increases the metabolism of some medicines by stimulating the hepatic enzyme CYP1A2. When smoking is discontinued, the dose of these drugs, in particular theophylline p. 159, and some antipsychotics (including clozapine p. 235, olanzapine p. 236, chlorpromazine hydrochloride p. 230, and haloperidol p. 231, may need to be reduced. Regular monitoring for adverse effects is advised.

Nicotine replacement therapy
Nicotine replacement therapy can be used in place of cigarettes after abrupt cessation of smoking, or alternatively to reduce the amount of cigarettes used in advance of making a quit attempt. Nicotine replacement therapy can also be used to minimise passive smoking, and to treat cravings and reduce compensatory smoking after enforced abstinence in smoke-free environments. Smokers who find it difficult to achieve abstinence should consult a healthcare professional for advice.

Choice
Nicotine patches are a prolonged-release formulation and are applied for 16 hours (with the patch removed overnight) or for 24 hours. If the individual experiences strong cravings for cigarettes on waking, a 24-hour patch may be more suitable. Immediate-release nicotine preparations (gum, lozenges, sublingual tablets, inhalator, nasal spray, and oral spray) are used whenever the urge to smoke occurs or to prevent cravings.

The choice of nicotine replacement preparation depends largely on patient preference, and should take into account what preparations, if any, have been tried before. Patients with a high level of nicotine dependence, or who have failed with nicotine replacement therapy previously, may benefit from using a combination of an immediate-release preparation and patches to achieve abstinence.

Side-effects of specific nicotine preparations
Mild local reactions at the beginning of treatment are common because of the irritant effect of nicotine. Oral preparations and inhalation cartridges can cause irritation of the throat, gum, lozenges, and oral spray can cause increased salivation, and patches can cause minor skin irritation. The nasal spray commonly causes coughing, nasal irritation, epistaxis, sneezing, and watery eyes; the oral spray can cause watery eyes and blurred vision.

Gastro-intestinal disturbances are common and may be caused by swallowed nicotine. Nausea, vomiting, dyspepsia, and hiccup occur most frequently. Ulcerative stomatitis has also been reported. Dry mouth is a common side-effect of lozenges, patches, oral spray, and sublingual tablets. Lozenges cause diarrhoea, constipation, dysphagia, oesophagitis, gastritis, mouth ulcers, bloating, flatulence, and less commonly, taste disturbance, thirst, gingival bleeding, and halitosis. The oral spray may also cause abdominal pain, flatulence, and taste disturbance.

Palpitations may occur with nicotine replacement therapy and rarely patches and oral spray can cause arrhythmia. Patches, lozenges, and oral spray can cause chest pain. The inhalator can very rarely cause reversible atrial fibrillation. Paraesthesia is a common side-effect of oral spray.

Abnormal dreams can occur with patches; removal of the patch before bed may help. Lozenges and oral spray may cause rash and hot flushes. Sweating and myalgia can occur with patches and oral spray; the patches can also cause arthralgia.

Neonatal abstinence syndrome
Neonatal abstinence syndrome occurs at birth as a result of intra-uterine exposure to opioids or high-dose benzodiazepines. Treatment is usually initiated if:
- feeding becomes a problem and tube feeding is required;
- there is profuse vomiting or watery diarrhoea;
- the baby remains very unsettled after two consecutive feeds despite gentle swaddling and the use of a pacifier.

Treatment involves weaning the baby from the drug on which it is dependent. Morphine p. 265 or methadone hydrochloride p. 279 can be used in babies of mothers who have been taking opioids. Morphine is widely used because the dose can be easily adjusted, but methadone hydrochloride may provide smoother control of symptoms. Weaning babies from opioids usually takes 7–10 days.

Weaning babies from benzodiazepines that have a long half-life is difficult to manage; chlorpromazine hydrochloride may be used in these situations but excessive sedation may occur. For babies who are dependent on barbiturates, phenobarbital p. 203 may be tried, although it does not control gastro-intestinal symptoms.

Nicotine dependence

NICOTINIC RECEPTOR AGONISTS

Nicotine

- INDICATIONS AND DOSE

Nicotine replacement therapy in individuals who smoke fewer than 20 cigarettes each day
  - BY MOUTH USING CHEWING GUM
    - Child 12–17 years: 2 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose; maximum 40 tablets per day

Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day or who require more than 15 pieces of 2-mg strength gum each day
  - BY MOUTH USING CHEWING GUM
    - Child 12–17 years: 4 mg as required, chew 1 piece of gum when the urge to smoke occurs or to prevent cravings, individuals should not exceed 15 pieces of 4-mg strength gum daily, if attempting smoking cessation, treatment should continue for up to 3 months before reducing the dose

Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day
  - BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS
    - Child 12–17 years: 2 tablets every 1 hour, if attempting smoking cessation, treatment should

Nicotine replacement therapy in individuals who smoke more than 20 cigarettes each day
  - BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS
    - Child 12–17 years: 2 tablets every 1 hour, if attempting smoking cessation, treatment should

  - BY SUBLINGUAL ADMINISTRATION USING SUBLINGUAL TABLETS
    - Child 12–17 years: 2 tablets every 1 hour, if attempting smoking cessation, treatment should
When used by inhalation

CAUTIONS
- Unlicensed use

Monitoring closely when initiating treatment
- Patients hospitalised with myocardial infarction
- Hyperthyroidism

SPECIFIC CAUTIONS
- Child 12-17 years: As required, the cartridges can be used when the urge to smoke occurs or to prevent cravings, individuals should not exceed 12 cartridges of the 10-mg strength daily, or 6 cartridges of the 15-mg strength daily
- Mouth using lozenges
- Child 12-17 years: 1 lozenge every 1–2 hours as required, one lozenge should be used when the urge to smoke occurs, individuals who smoke less than 20 cigarettes each day should usually use the lower-strength lozenges; individuals who smoke more than 20 cigarettes each day and those who fail to stop smoking with the low-strength lozenges should use the higher-strength lozenges; If attempting smoking cessation, treatment should continue for 6–12 weeks before attempting a reduction in dose; maximum 15 lozenges per day
- Mouth using oromucosal spray
- Child 12-17 years: 1–2 sprays as required, individuals can spray in the mouth when the urge to smoke occurs, up to twice every hour for 16 hours daily, if attempting smoking cessation, treatment should continue for 8 weeks before reducing the dose; maximum 64 sprays per day
- Intranasal administration using nasal spray
- Child 12-17 years: 1 spray as required, individuals can spray into each nostril when the urge to smoke occurs, up to twice every hour for 16 hours daily, if attempting smoking cessation, treatment should continue for 8 weeks before reducing the dose; maximum 64 sprays per day
- Transdermal application using patches
- Child 12-17 years: Individuals who smoke more than 10 cigarettes daily should apply a high-strength patch daily for 6–8 weeks, followed by the medium-strength patch for 2 weeks, and then the low-strength patch for the final 2 weeks; individuals who smoke fewer than 10 cigarettes daily can usually start with the medium-strength patch for 6–8 weeks, followed by the low-strength patch for 2–4 weeks; a slower titration schedule can be used in individuals who are not ready to quit but want to reduce cigarette consumption before a quit attempt; if abstinence is not achieved, or if withdrawal symptoms are experienced, the strength of the patch used should be maintained or increased until the patient is stabilised; individuals using the high-strength patch who experience excessive side-effects, that do not resolve within a few days, should change to a medium-strength patch for the remainder of the initial period and then use the low-strength patch for 2–4 weeks

**Unlicensed use** All preparations are licensed for adults and children over 12 years (with the exception of Nicotinell® lozenges which are licensed for children under 18 years only when recommended by a doctor).

**Cautions**

**General Caution**
Diabetes mellitus—blood-glucose concentration should be monitored closely when initiating treatment.
- Haemodynamically unstable patients hospitalised with cerebrovascular accident.
- Haemodynamically unstable patients hospitalised with myocardial infarction.
- Haemodynamically unstable patients hospitalised with severe arrhythmias.
- Pheochromocytoma.
- Uncontrolled hyperthyroidism.

**Specific Caution**
- When used by inhalation: Bronchospastic disease, chronic throat disease, obstructive lung disease

- With intranasal use: Bronchial asthma (may exacerbate)
- With oral use: Gastritis (can be aggravated by swallowed nicotine), oesophagitis (can be aggravated by swallowed nicotine), peptic ulcers (can be aggravated by swallowed nicotine)
- With topical (oral) use: Gum may also stick to and damage dentures
- With transdermal use: Patches should not be placed on broken skin.

**Side-effects**
- Common or very common: Bloating, blurred vision, constipation, coughing, diarrhoea, dry mouth, dyspepsia, dysphagia, epistaxis, flatulence, gastritis, gastrointestinal disturbances (may be caused by swallowed nicotine), hiccup, increased salivation, irritation of the throat, mild local reactions at the beginning of treatment are common because of the irritant effect of nicotine.
- Minor skin irritation, mouth ulcers, nasal irritation, nausea, oesophagitis, paraesthesia, sneezing, vomiting, watery eyes.
- Uncommon: Gingival bleeding, halitosis, thirst.
- Rare: Arrhythmia.
- Very rare: Reversible atrial fibrillation.
- Frequency not known: Abdominal pain, abnormal dreams (may occur with patches, removal of the patch before bed may help), arthralgia, chest pain, flatulence, hot flushes, myalgia, palpitations, rash, sweating, taste disturbance, ulcerative stomatitis.

**Special Information**

- Side-effects list has been reported with use of various nicotine replacement therapy preparations. See Nicotine replacement therapy, under Substance dependence p. 276 for further details on individual preparations.
- Nicotine withdrawal: Some systemic effects occur on initiation of therapy, particularly if the patient is using high-strength preparations; however, the patient may confuse side-effects of the nicotine replacement preparation with nicotine withdrawal symptoms. Common symptoms of nicotine withdrawal include malaise, headache, dizziness, sleep disturbance, coughing, influenza-like symptoms, depression, irritability, increased appetite, weight gain, restlessness, anxiety, drowsiness, aphthous ulcers, decreased heart rate, and impaired concentration.

**Pregnancy**

The use of nicotine replacement therapy in pregnancy is preferable to the continued smoking, but should be used only if smoking cessation without nicotine replacement fails. Intermittent therapy is preferable to patches but avoid liqueurice-flavoured nicotine products. Patches are useful, however, if the patient is experiencing pregnancy-related nausea and vomiting. If patches are used, they should be removed before bed.

**Breastfeeding**
Nicotine is present in milk; however, the amount to which the infant is exposed is small and less hazardous than second-hand smoke. Intermittent therapy is preferred.

**Hepatic Impairment** Use with caution in moderate to severe hepatic impairment.

**Renal Impairment** Use with caution in severe renal impairment.

**Directions for Administration**
Acidic beverages, such as coffee or fruit juice, may decrease the absorption of nicotine.
nicotine through the buccal mucosa and should be avoided for 15 minutes before the use of oral nicotine replacement therapy.

Administration by transdermal patch Patches should be applied on waking to dry, non-hairy skin on the hip, trunk, or upper arm and held in position for 10–20 seconds to ensure adhesion; place next patch on a different area and avoid using the same site for several days.

Administration by nasal spray Initially 1 spray should be used in both nostrils but when withdrawing from therapy, the dose can be gradually reduced to 1 spray in 1 nostril.

Administration by oral spray The oral spray should be released into the mouth, holding the spray as close to the mouth as possible and avoiding the lips. The patient should not inhale while spraying and avoid swallowing for a few seconds after use. If using the oral spray for the first time, or if unit not used for 2 or more days, prime the unit before administration.

Administration by sublingual tablet Each tablet should be placed under the tongue and allowed to dissolve. Administration by lozenge Slowly allow each lozenge to dissolve in the mouth; periodically move the lozenge from one side of the mouth to the other. Lozenges last for 40 minutes of intense use.

Administration by sublingual tablet Insert the cartridge into the device and draw in air through the mouthpiece; each session can last for approximately 5 minutes. The amount of nicotine from 1 puff of the cartridge is less than that from a cigarette, therefore it is necessary to inhale more often than when smoking a cigarette. A single 10 mg cartridge lasts for approximately 20 minutes of intense use; a single 15 mg cartridge lasts for approximately 40 minutes of intense use.

Administration by medicated chewing gum Chew the gum until the taste becomes strong, then rest it between the cheek and gum; when the taste starts to fade, repeat this process. One piece of gum lasts for approximately 30 minutes.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of chewing gum and lozenges may include mint, freshfruit, freshmint, icky white, or cherry.

**PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer nicotine chewing gum, inhalators, lozenges, sublingual tablets, oral spray, nasal spray and patches.

**NEURAL MIST**

- Brands may include Nicorette, NiQuitin, Nicorette invisi, Nicotinell TTS

**7.2 Opioid dependence**

**OPIOIDS**

**Methadone hydrochloride**

- **INDICATIONS AND DOSE**
  - Neonatal opioid withdrawal
  - **BY MOUTH**
  - Neonate: Initially 100 micrograms/kg, then increased in steps of 50 micrograms/kg every 6 hours until symptoms are controlled, doses may vary, consult local guidelines, for maintenance, total daily dose that controls symptoms to be given in 2 divided doses.

- **UNLICENSED USE** Not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**

Methadone oral solution 1 mg/mL is 2½ times the strength of Methadone Linctus (2 mg/5mL). Many preparations of Methadone oral solution are licensed for opioid drug addiction only but some are also licensed for analgesia in severe pain.

- **CONTRA-INDICATIONS** Phaeochromocytoma
- **CAUTIONS** Family history of sudden death (ECG monitoring recommended); history of cardiac conduction abnormalities

**CAUTIONS, FURTHER INFORMATION**

- QT-interval prolongation Patients with the following risk factors for QT-interval prolongation should be carefully monitored while taking methadone: heart or liver disease, electrolyte abnormalities, or concomitant treatment with drugs that can prolong QT interval; patients requiring more than 100 mg daily should also be monitored.

**SIDE-EFFECTS**

- Dry eyes - dysmenorrhoea - hyperprolactinaemia - hypothermia - QT-interval prolongation - raised intracranial pressure - restless leg syndrome - tardive dyskinesia

**SIDE-EFFECTS, FURTHER INFORMATION**

Methadone is a long-acting opioid therefore effects may be cumulative.
Methadone, even in low doses is a special hazard for children; non-dependent adults are also at risk of toxicity; dependent adults are at risk if tolerance is incorrectly assessed during induction.

**Overdose**
Methadone has a very long duration of action; patients may need to be monitored for long periods following large overdoses.

- **BREAST FEEDING** Withdrawal symptoms in infant; breast-feeding permissible during maintenance but dose should be as low as possible and infant monitored to avoid sedation (high doses of methadone carry an increased risk of sedation and respiratory depression in the neonate).
- **RENAL IMPAIRMENT** Avoid use or reduce dose; opioid effects increased and prolonged and increased cerebral sensitivity occurs.
- **TREATMENT CESSATION** Avoid abrupt withdrawal. When used for neonatal opioid withdrawal, reduce dose over 7–10 days.
- **DIRECTIONS FOR ADMINISTRATION** Syrup preserved with hydroxybenzoate (parabens) esters may be incompatible with methadone hydrochloride.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tolu.

**METHICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

**CAUTIONARY AND ADVISORY LABELS**

  - Diloxanide furoate (Non-proprietary)
  - Diloxanide furoate 500 mg Diloxanide 500 mg tablets | 30 tablet POUND £93.50

2 Bacterial infection

**Antibacterials, principles of therapy**

**Choice of a suitable drug**

Before selecting an antibacterial the clinician must first consider two factors— the patient and the known or likely causative organism. Factors related to the patient which must be considered include history of allergy, renal and hepatic function, susceptibility to infection (i.e. whether immunocompromised), ability to tolerate drugs by mouth, severity of illness, ethnic origin, age, whether taking other medication and, if female, whether pregnant, breast-feeding or taking an oral contraceptive.

The known or likely organism and its antibacterial sensitivity, in association with the above factors, will suggest one or more antibacterials, the final choice depending on the microbiological, pharmacological, and toxicological properties.

The principles involved in selection of an antibacterial must allow for a number of variables including changing renal and hepatic function, increasing bacterial resistance, and information on side-effects. Duration of therapy, dosage, and route of administration depend on site, type and severity of infection and response.

**Antibacterial policies**

Local policies often limit the antibacterials that may be used to achieve reasonable economy consistent with adequate cover, and to reduce the development of resistant organisms. A policy may indicate a range of drugs for general use, and permit other drugs only on the advice of the microbiologist or paediatric infectious diseases specialist.

**Before starting therapy**

The following precepts should be considered before starting:

- Viral infections should not be treated with antibacterials.
- However, antibacterials may be used to treat secondary bacterial infection (e.g. bacterial pneumonia secondary to influenza);
- Samples should be taken for culture and sensitivity testing; ‘blind’ antibacterial prescribing for unexplained
Infection

Duration
The prophylaxis is appropriate in specific indications such as vesico-ureteric reflux.

Switching from parenteral to oral treatment
The ongoing parenteral administration of an antibacterial should be reviewed regularly. In older children it may be possible to switch to an oral antibacterial; in neonates and infants this should be done more cautiously because of the relatively high incidence of bacteraemia and the possibility of variable oral absorption.

Prophylaxis
In most situations, only a short course of prophylactic antibacterial is needed. Longer-term antibacterial prophylaxis is appropriate in specific indications such as vesico-ureteric reflux.

Notifiable diseases
Doctors must notify the Proper Officer of the local authority (usually the consultant in communicable disease control) when attending a patient suspected of suffering from any of the diseases listed below; a form is available from the Proper Officer.

- Anthrax
- Botulism
- Brucellosis
- Cholera
- Diarrhoea (infectious bloody)
- Diphtheria
- Encephalitis, acute
- Food poisoning
- Haemolytic uremic syndrome
- Haemorrhagic fever (viral)
- Hepatitis, viral
- Legionnaires’ disease
- Leprosy
- Malaria
- Measles
- Meningitis
- Meningococcal septicaemia
- Mumps
- Paratyphoid fever
- Plague
- Poliomyelitis, acute
- Rabies
- Rubella
- SARS
- Scarlet fever
- Smallpox
- Streptococcal disease (Group A, invasive)
- Tetanus
- Tuberculosis
- Typhoid fever
- Typhus
- Whooping cough
- Yellow fever

Note: It is good practice for doctors to also inform the consultant in communicable disease control of instances of other infections (e.g. psittacosis) where there could be a public health risk.

Antibacterials, use for prophylaxis

Prevention of recurrence of rheumatic fever
- Phenoxyethylpenicillin p. 319 by mouth or erythromycin p. 310 by mouth.

Prevention of secondary case of invasive group A streptococcal infection
- Phenoxyethylpenicillin by mouth.
- If child penicillin allergic, either erythromycin by mouth or azithromycin p. 308 by mouth [unlicensed indication].
- For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England Laboratory).

Prevention of secondary case of meningococcal meningitis
- Ciprofloxacin p. 328 by mouth [unlicensed indication] or rifampicin p. 342 by mouth or ceftriaxone p. 302 by intramuscular injection [unlicensed indication].
- For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health...
England laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

**Prevention of secondary case of Haemophilus influenzae type b disease**
- Rifampicin by mouth or (if rifampicin cannot be used) ceftriaxone by intramuscular injection, or by intravenous injection, or by intravenous infusion [unlicensed indication].

For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Public Health England laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

Within 4 weeks of illness onset in an index case with confirmed or suspected invasive Haemophilus influenzae type b disease, give antibacterial prophylaxis to all household contacts if there is a vulnerable individual in the household. Also, give antibacterial prophylaxis to the index case if they are in contact with vulnerable household contacts or if they are under 10 years of age. Vulnerable individuals include the immunocompromised, those with asplenia, or children under 10 years of age. If there are 2 or more cases of invasive Haemophilus influenzae type b disease within 120 days in a pre-school or primary school, antibacterial prophylaxis should also be given to all room contacts (including staff). Also see immunisation against Haemophilus influenzae type b disease.

**Prevention of secondary case of diphtheria in non-immune patient**
- Erythromycin (or another macrolide e.g. azithromycin or clarithromycin p. 309) by mouth.
  - Treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment.

**Prevention of pertussis**
- Clarithromycin (or azithromycin or erythromycin) by mouth.
  - Within 3 weeks of onset of cough in the index case, give antibacterial prophylaxis to all close contacts if amongst them there is at least one unimmunised or partially immunised child under 1 year of age, or if there is at least one individual who has not received a pertussis-containing vaccine more than 1 week and less than 5 years ago (so long as that individual lives or works with children under 4 months of age, is pregnant at over 32 weeks gestation, or is a healthcare worker who works with children under 1 year of age or with pregnant women).

**Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease**
- Phenoxymethylpenicillin by mouth.
  - If cover also needed for *H. influenzae* in child give amoxicillin p. 320 instead.
  - If penicillin-allergic, erythromycin by mouth.
  - Antibacterial prophylaxis is not fully reliable. Antibacterial prophylaxis may be discontinued in children over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection.

**Prevention of Staphylococcus aureus lung infection in cystic fibrosis**
- **Primary prevention**, fluclaxacillin p. 325 by mouth.
- **Secondary prevention**, fluclaxacillin by mouth.

**Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive**
- Isoniazid p. 345 for 6 months or isoniazid + rifampicin for 3 months or (if isoniazid-resistant tuberculosis) rifampicin for 6 months.

For details of those who should receive chemoprophylaxis contact the lead clinician for local tuberculosis services (or a consultant in communicable disease control).

**Prevention of urinary-tract infection**
- Trimethoprim p. 338 by mouth or nitrofurantoin p. 347 by mouth.
  - Antibacterial prophylaxis can be considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage.

**Prevention of infection from animal and human bites**
- Co-amoxiclav p. 323 alone (or clindamycin p. 307 if penicillin-allergic).
  - Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 729 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection).

  - Consider rabies prophylaxis for bites from animals in endemic countries. Assess risk of blood-borne viruses (including HIV, hepatitis B and C) and give appropriate prophylaxis to prevent viral spread. Antibacterial prophylaxis recommended for wounds less than 48–72 hours old when the risk of infection is high (e.g. bites from humans or cats; bites to the hand, foot, face, or genital area; bites involving oedema, crush or puncture injury, or other moderate to severe injury; wounds that cannot be debrided adequately; patients with diabetes mellitus, cirrhosis, asplenia, prosthetic joints or valves, or those who are immunocompromised). Give antibacterial prophylaxis for up to 5 days.

**Prevention of infection in gastro-intestinal procedures**

**Operations on stomach or oesophagus**
- Single dose of i/v gentamicin p. 293 or i/v cefuroxime p. 300 or i/v co-amoxiclav (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).
  - Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.
  - Add i/v teicoplanin p. 305 (or vancomycin p. 305) if high risk of meticillin-resistant *Staphylococcus aureus*.

**Open biliary surgery**
- Single dose of i/v cefuroxime + i/v metronidazole p. 313 or i/v gentamicin + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).
  - Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.
  - Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.
  - Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant *Staphylococcus aureus*.

**Bacterial infection** 283
Infection

Resections of colon and rectum, and resections in inflammatory bowel disease, and appendicectomy

- Single dose of i/v gentamicin + i/v metronidazole or i/v cefuroxime + i/v metronidazole or i/v co-amoxiclav alone (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure. Where i/v metronidazole p. 313 is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery. Add i/v teicoplanin p. 305 (or vancomycin p. 305) if high risk of meticillin-resistant *Staphylococcus aureus*.

Endoscopic retrograde cholangiopancreatography

- Single dose of i/v gentamicin p. 293 or oral or i/v ciprofloxacin p. 328.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Prophylaxis recommended if pancreatic pseudocyst, immunocompromised, history of liver transplantation, or risk of incomplete biliary drainage. For biliary complications following liver transplantation, add i/v amoxicillin p. 320 or i/v teicoplanin (or vancomycin).

Percutaneous endoscopic gastrostomy or jejunostomy

- Single dose of i/v co-amoxiclav p. 323 or i/v cefuroxime p. 309.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Use single dose of i/v teicoplanin (or vancomycin) if history of allergy to penicillins or cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus*.

Prevention of infection in orthopaedic surgery

Closed fractures

- Single dose of i/v cefuroxime or i/v flucloxacin p. 325 (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

If history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant *Staphylococcus aureus*, use single dose of i/v teicoplanin (or vancomycin) (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

Open fractures

- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole (or i/v clindamycin p. 307 alone if history of allergy to penicillins or to cephalosporins).

Add i/v teicoplanin (or vancomycin) if high risk of meticillin-resistant *Staphylococcus aureus*. Start prophylaxis within 3 hours of injury and continue until soft tissue closure (max. 72 hours).

At first debridement also use a single dose of i/v cefuroxime + i/v metronidazole + i/v gentamicin or i/v co-amoxiclav + i/v gentamicin (or i/v clindamycin + i/v gentamicin if history of allergy to penicillins or to cephalosporins).

At time of skeletal stabilisation and definitive soft tissue closure use a single dose of i/v gentamicin and i/v teicoplanin (or vancomycin) (intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure).

High lower-limb amputation

- Use i/v co-amoxiclav alone or i/v cefuroxime + i/v metronidazole.

Intravenous antibacterial prophylaxis should be given up to 30 minutes before the procedure.

Continue antibacterial prophylaxis for at least 2 doses after procedure (max. duration of prophylaxis 5 days). If history of allergy to penicillin or to cephalosporins, or if high risk of meticillin-resistant *Staphylococcus aureus*, use i/v teicoplanin (or vancomycin) + i/v gentamicin + i/v metronidazole.

Where i/v metronidazole is suggested, it may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.

Prevention of infection in obstetric surgery

Termination of pregnancy

- Single dose of oral metronidazole (additional intra-operative or postoperative doses may be given for prolonged procedures or if there is major blood loss).

If genital chlamydial infection cannot be ruled out, give doxycycline p. 332 postoperatively.

Prevention of endocarditis

NICE guidance: Antimicrobial prophylaxis against infective endocarditis in adults and children undergoing interventional procedures (March 2008)

- Antibacterial prophylaxis and chlorhexidine mouthwash are not recommended for the prevention of endocarditis in patients undergoing dental procedures.

Antibacterial prophylaxis is not recommended for the prevention of endocarditis in patients undergoing procedures of the:

- upper and lower respiratory tract (including ear, nose, and throat procedures and bronchoscopy);

- genito-urinary tract (including urological, gynaecological, and obstetric procedures);

- upper and lower gastro-intestinal tract.

While these procedures can cause bacteraemia, there is no clear association with the development of infective endocarditis. Prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

If patients at risk of endocarditis are undergoing a gastro-intestinal or genito-urinary tract procedure at a site where infection is suspected, they should receive appropriate antibacterial therapy that includes cover against organisms that cause endocarditis.

Patients at risk of endocarditis should be:

- advised to maintain good oral hygiene;

- told how to recognise signs of infective endocarditis, and advised when to seek expert advice.

Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.

Dermatological procedures

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who undergo dermatological procedures do not require antibacterial prophylaxis against endocarditis.

The British Association of Dermatologists Therapy Guidelines and Audit Subcommittee advise that such dermatological procedures include skin biopsies and excision of moles or of malignant lesions.
Joint prostheses and dental treatment
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibacterial prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibacterials when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibacterials to which the infecting organisms are sensitive.

The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

Immunosuppression and indwelling intraperitoneal catheters
Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibacterial prophylaxis for dental treatment provided there is no other indication for prophylaxis.

The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

Blood infections, bacterial

Antibacterial therapy for septicaemia: community-acquired
- Child 1 month–18 years, aminoglycoside + amoxicillin p. 320 (or ampicillin p. 321) or cefotaxime p. 301 (or ceftiraxone p. 302) alone
- If pseudomonas or resistant micro-organisms suspected, use a broad-spectrum antipseudomonal beta-lactam antibacterial.
- If anaerobic infection suspected, add metronidazole p. 313.
- If Gram-positive infection suspected, add flucloxacillin p. 325 or vancomycin p. 305 (or teicoplanin p. 305).
- Suggested duration of treatment at least 5 days.

Antibacterial therapy for septicaemia: hospital-acquired
- Child 1 month–18 years, a broad-spectrum antipseudomonal beta-lactam antibacterial (e.g. piperacillin with tazobactam p. 317, ticarcillin with clavulanic acid p. 318, imipenem with cilastatin p. 295, or meropenem p. 296)
- If pseudomonas suspected, or if multiple-resistant organisms suspected, or if severe sepsis, add aminoglycoside.
- If meticillin-resistant Staphylococcus aureus suspected, add vancomycin (or teicoplanin).
- If anaerobic infection suspected, add metronidazole to a broad-spectrum cephalosporin.
- Suggested duration of treatment at least 5 days.

Septicaemia related to vascular catheter
- Vancomycin (or teicoplanin)
- If Gram-negative sepsis suspected, especially in the immunocompromised, add a broad-spectrum antipseudomonal beta-lactam.
- Consider removing vascular catheter, particularly if infection caused by Staphylococcus aureus, pseudomonas, or Candida species.

Meningococcal septicaemia
If meningococcal disease suspected, a single dose of benzylpenicillin sodium p. 318 should be given before urgent transfer to hospital, so long as this does not delay the transfer; ceftriaxone may be an alternative in penicillin allergy; chloramphenicol p. 334 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.
- Benzylpenicillin sodium or cefotaxime (or ceftiraxone)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol
- To eliminate nasopharyngeal carriage, ciprofloxacin p. 328, or rifampicin p. 342, or ceftiraxone may be used.

Antibacterial therapy for septicaemia in neonates
- Neonate less than 72 hours old, benzylpenicillin sodium + gentamicin p. 293
- If Gram-negative septicaemia suspected, use benzylpenicillin sodium + gentamicin + cefotaxime; stop benzylpenicillin sodium if Gram-negative infection confirmed.
- Suggested duration of treatment usually 7 days.
- Neonate more than 72 hours old, flucloxacillin + gentamicin or amoxicillin (or ampicillin) + cefotaxime
- Suggested duration of treatment usually 7 days.

Cardiovascular system infections, bacterial

Antibacterial therapy for endocarditis: initial ‘blind’ therapy
- Flucloxacillin p. 325 (or benzylpenicillin sodium p. 318 if symptoms less severe) + gentamicin p. 293
- If cardiac prostheses present, or if penicillin-allergic, or if meticillin-resistant Staphylococcus aureus suspected, vancomycin p. 305 + rifampicin p. 342 + gentamicin

Antibacterial therapy for endocarditis caused by staphylococci
- Flucloxacillin
- Add rifampicin for at least 2 weeks in prosthetic valve endocarditis
- Suggested duration of treatment at least 4 weeks
- If penicillin-allergic or if meticillin-resistant Staphylococcus aureus, vancomycin + rifampicin
- Suggested duration of treatment at least 4 weeks

Antibacterial therapy for native-valve endocarditis caused by fully-sensitive streptococci (e.g. viridans streptococci)
- Benzylpenicillin sodium
- Suggested duration of treatment 4 weeks
- Alternative if a large vegetation, intracardial abscess, or infected emboli are absent, benzylpenicillin sodium + gentamicin
- Suggested duration of treatment 2 weeks
- If penicillin-allergic, vancomycin
- Suggested duration of treatment 4 weeks
Antibacterial therapy for native-valve endocarditis caused by less-sensitive streptococci
- Benzylpenicillin sodium + gentamicin
  - **Suggested duration of treatment** 4–6 weeks (stop gentamicin after 2 weeks for micro-organisms moderately sensitive to penicillin)
- **If** aminoglycoside cannot be used and if streptococci moderately sensitive to penicillin, benzylpenicillin sodium + gentamicin
  - **Suggested duration of treatment** 4 weeks
- **If** penicillin-allergic or highly penicillin-resistant, vancomycin (or teicoplanin p. 305) + gentamicin
  - **Suggested duration of treatment** 4–6 weeks (stop gentamicin after 2 weeks for micro-organisms moderately sensitive to penicillin)

Antibacterial therapy for prosthetic valve endocarditis caused by streptococci
- Benzylpenicillin sodium + gentamicin
  - **Suggested duration of treatment** at least 6 weeks (stop gentamicin after 2 weeks if micro-organisms fully sensitive to penicillin)
- **If** penicillin-allergic or highly penicillin-resistant, vancomycin (or teicoplanin) + gentamicin
  - **Suggested duration of treatment** at least 6 weeks (stop gentamicin after 2 weeks if micro-organisms fully sensitive to penicillin)

Antibacterial therapy for endocarditis caused by enterococci (e.g. *Enterococcus faecalis*)
- Amoxicillin p. 320 (or ampicillin p. 321) + gentamicin
  - If gentamicin-resistant, substitute gentamicin with streptomycin p. 293
  - **Suggested duration of treatment** at least 4 weeks (at least 6 weeks for prosthetic valve endocarditis)
- **If** penicillin-allergic or penicillin-resistant, vancomycin (or teicoplanin) + gentamicin
  - If gentamicin-resistant, substitute gentamicin with streptomycin
  - **Suggested duration of treatment** at least 4 weeks (at least 6 weeks for prosthetic valve endocarditis)

Antibacterial therapy for endocarditis caused by *Haemophilus*, *Actinobacillus*, *Cardiobacterium*, *Eikenella*, and *Kingella* species (‘HACEK’ micro-organisms)
- Amoxicillin (or ampicillin) + gentamicin
  - **Suggested duration of treatment** 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks
- **If** amoxicillin-resistant, ceftriaxone p. 302 + gentamicin
  - **Suggested duration of treatment** 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks

Central nervous system infections, bacterial

Antibacterial therapy for meningitis: initial empirical therapy
- Transfer patient to hospital urgently.
- **If** meningococcal disease (meningitis with non-blanching rash or meningococcal septicemia) suspected, benzylpenicillin sodium p. 318 should be given before transfer to hospital, so long as this does not delay the transfer. If a patient with suspected bacterial meningitis without non-blanching rash cannot be transferred to hospital urgently, benzylpenicillin sodium should be given before the transfer. Cefotaxime p. 301 may be an alternative in penicillin allergy; chloramphenicol p. 334 may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins.
- In hospital, consider adjunctive treatment with dexamethasone p. 410, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial; avoid dexamethasone in septic shock, meningococcal septicaemia, or if immunocompromised, or in meningitis following surgery. In hospital, if aetiology unknown
  - **Neonate and child 1–3 months**, cefotaxime (or ceftriaxone p. 302) + amoxicillin p. 320 (or ampicillin p. 321)
  - Consider adding vancomycin p. 305 if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci
  - **Suggested duration of treatment** at least 14 days
  - **Child 3 months–18 years**, cefotaxime (or ceftriaxone)
  - Consider adding vancomycin if prolonged or multiple use of other antibacterials in the last 3 months, or if travelled, in the last 3 months, to areas outside the UK with highly penicillin- and cephalosporin-resistant pneumococci
  - **Suggested duration of treatment** at least 10 days

Antibacterial therapy for meningitis caused by group B streptococci
- Benzylpenicillin sodium + gentamicin p. 293 or cefotaxime (or ceftriaxone) alone
  - **Suggested duration of treatment** at least 14 days; stop gentamicin after 5 days

Antibacterial therapy for meningitis caused by meningococci
- Benzylpenicillin sodium or cefotaxime (or ceftriaxone)
  - **Suggested duration of treatment** 7 days.
  - **If** history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol
  - **Suggested duration of treatment** 7 days.

Antibacterial therapy for meningitis caused by pneumococci
- Cefotaxime (or ceftriaxone)
  - Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial (may reduce penetration of vancomycin into cerebrospinal fluid).
  - **If** micro-organism penicillin-sensitive, replace cefotaxime with benzylpenicillin sodium.
  - **If** micro-organism highly penicillin- and cephalosporin-resistant, add vancomycin and if necessary rifampicin p. 342.
  - **Suggested duration of antibacterial treatment** 14 days.

Antibacterial therapy for meningitis caused by *Haemophilus influenzae*
- Cefotaxime (or ceftriaxone)
  - Consider adjunctive treatment with dexamethasone, preferably starting before or with first dose of antibacterial, but no later than 12 hours after starting antibacterial.
  - **Suggested duration of antibacterial treatment** 10 days.
Antibacterial therapy for congenital chlamydial conjunctivitis
- Erythromycin p. 310 (by mouth)
  - Suggested duration of treatment 14 days

Antibacterial therapy for congenital gonococcal conjunctivitis
- Cefotaxime p. 301 (or ceftriaxone p. 302)
  - Suggested duration of treatment single dose.

Gastro-intestinal system infections, bacterial

Antibacterial therapy for gastro-enteritis
Frequently self-limiting and may not be bacterial.
- Antibacterial not usually indicated.

Antibacterial therapy for campylobacter enteritis
Frequently self-limiting; treat if immunocompromised or if severe infection.
- Clarithromycin p. 309 (or azithromycin p. 308 or erythromycin p. 310)
- Alternative, ciprofloxacin p. 328
- Strains with decreased sensitivity to ciprofloxacin isolated frequently

Antibacterial therapy for salmonella (non-typhoid)
Treat invasive or severe infection. Do not treat less severe infection unless there is a risk of developing invasive infection (e.g. immunocompromised children, those with haemoglobinopathy, or children under 6 months of age).
- Ciprofloxacin or cefotaxime p. 301

Antibacterial therapy for shigellosis
Antibacterial not indicated for mild cases.
- Azithromycin or ciprofloxacin
- Alternatives if micro-organism sensitive, amoxicillin p. 320 or trimethoprim p. 338

Antibacterial therapy for typhoid fever
Infections from Middle-East, South Asia, and South-East Asia may be multiple-antibacterial-resistant and sensitivity should be tested.
- Cefotaxime (or ceftriaxone p. 302)
  - azithromycin may be an alternative in mild or moderate disease caused by multiple-antibacterial-resistant micro-organisms
- Alternative if micro-organism sensitive, ciprofloxacin or chloramphenicol p. 334

Antibacterial therapy for Clostridium difficile infection
- For first episode of mild to moderate infection, oral metronidazole p. 313
  - Suggested duration of treatment 10–14 days
- For second or subsequent episode of infection, for severe infection, for infection not responding to metronidazole, or in children intolerant of metronidazole, oral vancomycin p. 305
  - Suggested duration of treatment 10–14 days
- For infection not responding to vancomycin, or for life-threatening infection, or in patients with ileus, oral vancomycin + i/v metronidazole
  - Suggested duration of treatment 10–14 days
Genital system infections, bacterial

**Antibacterial therapy for uncomplicated genital chlamydial infection, non-gonococcal urethritis, and non-specific genital infection**

Contact tracing recommended.
- **Child under 12 years**, erythromycin p. 310
  - **Suggested duration of treatment** 14 days
- **Child 12–18 years**, azithromycin p. 308 as a single dose or doxycycline p. 332 for 7 days
  - Alternatively, erythromycin for 14 days

**Antibacterial therapy for gonorrhoea: uncomplicated**

Contact tracing recommended. Consider chlamydia co-infection. Choice of antibacterial depends on locality where infection acquired.
- **Child under 12 years**, single-dose of ceftriaxone p. 302
- **Child 12–18 years**, single-dose of cefixime p. 306
  - Alternatively, if micro-organism sensitive, single-dose of ciprofloxacin p. 328
- **Child 12–18 years with pharyngeal infection**, single-dose of ceftriaxone

**Antibacterial therapy for pelvic inflammatory disease**

Contact tracing recommended.
- **Child 2–12 years**, erythromycin + metronidazole p. 313 + single-dose of i/m ceftriaxone
  - **Suggested duration of treatment** 14 days (except i/m ceftriaxone)
- **Child 12–18 years**, doxycycline + metronidazole + single-dose of i/m ceftriaxone
  - If severely ill, seek specialist advice.
  - **Suggested duration of treatment** 14 days (except i/m ceftriaxone)

**Antibacterial therapy for syphilis**

Contact tracing recommended.
- **Child under 12 years**, benzylpenicillin sodium or procaine benzylpenicillin [unlicensed]
  - **Suggested duration of treatment** 10 days

**Early syphilis (infection of less than 2 years)**

- **Child 12–18 years**, benzathine benzylpenicillin [unlicensed]

**Late latent syphilis (asymptomatic infection of more than 2 years)**

- **Child 12–18 years**, benzathine benzylpenicillin [unlicensed]
  - **Suggested duration of treatment** once weekly for 2 weeks
  - Alternatively, doxycycline
  - **Suggested duration of treatment** 28 days

**Asymptomatic contacts of patients with infectious syphilis**

- **Child 12–18 years**, doxycycline
  - **Suggested duration of treatment** 14 days

**Musculoskeletal system infections, bacterial**

**Antibacterial therapy for osteomyelitis**

Seek specialist advice if chronic infection or prostheses present.
- **Flucloxacillin** p. 325
  - Consider adding fusidic acid p. 336 or rifampicin p. 342 for initial 2 weeks.
  - **Suggested duration of treatment** 6 weeks for acute infection
  - If penicillin-allergic, clindamycin p. 307
  - Consider adding fusidic acid or rifampicin for initial 2 weeks.
  - **Suggested duration of treatment** 6 weeks for acute infection
  - If meticillin-resistant *Staphylococcus aureus* suspected, vancomycin p. 305 (or teicoplanin p. 305)
  - Consider adding fusidic acid or rifampicin for initial 2 weeks.
  - **Suggested duration of treatment** 6 weeks for acute infection

**Antibacterial therapy for septic arthritis**

Seek specialist advice if prostheses present.
- **Flucloxacillin**
  - **Suggested duration of treatment** 4–6 weeks (longer if infection complicated).
  - If penicillin-allergic, clindamycin
  - **Suggested duration of treatment** 4–6 weeks (longer if infection complicated).
  - If meticillin-resistant *Staphylococcus aureus* suspected, vancomycin (or teicoplanin)
  - **Suggested duration of treatment** 4–6 weeks (longer if infection complicated).
  - If gonococcal arthritis or Gram-negative infection suspected, cefotaxime p. 301 (or ceftriaxone p. 302)
  - **Suggested duration of treatment** 4–6 weeks (longer if infection complicated; treat gonococcal infection for 2 weeks).
Nose infections, bacterial

Antibacterial therapy for sinusitis

Antibacterial should usually be used only for persistent symptoms and purulent discharge lasting at least 7 days or if severe symptoms. Also, consider antibacterial for those at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis).

- Amoxicillin p. 320 (or ampicillin p. 321) or clarithromycin p. 309 (or azithromycin p. 308 or erythromycin p. 310)
- Suggested duration of treatment 7 days.
- Consider oral co-amoxiclav p. 323 if no improvement after 48 hours.
- In severe infection, initial parenteral therapy with co-amoxiclav or cefuroxime p. 300 may be required.

Oral bacterial infections

Antibacterial drugs

Antibacterial drugs should only be prescribed for the treatment of oral infections on the basis of defined need. They may be used in conjunction with (but not as an alternative to) other appropriate measures, such as providing drainage or extracting a tooth.

The ‘blind’ prescribing of an antibacterial for unexplained pyrexia, cervical lymphadenopathy, or facial swelling can lead to difficulty in establishing the diagnosis. In severe oral infections, a sample should always be taken for bacteriology.

Infections which may require antibacterial treatment include acute periapical or periodontal abscess, cellulitis, acutely created oral-antral communication (and acute sinusitis), severe pericoronitis, localised osteitis, acute necrotising ulcerative gingivitis, and destructive forms of chronic periodontal disease. Most of these infections are readily resolved by the early establishment of drainage and removal of the cause (typically an infected necrotic pulp). Antibacterials may be required if treatment has to be delayed, in immunocompromised patients, or in those with conditions such as diabetes. Certain rarer infections including bacterial sialadenitis, osteomyelitis, actinomycosis, and infections involving fascial spaces such as Ludwig’s angina, require antibiotics and specialist hospital care.

Antibacterial drugs may also be useful after dental surgery in some cases of spreading infection. Infection may spread to involve local lymph nodes, to fascial spaces (where it can cause airway obstruction), or into the bloodstream (where it can lead to cavernous sinus thrombosis and other serious complications). Extension of an infection can also lead to maxillary sinusitis; osteomyelitis is a complication, which usually arises when host resistance is reduced.

If the oral infection fails to respond to antibacterial treatment within 48 hours the antibacterial should be changed, preferably on the basis of bacteriological investigation. Failure to respond may also suggest an incorrect diagnosis, lack of essential additional measures (such as drainage), poor host resistance, or poor patient compliance.

Combination of a penicillin (or a macrolide) with metronidazole p. 315 may sometimes be helpful for the treatment of severe oral infections or oral infections.

Penicillins

Phenoxymethylpenicillin p. 319 is effective for dentoalveolar abscess.

Broad-spectrum penicillins

Amoxicillin p. 320 is as effective as phenoxymethylpenicillin but is better absorbed; however, it may encourage emergence of resistant organisms.

Like phenoxymethylpenicillin, amoxicillin is ineffective against bacteria that produce beta-lactamases.

- Co-amoxiclav p. 323 is active against beta-lactamase-producing bacteria that are resistant to amoxicillin. Co-amoxiclav may be used for severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial treatment.

Cephalosporins

The cephalosporins offer little advantage over the penicillins in dental infections, often being less active against anaerobes. Infections due to oral streptococci (often termed viridans streptococci) which become resistant to penicillin are usually also resistant to cephalosporins. This is of importance in the case of patients who have had rheumatic fever and are on long-term penicillin therapy. Cefalexin p. 298 and cefradine p. 299 have been used in the treatment of oral infections.

Tetracyclines

In children over 12 years of age, tetracyclines can be effective against oral anaerobes but the development of resistance (especially by oral streptococci) has reduced their usefulness for the treatment of acute oral infections; they may still have a role in the treatment of destructive (refractory) forms of periodontal disease. Doxycycline p. 332 has a longer duration of action than tetracycline p. 334 or oxytetracycline p. 334 and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.

Doxycycline may have a role in the treatment of recurrent aphthous ulceration, or as an adjunct to gingival scaling and root planing for periodontitis.

Macrolides

The macrolides are an alternative for oral infections in penicillin-allergic patients or where a beta-lactamase producing organism is involved. However, many organisms are now resistant to macrolides or rapidly develop resistance; their use should therefore be limited to short courses.

Clindamycin

Clindamycin p. 307 should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin p. 310-resistant bacteria. Clindamycin can be used for the treatment of dentoalveolar abscess that has not responded to penicillin or to metronidazole.

Metronidazole and tinidazole

Metronidazole is an alternative to a penicillin for the treatment of many oral infections where the patient is allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes. It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent’s infection) and pericoronitis; amoxicillin is a suitable alternative. For these purposes metronidazole for 3 days is sufficient, but the duration of treatment may need to be longer in pericoronitis. Tinidazole p. 315 is licensed for the treatment of acute ulcerative gingivitis.
Respiratory system infections, bacterial

Antibacterial therapy for *Haemophilus influenzae* epiglottitis

- Cefotaxime p. 301 (or ceftriaxone p. 302)
- If history of immediate hypersensitivity reaction to penicillin or to cephalosporins, chloramphenicol p. 334

Antibacterial therapy for pneumonia: community-acquired

Children under 2 years with mild symptoms of lower respiratory tract infection (particularly those vaccinated with pneumococcal polysaccharide conjugate vaccine (adsorbed) and *Haemophilus* type b conjugate vaccine) are unlikely to have pneumonia; antibacterial treatment may be considered if symptoms persist.

- Neonate, benzylpenicillin sodium p. 318 + gentamicin p. 293
- Child 1 month–18 years, amoxicillin p. 320 (or ampicillin p. 321) by mouth
- Pneumococci with decreased penicillin sensitivity have been isolated in the UK, but are not common.
  - If no response to treatment, add clarithromycin p. 309 (or azithromycin p. 308 or erythromycin p. 310)
  - If staphylococci suspected (e.g. in influenza or measles), give by mouth amoxicillin + flucloxacillin p. 325 or co-amoxiclav p. 323 alone
  - If septicaemia, complicated pneumonia, or if oral administration not possible, initiate treatment with i/v amoxicillin or i/v co-amoxiclav or i/v cefotaxime p. 300 or i/v cefotaxime (or ceftriaxone)
  - Suggested duration of treatment 7 days (may extend treatment to 14 days in some cases e.g. if staphylococci suspected)
- Child 1 month–18 years, if penicillin-allergic, clarithromycin (or azithromycin or erythromycin)
- Suggested duration of treatment 7 days (may extend treatment to 14 days in some cases e.g. if staphylococci suspected)

Antibacterial therapy for pneumonia possibly caused by atypical pathogens

- Clarithromycin (or azithromycin or erythromycin)
- Suggested duration of treatment 10–14 days
- Alternative for chlamydial or mycoplasma infections in children over 12 years, doxycycline p. 332
- Suggested duration of treatment 10–14 days

Antibacterial therapy for pneumonia: hospital-acquired

- Early-onset infection (less than 5 days after admission to hospital), treat as for severe community-acquired pneumonia of unknown aetiology; if life-threatening infection, or if recent history of antibacterial treatment, or if resistant organisms suspected, treat as for late-onset hospital-acquired pneumonia
- Late-onset infection (more than 5 days after admission to hospital), an antipseudomonal penicillin (e.g. piperacillin with tazobactam p. 317) or another antipseudomonal beta-lactam
  - If meticillin-resistant *Staphylococcus aureus* suspected, add vancomycin p. 305.
  - If severe illness caused by *Pseudomonas aeruginosa*, add an aminoglycoside.
  - Suggested duration of treatment 7 days (longer if *Pseudomonas aeruginosa* confirmed)

Antibacterial therapy for staphylococcal lung infection in cystic fibrosis

- Flucloxacillin
  - If child already taking flucloxacillin prophylaxis or if severe exacerbation, add fusidic acid p. 336 or rifampicin p. 342; use flucloxacillin at treatment dose
  - If penicillin-allergic, clarithromycin (or azithromycin or erythromycin) or clindamycin p. 307
  - Use clarithromycin only if micro-organism sensitive

Antibacterial therapy for *Haemophilus influenzae* lung infection in cystic fibrosis

- Amoxicillin or a broad-spectrum cephalosporin
- In severe exacerbation use a third-generation cephalosporin (e.g. cefotaxime)

Antibacterial therapy for pseudomonal lung infection in cystic fibrosis

- Ciprofloxacin p. 328 + nebulised colistimethate sodium p. 326
- For severe exacerbation, an antipseudomonal beta-lactam antibacterial + parenteral tobramycin p. 294

Skin infections, bacterial

Antibacterial therapy for impetigo: small areas of skin infected

Seek local microbiology advice before using topical treatment in hospital.

- Topical fusidic acid p. 336
  - Suggested duration of treatment 7 days is usually adequate (max. 10 days).
- Alternatively, if meticillin-resistant *Staphylococcus aureus*, topical mupirocin p. 650
  - Suggested duration of treatment 7 days is usually adequate (max. 10 days).

Impetigo: widespread infection

- Oral flucloxacillin p. 325
  - If streptococci suspected in severe infection, add phenoxybenzylpenicillin p. 319
  - Suggested duration of treatment 7 days.
- If penicillin-allergic, oral clarithromycin p. 309 (or azithromycin p. 308 or erythromycin p. 310)
  - Suggested duration of treatment 7 days.

Antibacterial therapy for erysipelas

- Phenoxybenzylpenicillin or benzylpenicillin sodium p. 318
  - If severe infection, replace phenoxybenzylpenicillin or benzylpenicillin sodium with high-dose flucloxacillin
  - Suggested duration of treatment at least 7 days
- If penicillin-allergic, clindamycin p. 307 or clarithromycin (or azithromycin or erythromycin)
  - Suggested duration of treatment at least 7 days.

Antibacterial therapy for cellulitis

- Flucloxacillin (high dose)
  - If streptococcal infection confirmed, replace flucloxacillin with phenoxybenzylpenicillin or benzylpenicillin sodium
  - If Gram-negative bacteria or anaerobes suspected (e.g. facial infection, orbital infection, or infection caused by animal or human bites), use broad-spectrum antibacterials; if periumbilical cellulitis, use flucloxacillin + gentamicin p. 293
If penicillin-allergic, clindamycin or clarithromycin (or azithromycin or erythromycin)
- If Gram-negative bacteria suspected, use broad-spectrum antibacterials.

**Antibacterial therapy for staphylococcal scalded skin syndrome**
- Flucloxacillin
- *Suggested duration of treatment* 7–10 days.
- If penicillin-allergic, clarithromycin (or azithromycin or erythromycin)
- *Suggested duration of treatment* 7–10 days.

**Antibacterial therapy for animal and human bites**
Cleanse wound thoroughly. For tetanus-prone wound, give human tetanus immunoglobulin p. 729 (with a tetanus-containing vaccine if necessary, according to immunisation history and risk of infection). Consider rabies prophylaxis for bites from animals in endemic countries; assess risk of human tetanus immunoglobulin p.
- If penicillin-allergic, clarithromycin (or azithromycin or erythromycin)
- *Suggested duration of treatment* 7–10 days.

**Antibacterial therapy for surgical wound infection**
- Flucloxacillin or co-amoxiclav

**Antibacterial therapy for paronychia or ‘septic spots’ in neonate**
- Flucloxacillin
- If systemically unwell, add an aminoglycoside.

### ANTIBACTERIALS > AMINOGLYCOSIDES

#### Aminoglycosides

**Overview**
These include amikacin p. 292, gentamicin p. 293, neomycin sulfate p. 645, streptomycin p. 293, and tobramycin p. 294. All are bactericidal and active against some Gram-positive and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against *Pseudomonas aeruginosa*; streptomycin is active against *Mycobacterium tuberculosis* and is now almost entirely reserved for tuberculosis.

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections. Gentamicin is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the ‘blind’ therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole p. 313 (or both). Gentamicin is used together with another antibiotic for the treatment of endocarditis. Streptomycin may be used as an alternative in gentamicin-resistant enterococcal endocarditis.

Loading and maintenance doses of gentamicin may be calculated on the basis of the patient’s weight and renal function (e.g. using a nomogram); adjustments are then made according to serum-gentamicin concentrations. High doses are occasionally indicated for serious infections, especially in the neonate, in the patient with cystic fibrosis, or in the immunocompromised patient. Whenever possible treatment should not exceed 7 days.

Amikacin is more stable than gentamicin to enzyme inactivation. Amikacin is used in the treatment of serious infections caused by gentamicin-resistant Gram-negative bacilli.

Tobramycin has similar activity to gentamicin. It is slightly more active against *Ps. aeruginosa* but shows less activity against certain other Gram-negative bacteria..

Neomycin sulfate is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin sulfate may be absorbed from the gut in patients with hepatic failure and, as these patients may also be uraemic, cumulation may occur with resultant ototoxicity.

**Cystic fibrosis**
A higher dose of parenteral aminoglycoside is often required in children with cystic fibrosis because renal clearance of the aminoglycoside is increased. Aminoglycosides have a role in the treatment of pseudomonal lung infections in cystic fibrosis. Tobramycin can be administered by nebuliser or by inhalation of powder on a cyclical basis (28 days of tobramycin followed by a 28-day tobramycin-free interval) for the treatment of chronic pulmonary *Ps. aeruginosa* infection in cystic fibrosis; however, resistance may develop and some patients do not respond to treatment.

**Once daily dosage**
*Once daily administration* of aminoglycosides is more convenient, provides adequate serum concentrations, and has largely superseded *multiple*–*daily dose regimens* (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted. A once-daily, high-dose regimen of an aminoglycoside should be avoided in children with endocarditis or burns of more than 20% of the total body surface area. There is insufficient evidence to recommend a once daily, high-dose regimen of an aminoglycoside in pregnancy.

**Serum concentrations**
Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. Serum-aminoglycoside concentrations should be monitored in patients receiving parenteral aminoglycosides and must be determined in obesity, and in cystic fibrosis, or if high doses are being given, or if there is renal impairment.

**Neonates**
- In neonates As aminoglycosides are eliminated principally via the kidney, neonatal treatment must reflect the changes in glomerular filtration that occur with increasing gestational and postnatal age. The extended interval dose regimen is used in neonates, and serum-aminoglycoside concentrations must be measured. In patients on single daily dose regimens it may become necessary to prolong the dose interval to more than 24 hours if the trough concentration is high.

#### Aminoglycosides (by injection)

- **CONTRA-INDICATIONS** Myasthenia gravis (aminoglycosides may impair neuromuscular transmission)
- **CAUTIONS** Care must be taken with dosage (the main side-effects of the aminoglycosides are dose-related · conditions characterised by muscular weakness (aminoglycosides may impair neuromuscular transmission) · if possible, dehydration should be corrected before starting an aminoglycoside · whenever possible, parenteral treatment should not exceed 7 days
Renal function should be assessed before starting an antibiotic. If possible, aminoglycosides should not be given with potentially ototoxic drugs (e.g. cisplatin). Administration of an aminoglycoside and of an ototoxic diuretic (e.g. furosemide) should be separated by as long a period as practicable.

### Renal Impairment

- **Frequency not known**
- Rare: Antibiotic-associated colitis - electrolyte disturbances - hypocalcaemia - hypokalaemia - hypomagnesaemia on prolonged therapy - nausea - peripheral neuropathy - stomatitis - vomiting
- **Very rare**: Blood disorders - CNS effects - convulsions - exophthalmy - headache

### Side-effects

- **Pregnancy**: There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy. The risk is greatest with streptomycin. The risk is probably very small with gentamicin and tobramycin, but their use should be avoided unless essential.

- **Side-effects**: Further information
  - Nephrotoxicity: Occurs most commonly in children with renal failure.
  - **Pregnancy**: There is a risk of auditory or vestibular nerve damage in the infant when aminoglycosides are used in the second and third trimesters of pregnancy. The risk is greatest with streptomycin. The risk is probably very small with gentamicin and tobramycin, but their use should be avoided unless essential.

- **Side-effects**: Monitoring requirements
  - Serum concentration: Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy.
  - Serum-aminoglycoside concentrations should be measured in all patients receiving parenteral aminoglycosides and must be determined in obesity, if high doses are being given and in cystic fibrosis.

  - In neonates: Serum aminoglycoside concentrations must be determined in neonates.

  - In children with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen.

  - Blood samples should be taken just before the next dose is administered ('trough' concentration). If the pre-dose ('trough') concentration is high, the interval between doses must be decreased. For multiple daily dose regimens, blood samples should also be taken approximately 1 hour after intramuscular or intravenous administration ('peak' concentration). If the post-dose ('peak') concentration is high, the dose must be decreased.

  - Renal function should be assessed before starting an aminoglycoside and during treatment.

  - Auditory and vestibular function should also be monitored during treatment.

### Interactions

- Appendix I (aminoglycosides).

### Medicinal forms

- **Amikacin (as Amikacin sulfate)**: 250 mg per 1 ml Amikacin 500mg/2ml solution for injection vials | 5 vial pack £60.00
- **Amikin (Bristol-Myers Squibb Pharmaceuticals)**: 50 mg per 1 ml Amikin 100mg/2ml solution for injection vials | 5 vial pack £10.33
Gentamicin

### INDICATIONS AND DOSE

- Septicaemia | Meningitis and other CNS infections | Biliary-tract infection | Acute pyelonephritis | Endocarditis | Pneumonia in hospital patients | Adjunct in listerial meningitis

- **BY INTRAVENOUS INFUSION**
  - Child: Initially 7 mg/kg, to be given in a once daily regimen (not suitable for endocarditis or meningitis), subsequent doses adjusted according to serum-gentamicin concentration
  - By intramuscular injection, or by slow intravenous injection
  - Child 1 month-11 years: 2.5 mg/kg every 8 hours, to be given in a multiple daily dose regimen, intravenous injection to be administered over at least 3 minutes
  - Child 12-17 years: 2 mg/kg every 8 hours, to be given in a multiple daily dose regimen, intravenous injection to be administered over at least 3 minutes

- **NEONATAL SEPSIS**
  - By slow intravenous injection, or by intravenous infusion
  - Neonate up to 7 days: 5 mg/kg every 36 hours, to be given in an extended interval dose regimen.
  - Neonate 7 days to 28 days: 5 mg/kg every 24 hours, to be given in an extended interval dose regimen.

- **Pseudomonal lung infection in cystic fibrosis**
  - By slow intravenous injection, or by intravenous infusion
  - Child: 3 mg/kg every 8 hours, to be given in a multiple daily dose regimen, intravenous injection to be administered over at least 3 minutes.

- **Bacterial ventriculitis and CNS infection (supplement to systemic therapy)** (administered on expert advice)
  - By intrathecal injection, or by intraventricular injection
  - Neonate: consult local protocol.
  - Child: Initially 1 mg daily, then increased if necessary to 5 mg daily, seek specialist advice

### DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, use ideal weight for height to calculate dose and monitor serum-gentamicin concentration closely.

### SIDE-EFFECTS

- Uncommon
  - Rash

### MONITORING REQUIREMENTS

- With intravenous use in neonates: Extended interval dose regimen in neonates: pre-dose ('trough') concentration should be less than 2 mg/litre (less than 1 mg/litre if more than 3 doses administered); consider monitoring one hour ('peak') concentration in neonates with poor response to treatment, with oedema, with Gram-negative infection, or with birth-weight greater than 4.5 kg (consider increasing dose if 'peak' concentration less than 8 mg/litre in severe sepsis).

- With intravenous use: Once daily dose regimen: pre-dose ('trough') concentration should be less than 1 mg/litre.

- With intramuscular use or intravenous use: Multiple daily dose regimen: one hour ('peak') serum concentration should be 5–10 mg/litre; pre-dose ('trough') concentration should be less than 2 mg/litre.

Multiple daily dose regimen for endocarditis: one hour ('peak') serum concentration should be 3–5 mg/litre; pre-dose ('trough') concentration should be less than 1 mg/litre. Serum-gentamicin concentration should be determined twice each week (more often in renal impairment).

Multiple daily dose regimen for cystic fibrosis: one hour ('peak') serum concentration should be 8–12 mg/litre; pre-dose ('trough') concentration should be less than 2 mg/litre.

### DIRECTIONS FOR ADMINISTRATION

- With intrathecal or intraventricular use
  - Intrathecal/intraventricular injection: cerebrospinal fluid concentration should not exceed 10 mg/litre.

### MEDICATION FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- Gentamicin (Non-proprietary)
  - Gentamicin (as Gentamicin sulfate) 5 mg per 1 ml: Gentamicin intrathecal 5mg/1ml solution for injection ampoules | 5 ampoule (Pzn) £22.50 (Hospital only)
  - Gentamicin (as Gentamicin sulfate) 10 mg per 1 ml: Gentamicin 20mg/2ml solution for injection ampoules | 5 ampoule (Pzn) £11.25
  - Gentamicin Paediatric 20mg/2ml solution for injection vials | 5 vial (Pzn) £11.25
  - Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml: Gentamicin 80mg/2ml solution for injection vials | 5 vial (Pzn) £20.00
  - Gentamicin 80mg/2ml solution for injection ampoules | 5 ampoule (Pzn) £6.88 | 10 ampoule (Pzn) £10.00

- Cidomycin (Sanofi)
  - Gentamicin (as Gentamicin sulfate) 40 mg per 1 ml: Cidomycin Adult Injectable 80mg/2ml solution for injection vials | 5 vial (Pzn) £6.88
  - Cidomycin Adult Injectable 80mg/2ml solution for injection ampoules | 5 ampoule (Pzn) £6.88

- **Infusion**
  - Gentamicin (Non-proprietary)
    - Gentamicin (as Gentamicin sulfate) 1 mg per 1 ml: Gentamicin 80mg/80ml infusion bags | 20 bag (Pzn) £39.00
    - Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml: Gentamicin 240mg/80ml infusion bags | 20 bag (Pzn) £118.00
    - Gentamicin 360mg/120ml infusion bags | 20 bag (Pzn) £169.00

### Streptomycin

#### INDICATIONS AND DOSE

- Tuberculosis, resistant to other treatment, in combination with other drugs
  - By deep intramuscular injection
  - Child: 15 mg/kg once daily (max. per dose 1 g)

- Adjunct to doxycycline in brucellosis (administered on expert advice)
  - By deep intramuscular injection
  - Child: 5–10 mg/kg every 6 hours, total daily dose may alternatively be given in 2–3 divided doses

### UNLICENSED USE

- Not licensed for use in children.

### IMPORTANT SAFETY INFORMATION

Side-effects increase after a cumulative dose of 100 g, which should only be exceeded in exceptional circumstances.

#### SIDE-EFFECTS

- Common or very common
  - Rash
- Frequency not known
  - Hypersensitivity reactions - paraesthesia of mouth

#### RENAL IMPAIRMENT

Should preferably be avoided. If essential, use with great care and consider dose reduction.
Tobramycin

**INDICATIONS AND DOSE**

**Chronic Pseudomonas aeruginosa infection in patients with cystic fibrosis**
- By inhalation of nebulised solution
- Child 6–17 years: 300 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin nebuliser solution
- By inhalation of powder
  - Child 6–17 years: 112 mg every 12 hours for 28 days, subsequent courses repeated after 28-day interval without tobramycin inhalation powder

**Pseudomonal lung infection in cystic fibrosis**
- By slow intravenous injection
  - Child: 8–10 mg/kg daily in 3 divided doses, to be given as a multiple daily dose regimen over 3–5 minutes
- By intravenous infusion
  - Child: Initially 10 mg/kg once daily (max. per dose 660 mg), to be given over 30 minutes, subsequent doses adjusted according to serum-tobramycin concentration

**Septicaemia, Meningitis and other CNS infections**

**Biliary-tract infection**

**Acute pyelonephritis**

**Pneumonia**

**Acute MI**

**Reduced renal function**

**Emphysema**

**Doses at extremes of body-weight**

**MONITORING REQUIREMENTS**

- One-hour (‘peak’) concentration should be 15–40 mg/litre; pre-dose (‘trough’) concentration should be less than 5 mg/litre (less than 1 mg/litre in renal impairment).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder for solution for injection.

**DOSES AT EXTREMES OF BODY-WEIGHT**

- With intravenous use To avoid excessive dosage in obese patients, use ideal weight for height to calculate parenteral dose and monitor serum-tobramycin concentration closely.

**CAUTIONS**

- When used by inhalation Severe haemoptysis—risk of further haemorrhage

**SIDE-EFFECTS**

- Uncommon
  - With intravenous use Rash
  - Frequency not known
    - When used by inhalation Bronchospasm - cough (more frequent by inhalation of powder) - dysphonia - epistaxis - haemoptysis - laryngitis - mouth ulcers - pharyngitis - salivary hypersecretion - taste disturbances

- With intravenous use in neonates
  - Extended interval dose regimen in neonates: pre-dose (‘trough’) concentration should be less than 2 mg/litre.
  - With intravenous use
    - Once daily dose regimen: pre-dose (‘trough’) concentration should be less than 1 mg/litre.

- With intravenous use
  - Multiple daily dose regimen: one-hour (‘peak’) serum concentration should not exceed 10 mg/litre (8–12 mg/litre in cystic fibrosis); pre-dose (‘trough’) concentration should be less than 2 mg/litre.

- With intravenous use
  - Measure lung function before and after initial dose of tobramycin and monitor for bronchospasm; if bronchospasm occurs in a patient not using a bronchodilator, repeat test using bronchodilator.

- Monitor renal function before treatment and then annually.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use
  - For intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%; give over 20–60 minutes.
  - When used by inhalation Other inhaled drugs should be administered before tobramycin.

**PRESCRIBING AND DISPENSING INFORMATION**

- With intravenous use or when used by inhalation
  - Local guidelines may vary in dosing advice provided.

**PATIENT AND CARER ADVICE**

- When used by inhalation Patient counselling is advised for Tobramycin dry powder for inhalation (administration).

**NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- Tobramycin dry powder inhalation for pseudomonal lung infection in cystic fibrosis (March 2013) NICE TA276

- When used by inhalation Tobramycin dry powder for inhalation is recommended for chronic pulmonary infection caused by *Pseudomonas aeruginosa* in patients with cystic fibrosis only if there is an inadequate response to colistimethate sodium, or if colistimethate sodium cannot be used because of contra-indications or intolerance. The manufacturer must provide tobramycin dry powder for inhalation at the discount agreed as part of the patient access scheme to primary, secondary and tertiary care in the NHS. Patients currently receiving tobramycin dry powder for inhalation can continue treatment until they and their clinician consider it appropriate to stop.

- www.nice.org.uk/TA276

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution.
**ANTIBACTERIALS > CARBAPENEMS**

### Carbapenems

**Overview**

The carbapenems are beta-lactam antibiotics with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; *imipenen* (imipenem with cilastatin below) and meropenem p. 296 have good activity against *Pseudomonas aeruginosa*. The carbapenems are not active against meticillin-resistant *Staphylococcus aureus* and *Enterococcus faecium*.

*Imipenem* (imipenem with cilastatin) and meropenem are used for the treatment of severe hospital-acquired infections and polymicrobial infections caused by multiple-antibacterial resistant organisms (including septicaemia, hospital-acquired pneumonia, intra-abdominal infections, skin and soft-tissue infections, and complicated urinary-tract infections).

Ertapenem below is licensed for treating abdominal and gynaecological infections and for community-acquired pneumonia, but it is not active against atypical respiratory pathogens and it has limited activity against penicillin-resistant pneumococci. Unlike the other carbapenems, ertapenem is not active against *Pseudomonas* or against *Acinetobacter spp.*

*Imipenem* is partially inactivated in the kidney by enzymatic activity and is therefore administered in combination with *cilastatin* (imipenem with cilastatin), a specific enzyme inhibitor, which blocks its renal metabolism. Meropenem and ertapenem are stable to the renal enzyme which inactivates imipenem and therefore can be given without cilastatin.

Side-effects of imipenem with cilastatin are similar to those of other beta-lactam antibiotics. Meropenem has less seizure-inducing potential and can be used to treat central nervous system infection.

### Ertapenem

#### CAUTIONS

- CNS disorders—risk of seizures

#### SIDE-EFFECTS

- Common or very common: Diarrhoea, headache, injection-site reactions, nausea, puritus, raised platelet count, rash (also reported with eosinophilia and systemic symptoms) - vomiting
- Uncommon: Abdominal pain, anorexia, antibiotic-associated colitis, asthenia, bradycardia, chest pain, confusion, constipation, dizziness, dry mouth, dyspepsia, dysphagia, hypotension, melaena, oedema, petechiae, pharyngeal discomfort, raised glucose, seizures, sleep disturbances - taste disturbances
- Rare: Agitation, anxiety, arthralgia, blood disorders - cholecystitis, cough, depression, dysphagia, electrolyte disturbances - haemorrhage, hypoglycaemia, increase in blood pressure - jaundice - liver disorder - muscle cramp - nasal congestion - neutropenia - pelvic peritonitis - renal impairment - scleral disorder - syncope - thrombocytopenia - tremor - wheezing
- Frequency not known: Dyskinesia - hallucinations - muscular weakness

#### ALLERGY AND CROSS-SENSITIVITY

Avoid if history of immediate hypersensitivity reaction to beta-lactam antibiotics.

Use with caution in patients with sensitivity to beta-lactam antibiotics.

#### PREGNANCY

Manufacturer advises avoid unless potential benefit outweighs risk.

#### BREAST FEEDING

Present in milk—manufacturer advises avoid.

#### RENAL IMPAIRMENT

Use with caution (risk of seizures); avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

#### DIRECTIONS FOR ADMINISTRATION

For intravenous infusion *(Invanz®)*, give intermittently in Sodium chloride 0.9%. Reconstitute 1 g with 10 mL Water for injections or Sodium chloride 0.9%; dilute requisite dose in infusion fluid to a final concentration not exceeding 20 mg/mL; give over 30 minutes; incompatible with glucose solutions.

### Imipenem with cilastatin

#### INDICATIONS AND DOSE

- Aerobic and anaerobic Gram-positive and Gram-negative infections (not indicated for CNS infections) - Hospital-acquired septicaemia
- **BY INTRAVENOUS INFUSION**

  - Neonate up to 7 days: 20 mg/kg every 12 hours.
  - Neonate 7 days to 20 days: 20 mg/kg every 8 hours.
  - Neonate 21 days to 28 days: 20 mg/kg every 6 hours.
  - Child 1–2 months: 20 mg/kg every 6 hours
  - Child 3 months–17 years: 15 mg/kg every 6 hours (max. per dose 500 mg)

  continued →
Infection caused by *Pseudomonas* or other less sensitive organisms: Empirical treatment of infection in febrile patients with neutropenia | Life-threatening infection

- **BY INTRAVENOUS INFUSION**
  - Child 3 months–17 years: 25 mg/kg every 6 hours (max. per dose 1 g)

**Cystic fibrosis**

- **BY INTRAVENOUS INFUSION**
  - Child: 25 mg/kg every 6 hours (max. per dose 1 g)

**DOSE EQUILIBRATION AND CONVERSION**

Dose expressed in terms of imipenem.

- **UNLICENSED USE** Not licensed for use in children under 1 year; not licensed for use with children with renal impairment.

- **CAUTIONS** CNS disorders - epilepsy

- **INTERACTIONS** → Appendix 1 (imipenem with cilastatin).

**SIDE-EFFECTS**

- **Common or very common** Diarrhoea - eosinophilia - nausea (may reduce rate of infusion) - rash - vomiting

- **Uncommon** Confusion - dizziness - drowsiness - hallucinations - hypotension - leucopenia - myoclonic activity - seizures - thrombocytopenia - thrombocytosis

- **Rare** Acute renal failure - anaphylactic reactions - antibiotic-associated colitis - encephalopathy - hearing loss - hepatitis - paraesthesia - polyuria - Stevens-Johnson syndrome - taste disturbances - tooth, tongue or urine discolouration - toxic epidermal necrolysis - tremor

- **Frequency not known** Neurotoxicity (at high dose, renal failure, CNS disease)

**ALLERGY AND CROSS-SENSITIVITY** Avoid if history of immediate hypersensitivity reaction to beta-lactam antibacterials.

Use with caution in patients with sensitivity to beta-lactam antibacterials.

**PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in *animal* studies).

**BREAST FEEDING** Present in milk but unlikely to be absorbed.

**RENAI IMPAIRMENT** Reduce dose if estimated glomerular filtration rate less than 70 mL/minute/1.73 m², risk of CNS side-effects.

**EFFECT ON LABORATORY TESTS** Positive Coombs’ test.

**DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* dilute to a concentration of 5 mg (as imipenem)/mL in Sodium chloride 0.9%; give up to 500 mg (as imipenem) over 20–30 minutes, give dose greater than 500 mg (as imipenem) over 40–60 minutes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for infusion**
  - **ELECTROLYTES:** May contain Sodium
    - Imipenem with cilastatin (Non-proprietary)
      - Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as imipenem monohydrate) 500 mg
      - Imipenem 500mg / Cilastatin 500mg powder for solution for infusion vials |
        - 1 vial (£2.00) (£12.00 (Hospital only)) |
        - 5 vial (£10.60) (£60.00 (Hospital only)) |
        - 10 vial (£15.75) (£75.45–£120.00)
      - Primaxin IV (Merck Sharp & Dohme Ltd)
      - Cilastatin (as Cilastatin sodium) 500 mg, Imipenem (as imipenem monohydrate) 500 mg
      - Imipenem 500mg / Cilastatin 500mg powder for solution for infusion vials |
        - 1 vial (£2.00) (£12.00)

**Meropenem**

- **INDICATIONS AND DOSE**
  - **Aerobic and anaerobic Gram-positive and Gram-negative infections | Hospital-acquired sepsicaemia**
    - **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
      - Neonate up to 7 days: 20 mg/kg every 12 hours.
      - Neonate 7 days to 28 days: 20 mg/kg every 8 hours.
      - Child 1 month–11 years (body-weight up to 50 kg): 10–20 mg/kg every 8 hours
      - Child 1 month–11 years (body-weight 50 kg and above): 0.5–1 g every 8 hours
      - Child 12–17 years: 0.5–1 g every 8 hours
  
  **Severe aerobic and anaerobic Gram-positive and Gram-negative infections**
    - **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
      - Neonate up to 7 days: 40 mg/kg every 12 hours.
      - Neonate 7 days to 28 days: 40 mg/kg every 8 hours.
  
  **Exacerbations of chronic lower respiratory-tract infection in cystic fibrosis**
    - **BY INTRAVENOUS INFUSION**
      - Child 1 month–11 years (body-weight up to 50 kg): 40 mg/kg every 8 hours
      - Child 1 month–11 years (body-weight 50 kg and above): 2 g every 8 hours
      - Child 12–17 years: 2 g every 8 hours
  
  **Meningitis**
    - **BY INTRAVENOUS INFUSION**
      - Neonate up to 7 days: 40 mg/kg every 12 hours.
      - Neonate 7 days to 28 days: 40 mg/kg every 8 hours.
      - Child 1 month–11 years (body-weight up to 50 kg): 40 mg/kg every 8 hours
      - Child 1 month–11 years (body-weight 50 kg and above): 2 g every 8 hours
      - Child 12–17 years: 2 g every 8 hours

- **UNLICENSED USE** Not licensed for use in children under 3 months.

- **INTERACTIONS** → Appendix 1 (meropenem).

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - diarrhoea - eosinophilia - nausea (may reduce rate of infusion) - rash - vomiting

- **Uncommon** Confusion - dizziness - drowsiness - hallucinations - hypotension - leucopenia - myoclonic activity - seizures - thrombocytopenia - thrombocytosis

- **Rare** Acute renal failure - anaphylactic reactions - antibiotic-associated colitis - encephalopathy - hearing loss - hepatitis - paraesthesia - polyuria - Stevens-Johnson syndrome - taste disturbances - tooth, tongue or urine discolouration - toxic epidermal necrolysis - tremor

- **Frequency not known** Neurotoxicity (at high dose, renal failure, CNS disease)

**ALLERGY AND CROSS-SENSITIVITY** Avoid if history of immediate hypersensitivity reaction to beta-lactam antibacterials.

Use with caution in patients with sensitivity to beta-lactam antibacterials.

**PREGNANCY** Use only if potential benefit outweighs risk—no information available.

**BREAST FEEDING** Unlikely to be absorbed (however, manufacturer advises avoid).

**HEPATIC IMPAIRMENT**

Monitoring

Monitor liver function in hepatic impairment.
Cefuroxime is an orally active ‘third generation’ cephalosporin. It has a longer duration of action than the other cephalosporins that are active by mouth. It is only licensed for acute infections.

Cefuroxime is a ‘second generation’ cephalosporin that is less susceptible than the earlier cephalosporins to inactivation by beta-lactamases. It is, therefore, active against certain bacteria which are resistant to the other drugs and has greater activity against Haemophilus influenzae.

Cefotaxime, ceftazidime and ceftriaxone are ‘third generation’ cephalosporins with greater activity than the ‘second generation’ cephalosporins against certain Gram-negative bacteria. However, they are less active than cefuroxime against Gram-positive bacteria, most notably Staphylococcus aureus. Their broad antibacterial spectrum may encourage superinfection with resistant bacteria or fungi.

Cefadroxil has a longer half-life and therefore needs to be given only once daily. Indications include serious infections such as septicaemia, pneumonia, and meningitis. The calcium salt of ceftriaxone forms a precipitate in the gall bladder which may rarely cause symptoms but these usually resolve when the antibacterial is stopped. In neonates, ceftriaxone may displace bilirubin from plasma-albumin and should be avoided in neonates with unconjugated hyperbilirubinaemia, hypoalbuminaemia, acidosis or impaired bilirubin binding.

### Cephalosporins

**Overview**

The cephalosporins are broad-spectrum antibiotics which are used for the treatment of septicaemia, pneumonia, meningitis, biliary-tract infections, peritonitis, and urinary-tract infections. The pharmacology of the cephalosporins is similar to that of the penicillins, excretion being principally renal. Cephalosporins penetrate the cerebrospinal fluid poorly unless the meninges are inflamed; cefotaxime p. 301 and ceftriaxone p. 302 are suitable cephalosporins for infections of the CNS (e.g meningitis).

The principal side-effect of the cephalosporins is hypersensitivity about 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. If a cephalosporin is essential in patients with a history of immediate hypersensitivity to penicillin, because a suitable alternative antibacterial is not available, then cefixime p. 300, cefotaxime, ceftazidime p. 301, ceftriaxone, or cefuroxime p. 300 can be used with caution; cefaclor p. 299, cefadroxil p. 298, cefalexin p. 298, and cefradine p. 299 should be avoided.

The orally active ‘first generation’ cephalosporins, cefalexin, cefadroxil, and cefadroxil and the ‘second generation’ cephalosporin, cefaclor have a similar antimicrobial spectrum. They are useful for urinary-tract infections which do not respond to other drugs or which occur in pregnancy, respiratory-tract infections, otitis media, sinusitis, and skin and soft-tissue infections. Cefaclor has good activity against H. influenzae. Cefadroxil has a long duration of action and can be given twice daily; it has poor activity against H. influenzae. Cefuroxime axetil, an ester of the ‘second generation’ cephalosporin cefuroxime, has the same antibacterial spectrum as the parent compound; it is poorly absorbed and needs to be given with food to maximise absorption.
ANTIBACTERIALS > CEPHALOSPORINS, FIRST-GENERATION

Cefadroxil

- INDICATIONS AND DOSE
  Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria
    - BY MOUTH
      - Child 6-17 years (body-weight up to 40 kg): 0.5 g twice daily
      - Child 6-17 years (body-weight 40 kg and above): 0.5–1 g twice daily
  Skin infections | Soft-tissue infections | Uncomplicated urinary-tract infections
    - BY MOUTH
      - Child 6-17 years (body-weight 40 kg and above): 1 g once daily

- PREGNANCY
  Not known to be harmful.

- BREAST FEEDING
  Present in milk in low concentration, but appropriate to use.

- RENAL IMPAIRMENT
  Reduce dose if estimated glomerular filtration rate less than 50 ml/minute/1.73 m².

- MEDICINAL FORMS
  There can be variation in the licensing of different medicines containing the same drug.

- PATIENT AND CARER ADVICE
  Medicines for Children leaflet: Cefalexin for bacterial infections

- PREGNANCY
  Not known to be harmful.

298 Bacterial infection
Cefradine (Cephadrine)

**INDICATIONS AND DOSE**

Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria | Surgical prophylaxis

- **BY MOUTH**
  - Child 7–11 years: 25–50 mg/kg daily in 2–4 divided doses
  - Child 12–17 years: 250–500 mg 4 times a day, alternatively 0.5–1 g twice daily; increased if necessary up to 1 g 4 times a day, increased dose may be used in severe infections

Prevention of *Staphylococcus aureus* lung infection in cystic fibrosis

- **BY MOUTH**
  - Child 5–7 years: 1 g twice daily
  - Child 7–17 years: 2 g twice daily

**UNLICENSED USE**

Not licensed for use in children prevention of *Staphylococcus aureus* lung infection in cystic fibrosis.

**PREGNANCY**

Not known to be harmful.

**BREAST FEEDING**

Present in milk in low concentration, but appropriate to use.

**RENAI IMPAIRMENT**

Reduce dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary

Cefradine Capsules may be prescribed.

Bacterial infection 299
300 Bacterial infection

**Cefuroxime**

**INDICATIONS AND DOSE**

Susceptible infections due to Gram-positive and Gram-negative bacteria

- **BY MOUTH**
  - Child 3 months–1 year: 10 mg/kg twice daily (max. per dose 125 mg)
  - Child 2–11 years: 15 mg/kg twice daily (max. per dose 250 mg)
  - Child 12–17 years: 250 mg twice daily, dose may be doubled in severe lower respiratory-tract infections or if pneumonia is suspected
  - **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION**
    - Neonate up to 7 days: 25 mg/kg every 12 hours, increased if necessary to 50 mg/kg every 12 hours, increased dose used in severe infection.
    - Neonate 7 days to 20 days: 25 mg/kg every 8 hours, increased if necessary to 50 mg/kg every 8 hours, increased dose used in severe infection.
    - Neonate 21 days to 28 days: 25 mg/kg every 6 hours, increased if necessary to 50 mg/kg every 6 hours, increased dose used in severe infection.
  - **BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
    - Child: 20 mg/kg every 8 hours (max. per dose 750 mg); increased to 50–60 mg/kg every 6–8 hours (max. per dose 1.5 g), increased dose used for severe infection and cystic fibrosis

**Lyme disease**

- **BY MOUTH**
  - Child 3 months–11 years: 15 mg/kg twice daily (max. per dose 500 mg) for 14–21 days (for 28 days in Lyme arthritis)
  - Child 12–17 years: 500 mg twice daily for 14–21 days (for 28 days in Lyme arthritis)

**Lower urinary-tract infection**

- **BY MOUTH**
  - Child 12–17 years: 125 mg twice daily

**Surgical prophylaxis**

- **INITIALLY BY INTRAVENOUS INJECTION**
  - Child: 50 mg/kg (max. per dose 1.5 g), to be administered up to 30 minutes before the procedure, then (by intravenous injection or by intramuscular injection) 30 mg/kg every 8 hours (max. per dose 750 mg) if required for up to 3 doses (for high-risk procedures)

**UNLICENSED USE**

- With oral use Not licensed for treatment of Lyme disease in children under 12 years. Duration of treatment in Lyme disease is unlicensed.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT** Reduce parenteral dose if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².
- **DIRECTIONS FOR ADMINISTRATION** Single doses over 750 mg should be administered by the intravenous route only.

**With intravenous use** Displacement value may be significant when reconstituting injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%; give over 30 minutes.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion

  - 50 mg/kg every 6–8 hours.
  - Child: 50 mg/kg every 6 hours; maximum 12 g per day

- **Emergency treatment of suspected bacterial meningitis or meningococcal disease, before urgent transfer to hospital, in patients who cannot be given benzylpenicillin (e.g. because of an allergy)**
  - By intramuscular injection, or by intramuscular injection
  - Child 1 month–11 years: 50 mg/kg for 1 dose
  - Child 12–17 years: 1 g for 1 dose

**SIDE-EFFECTS**

- **Rare** Arthralgia (following rapid injection)
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Present in milk in low concentration, but appropriate to use.
- **RENAL IMPAIRMENT** Usual initial dose, then use half normal dose if estimated glomerular filtration rate less than 5 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use
  - Displacement value may be significant, consult local guidelines. For intermittent intravenous infusion dilute in glucose 5% or sodium chloride 0.9%; administer over 20–60 minutes; incompatible with alkaline solutions.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug.
- **Powder for solution for injection**
  - Cefotaxime (Non-proprietary)
  - Cefotaxime (as Cefotaxime sodium) 500 mg Cefotaxime 500 mg powder for solution for injection vial | 1 vial \( \text{P} \) £1.50 | 10 vial \( \text{P} \) £25.50–£30.00
  - Cefotaxime (as Cefotaxime sodium) 1 gram Cefotaxime 1g powder for solution for injection vials | 1 vial \( \text{P} \) £3.00 | 10 vial \( \text{P} \) £35.00
  - Cefotaxime (as Cefotaxime sodium) 2 gram Cefotaxime 2g powder for solution for injection vials | 1 vial \( \text{P} \) £8.00 | 10 vial \( \text{P} \) £37.50

**Ceftazidime**

**INDICATIONS AND DOSE**

- **Pseudomonal lung infection in cystic fibrosis**
  - By intravenous infusion, or by intravenous injection, or by deep intramuscular injection
  - Child: 50 mg/kg every 8 hours; maximum 9 g per day

- **Febrile neutropenia**
  - By intravenous infusion, or by intravenous injection
  - Child: 50 mg/kg every 8 hours; maximum 6 g per day

- **Meningitis**
  - By intravenous injection, or by intravenous infusion
  - Neonate up to 7 days: 50 mg/kg every 24 hours.

- **Neonate 7 days to 20 days:**
  - 50 mg/kg every 12 hours.

- **Neonate 21 days to 28 days:**
  - 50 mg/kg every 8 hours.
  - Child: 50 mg/kg every 8 hours; maximum 6 g per day

- **Susceptible infections due to sensitive Gram-positive and Gram-negative bacteria**
  - By intravenous injection, or by intravenous infusion
  - Neonate up to 7 days: 25 mg/kg every 24 hours.

- **Neonate 7 days to 20 days:**
  - 25 mg/kg every 12 hours.

- **Neonate 21 days to 28 days:**
  - 25 mg/kg every 8 hours.
  - Child: 25 mg/kg every 8 hours; maximum 6 g per day

- **Severe susceptible infections due to sensitive Gram-positive and Gram-negative bacteria**
  - By intravenous injection, or by intravenous infusion
  - Neonate up to 7 days: 25 mg/kg every 12 hours.

- **Neonate 7 days to 20 days:**
  - 25 mg/kg every 12 hours.

- **Neonate 21 days to 28 days:**
  - 25 mg/kg every 8 hours.
  - Child: 25 mg/kg every 8 hours; maximum 6 g per day

- **Chronic Burholderia cepacia infection in cystic fibrosis**
  - By inhalation of nebulised solution
  - Child: 1 g twice daily
Infection

With intravenous use Displacement value may be significant, consult local guidelines. For intermittent intravenous infusion dilute reconstituted solution further to a concentration of not more than 40 mg/ml in Glucose 5% or Glucose 10% or Sodium chloride 0.9%; give over 20–30 minutes.

When used by inhalation For nebulisation, dissolve dose in 3 mL of water for injection.

**MEDICINAL FORMS**

**297**

- **Ceftaxione**

**INDICATIONS AND DOSE**

Community-acquired pneumonia | Hospital-acquired pneumonia | Intra-abdominal infections | Complicated urinary-tract infections

- **BY INTRAVENOUS INFUSION**

- **Neonate up to 15 days**: 20–50 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.

- **Neonate 15 days to 28 days**: 50–80 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.

- **Child 1 month–11 years (body-weight up to 50 kg)**: 50–80 mg/kg once daily, doses at the higher end of the recommended range used in severe cases; maximum 4 g per day

- **Child 9–11 years (body-weight 50 kg and above)**: 1–2 g once daily, 2 g dose to be used for hospital-acquired pneumonia and severe cases

- **Child 12–17 years**: 1–2 g once daily, 2 g dose to be used for hospital-acquired pneumonia and severe cases

- **Ceftazidime (as Ceftazidime pentahydrate) 500 mg**
  - Ceftazidime 500mg powder for solution for injection vials | 1 vial (£9.70)

- **Neonate up to 15 days**: 20–50 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.

- **Neonate 15 days to 28 days**: 50–100 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.

- **Child 11 years (body-weight 50 kg and above)**: 1–2 g once daily, 2 g dose to be used for hospital-acquired pneumonia and severe cases

- **Child 12–17 years**: 1–2 g once daily, 2 g dose to be used for hospital-acquired pneumonia and severe cases

- **Complicated skin and soft tissue infections | Infections of bones and joints**

- **BY INTRAVENOUS INFUSION**

- **Neonate up to 15 days**: 20–50 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.

- **Neonate 15 days to 28 days**: 50–100 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.

- **Child 1 month–11 years (body-weight up to 50 kg)**: 50–100 mg/kg once daily, doses at the higher end of the recommended range used in severe cases; maximum 4 g per day

- **Child 9–11 years (body-weight 50 kg and above)**: 2 g once daily

- **Child 12–17 years**: 2 g once daily

- **BY INTRAVENOUS INFUSION**

- **Neonate up to 15 days**: 20–50 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.

- **Neonate 15 days to 28 days**: 50–100 mg/kg once daily, doses at the higher end of the recommended range used in severe cases.

- **Child 1 month–11 years (body-weight up to 50 kg)**: 50–100 mg/kg once daily, doses at the higher end of the recommended range used in severe cases; maximum 4 g per day

- **Child 9–11 years (body-weight 50 kg and above)**: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases

- **Child 12–17 years**: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases
Bacterial meningitis  
| Neonate up to 15 days: 50 mg/kg once daily. |
| Neonate 15 days to 28 days: 80–100 mg/kg once daily, 100 mg/kg once daily dose should be used for bacterial endocarditis. |
| Child 1 month–11 years (body-weight up to 50 kg): 80–100 mg/kg once daily, 100 mg/kg once daily dose should be used for bacterial endocarditis; maximum 4 g per day |
| Child 9–11 years (body-weight 50 kg and above): 2–4 g once daily, doses at the higher end of the recommended range used in severe cases |
| Child 12–17 years: 2–4 g once daily, doses at the higher end of the recommended range used in severe cases |
| Neonate 15–100 mg/kg once daily for 10–14 days. |

**Syphilis**

| Neonate up to 15 days: 50 mg/kg once daily for 10–14 days. |
| Child 1 month–11 years (body-weight up to 50 kg): 75–100 mg/kg once daily for 10–14 days; maximum 4 g per day |
| Child 9–11 years (body-weight 50 kg and above): 0.5–1 g once daily for 10–14 days, dose can be increased to 2 g once daily for neurosyphilis |
| Child 12–17 years: 0.5–1 g once daily for 10–14 days, dose can be increased to 2 g once daily for neurosyphilis |

**Surgical prophylaxis**

| Neonate up to 15 days: 20–50 mg/kg for 1 dose, dose to be administered 30–90 minutes before procedure. |
| Neonate 15 days to 28 days: 50–80 mg/kg for 1 dose, dose to be administered 30–90 minutes before procedure. |
| Child 1 month–11 years (body-weight up to 50 kg): 50–80 mg/kg for 1 dose, dose to be administered 30–90 minutes before procedure; maximum 4 g per day |
| Child 9–11 years (body-weight 50 kg and above): 2 g for 1 dose, dose to be administered 30–90 minutes before procedure |
| Child 12–17 years: 2 g for 1 dose, dose to be administered 30–90 minutes before procedure |
| Child 12–17 years: 2 g for 1 dose, dose to be administered 30–90 minutes before procedure |
| Child 12–17 years: 2 g for 1 dose, dose to be administered 30–90 minutes before procedure |

**Disseminated Lyme borreliosis (early [Stage II] and late [Stage III])**

| Neonate 15 days to 28 days: 50–80 mg/kg once daily for 14–21 days, the recommended treatment durations vary and national or local guidelines should be taken into consideration. |

**Uncomplicated gonorrhoea**

| Child 1 month–11 years (body-weight up to 45 kg): 125 mg for 1 dose |
| Child 9–11 years (body-weight 45 kg and above): 250 mg for 1 dose |
| Child 12–17 years: 500 mg for 1 dose |

**Pelvic inflammatory disease**

| Child 1 month–11 years (body-weight up to 45 kg): 125 mg for 1 dose |
| Child 9–11 years (body-weight 45 kg and above): 250 mg for 1 dose |

---

**BNFC 2016–2017**

**Bacterial infection 303**

- **INFECTION**
- **Bacterial meningitis**
- **Endocarditis**
- **Syphilis**
- **Surgical prophylaxis**
- **Disseminated Lyme borreliosis**
- **Uncomplicated gonorrhoea**
- **Pelvic inflammatory disease**

---

**Notes:**

- Recommended treatment durations vary and national or local guidelines should be taken into consideration.
- For severe cases, doses at the higher end of the recommended range should be used.
- Doses can be increased to 2 g once daily for neurosyphilis.
- Recommended treatment durations vary and national or local guidelines should be taken into consideration.
CONTRA-INDICATIONS
Concomitant treatment with intravenous calcium (including total parenteral nutrition containing calcium) in neonates over 41 weeks corrected gestational age—risk of precipitation in urine and lungs—neonates less than 41 weeks corrected gestational age—neonates over 41 weeks corrected gestational age with jaundice, hypoalbuminaemia, acidosis, unconjugated hyperbilirubinaemia, or impaired bilirubin binding

CAUTIONS
History of hypercalciuria - history of kidney stones - use with caution in neonates

SIDE-EFFECTS
Common or very common Calcium ceftriaxone precipitates in gall bladder—consider discontinuation if symptomatic - calcium ceftriaxone precipitates in urine (particularly in very young, dehydrated or those who are immobilised)—consider discontinuation if symptomatic

Rare Pancreatitis - prolongation of prothrombin time

PREGNANCY
Not known to be harmful.

BREAST FEEDING
Present in milk in low concentration, but appropriate to use.

HEPATIC IMPAIRMENT
Reduce dose if both hepatic and severe renal impairment. Monitor plasma concentration if both hepatic and severe renal impairment.

RENAL IMPAIRMENT
Max. 50 mg/kg daily (max. 2 g daily) in severe renal impairment. Use with caution in renal failure. Monitor plasma concentration if both hepatic and severe renal impairment.

DIRECTIONS FOR ADMINISTRATION
- With intravenous use For intravenous infusion (preferred route), dilute reconstituted solution with Glucose 5% (or 10% in neonates) or Sodium Chloride 0.9%; give over at least 30 minutes (60 minutes in neonates—may displace bilirubin from serum albumin). Not to be given simultaneously with parenteral nutrition or infusion fluids containing calcium, even by different infusion lines; in children, may be infused sequentially with infusion fluids containing calcium if flush with sodium chloride 0.9% between infusions or give infusions by different infusion lines at different sites. Displacement value may be significant, consult local guidelines.
- For intravenous injection, give over 5 minutes; intravenous doses of 50 mg/kg or more in children under 12 years should be given by infusion.
- With intramuscular use or intravenous use Twice daily dosing may be considered for doses greater than 2 g daily.
- With intramuscular use For intramuscular injection, may be mixed with 1% Lidocaine Hydrochloride Injection to reduce pain at intramuscular injection site. Intramuscular injection should only be considered when the intravenous route is not possible or less appropriate. If administered by intramuscular injection, the lower end of the dose range should be used for the shortest time possible; volume depends on the age and size of the child, but doses over 1 g must be divided between more than one site. The maximum intramuscular dose is 2 g, doses greater than 2 g must be given by intravenous infusion or intravenous injection (see above). Displacement value may be significant, consult local guidelines.

MEDI CAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

Powder for solution for injection
ELECTROLYTES: May contain Sodium

Ceftriaxone (as Ceftriaxone sodium) 250 mg
Ceftriaxone 250mg powder for solution for injection vials | 1 vial | £1.80-£2.30 DT price = £2.40

  - Child 1 month–11 years: 50 mg/kg daily (max. per dose 1 g) for 2 days
  - By Intramuscular Injection, or By Intravenous Injection
  - Child 12–17 years: 1 g daily for 2 days

Acute Otitis Media
- Child 1 month
  - 25–50 mg/kg (max. per dose 125 mg) for 1 dose, intravenous infusion to be administered over 60 minutes.
Teicoplanin

- **DRUG ACTION** The glycopeptide antibiotic teicoplanin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides and increasing reports of glycopeptide-resistant enterococci. Teicoplanin is similar to vancomycin, but has a significantly longer duration of action, allowing once daily administration after the loading dose.

- **INDICATIONS AND DOSE**
  - **Surgical prophylaxis**
    - Child: (consult local protocol)
  - Potentially serious Gram-positive infections including endocarditis, and serious infections due to *Staphylococcus aureus*
    - Initially by intravenous injection, or by intravenous infusion

- **Neonate**: Initially 16 mg/kg for 1 dose, followed by (by intravenous infusion) 8 mg/kg once daily, subsequent dose to be administered 24 hours after initial dose.
- **Child**: Initially 10 mg/kg every 12 hours (max. per dose 400 mg) for 3 doses, then (by intravenous injection or by intravenous infusion or by intramuscular injection) 6 mg/kg once daily (max. per dose 400 mg). (After initial 3 doses subsequent doses can be given by intramuscular route, if necessary, although, intravenous route is preferable).
- **Severe Gram-positive infections (including burns, septicaemia, septic arthritis and osteomyelitis)**
  - By intravenous injection, or by intravenous infusion
  - Child: Initially 10 mg/kg every 12 hours for 3 doses, then 10 mg/kg once daily

**PHARMACOKINETICS**
Teicoplanin should not be given by mouth for systemic infections because it is not absorbed significantly.

- **UNLICENSED USE** Not licensed for surgical prophylaxis.
- **INTERACTIONS** → Appendix 1 (teicoplanin).

If other nephrotoxic or neurotoxic drugs given, monitor renal and auditory function on prolonged administration.

- **SIDE-EFFECTS**
  - **Common or very common** Pruritus - rash
  - **Frequency not known** Exfoliative dermatitis - nephrotoxicity - renal failure - Stevens-Johnson syndrome - toxic epidermal necrolysis

**SIDE-EFFECTS, FURTHER INFORMATION**
Nephrotoxicity Teicoplanin is associated with a lower incidence of nephrotoxicity than vancomycin.

- **ALLERGY AND CROSS-SENSITIVITY** Caution if history of vancomycin sensitivity.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREASTFEEDING** No information available.

- **RENAL IMPAIRMENT** Use normal dose regimen on days 1–4, then use normal maintenance dose every 48 hours if estimated glomerular filtration rate 30–80 mL/minute/1.73 m² and use normal maintenance dose every 72 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m². Plasma-teicoplanin concentration should be monitored during parenteral maintenance treatment. Also monitor renal and auditory function during prolonged treatment in renal impairment.

- **MONITORING REQUIREMENTS**
  - With intramuscular use or intravenous use Plasma-teicoplanin concentration is not measured routinely because a relationship between plasma concentration and toxicity has not been established. However, the plasma-teicoplanin concentration can be used to optimise parenteral treatment in severe sepsis or burns, deep-seated staphylococcal infection (including bone and joint infection), endocarditis and in intravenous drug abusers. Pre-dose (‘trough’): concentrations should be greater than 15 mg/litre (greater than 20 mg/litre in endocarditis or deep-seated infection such as bone and joint infection), but less than 60 mg/litre.
  - Blood counts and liver and kidney function tests required.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For intermittent intravenous infusion, dilute reconstituted solution further in sodium chloride 0.9% or glucose 5%; give over 30 minutes. Intermittent intravenous infusion preferred in neonates.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

- **Powder and solvent for solution for injection**
  - **ELECTROLYTES**: May contain Sodium
    - Targocid (Sanofi) ▼
      - Teicoplanin 200 mg Targocid 200mg powder and solvent for solution for injection vials | 1 vial (£9.33)
      - Teicoplanin 400 mg Targocid 400mg powder and solvent for solution for injection vials | 1 vial (£7.32)

**Vancomycin**

- **DRUG ACTION** The glycopeptide antibiotic vancomycin has bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci. Penetration into cerebrospinal fluid is poor.

- **INDICATIONS AND DOSE**
  - **Clostridium difficile infection**
    - **BY MOUTH**
      - Child 1 month–4 years: 5 mg/kg 4 times a day for 10–14 days, dose may be increased if infection fails to respond or is life-threatening, increased if necessary up to 10 mg/kg 4 times a day
      - Child 5–11 years: 62.5 mg 4 times a day for 10–14 days, dose may be increased if infection fails to respond or is life-threatening, increased if necessary up to 250 mg 4 times a day
      - Child 12–17 years: 125 mg 4 times a day for 10–14 days, dose may be increased if infection fails to respond or is life-threatening, increased if necessary up to 500 mg 4 times a day
  - **Infections due to Gram-positive bacteria including endocarditis, osteomyelitis, septicemia and soft-tissue infections**
    - **BY INTRAVENOUS INFUSION**
      - Neonate up to 29 weeks corrected gestational age: 15 mg/kg every 24 hours adjusted according to plasma-concentration monitoring.
      - Neonate 29 weeks to 35 weeks corrected gestational age: 15 mg/kg every 12 hours adjusted according to plasma-concentration monitoring. continued →
306 Bacterial infection

**Neonate** 35 weeks corrected gestational age and above: 15 mg/kg every 8 hours adjusted according to plasma-concentration monitoring.

- **Child:** 15 mg/kg every 8 hours adjusted according to plasma-concentration monitoring; maximum 2 g per day

**Surgical prophylaxis (when high risk of MRSA)**
- **By intravenous infusion**
- **Child:** consult local protocol

**CNS infection e.g. ventriculitis (administered on expert advice)**
- **By intraventricular administration**

**Neonate:** 10 mg every 24 hours.

- **Child:** 10 mg every 24 hours, for all children reduce to 5 mg daily if ventricular size reduced or increase to 15–20 mg once daily if ventricular size increased, adjust dose according to CSF concentration after 3–4 days; aim for pre-dose (‘trough’) concentration less than 10 mg/litre. If CSF not draining free reduce dose frequency to once every 2–3 days

**Peritonitis associated with peritoneal dialysis**
- **By intraperitoneal administration**
- **Child:** Add to each bag of dialysis fluid to achieve a concentration of 20–25 mg/litre

**Eradication of meticillin-resistant *Staphylococcus aureus* from the respiratory tract in cystic fibrosis**
- **By inhalation of nebulised solution**
- **Child:** 4 mg/kg twice daily (max. per dose 250 mg) for 5 days, alternatively 4 mg/kg 4 times a day (max. per dose 250 mg) for 5 days

**PHARMACOKINETICS**
Vancomycin should not be given by mouth for systemic infections because it is not absorbed significantly.

**UNLICENSED USE** Vancomycin doses in BNF publications may differ from those in product literature. Use of vancomycin (added to dialysis fluid) for the treatment of peritonitis associated with peritoneal dialysis is an unlicensed route.

Not licensed for intravenous use or inhalation.

Not licensed for use by the intrathecal route for the treatment of meningitis.

**IMPORTANT SAFETY INFORMATION**
**SAFE PRACTICE**
For intraventricular administration, seek specialist advice.

**CAUTIONS**
**GENERAL CAUTIONS**
Avoid if history of deafness

**SPECIFIC CAUTIONS**
- With oral use Systemic absorption may follow oral administration especially in inflammatory bowel disorders or following multiple doses

**INTERACTIONS** Appendix 1 (vancomycin).

**SIDE-EFFECTS**
- Common or very common
  - With intravenous use Blood disorders, including neutropenia (usually after 1 week or high cumulative dose) - interstitial nephritis - nephrotoxicity - ototoxicity (discontinue if tinnitus occurs) - renal failure
  - Rare
    - With intravenous use Agranulocytosis - thrombocytopenia
  - Frequency not known
    - With intravenous use Anaphylaxis - cardiac arrest on rapid infusion - chills - dyspnoea - eosinophilia - exfoliative dermatitis - fever - flushing of the upper body (‘red man’ syndrome) - nausea - pain and muscle spasm of back and chest - phlebitis (irritant to tissue) - pruritus - rashes - severe hypotension on rapid infusion - shock on rapid infusion - Stevens-Johnson syndrome - toxic epidermal necrolysis - urticaria - vasculitis - wheezing

**SIDE-EFFECTS, FURTHER INFORMATION**
- Nephrotoxicity Vancomycin is associated with a higher incidence of nephrotoxicity than teicoplanin.
- **ALLERGY AND CROSS-SENSITIVITY** Caution if teicoplanin sensitivity.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

Plasma-vancomycin concentration monitoring essential to reduce risk of fetal toxicity.

**BREAST FEEDING** Present in milk—significant absorption following oral administration unlikely.

**RENAI IMPAIRMENT** Reduce dose. In renal impairment monitor plasma-vancomycin concentration and renal function regularly. Also monitor auditory function.

**MONITORING REQUIREMENTS**
- All patients require plasma-vancomycin measurement (after 3 or 4 doses if renal function normal, earlier if renal impairment).
- All patients require blood counts, urinalysis, and renal function tests.
- With intravenous use Pre-dose (‘trough’) concentration should be 10–15 mg/litre (15–20 mg/litre for less sensitive strains of meticillin-resistant *Staphylococcus aureus*)
- With intraventricular use Aim for pre-dose (‘trough’) concentration less than 10 mg/litre.
- When used by inhalation Measure lung function before and after initial dose of vancomycin and monitor for bronchospasm.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use Avoid rapid infusion (risk of anaphylactoid reactions) and rotate infusion sites. Displacement value may be significant, consult product literature and local guidelines. For intermittent intravenous infusion, the reconstituted preparation should be further diluted in sodium chloride 0.9% or glucose 5% to a concentration of up to 5 mg/ml; give over at least 60 minutes (rate not to exceed 10 mg/minute for doses over 500 mg); use continuous infusion only if intermittent not available (limited evidence); 10 mg/ml can be used if infused via a central venous line over at least 1 hour.
- With oral use Injection can be used to prepare solution for oral administration; flavouring syrups may be added to the solution at the time of administration.
- When used by inhalation For nebulisation administer required dose in 4 ml of sodium chloride 0.9% (or water for injections). Administer inhaled bronchodilator before vancomycin.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, pastille, solution for injection, infusion

**Capsule**

**CAUTIONARY AND ADVISORY LABELS**

- Vancomycin (as Vancomycin hydrochloride) 125 mg Vancomycin 125mg capsules | 28 capsule [Rs] ₹132.47 DT price = ₹132.47
- Vancomycin (as Vancomycin hydrochloride) 250 mg Vancomycin 250mg capsules | 28 capsule [Rs] ₹140.08 DT price = ₹140.08
- Vancomycin Matrigel (Flynn Pharma Ltd)
- Vancomycin (as Vancomycin hydrochloride) 125 mg Vancomycin Matrigel 125mg capsules | 28 capsule [Rs] ₹188.31 DT price = ₹132.47

**Vancomycin (Non-proprietary)**
Bacterial infection

ANTIBACTERIALS

Clindamycin

- **DRUG ACTION**
  - With systemic use Clindamycin is active against Gram-positive cocci, including streptococci and penicillin-resistant staphylococci, and also against many anaerobes, especially *Bacteroides fragilis*. It is well concentrated in bone and excreted in bile and urine.

- **INDICATIONS AND DOSE**
  - **Staphylococcal bone and joint infections such as osteomyelitis | Peritonitis | intra-abdominal sepsis | Metillin-resistant *Staphylococcus aureus* (MRSA) in bronchiectasis, bone and joint infections, and skin and soft-tissue infections | Erysipelas or cellulitis in penicillin-allergic patients (alternative to macrolides)**
    - **BY MOUTH**
      - Neonate up to 14 days: 3–6 mg/kg 3 times a day.
      - Neonate 14 days to 28 days: 3–6 mg/kg 4 times a day.
      - Child: 3–6 mg/kg 4 times a day (max. per dose 450 mg)
      - **BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION**
        - Child: 3.75–6.25 mg/kg 4 times a day; increased if necessary up to 10 mg/kg 4 times a day (max. per dose 1.2 g), increased dose used for severe infections, total daily dose may alternatively be given in 3 divided doses, single doses above 600 mg to be administered by intravenous infusion only, single doses by intravenous infusion not to exceed 1.2 g
  - **Staphylococcal lung infection in cystic fibrosis**
    - **BY MOUTH**
      - Child: 5–7 mg/kg 4 times a day (max. per dose 600 mg)
    - Treatment of falciparum malaria (to be given with or following quinine)
      - **BY MOUTH**
        - Child: 7–13 mg/kg every 8 hours (max. per dose 450 mg) for 7 days
  - **UNLICENSED USE** Not licensed for treatment of falciparum malaria.
  - **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates | diarrhoeal states
  - **CAUTIONS** Avoid in Acute porphyrias p. 562
  - **INTERACTIONS** → Appendix 1 (clindamycin).
  - **SIDE-EFFECTS**
    - With intramuscular use Abscess | induration | pain
    - With intravenous use Thrombophlebitis
    - With systemic use Abdominal discomfort | anaphylactoid reactions | antibiotic-associated colitis | diarrhoea (discontinue treatment) | eosinophilia | exfoliative dermatitis | jaundice | leukopenia | nausea | oesophageal ulcers | oesophagitis | polyarthritis | pruritus | rash

- **CONTRA-INDICATIONS**

- **INTERACTIONS**

- **SIDE-EFFECTS**

- **UNLICENSED USE**

- **REFERENCES**

- **PRIORITY INFORMATION**

Stevens-Johnson syndrome | taste disturbances | thrombocytopenia | toxic epidermal necrolysis | urticaria | vesiculobullous dermatitis | vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Antibiotic-associated colitis** Clindamycin has been associated with antibiotic-associated colitis, which may be fatal.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Amount probably too small to be harmful but bloody diarrhoea reported in 1 infant.

- **MONITORING REQUIREMENTS**
  - Monitor liver and renal function if treatment exceeds 10 days.
  - Monitor liver and renal function in neonates and infants.

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use Avoid rapid intravenous administration.
  - With intravenous use For *intravenous infusion*, dilute to a concentration of not more than 18 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 10–60 minutes at a max. rate of 20 mg/kg/hour.

- **PATIENT AND CARER ADVICE** Capsules should be swallowed with a glass of water. Patients and their carers should be advised to discontinue immediately and contact doctor if diarrhoea develops.

- **PROFESSION SPECIFIC INFORMATION**

  - Dental practitioners’ formulary
  - Clindamycin capsules may be prescribed.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

- **Capsule**
  - **Clindamycin (Non-proprietary)**
    - Clindamycin (as Clindamycin hydrochloride) 150 mg
      - Clindamycin 150mg capsules | 24 capsule [POT] £48.00 DT price = £12.00 | 100 capsule [POT] £60.00
    - Clindamycin (as Clindamycin hydrochloride) 300 mg
      - Clindamycin 300mg capsules | 30 capsule [POT] £38.96 DT price = £37.46
    - [Dalacin C (Pfizer Ltd)]
      - Clindamycin (as Clindamycin hydrochloride) 75 mg
        - Dalacin C 75mg capsules | 24 capsule [POT] £7.45 DT price = £7.45
      - Clindamycin (as Clindamycin hydrochloride) 150 mg
        - Dalacin C 150mg capsules | 24 capsule [POT] £13.72 DT price = £12.00 | 100 capsule [POT] £55.08
    - **Solution for injection**
      - **EXCIPENTS**: May contain Benzyl alcohol
        - Clindamycin (Non-proprietary)
          - Clindamycin (as Clindamycin phosphate) 150 mg per 1 ml
            - Clindamycin 600mg/4ml solution for injection ampoules | 1 ml Clindamycin 600mg/4ml solution for injection ampoules | 5 ampoule [POT] £61.75
          - Clindamycin 300mg/2ml solution for injection ampoules | 5 ampoule [POT] £28.50–£31.01
        - [Dalacin C (Pfizer Ltd)]
          - Clindamycin (as Clindamycin phosphate) 150 mg per 1 ml
            - Dalacin C Phosphate 300mg/2ml solution for injection ampoules | 1 ml Dalacin C Phosphate 300mg/2ml solution for injection ampoules | 5 ampoule [POT] £31.01
            - Dalacin C Phosphate 600mg/4ml solution for injection ampoules | 5 ampoule [POT] £61.75

**ANTIBACTERIALS > MACROLIDES**

**Macrolides**

**Overview**

The macrolides have an antibacterial spectrum that is similar but not identical to that of penicillin; they are thus an alternative in penicillin-allergic patients. They are active
against many penicillin-resistant staphylococci, but some are now also resistant to the macrolides. Indications for the macrolides include campylobacter enteritis, respiratory infections (including pneumonia, whooping cough, legionella, chlamydia, and mycoplasma infection), and skin infections.

Erythromycin p. 310 is also used in the treatment of early syphilis, uncomplicated genital chlamydial infection, and non-gonococcal urethritis. Erythromycin has poor activity against Haemophilus influenzae. Erythromycin causes nausea, vomiting, and diarrhoea in some patients; in mild to moderate infections this can be avoided by giving a lower dose or the total dose in 4 divided doses, but if a more serious infection, such as legionella pneumonia, is suspected higher doses are needed.

Azithromycin below is a macrolide with slightly less activity than erythromycin against gram-positive bacteria, but predisposition activity against some gram-negative organisms including H. influenzae. Plasma concentrations are very low, but tissue concentrations are much higher. It has a long tissue half-life and once daily dosing is recommended. Azithromycin is also used in the treatment of uncomplicated genital chlamydial infection, non-gonococcal urethritis, typhoid [unlicensed indication], and trachoma [unlicensed indication].

Clarithromycin p. 309 is an erythromycin derivative with slightly greater activity than the parent compound. Tissue concentrations are higher than with erythromycin. It is given twice daily. Clarithromycin is also used in regimens for Helicobacter pylori eradication.

Erythromycin, azithromycin, and clarithromycin have a role in the treatment of Lyme disease p. 339. Spiramycin is also a macrolide which is used for the treatment of toxoplasmosis.

**Macrolides**

**Side-effects, Further Information**

- With intravenous use or oral use Gastro-intestinal side-effects are mild and less frequent with azithromycin and clarithromycin than with erythromycin.

**Azithromycin**

**Indications and Dose**

Prevention of secondary case of invasive group A streptococcal infection in patients who are allergic to penicillin
- **By mouth**
  - Child 6 months-11 years: 12 mg/kg once daily (max. per dose 500 mg) for 5 days
  - Child 12-17 years: 500 mg once daily for 5 days

Respiratory-tract infections, otitis media, skin and soft-tissue infections
- **By mouth**
  - Child 6 months-17 years: 10 mg/kg once daily (max. per dose 500 mg) for 3 days
  - Child 6 months-17 years (body-weight 15-25 kg): 200 mg once daily for 3 days
  - Child 6 months-17 years (body-weight 26-35 kg): 300 mg once daily for 3 days
  - Child 6 months-17 years (body-weight 36-45 kg): 400 mg once daily for 3 days
  - Child 6 months-17 years (body-weight 46 kg and above): 500 mg once daily for 3 days

Infection in cystic fibrosis
- **By mouth**
  - Child 6 months-17 years: 10 mg/kg once daily (max. per dose 500 mg) for 3 days, repeated after 1 week to complete course, treatment may be repeated as necessary

Chronic Pseudomonas aeruginosa infection in cystic fibrosis
- **By mouth**
  - Child 6-17 years (body-weight 25-40 kg): 250 mg 3 times a week
  - Child 6-17 years (body-weight 41 kg and above): 500 mg 3 times a week

Uncomplicated genital chlamydial infections | Non-gonococcal urethritis
- **By mouth**
  - Child 12-17 years: 1 g for 1 dose

Lyme disease (under expert supervision)
- **By mouth**
  - Child 6 months-17 years: 10 mg/kg once daily (max. per dose 500 mg) for 7–10 days

Mild to moderate typhoid due to multiple-antibacterial resistant organisms
- **By mouth**
  - Child 6 months-17 years: 10 mg/kg once daily (max. per dose 500 mg) for 7 days

**Unlicensed Use** Not licensed for typhoid fever, Lyme disease, chronic Pseudomonas aeruginosa infection in cystic fibrosis, or prophylaxis of group A streptococcal infection.

**Interactions** Appendix 1 (macrolides). Caution with concomitant use of drugs that prolong the QT interval.
PATIENT AND CARER ADVICE

RENAL IMPAIRMENT

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 5, 9

Azithromycin (Non-proprietary)

- Azithromycin 250 mg: Azithromycin 250mg tablets | 4 tablet [POM] £10.11 DT price = £1.38 | 6 tablet [POM] £14.46
- Azithromycin 500 mg: Azithromycin 500mg tablets | 3 tablet [POM] £9.80 DT price = £1.34

Capsule

CAUTIONARY AND ADVISORY LABELS 5, 9, 23

Azithromycin (Non-proprietary)

- Azithromycin (as Azithromycin dihydrate) 250 mg: Azithromycin 250mg capsules | 4 capsule [POM] £10.10 | 6 capsule [POM] £15.15 DT price = £15.13
- Zithromax (Pfizer Ltd)
- Azithromycin (as Azithromycin dihydrate) 250 mg: Zithromax 250mg capsules | 4 capsule [POM] £7.16 | 6 capsule [POM] £10.74 DT price = £15.13

Oral suspension

CAUTIONARY AND ADVISORY LABELS 5, 9

Azithromycin (Non-proprietary)

- Azithromycin 40 mg per 1 ml: Azithromycin 200mg/5ml oral suspension | 15 ml [POM] £6.18 DT price = £0.46 | 30 ml [POM] £11.04 DT price = £0.77
- Zithromax (Pfizer Ltd)
- Azithromycin 40 mg per 1 ml: Zithromax 200mg/5ml oral suspension | 15 ml [POM] £4.06 DT price = £0.46 | 22.5 ml [POM] £6.10 DT price = £0.67 | 30 ml [POM] £11.04 DT price = £1.10

SIDE-EFFECTS

- Common or very common: Anorexia, arthralgia, disturbances in taste, disturbances in vision, dizziness, dyspepsia, flatulence, headache, malaise, paraesthesia, reversible hearing loss (sometimes with tinnitus) after long-term therapy
- Uncommon
  - With oral use: Anxiety, chest pain, constipation, gastritis, hypoesthesia, leucopenia, oedema, photophobia, sleep disturbances
- Rare: Agitation
- Frequency not known: Acute renal failure, convulsions, haemolytic anaemia, interstitial nephritis, smell disturbances, syncope, thrombocytopenia, tongue discoloration

PREGNANCY

Manufacturers advise use only if adequate alternatives not available.

BREAST FEEDING

Present in milk; use only if no suitable alternatives.

HEPATIC IMPAIRMENT

Manufacturers advise avoid in severe liver disease–no information available.

RENAL IMPAIRMENT

Use with caution if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral liquid formulations may include cherry or banana.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Azithromycin for bacterial infections www.medicinesforchildren.org.uk/azithromycin-bacterial-infections-0

PROFESSIONAL INFORMATION

Dental practitioners’ formulary

Azithromycin Capsules may be prescribed. Azithromycin Tablets may be prescribed. Azithromycin Oral Suspension 200 mg/5 mL may be prescribed.

EXCEPTIONS TO LEGAL CATEGORY

Azithromycin tablets can be sold to the public for the treatment of confirmed, asymptomatic Chlamydia trachomatis genital infection in those over 16 years of age, and for the epidemiological treatment of their sexual partners, subject to maximum single dose of 1 g, maximum daily dose 1 g, and a pack size of 1 g.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Clarithromycin

INDICATIONS AND DOSE

Respiratory-tract infections | Mild to moderate skin and soft-tissue infections | Otitis media

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- Neonate: 7.5 mg/kg twice daily.
  - Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily
  - Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily
  - Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily
  - Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily
  - Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily
  - Child 12–17 years: 250 mg twice daily usually for 7–14 days, increased to 500 mg twice daily, if required in severe infections (e.g. pneumonia)
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
  - Child 12–17 years: 500 mg once daily usually for 7–14 days, increased to 1 g once daily, if required in severe infections (e.g. pneumonia)
  - BY INTRAVENOUS INFUSION
  - Child 1 month–11 years: 7.5 mg/kg every 12 hours (max. per dose 500 mg every 12 hours) maximum duration 5 days, switch to oral route when appropriate, to be administered into a large proximal vein
  - Child 12–17 years: 500 mg every 12 hours maximum duration 5 days, switch to oral route when appropriate, to be administered into a large proximal vein

Lyme disease

- BY MOUTH
  - Child 1 month–11 years: 7.5 mg/kg twice daily (max. per dose 500 mg) for 14–21 days
  - Child 12–17 years: 500 mg twice daily for 14–21 days

Prevention of pertussis

- BY MOUTH
  - Neonate: 7.5 mg/kg twice daily for 7 days.
  - Child 1 month–11 years (body-weight up to 8 kg): 7.5 mg/kg twice daily for 7 days
  - Child 1 month–11 years (body-weight 8–11 kg): 62.5 mg twice daily for 7 days
  - Child 1 month–11 years (body-weight 12–19 kg): 125 mg twice daily for 7 days
  - Child 1 month–11 years (body-weight 20–29 kg): 187.5 mg twice daily for 7 days
  - Child 1 month–11 years (body-weight 30–40 kg): 250 mg twice daily for 7 days
  - Child 12–17 years: 500 mg twice daily for 7 days

Helicobacter pylori eradication in combination with omeprazole, and amoxicillin or metronidazole

- BY MOUTH
  - Child 1–5 years: 7.5 mg/kg twice daily (max. per dose 500 mg)
  - Child 6–11 years: 7.5 mg/kg twice daily (max. per dose 500 mg)
  - Child 12–17 years: 500 mg twice daily

UNLICENSED USE

- With oral use: Tablets not licensed for use in children under 12 years; oral suspension not licensed for use in infants under 6 months.
- With intravenous use: Intravenous infusion not licensed for use in children under 12 years.

INTERACTIONS

→ Appendix 1 (macrolides).
Caution with concomitant use of drugs that prolong the QT interval.
Bacterial infection

SIDE-EFFECTS

- **Common or very common** Dyspepsia - headache - hyperhidrosis - insomnia - taste disturbances
- **Uncommon** Anorexia - anxiety - blood disorders - chest pain - constipation - dizziness - dry mouth - flatulence - gastritis - glossitis - hepatic dysfunction including jaundice - leucopenia - malaise - myalgia - stomatitis - tinnitus - tremor
- **Frequency not known** Abnormal dreams - confusion - convulsions - depression - hypoglycaemia - interstitial nephritis - myopathy - paraesthesia - psychotic disorders - renal failure - smell disturbances - tongue discoloration - tooth discoloration
- **PREGNANCY** Manufacturer advises avoid, particularly in the first trimester, unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—present in milk.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment if renal impairment also present.
- **RENAL IMPAIRMENT** Use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m², max. duration 14 days. Avoid if severe hepatic impairment also present.
- With oral use Avoid Klaricid XL.⁹ or clarithromycin m/r preparations if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

DIRECTIONS FOR ADMINISTRATION

- With intravenous use For intermittent intravenous infusion dilute reconstituted solution further in Glucose 5% or Sodium chloride 0.9% to a concentration of 2 mg/mL; give into large proximal vein over 60 minutes.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Clarithromycin for bacterial infections www.medicinesforchildren.org.uk/clarithromycin-bacterial-infections

PROFESSION SPECIFIC INFORMATION

Dental practitioners’ formulary

Clarithromycin Tablets may be prescribed. Clarithromycin Oral Suspension may be prescribed.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

**Tablet**

| CAUTIONARY AND ADVISORY LABELS | 9 |
| Clarithromycin (Non-proprietary) |
| Clarithromycin 250 mg Clarithromycin 250mg tablets | 14 tablet | £0.50 DT price = £1.40 |
| Clarithromycin 500 mg Clarithromycin 500mg tablets | 14 tablet | £2.35 |

**Modified-release tablet**

| CAUTIONARY AND ADVISORY LABELS | 9, 21, 25 |
| Clari XL (Teva UK Ltd) |
| Clarithromycin 500 mg Clari XL 500mg tablets | 7 tablet | £6.72 DT price = £6.72 | 14 tablet | £11.23 |
| Klaricid XL (BGP Products Ltd) |

  - Clarithromycin 500 mg Klaricid IV 500mg powder for solution for infusion vials | 1 vial | £9.45 DT price = £9.45 |

**Erythromycin**

INDICATIONS AND DOSE

Susceptible infections in patients with penicillin hypersensitivity (e.g. respiratory-tract infections (including Legionella infection), skin and oral infections, and campylobacter enteritis)

- **BY MOUTH**
  - **Neonate:** 12.5 mg/kg every 6 hours.
  - **Child 1 month–1 year:** 125 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 250 mg 4 times a day, dose increase may be used in severe infections
  - **Child 2–7 years:** 250 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500 mg 4 times a day, dose increase may be used in severe infections
  - **Child 8–17 years:** 250–500 mg 4 times a day, total daily dose may alternatively be given in two divided doses, increased to 500–1000 mg 4 times a day, dose increase may be used in severe infections
  - **BY INTRAVENOUS INFUSION**
  - **Neonate:** 10–12.5 mg/kg every 6 hours.
  - **Child:** 12.5 mg/kg every 6 hours (max. per dose 1 g)

**Lyme disease (under expert supervision)**

- **BY MOUTH**
  - **Child:** 12.5 mg/kg 4 times a day (max. per dose 500 mg) for 14–21 days

**Chlamydial ophthalmia**

- **BY MOUTH**
  - **Neonate:** 12.5 mg/kg every 6 hours.
  - **Child 1 month–1 year:** 125 mg 4 times a day, increased to 250 mg every 6 hours, dose increase for severe infections, total daily dose may alternatively be given in two divided doses
  - **Child 2–7 years:** 250 mg 4 times a day, increased to 500 mg every 6 hours, dose increase for severe infections, total daily dose may alternatively be given in two divided doses
  - **Child 8–17 years:** 250–500 mg 4 times a day, increased to 500–1000 mg every 6 hours, dose increase for severe infections, total daily dose may alternatively be given in two divided doses
  - **BY INTRAVENOUS INFUSION**
  - **Neonate:** 10–12.5 mg/kg every 6 hours.
  - **Child:** 12.5 mg/kg every 6 hours (max. per dose 1 g)

**Early syphilis**

- **BY MOUTH**
  - **Child 12–17 years:** 500 mg 4 times a day for 14 days
**Acne**

- **BY MOUTH**
  - Child 1-23 months: 250 mg once daily, alternatively 125 mg twice daily
  - Child 12-17 years: 500 mg twice daily

**Gastro-intestinal stasis**

- **BY MOUTH**
  - Neonate: 3 mg/kg 4 times a day.
  - Child: 3 mg/kg 4 times a day.
  - **BY INTRAVENOUS INFUSION**
  - Neonate: 3 mg/kg 4 times a day.
  - Child: 1-11 months: 3 mg/kg 4 times a day

- **UNLICENSED USE** Not licensed for use in gastro-intestinal stasis.

- **CAUTIONS** Avoid in Acute porphyrias p. 562 - neonate under 2 weeks (risk of hypertrophic pyloric stenosis)

- **INTERACTIONS** → See Appendix 1 (macrolides).
  Caution with concomitant use of drugs that prolong the QT interval.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Only small amounts in milk— not known to be harmful.

- **HEPATIC IMPAIRMENT** May cause idiosyncratic hepatotoxicity.

- **RENAL IMPAIRMENT** Reduce dose in severe renal impairment (ototoxicity).

- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use Dilute reconstituted solution further in glucose 5% (neutralised with Sodium bicarbonate) or sodium chloride 0.9% to a concentration of 1–5 mg/mL; give over 20–60 minutes. Concentration of up to 10 mg/mL may be used in fluid-restriction if administered via a central venous catheter.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana.

- **PATIENT AND CARER ADVICE**

- **PROFESSION SPECIFIC INFORMATION**
  - **Dental practitioners’ formulary**
  - With oral use Erythromycin tablets o/c may be prescribed. Erythromycin ethyl succinate oral suspension may be prescribed. Erythromycin stearate tablets may be prescribed. Erythromycin ethyl succinate tablets may be prescribed.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- **CAUTIONARY AND ADVISORY LABELS** 9
  - **Erythromycin (Non-proprietary)**
    - Erythromycin (as Erythromycin ethyl succinate) 500 mg
      - Erythromycin ethyl succinate 500mg tablets | 28 tablet [PDr] £11.95-£19.90 DT price = £10.78
    - Erythromycin (AmCo)
      - Erythromycin (as Erythromycin stearate) 250 mg
        - Erythromycin 250 tablets | 100 tablet [PDr] £18.20 DT price = £18.20
      - Erythromycin (as Erythromycin stearate) 500 mg
        - Erythromycin 500 tablets | 100 tablet [PDr] £36.40 DT price = £36.40
    - Erythrolar (Ennogen Pharma Ltd)
      - Erythromycin (as Erythromycin stearate) 250 mg
        - Erythrolar 250mg tablets | 100 tablet [PDr] £22.80 DT price = £18.20
      - Erythromycin (as Erythromycin stearate) 500 mg
        - Erythrolar 500mg tablets | 100 tablet [PDr] £45.60 DT price = £36.40
    - Erythroped A (AmCo)
      - Erythromycin (as Erythromycin ethyl succinate) 500 mg
        - Erythroped A 500mg tablets | 28 tablet [PDr] £10.78 DT price = £10.78

---

**Uncomplicated genital chlamydia | Non-gonococcal urethritis**

- **BY MOUTH**
  - Child 1 month-1 year: 12.5 mg/kg 4 times a day for 14 days
  - Child 2-11 years: 250 mg twice daily for 14 days
  - Child 12-17 years: 500 mg twice daily for 14 days

**Pelvic inflammatory disease**

- **BY MOUTH**
  - Child 1 month-1 year: 12.5 mg/kg 4 times a day for 14 days
  - Child 2-11 years: 250 mg twice daily for 14 days
  - Child 12-17 years: 500 mg twice daily for 14 days

**Prevention and treatment of pertussis**

- **BY MOUTH**
  - Neonate: 12.5 mg/kg every 6 hours.
  - Child: 12.5 mg/kg every 6 hours (max. per dose 1 g)

**Prevention of secondary case of diphtheria in non-immune patient**

- **BY MOUTH**
  - Child 1 month-1 year: 125 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment
  - Child 2-7 years: 250 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment
  - Child 8-17 years: 500 mg every 6 hours for 7 days, treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment

**Prevention of secondary case of invasive group A streptococcal infection in penicillin allergic patients**

- **BY MOUTH**
  - Child 1 month-1 year: 125 mg every 6 hours for 10 days
  - Child 2-7 years: 250 mg every 6 hours for 10 days
  - Child 8-17 years: 500 mg every 6 hours for 10 days

**Prevention of pneumococcal infection in asplenia or in patients with sickle-cell disease (if penicillin-allergic)**

- **BY MOUTH**
  - Child 1 month-1 year: 125 mg twice daily, antibiotic prophylaxis is not fully reliable
  - Child 2-7 years: 250 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those over 5 years of age with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection
  - Child 8-17 years: 500 mg twice daily, antibiotic prophylaxis is not fully reliable. It may be discontinued in those with sickle-cell disease who have received pneumococcal immunisation and who do not have a history of severe pneumococcal infection

**Prevention of recurrence of rheumatic fever**

- **BY MOUTH**
  - Child 1 month-1 year: 125 mg twice daily
  - Child 2-17 years: 250 mg twice daily

---

**Erythroped A**

- Price = £500 mg

---

**Erythrolar**

- Price = £500 mg
**Telithromycin**

**Drug action** The ketolide telithromycin is a derivative of erythromycin. The antibacterial spectrum of telithromycin is similar to that of macrolides and it is also active against penicillin- and erythromycin-resistant *Streptococcus pneumoniae*.

**Indications and dosage**

Treatment of beta-haemolytic streptococcal pharyngitis if caused by organisms resistant to beta-lactam antibacterials and other macrolides, or if conventional treatment is contra-indicated.

- **By mouth**
  - Child 12–17 years: 800 mg once daily for 5 days

**Contra-indications**

Congenital history of QT interval prolongation (if not excluded by ECG) • family history of QT interval prolongation (if not excluded by ECG) • history of telithromycin-associated jaundice • myasthenia gravis • prolongation of QT interval

**Caution** Avoid in Acute porphyrias p. 562 • bradycardia—risk of QT interval prolongation • coronary heart disease—risk of QT interval prolongation • hypokalaemia—risk of QT interval prolongation • hypomagnesaemia—risk of QT interval prolongation • ventricular arrhythmias—risk of QT interval prolongation

**Interactions** → Appendix 1 (telithromycin).

Caution with concomitant use of drugs that prolong the QT interval.

**Side-effects**

- Common or very common Abdominal pain • diarrhoea • dizziness • flatulence • headache • nausea • taste disturbances • vomiting
- Uncommon Anorexia • blurred vision • constipation • drowsiness • eosinophilia • flushing • hepatitis • insomnia • nervousness • palpitations • pruritus • rash • stomatitis • urticaria
- Rare Arrhythmias • cholestatic jaundice • diplopia • hypotension • paraesthesia • transient loss of consciousness
- Very rare Altered sense of smell • antibiotic-associated colitis • erythema multiforme • muscle cramp
- Frequency not known Arthralgia • confusion • hallucinations • pancreatitis

**Pregnancy**

Toxicity in animal studies—manufacturer advises use only if potential benefit outweighs risk.

**Breast-feeding**

Manufacturer advises avoid—present in milk in animal studies.

**Hepatic impairment**

Manufacturer advises caution.

**Renal impairment**

Manufacturer advises avoid if possible if eGFR less than 30 mL/minute/1.73 m²—if no alternative, use alternating daily doses of 800 mg and 400 mg, starting with 800 mg dose.

**Patient and carer advice**

Driving and skilled tasks

Visual disturbances or transient loss of consciousness may affect performance of skilled tasks (e.g. driving); effects may occur after the first dose. Administration at bedtime may reduce these side-effects. Patients should be advised not to drive or operate machinery if affected. Haptic disorders Counselling on hepatic disorders is advised. Patients should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, abdominal pain, jaundice, or dark urine develop.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.
AZTREONAM — MONOBACTAMS

**Aztreonam**

**Drug Action** Aztreonam is a monocyclic beta-lactam antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudomonas aeruginosa*, *Neisseria meningitidis*, and *Haemophilus influenzae*; it should not be used alone for "blind" treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydial infection).

**Indications and Dose**

**Gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis***

- **By intravenous injection, or by intravenous infusion**
  - Neonate up to 7 days: 30 mg/kg every 12 hours.
  - Neonate 7 days to 28 days: 30 mg/kg every 6–8 hours.
  - Child 1 month: 1 g every 8 hours, alternatively 2 g every 12 hours.
  - **Severe gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, *Neisseria meningitidis*, and lung infections in cystic fibrosis**
    - By intravenous infusion, or by intravenous injection
    - Child 2–11 years: 50 mg/kg every 6–8 hours (max. per dose 2 g 4 times a day).
    - Child 12–17 years: 2 g every 6–8 hours.
  - **Chronic pulmonary *Pseudomonas aeruginosa* infection in patients with cystic fibrosis**
    - By inhalation of nebulised solution
    - Child 6–17 years: 75 mg 3 times a day for 28 days, doses to be administered at least 4 hours apart, subsequent courses repeated after 28-day interval without aztreonam nebuliser solution
  - **Unlicensed use**
    - With systemic use: Injection not licensed for use in children under 7 days.
    - **Caution**
      - When used by inhalation: Haemoptysis — risk of further haemorrhage.
    - **Interactions** Appendix 1 (aztreonam).
  - **Side-effects**
    - **General side-effects**
      - Bronchospasm • rash
    - **Specific side-effects**
      - **Rare**
        - With systemic use: Antibiotic-associated colitis • asthenia • blood disorders • breast tenderness • chest pain • confusion • diplopia • dizziness • dysphoria • gastro-intestinal bleeding • halitosis • headache • hepatitis • hypotension • insomnia • jaundice • myalgia • neutropenia • paraesthesia • seizures • thrombocytopenia • tinnitus
      - **Frequency not known**
        - When used by inhalation: Arthralgia • cough • haemoptysis • pharyngolaryngeal pain • pyrexia • rhinorrhoea • wheezing
        - With systemic use: Abdominal pain • diarrhoea • erythema multiforme • flushing • mouth ulcers • nausea • taste disturbances • toxic epidermal necrolysis • vomiting
    - **Allergy and cross-sensitivity** Contra-indicated in aztreonam hypersensitivity.
    - Use with caution in patients with hypersensitivity to other beta-lactam antibiotics (although aztreonam may be less likely than other beta-lactams to cause hypersensitivity in penicillin-sensitive patients).
  - **Pregnancy**
    - With systemic use: No information available; manufacturer of injection advises avoid.
    - When used by inhalation: No information available; manufacturer of powder for nebuliser solution advises avoid unless essential.
  - **Breastfeeding**
    - Amount in milk probably too small to be harmful.
  - **Hepatic impairment**
  - **Renal impairment**
    - With systemic use: If estimated glomerular filtration rate 10–30 mL/minute/1.73 m², usual initial dose of injection, then half normal dose. If estimated glomerular filtration rate less than 10 mL/minute/1.73 m², usual initial dose of injection, then one-quarter normal dose.
  - **Monitoring requirements**
    - When used by inhalation: Measure lung function before and after initial dose of aztreonam and monitor for bronchospasm.
  - **Directions for administration** For intravenous injection, give over 3–5 minutes.
    - With intravenous use: Displacement value of injection may be significant, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in Glucose 5% or Sodium chloride 0.9% to a concentration of less than 20 mg/mL; to be given over 20–60 minutes.
    - When used by inhalation: Other inhaled drugs should be administered before aztreonam; a bronchodilator should be administered before each dose.
  - **National funding/access decisions**
    - Scottish Medicines Consortium (SMC) Decisions
      - The Scottish Medicines Consortium has advised (December 2014) that aztreonam powder for nebuliser solution (Cayston®) is accepted for restricted use within NHS Scotland when inhaled colistimethate sodium and inhaled tobramycin are not tolerated or are not providing satisfactory therapeutic benefit (measured as >2% decline in forced expiratory volume in 1 second).
  - **Medicinal forms**
    - There can be variation in the licensing of different medicines containing the same drug.
    - **Powder for solution for injection**
      - Azactam (Bristol-Myers Squibb Pharmaceuticals Ltd)
        - Aztreonam 1 gram: Azactam 1 g powder for solution for injection vials
          - 1 vial (P) £0.40 (Hospital only)
        - Aztreonam 2 gram: Azactam 2 g powder for solution for injection vials
          - 1 vial (P) £1.82 (Hospital only)
    - **Powder and solvent for nebuliser solution**
      - Cayston (Gilead Sciences International Ltd)
        - Aztreonam (as Aztreonam lysine) 75 mg: Cayston 75 mg powder and solvent for nebuliser solution vials with Altera Nebuliser Handset
          - 8 vial (P) £2,181.53

**Antibacterials — Nitroimidazole Derivatives**

**Metronidazole**

**Drug Action** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

**Indications and Dose**

**Anaerobic infections**

- **By mouth**
  - Child 1 month: 7.5 mg/kg every 12 hours usually treated for 7 days (for 10–14 days in *Clostridium difficile* infection)
Acute ulcerative gingivitis

▶ BY MOUTH
Child 2 months–11 years: 7.5 mg/kg every 8 hours (max. per dose 400 mg) usually treated for 7 days (for 10–14 days in Clostridium difficile infection)
Child 12–17 years: 400 mg every 8 hours usually treated for 7 days (for 10–14 days in Clostridium difficile infection)
▶ BY RECTUM
Child 1–4 months: 125 mg 3 times a day for 3 days, then 125 mg twice daily, for usual total treatment duration of 7 days
Child 1–4 years: 250 mg 3 times a day for 3 days, then 250 mg twice daily, for usual total treatment duration of 7 days
Child 5–9 years: 500 mg 3 times a day for 3 days, then 500 mg twice daily, for usual total treatment duration of 7 days
Child 10–17 years: 1 g 3 times a day for 3 days, then 1 g twice daily, for usual total treatment duration of 7 days
▶ BY INTRAVENOUS INFUSION
Child 12 months
Child 1 month:
Child 2 months

Neonate up to 26 weeks corrected gestational age: Loading dose 15 mg/kg, followed by 7.5 mg/kg after 24 hours, then 7.5 mg/kg daily usually treated for a total duration of 7 days (for 10–14 days in Clostridium difficile infection).

Neonate 26 weeks to 34 weeks corrected gestational age: Loading dose 15 mg/kg, followed by 7.5 mg/kg after 12 hours, then 7.5 mg/kg every 12 hours usually treated for a total duration of 7 days (for 10–14 days in Clostridium difficile infection).

Neonate 34 weeks corrected gestational age and above: Loading dose 15 mg/kg, followed by 7.5 mg/kg after 8 hours, then 7.5 mg/kg every 8 hours usually treated for a total duration of 7 days (for 10–14 days in Clostridium difficile infection).

Child 1 month: Loading dose 15 mg/kg, followed by 7.5 mg/kg after 8 hours, then 7.5 mg/kg every 8 hours usually treated for a total duration of 7 days (for 10–14 days in Clostridium difficile infection)
Child 2 months–17 years: 7.5 mg/kg every 8 hours (max. per dose 500 mg) usually treated for 7 days (for 10–14 days in Clostridium difficile infection)

Helicobacter pylori eradication; in combination with clarithromycin and omeprazole
▶ BY MOUTH
Child 1–5 years: 100 mg twice daily
Child 6–11 years: 200 mg twice daily
Child 12–17 years: 400 mg twice daily

Helicobacter pylori eradication; in combination with amoxicillin and omeprazole
▶ BY MOUTH
Child 1–5 years: 100 mg 3 times a day
Child 6–11 years: 200 mg 3 times a day
Child 12–17 years: 400 mg 3 times a day

Fistulising Crohn’s disease
▶ BY MOUTH
Child: 7.5 mg/kg 3 times a day usually given for 1 month but should not be used for longer than 3 months because of concerns about peripheral neuropathy

Pelvic inflammatory disease
▶ BY MOUTH
Child 12–17 years: 400 mg twice daily for 14 days

Acute ulcerative gingivitis
▶ BY MOUTH
Child 1–2 years: 50 mg every 8 hours for 3 days
Child 3–6 years: 100 mg every 12 hours for 3 days
Child 7–9 years: 100 mg every 8 hours for 3 days
Child 10–17 years: 200–250 mg every 8 hours for 3 days

Acute oral infections
▶ BY MOUTH
Child 1–2 years: 50 mg every 8 hours for 3–7 days
Child 3–6 years: 100 mg every 12 hours for 3–7 days
Child 7–9 years: 100 mg every 8 hours for 3–7 days
Child 10–17 years: 200–250 mg every 8 hours for 3–7 days

Surgical prophylaxis
▶ BY MOUTH
Child 1 month–11 years: 30 mg/kg (max. per dose 500 mg), to be administered 2 hours before surgery
Child 12–17 years: 400–500 mg, to be administered 2 hours before surgery, then 400–500 mg every 8 hours if required for up to 3 doses (in high-risk procedures)
▶ BY RECTUM
Child 1–5 years: 1 g, to be administered 2 hours before surgery, then 1 g every 8 hours if required for up to 3 doses (in high-risk procedures)
Child 6–17 years: 1 g, to be administered 2 hours before surgery, then 1 g every 8 hours for up to 3 doses (in high-risk procedures)
▶ BY INTRAVENOUS INFUSION
Neonate up to 40 weeks corrected gestational age: 10 mg/kg, to be administered up to 30 minutes before the procedure.

Neonate 40 weeks corrected gestational age and above: 20–30 mg/kg, to be administered up to 30 minutes before the procedure.

Child 1 month–11 years: 30 mg/kg (max. per dose 500 mg), to be administered up to 30 minutes before the procedure
Child 12–17 years: 500 mg, to be administered up to 30 minutes before the procedure, then 500 mg every 8 hours if required for up to 3 further doses (in high-risk procedures)

Invasive intestinal amoebiasis; Extra-intestinal amoebiasis (including liver abscess)
▶ BY MOUTH
Child 1–2 years: 200 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
Child 3–6 years: 200 mg 4 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
Child 7–9 years: 400 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)
Child 10–17 years: 800 mg 3 times a day for 5 days in intestinal infection (for 5–10 days in extra-intestinal infection)

Urogenital trichomoniasis
▶ BY MOUTH
Child 1–2 years: 50 mg 3 times a day for 7 days
Child 3–6 years: 100 mg twice daily for 7 days
Child 7–9 years: 100 mg 3 times a day for 7 days
Child 10–17 years: 200 mg 3 times a day for 7 days, alternatively 400–500 mg twice daily for 5–7 days, alternatively 2 g for 1 dose

Giardiasis
▶ BY MOUTH
Child 1–2 years: 500 mg once daily for 3 days
Child 3–6 years: 600–800 mg once daily for 3 days
Child 7–9 years: 1 g once daily for 3 days
Child 10–17 years: 2 g once daily for 3 days, alternatively 400 mg 3 times a day for 5 days, alternatively 500 mg twice daily for 7–10 days

Established case of tetanus
▶ BY INTRAVENOUS INFUSION
Child: (consult product literature)
Bacterial infection 315

Tinidazole

DRUG ACTION Tinidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; it has a longer duration of action than metronidazole.

INDICATIONS AND DOSE

Intestinal amoebiasis
BY MOUTH
Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 3 days
Child 12–17 years: 2 g once daily for 2–3 days

Amebic involvement of liver
BY MOUTH
Child 1 month–11 years: 50–60 mg/kg once daily (max. per dose 2 g) for 5 days
Child 12–17 years: 1.5–2 g once daily for 3–6 days

Urogenital trichomoniasis | Giardiasis
BY MOUTH
Child 1 month–11 years: 50–75 mg/kg (max. per dose 2 g) for 1 single dose, dose may be repeated once if necessary
Child 12–17 years: 2 g for 1 single dose, dose may be repeated once if necessary

CAUTIONS Avoid in Acute porphyrias p. 562
INTERACTIONS → Appendix 1 (tinidazole).
Caution—disulfiram-like reaction with alcohol.

SIDE-EFFECTS
Common or very common Anorexia · furred tongue · gastro-intestinal disturbances · nausea · optic neuropathy · oral mucositis · taste disturbances · vomiting

Very rare Arthralgia · ataxia · darkening of urine · dizziness · drowsiness · erythema multiforme · headache · hepatitis · jaundice · leucopenia (on prolonged or intensive therapy) · myalgia · pancreatitis · pancytopenia · peripheral neuropathy (on prolonged or intensive therapy) · pruritus · psychotic disorders · rash · thrombocytopenia · transient epileptiform seizures (on prolonged or intensive therapy) · visual disturbances

Frequency not known Anorexia · aseptic meningitis · furred tongue · gastro-intestinal disturbances · nausea · optic neuropathy · oral mucositis · taste disturbances · vomiting

PREGNANCY Manufacturer advises avoid in first trimester.

BREAST FEEDING Present in milk—manufacturer advises avoid breast-feeding during and for 3 days after stopping treatment.

MONITORING REQUIREMENTS Clinical and laboratory monitoring advised if treatment exceeds 10 days.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 4, 9

Penicillins

Benzylenicillin and phenoxybenzylpenicillin
Benzylenicillin sodium p. 318 (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamases. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also for anthrax, diphtheria, gas gangrene, leptospirosis, and treatment of Lyme disease in children. It is also used in combination with gentamicin p. 293 for the empirical treatment of sepsis in neonates less than 48 hours old. Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; benzylenicillin sodium is no longer the drug of first choice for pneumococcal meningitis.

Although benzylenicillin sodium is effective in the treatment of tetanus, metronidazole p. 313 is preferred. Benzylenicillin sodium is inactivated by gastric acid and absorption from the gastro-intestinal tract is low; therefore it must be given by injection.

Phenoxymethylpenicillin or procaine benzylenicillin are used in the treatment of syphilis. Phenoxymethylpenicillin p. 319 (Penicillin V) has a similar antibacterial spectrum to benzylpenicillin sodium, but is less active. It is a gastric acid-stable, so is suitable for oral administration. It should not be used for serious infections because absorption can be unpredictable and plasma concentrations variable. It is indicated principally for respiratory-tract infections in children, for streptococcal infections and gonococcal infections. Phenoxymethylpenicillin is used for prophylaxis against streptococcal infections following rheumatic fever and against pneumococcal infections following splenectomy or in sickle cell disease.

Penicillinase-resistant penicillins
Most staphylococci are now resistant to benzylpenicillin sodium because they produce penicillinases. Flucloxacillin p. 325, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the main indication for its use. Flucloxacillin is acid-stable and can, therefore, be given by mouth as well as by injection. Flucloxacillin is well absorbed from the gut.

Broad-spectrum penicillins
Ampicillin p. 321 is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinases including those produced by Staphylococcus aureus and by common Gram-negative bacilli such as Escherichia coli.

Ampicillin is also active against Listeria spp. and enterococci. Almost all staphylococci, approx. 60% of E. coli strains and approx. 20% of Haemophilus influenzae strains are now resistant. The likelihood of resistance should therefore be considered before using ampicillin for the ‘blind’ treatment of infections; in particular, it should not be used for hospital patients without checking sensitivity.

Ampicillin can be given by mouth, but less than half the dose is absorbed and absorption is further decreased by the presence of food in the gut. Ampicillin is well excreted in the bile and urine.

Ampicillin p. 320 is a derivative of ampicillin and has a similar antibacterial spectrum. It is better absorbed than ampicillin when given by mouth, producing higher plasma and tissue concentrations; unlike ampicillin, absorption is not affected by the presence of food in the stomach.

Ampicillin or amoxicillin are principally indicated for the treatment of community-acquired pneumonia and middle ear infections, both of which may be due to Streptococcus pneumoniae and H. influenzae, and for urinary-tract infections. They are also used in the treatment of endocarditis and listerial meningitis. Amoxicillin may also be used for the treatment of Lyme disease [not licensed].

Maculopapular rashes occur commonly with ampicillin (and amoxicillin) but are not usually related to true penicillin allergy. They often occur in children with glandular fever; broad-spectrum penicillins should not therefore be used for ‘blind’ treatment of a sore throat. The risk of rash is also increased in children with acute or chronic lymphocytic leukaemia or in cytomegalovirus infection.

Co-amoxiclav p. 323 consists of amoxicillin with the beta-lactamase inhibitor clavulanic acid. Clavulanic acid itself has no significant antibacterial activity but, by inactivating beta-lactamases, it makes the combination active against beta-lactamase-producing bacteria that are resistant to amoxicillin. These include resistant strains of Staph. aureus, E. coli, and H. influenzae, as well as many Bacteroides and Klebsiella spp. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase-producing strains.

A combination of ampicillin with flucloxacillin (as co-fluampic p. 322) is available to treat infections involving either streptococci or staphylococci (e.g. cellulitis).

Antipseudomonal penicillins
Piperacillin, a ureidopenicillin, is only available in combination with the beta-lactamase inhibitor tazobactam.

Ticarcillin, a carboxypenicillin, is only available in combination with the beta-lactamase inhibitor clavulanic acid. Both preparations have a broad spectrum of activity against a range of Gram-positive and Gram-negative bacteria, and anaerobes. Piperacillin with tazobactam p. 317 has activity against a wider range of Gram-negative organisms than ticarcillin with clavulanic acid p. 318 and it is more active against Pseudomonas aeruginosa. These antibacterials are not active against MRSA. They are used in the treatment of septicaemia, hospital-acquired pneumonia, and complicated infections involving the urinary-tract, skin and soft tissue, or intra-abdomen. They may be used for the empirical treatment of septicaemia in immunocompromised children but otherwise should generally be reserved for serious infections resistant to other antibacterials. For severe pseudomonas infections these antipseudomonal penicillins can be given with an aminoglycoside (e.g. gentamicin) since they have a synergistic effect.

Piperacillin with tazobactam is used in cystic fibrosis for the treatment of Ps. aeruginosa colonisation when ciprofloxacin p. 328 and nebulised colistimethate sodium p. 326 have been ineffective; it can also be used in infective exacerbations, when it is combined with an aminoglycoside.

Mecillinams
Pivmecillinam hydrochloride p. 324 has significant activity against many Gram-negative bacteria including Escherichia coli, klebsiella, enterobacter, and salmonellae. It is not active against Pseudomonas aeruginosa or enterococci.

Pivmecillinam hydrochloride is hydrolysed to mecillinam, which is the active drug.

Penicillins

- **DRUG ACTION** The penicillins are bactericidal and act by interfering with bacterial cell wall synthesis. They diffuse well into body tissues and fluids, but penetration into the cerebrospinal fluid is poor except when the meninges are inflamed. They are excreted in the urine in therapeutic concentrations.

- **CAUTIONS** History of allergy

- **INTERACTIONS** → Appendix 1 (penicillins).
Bacterial infection

Complicated intra-abdominal infections
- **BY INTRAVENOUS INFUSION**
  - Child 2–11 years: 112.5 mg/kg every 8 hours (max. per dose 4.5 g)
  - Child 12–17 years: 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections

Infections in neutropenic patients
- **BY INTRAVENOUS INFUSION**
  - Child: 90 mg/kg every 6 hours (max. per dose 4.5 g)

**SIDE-EFFECTS**
- **Common or very common** Anaphylaxis · angioedema · diarrhoea · fever · hypersensitivity reactions · joint pains · rashes · serum sickness–like reaction · urticaria
- **Rare** Cerebral irritation · CNS toxicity (including convulsions) · coagulation disorders · encephalopathy · haemolytic anaemia · interstitial nephritis · leucopenia · thrombocytopenia
- **Frequency not known** Antibiotic–associated colitis

**SIDE-EFFECTS, FURTHER INFORMATION**
- CNS toxicity A rare but serious toxic effect of the penicillins is hypersensitivity which may cause severe renal failure. The penicillins should not be given by intrathecal injection because they can cause encephalopathy which may be fatal.
- Diarrhoea Diarrhoea frequently occurs during oral penicillin therapy. It is most common with broad-spectrum penicillins, which can also cause antibiotic-associated colitis.

**ALLERGY AND CROSS-SENSITIVITY**
The most important side-effect of the penicillins is hypersensitivity which causes rashes and anaphylaxis and can be fatal. Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactic reactions occur in fewer than 0.05% of treated patients. Patients with a history of atopic allergy (e.g. asthma, eczema, hay fever) are at a higher risk of anaphylactic reactions to penicillins. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should not receive a penicillin. Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should not receive a penicillin. Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients. Patients who are allergic to one penicillin will be allergic to all because the hypersensitivity is related to the basic penicillin structure. Patients with a history of immediate hypersensitivity to penicillins may also react to the cephalosporins and other beta–lactam antibiotics, they should not receive these antibiotics. If a penicillin (or another beta-lactam antibiotic) is essential in an individual with immediate hypersensitivity to a penicillin then specialist advice should be sought on hypersensitivity testing or using a beta-lactam antibiotic with a different structure to the penicillin that caused the hypersensitivity.

**UNLICENSED USE** Not licensed for use in children under 12 years (except for children 2–12 years with neutropenia and complicated intra-abdominal infections).

**CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations).

**SIDE-EFFECTS**
- **Common or very common** Nausea · vomiting
- **Uncommon** Constipation · dyspepsia · headache · hypotension · injection-site reactions · insomnia · jaundice · stomatitis
- **Rare** Abdominal pain · eosinophilia · hepatitis
- **Very rare** Hypoglycaemia · hypokalaemia · pancytopenia · Steven-Johnson syndrome · toxic epidermal necrolysis

**PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk.

**BREAST FEEDING** Trace amount in milk, but appropriate to use.

**RENAL IMPAIRMENT** Child under 12 years 78.75 mg/kg (max. 4.5 g) every 8 hours if estimated glomerular filtration rate less than 50 mL/minute/1.73 m². Child 12–18 years max. 4.5 g every 8 hours if estimated glomerular filtration rate 20–40 mL/minute/1.73 m²; max. 4.5 g every 12 hours if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

**EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use Displacement value may be significant when reconstituting injection, consult local guidelines.
  - For **intravenous infusion**, dilute reconstituted solution to a concentration of 15–90 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 30 minutes.

**PRESCRIBING AND DISPENSING INFORMATION** Dose expressed as a combination of piperacillin and tazobactam (both as sodium salts) in a ratio of 8:1.

**ANTIBACTERIALS > PENICILLINS, ANTIPSEUDOMONAL WITH BETA-LACTAMASE INHIBITOR**

**INDICATIONS AND DOSE**
- **Hospital-acquired pneumonia** · Septicaemia · Complicated infections involving the urinary-tract · Complicated infections involving the skin · Complicated infections involving the soft-tissues
  - **BY INTRAVENOUS INFUSION**
    - Neonate: 90 mg/kg every 8 hours.
    - Child 1 month–11 years: 90 mg/kg every 6–8 hours (max. per dose 4.5 g every 6 hours)
    - Child 12–17 years: 4.5 g every 8 hours; increased if necessary to 4.5 g every 6 hours, increased frequency may be used for severe infections

**Piperacillin with tazobactam**

**ELECTROLYTES** May contain Sodium
- Piperacillin with tazobactam (Non-proprietary)
  - Piperacillin with tazobactam 250 mg, Piperacillin (as Piperacillin sodium) 2 gram Piperacillin 2g / Tazobactam 250mg powder for solution for injection vials | 1 vial (P) £7.96 DT price = £7.91 (Hospital only) | 1 vial (P) £6.50–£7.91 DT price = £7.91 | 10 vial (P) £60.30–£70.80
  - Piperacillin with tazobactam 500 mg, Piperacillin (as Piperacillin sodium) 4 gram Piperacillin 4g / Tazobactam 500mg powder for solution for injection vials | 1 vial (P) £11.77–£15.79 (Hospital only) | 1 vial (P) £12.90
  - Piperacillin with tazobactam (Pfizer Ltd)
    - Piperacillin with tazobactam 250 mg, Piperacillin (as Piperacillin sodium) 2 gram Tazocin 2.25g powder for solution for injection vials | 1 vial (P) £7.65 DT price = £7.91
    - Piperacillin with tazobactam 500 mg, Piperacillin (as Piperacillin sodium) 4 gram Tazocin 4.5g powder for solution for injection vials | 1 vial (P) £15.17 (Hospital only)
**Ticarcillin with clavulanic acid**

**INDICATIONS AND DOSE**

Infections due to *Pseudomonas* and *Proteus* spp.
- **BY INTRAVENOUS INFUSION**
  - Preterm neonate (body-weight up to 2 kg): 80 mg/kg every 12 hours.
  - Preterm neonate (body-weight 2 kg and above): 80 mg/kg every 8 hours; increased if necessary to 80 mg/kg every 6 hours, increased frequency used for more severe infections.
  - Neonate: 80 mg/kg every 8 hours; increased if necessary to 80 mg/kg every 6 hours, increased frequency used for more severe infections.
  - Child (body-weight up to 40 kg): 80 mg/kg every 8 hours; increased if necessary to 80 mg/kg every 6 hours, increased frequency used for more severe infections.
  - Child (body-weight 40 kg and above): 3.2 g every 6–8 hours; increased if necessary to 3.2 g every 4 hours, increased frequency used for more severe infections.

**CAUTIONS** High doses may lead to hypernatraemia (owing to sodium content of preparations).

**SIDE-EFFECTS** Eosinophilia - haemorrhagic cystitis (more frequent in children) - hypokalaemia - injection-site reactions - nausea - Stevens-Johnson syndrome - toxic epidermal necrolysis - vomiting

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Trace amounts in milk, but appropriate to use.

**HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.

**RENAL IMPAIRMENT**
- In neonates: Reduce dose if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².
  - Child 1 month–18 years: use normal dose every 8 hours if estimated glomerular filtration rate 30–60 mL/minute/1.73 m²; use half normal dose every 8 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; use half normal dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m². Accumulation of electrolytes contained in preparation can occur in patients with renal failure.
- Caution: Chronic renal failure.

**EFFECT ON LABORATORY TESTS** False-positive urinary glucose (if tested for reducing substances).

**DIRECTIONS FOR ADMINISTRATION** Displacement value may be important, consult local guidelines. For intermittent infusion, dilute reconstituted solution further to a concentration of 16–32 mg/mL, with glucose 5%; infuse over 30–40 minutes.

**PRESCRIBING AND DISPENSING INFORMATION** Dose is expressed as a combination of ticarcillin (as sodium salt) and clavulanic acid (as potassium salt) in a ratio of 15:1.

**MEDICINAL FORMS**

- **Timentin** (GlaxoSmithKline UK Ltd)
  - Clavulanic acid (as Potassium clavulanate) 200 mg, Ticarcillin (as Ticarcillin sodium) 3 g
  - Timentin 3.2 g powder for solution for infusion vials | 4 vial pack | £21.32

**ANTIBACTERIALS > PENICILLINS, BETALACTAMASE SENSITIVE**

**Benzylpenicillin sodium**

(Penicillin G)

**INDICATIONS AND DOSE**

Mild to moderate susceptible infections | Throat infections | Otitis media | Cellulitis | Pneumonia
- **BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Neonate up to 7 days: 25 mg/kg every 12 hours; increased if necessary to 25 mg/kg every 8 hours, intravenous route recommended in neonates.
  - Child: 25 mg/kg every 6 hours; increased if necessary to 50 mg/kg every 4–6 hours (max. per dose 2.4 g every 4 hours) in severe infection, intravenous route recommended in infants

**ENDOCARDITIS (IN COMBINATION WITH OTHER ANTIBACTERIAL IF NECESSARY)**
- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Child: 25 mg/kg every 4 hours; increased if necessary to 50 mg/kg every 4 hours (max. per dose 2.4 g every 4 hours)

**Meningitis | Meningococcal disease**
- **BY INTRAVENOUS INFUSION**
  - Neonate up to 7 days: 50 mg/kg every 12 hours.
  - Neonate 7 days to 28 days: 50 mg/kg every 8 hours.
  - Child: 50 mg/kg every 4–6 hours (max. per dose 2.4 g every 4 hours)

**Suspected meningococcal disease (meningitis with non-blanching rash or meningococcal septicaemia) prior to urgent transfer to hospital**
- **BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION**
  - Child 1–11 months: 300 mg, administrer as single dose prior to urgent transfer to hospital so long as does not delay transfer
  - Child 1–9 years: 600 mg, administrer as single dose prior to urgent transfer to hospital so long as does not delay transfer
  - Child 10–17 years: 1.2 g, administrer as single dose prior to urgent transfer to hospital so long as does not delay transfer

**Suspected bacterial meningitis without non-blanching rash where patient cannot be transferred to hospital urgently**
- **BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
  - Child 1–11 months: 300 mg, administrer as single dose prior to transfer to hospital
### Pharoxymethylpenicillin (Penicillin V)

#### INDICATIONS AND DOSE

**Oral infections**
- **Tonsillitis**
- **Otitis media**
- **Erysipelas**
- **Cellulitis**

**By Mouth**
- **Child 1-11 months:** 62.5 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
- **Child 1-5 years:** 125 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day
- **Child 6-11 years:** 250 mg 4 times a day; increased if necessary up to 12.5 mg/kg 4 times a day

**Neonatal sepsis**
- **By intramuscular, or by slow intravenous injection, or by intravenous infusion**
- **Neonate up to 7 days:** 25 mg/kg every 12 hours; increased if necessary to 50 mg/kg every 8 hours, intravenous route recommended in neonates.
- **Neonate 7 days to 28 days:** 25 mg/kg every 8 hours; increased if necessary to 50 mg/kg every 8 hours in severe infection, intravenous route recommended in neonates.

**EFFECT ON LABORATORY TESTS**
- Trace amounts in milk, but appropriate to use.
- False-positive urinary glucose (if tested for reducing substances).

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use. Intravenous route recommended in neonates and infants. For **intravenous infusion**, dilute with glucose 5% or sodium chloride 0.9%; give over 15–30 minutes. Longer administration time is particularly important when using doses of 50 mg/kg (or greater) to avoid CNS toxicity.

**PROFESSION SPECIFIC INFORMATION**
- **Dental practitioners’ formulary:**
  - Phenoxymethylpenicillin Tablets may be prescribed.
  - Phenoxymethylpenicillin Oral Solution may be prescribed.

**PREGNANCY**
- Not known to be harmful.

**BREAST FEEDING**
- Trace amounts in milk, but appropriate to use.

**CAUTIONS**
- Accumulation of sodium from injection can occur with high doses.

**RENTAL IMPAIRMENT**
- Estimated glomerular filtration rate 10–50 ml/minute/1.73 m² use normal dose every 8–12 hours. Estimated glomerular filtration rate less than 10 ml/minute/1.73 m² use normal dose every 12 hours. Accumulation of sodium from injection can occur in renal failure.
- High doses may cause neurotoxicity, including cerebral irritation, convulsions, or coma.

**Effect on laboratory tests**
- False-positive urinary glucose (if tested for reducing substances).

**IMPORTANT SAFETY INFORMATION**
- Intrathecal injection of benzylpenicillin is not recommended.

**Medicines for Children leaflet:**

**ELECTROLYTES:** May contain Sodium.
### Amoxicillin
(Amoxycillin)

#### INDICATIONS AND DOSE

**Susceptible infections (including urinary-tract infections, otitis media, sinusitis, uncomplicated community acquired pneumonia, salmonellosis, oral infections)**

- **BY MOUTH**
  - Neonate 7 days to 28 days: 30 mg/kg 3 times a day (max. per dose 125 mg).
  - Child 1–11 months: 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
  - Child 1–4 years: 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
  - Child 5–11 years: 500 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day (max. per dose 1 g)
  - Child 12–17 years: 500 mg 3 times a day; increased if necessary up to 1 g 3 times a day, use increased dose in severe infection
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Neonate 7 days to 28 days: 30 mg/kg every 12 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis.
  - Child: 20–30 mg/kg every 8 hours (max. per dose 500 mg), increased if necessary up to 40–60 mg/kg every 8 hours (max. per dose 1 g every 8 hours), increased dose used in severe infection

**Cystic fibrosis (treatment of asymptomatic Haemophilus influenzae carriage or mild exacerbation)**

- **BY MOUTH**
  - Neonate 7 days to 28 days: 30 mg/kg 3 times a day (max. per dose 125 mg).
  - Child 1–11 months: 125 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
  - Child 1–4 years: 250 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day
  - Child 5–11 years: 500 mg 3 times a day; increased if necessary up to 30 mg/kg 3 times a day (max. per dose 1 g)
  - Child 12–17 years: 500 mg 3 times a day; increased if necessary up to 1 g 3 times a day, use increased dose in severe infection
  - **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Neonate 7 days to 28 days: 30 mg/kg every 12 hours, increased dose used in severe infection, community-acquired pneumonia or salmonellosis.

**Prevention of pneumococcal infection in asplenia**

- **BY MOUTH**
  - Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

**Helicobacter pylori eradication in combination with clarithromycin and omeprazole**

- **BY MOUTH**
  - Child 1–5 years: 125 mg twice daily
  - Child 6–11 years: 500 mg twice daily
  - Child 12–17 years: 1 g twice daily

**Helicobacter pylori eradication in combination with metronidazole and omeprazole**

- **BY MOUTH**
  - Child 1–5 years: 125 mg 3 times a day
  - Child 6–11 years: 250 mg 3 times a day
  - Child 12–17 years: 500 mg 3 times a day

#### SPECIAL CAUTIONS

- With intravenous use: Accumulation of sodium can occur with high parenteral doses

#### GENERAL CAUTIONS

- Acute lymphocytic leukaemia (increased risk of erythematous rash)
- Chronic lymphocytic leukaemia (increased risk of erythematous rash)
- Cytomegalovirus infection (increased risk of erythematous rash)
- Glandular fever (erythematous rash common)
- Maintain adequate hydration with high doses (particularly during parenteral therapy)

#### SPECIFIC CAUTIONS

- Increased dose used in severe infection.
Powder for solution for injection

**ELECTROLYTES:** May contain Sodium

**Amoxicillin (Non-proprietary)**

Amoxicillin (as Amoxicillin sodium) 250 mg Amoxicillin 250mg powder for solution for injection vials | 10 vial (PSt) £4.65–£4.80
Amoxicillin (as Amoxicillin sodium) 500 mg Amoxicillin 500mg powder for solution for injection vials | 10 vial (PSt) £8.55–£9.60 DT price = £5.48

**Amoxicillin (as Amoxicillin trihydrate) 100 mg per 1 ml** Amoxicillin 100mg/5ml oral suspension | 100 ml (PSt) £35.00 DT price = £1.15

**Amoxicillin (as Amoxicillin trihydrate) 25 mg per 1 ml** Amoxicillin 25mg/5ml oral suspension sugar free sugar-free | 100 ml (PSt) £25.00 DT price = £1.02
Amoxicillin 125mg/5ml oral suspension | 100 ml (PSt) £25.00 DT price = £0.97
Amoxicillin 250mg/5ml oral suspension | 100 ml (PSt) £35.00 DT price = £1.18

**Amoxicillin (as Amoxicillin trihydrate) 50 mg per 1 ml** Amoxicillin 50mg/5ml oral suspension sugar free sugar-free | 100 ml (PSt) £35.00 DT price = £1.15

**Amoxicillin (as Amoxicillin trihydrate) 100 mg per 1 ml** Amoxicillin 100mg/5ml oral suspension | 100 ml (PSt) £35.00 DT price = £1.15
Group B streptococcal infection | Enterococcal endocarditis (in combination with another antibiotic)

- **BY INTRAVENOUS INFUSION**
  - Neonate up to 7 days: 50 mg/kg every 12 hours.
  - Neonate 7 days to 20 days: 50 mg/kg every 8 hours.
  - Neonate 21 days to 28 days: 50 mg/kg every 6 hours.
  - Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

**Listerial meningitis**

- **BY INTRAVENOUS INFUSION**
  - Neonate up to 7 days: 100 mg/kg every 12 hours.
  - Neonate 7 days to 20 days: 100 mg/kg every 8 hours.
  - Neonate 21 days to 28 days: 100 mg/kg every 6 hours.
  - Child: 50 mg/kg every 4–6 hours (max. per dose 2 g every 4 hours)

**CAUTIONS**

- **GENERAL CAUTIONS**
  - Acute lymphocytic leukaemia (increased risk of erythematous rashes) - chronic lymphocytic leukaemia (increased risk of erythematous rashes) - cytomegalovirus infection (increased risk of erythematous rashes) - glandular fever (erythematous rashes common)
  - With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses

- **SIDE-EFFECTS**
  - Common or very common Nausea - vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Rash If rash occurs, discontinue treatment.
- Pregnancy Not known to be harmful.
- Breast feeding Trace amounts in milk, but appropriate to use.
- Renal impairment If estimated glomerular filtration rate less than 10 mL/minute/1.73 m² reduce dose or frequency; rashes more common.
  - With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur in patients with renal failure.

**DIRECTIONS FOR ADMINISTRATION**

- With oral use Administer at least 30 minutes before food.
- With intravenous use Displacement value may be significant when reconstituting injection, consult local guidelines. Dilute intravenous injection to a concentration of 50–100 mg/mL. May be further diluted with glucose 5% or 10% or sodium chloride 0.9% or 0.45% for infusion. Give over 30 minutes when using doses of greater than 50 mg/kg to avoid CNS toxicity including convulsions.

**PATIENT AND CARER ADVICE**

- Medicines for Children leaflet: Ampicillin for bacterial infection www.medicinesforchildren.org.uk/ampicillin-bacterial-infection

**MEDICINAL FORMS**

There can be a variation in the licensing of different medicines containing the same drug.

- **Capsule**
  - Ampicillin (Non-proprietary)
  - Ampicillin 250 mg Ampicillin 250 mg capsules | 28 capsule £25.00 DT price + £5.48
  - Ampicillin 500 mg Ampicillin 500 mg capsules | 28 capsule £35.00 DT price + £23.92
  - Penbritin (Chemidex Pharma Ltd)
  - Ampicillin 250 mg Penbritin 250 mg capsules | 28 capsule £2.10 DT price + £5.48
  - Ampicillin 500 mg Penbritin 500 mg capsules | 28 capsule £5.28 DT price + £25.92

Oral suspension

- **CAUTIONARY AND ADVISORY LABELS 9, 23**
  - Ampicillin (Non-proprietary)
    - Ampicillin 25 mg per 1 ml Ampicillin 125 mg/mL oral suspension | 100 ml £29.86 DT price + £29.86
    - Ampicillin 50 mg per 1 ml Ampicillin 250 mg/mL oral suspension | 100 ml £38.86 DT price + £38.86

**Powder for solution for injection**

- Ampicillin (Non-proprietary)
  - Ampicillin (as Ampicillin sodium) 500 mg Ampicillin 500 mg powder for solution for injection vials | 10 vial £78.30 DT price + £78.30

**Co-fluampicil**

- **INDICATIONS AND DOSE**
  - Mixed infections involving beta-lactamase-producing staphylococci
    - **By mouth**
      - Child 1 month–9 years: 125/250 mg every 6 hours
      - Child 10–17 years: 250/250 mg every 6 hours
    - **By intramuscular injection, or by slow intravenous injection, or by intravenous infusion**
      - Child 1 month–1 year: 62.5/62.5 mg every 6 hours
      - Child 2–9 years: 125/125 mg every 6 hours
      - Child 10–17 years: 250/250 mg every 6 hours
  - Severe mixed infections involving beta-lactamase-producing staphylococci
    - **By mouth**
      - Child 1 month–9 years: 250/250 mg every 6 hours
      - Child 10–17 years: 500/500 mg every 6 hours
    - **By intramuscular injection, or by slow intravenous injection, or by intravenous infusion**
      - Child 1 month–1 year: 125/125 mg every 6 hours
      - Child 2–9 years: 250/250 mg every 6 hours
      - Child 10–17 years: 500/500 mg every 6 hours

**IMPORTANT SAFETY INFORMATION**

- **HEPATIC DISORDERS**
  - Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:
  - flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin;
  - flucloxacillin should be used with caution in patients with hepatic impairment;
  - careful enquiry should be made about hypersensitivity reactions to beta-lactam antibiotics.

**CAUTIONS**

- **GENERAL CAUTIONS**
  - Acute lymphocytic leukaemia (increased risk of erythematous rashes) - chronic lymphocytic leukaemia (increased risk of erythematous rashes) - cytomegalovirus infection (increased risk of erythematous rashes) - glandular fever (erythematous rashes common)

**SPECIFIC CAUTIONS**

- With intravenous use Accumulation of electrolytes contained in parenteral preparations can occur with high doses - risk of kernicterus in jaundiced neonates when high doses given parenterally

- **SIDE-EFFECTS**
  - Common or very common Gastro-intestinal disturbances - nausea - vomiting
  - Very rare Cholestatic jaundice - hepatitis

**SIDE-EFFECTS, FURTHER INFORMATION**

- Rash If rash occurs, discontinue treatment.
**CO-AMOXICLAV**

**Indications**
- Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate), including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, and animal bites.
  - **Adults and Children over 12 years**: 1.25 g every 8 hours.
  - **Children 12-17 years (body weight 22-41 kg)**: 5 mL twice daily.
  - **Children 12-17 years (body weight over 41 kg)**: 10 mL twice daily.

**Contraindications**
- History of co-amoxiclav-associated jaundice or hepatic dysfunction.
- History of penicillin-associated jaundice or hepatic dysfunction.

**Warnings and Precautions**
- Use with caution in patients with a history of co-amoxiclav-associated jaundice or hepatic dysfunction.
- Pregnancy: Use with caution.

**Adverse Reactions**
- **Common Side-Effects**
  - Rash
  - Headache
  - Nausea
  - Diarrhoea
  - Vomiting

**Dosing**
- **Children**
  - **0-11 months**: 0.25 mL/kg every 8 hours.
  - **12-23 months**: 0.5 mL/kg every 8 hours.
- **Adults**
  - **1.25 g every 8 hours**.

**Pharmacokinetics**
- **Absorption**
  - Oral suspension
  - **Bioavailability**
  - **Distribution**
  - **Metabolism**
  - **Excretion**

**Special Populations**
- **Renal Impairment**: Reduce dose or frequency if estimated filtration rate less than 10 mL/minute/1.73 m²; doses more common.
- **Liver Impairment**: Use with caution.
- **Pregnancy**: Use with caution.

**Dose Adjustments**
- **Children**: Doses expressed as a combination of equal parts by mass of flucloxacillin and amoxicillin.
- **Adults**: Doses are expressed as co-amoxiclav.

**Pharmacology**
- A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

**BNFC 2016–2017**

---

**ANTIBACTERIALS**

**PENICILLINS, BROAD-SPECTRUM WITH BETA-LACTAMASE INHIBITOR**

**Co-amoxiclav**

### Indications and Dose

- **Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate), including respiratory tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, and animal bites**
  - **ORAL USE**
    - **Child 1-5 years**: 0.25 mL/kg 3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection
    - **Infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, bone and joint infections, genito-urinary and abdominal infections, cellulitis, animal bites (doses for 250/62 suspension)**
      - **BY MOUTH USING ORAL SUSPENSION**
      - **Child 6-11 years**: 0.15 mL/kg 3 times a day, alternatively 5 mL 3 times a day, dose doubled in severe infection
  - **Parenteral use**
    - **Reduce dose or frequency if estimated filtration rate less than 10 mL/minute/1.73 m²**

### Contraindications
- History of co-amoxiclav-associated jaundice or hepatic dysfunction
- History of penicillin-associated jaundice or hepatic dysfunction

### Warnings and Precautions
- Use with caution in patients with a history of co-amoxiclav-associated jaundice or hepatic dysfunction
- Pregnancy: Use with caution

### Adverse Reactions
- **Common Side-Effects**
  - Rash
  - Headache
  - Prolongation of bleeding time

### Dosing
- **Children**
  - **0-11 months**: 0.25 mL/kg 3 times a day
  - **12-23 months**: 0.5 mL/kg 3 times a day

### Pharmacokinetics
- **Absorption**
  - **Bioavailability**
  - **Distribution**
  - **Metabolism**
  - **Excretion**

### Special Populations
- **Renal Impairment**: Reduce dose or frequency if estimated filtration rate less than 10 mL/minute/1.73 m²; doses more common
- **Liver Impairment**: Use with caution
- **Pregnancy**: Use with caution

### Dose Adjustments
- **Children**: Doses expressed as a combination of equal parts by mass of flucloxacillin and amoxicillin
- **Adults**: Doses are expressed as co-amoxiclav

### Pharmacology
- A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.
### 324 Bacterial infection

**MEDICINAL FORMS**

- **With intravenous use**
  - Phlebitis at injection site
  - Discontinue treatment.
- **PREGNANCY**
  - Not known to be harmful.
- **BREAST FEEDING**
  - Trace amount in milk, but appropriate to use.
- **HEPATIC IMPAIRMENT**
  - Monitor liver function in liver disease.
- **RENAL IMPAIRMENT**
  - Doses are halved every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
  - Use half normal dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Risk of crystalluria with high doses** (particularly during parenteral therapy). Accumulation of electrolytes contained in parenteral preparations can occur in patients on parenteral therapy.

**SPECIFIC SIDE-EFFECTS**

- **Renal impairment**
  - With oral use:
    - Rare
    - Frequency not known

**RENAL IMPAIRMENT**

- With oral use **Co-amoxiclav 125/31 suspension, 250/62 suspension, 500/125 tablets**
  - Use normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m².
  - Use normal dose every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**SIDE-EFFECTS**

- **Skin**
  - Glucagonoma syndrome
  - Vasculitis
  - Johnson syndrome
  - Superficial staining of teeth with suspension

**PENICILLINS, MECillinAM-TYPE**

- **Clavulanic acid (as Potassium clavulanate) 125 mg**
  - Amoxicillin (as Amoxicillin trihydrate) 875 mg
  - **Augmentin (GlaxoSmithKline UK Ltd)**
    - Clavulanic acid (as Potassium clavulanate) 125 mg, Amoxicillin (as Amoxicillin trihydrate) 250 mg
    - Amoxicillin 375 mg tablets
  - **Augmentin (GlaxoSmithKline UK Ltd)**
    - Clavulanic acid (as Potassium clavulanate) 125 mg, Amoxicillin (as Amoxicillin trihydrate) 500 mg
    - Amoxicillin 625 mg tablets

**ELECTROLYTES**

- May contain Potassium, sodium.
- Risk of crystalluria with high doses (particularly during parenteral therapy). Accumulation of electrolytes contained in parenteral preparations can occur in patients on parenteral therapy.

**PENICILLINS, MECillinAM-TYPE**

- **Clavulanic acid (as Potassium clavulanate) 6.25 mg per 1 ml**
  - Amoxicillin (as Amoxicillin trihydrate) 25 mg per 1 ml
  - **Co-amoxiclav 125mg/31mg/5ml oral suspension**
    - 100 ml (PSt) £5.00 DT price = £5.00
    - Co-amoxiclav 125mg/31mg/5ml oral suspension sugar free sugar-free
      - 100 ml (PSt) £13.79
  - **Clavulanic acid (as Potassium clavulanate) 12.5 mg per 1 ml**
    - Amoxicillin (as Amoxicillin trihydrate) 50 mg per 1 ml
    - **Co-amoxiclav 250mg/62mg/5ml oral suspension**
      - 100 ml (PSt) £13.79
      - Co-amoxiclav 250mg/62mg/5ml oral suspension sugar free sugar-free
        - 100 ml (PSt) £16.62

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Frequency not known**
  - Exfoliative dermatitis
  - Stevens–Johnson syndrome
  - Toxic epidermal necrolysis
  - Vasculitis

**SPECIFIC SIDE-EFFECTS**

- **Rare**
  - Frequency not known

**RECOMMENDED DOSAGES**

- **Oral suspension**
  - Initial dose and then use half normal dose every 12 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m².
  - Use half normal dose every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

**DIRECTIONS FOR ADMINISTRATION**

- For intravenous infusion, dilute reconstituted solution to a concentration of 10 mg/mL with Sodium Chloride 0.9%; give intermittently over 30–40 minutes. For intravenous injection, administer over 3–4 minutes.

**PRESCRIBING AND DISPENSING INFORMATION**

- Doses are expressed as co-amoxiclav: a mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively.

- With oral use
  - Flavours of oral liquid formulations may include raspberry and orange.

**PENICILLINS, MECillinAM-TYPE**

- **Clavulanic acid (as Potassium clavulanate) 12.5 mg per 1 ml**
  - Amoxicillin (as Amoxicillin trihydrate) 50 mg per 1 ml
  - **Augmentin 125/31 SF oral suspension sugar-free**
    - 35 ml (PSt) £4.13 DT price = £4.13 sugar-free
    - 70 ml (PSt) £6.97 DT price = £5.79
  - **Augmentin-Duo (GlaxoSmithKline UK Ltd)**
    - Clavulanic acid (as Potassium clavulanate) 11.4 mg per 1 ml
      - Amoxicillin (as Amoxicillin trihydrate) 80 mg per 1 ml
      - **Co-amoxiclav 400mg/57mg/5ml oral suspension sugar-free**
        - 35 ml (PSt) £4.13 DT price = £4.13 sugar-free
        - 70 ml (PSt) £6.97 DT price = £5.79

**Powder for solution for injection**

- **Electrolytes**: May contain Potassium, sodium.
  - **Co-amoxiclav (non-proprietary)**
    - Clavulanic acid (as Potassium clavulanate) 100 mg, Amoxicillin (as Amoxicillin sodium) 500 mg
    - **Co-amoxiclav 500mg/100mg powder for solution for injection vials**
      - 10 vial (PSt) £11.39–£14.90
  - **Clavulanic acid (as Potassium clavulanate) 200 mg, Amoxicillin (as Amoxicillin sodium) 1000 mg**
    - **Co-amoxiclav 1000mg/200mg powder for solution for injection vials**
      - 10 vial (PSt) £29.70
  - **Augmentin Intraavenous (GlaxoSmithKline UK Ltd)**
    - Clavulanic acid (as Potassium clavulanate) 100 mg, Amoxicillin (as Amoxicillin sodium) 500 mg
      - Augmentin Intraavenous 600mg powder for solution for injection vials
        - 10 vial (PSt) £10.60
  - **Clavulanic acid (as Potassium clavulanate) 200 mg, Amoxicillin (as Amoxicillin sodium) 1000 mg**
    - Augmentin Intraavenous 1.2g powder for solution for injection vials
      - 10 vial (PSt) £10.60

### 316 Pivmecillinam hydrochloride

**INDICATIONS AND DOSE**

- **Acute uncomplicated cystitis**
  - **By mouth**
    - Child (body-weight 40 kg and above): Initially 400 mg for 1 dose, then 200 mg every 8 hours for 3 days
  - **Chronic or recurrent bacteriuria**
    - **By mouth**
      - Child (body-weight 40 kg and above): 400 mg every 6–8 hours
Bacterial infection

Flucloxacillin

### Indications and Dose

- **Infections due to beta-lactamase-producing staphylococci including otitis externa | Adjunct in pneumonia | Adjunct in impetigo | Adjunct in cellulitis**
  - **By mouth**
  - Neonate up to 7 days: 25 mg/kg twice daily.
  - Neonate 7 days to 20 days: 25 mg/kg 3 times a day.
  - Neonate 21 days to 28 days: 25 mg/kg 4 times a day.
  - Child 1 month-1 year: 62.5–125 mg 4 times a day
  - Child 2–9 years: 125–250 mg 4 times a day
  - Child 10–17 years: 250–500 mg 4 times a day
  - **By intramuscular injection**
  - Child: 12.5–25 mg/kg every 6 hours (max. per dose 500 mg every 6 hours)
  - **By slow intravenous injection, or by intravenous infusion**
  - Neonate up to 7 days: 25 mg/kg every 12 hours.
  - Neonate 7 days to 20 days: 25 mg/kg every 8 hours.

- **Severe infections due to beta-lactamase-producing staphylococci including otitis externa | Adjunct in pneumonia (severe infection) | Adjunct in impetigo (severe infection) | Adjunct in cellulitis (severe infection)**
  - **By slow intravenous injection, or by intravenous infusion**

- Neonate up to 7 days: 50 mg/kg every 12 hours.
- Neonate 7 days to 20 days: 50 mg/kg every 8 hours.
- Neonate 21 days to 28 days: 50 mg/kg every 6 hours.
- Child: 25–50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

- **Endocarditis (in combination with other antibacterial if necessary)**
  - **By slow intravenous injection, or by intravenous infusion**
  - Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

- **Osteomyelitis**
  - **By slow intravenous injection, or by intravenous infusion**

- Neonate up to 7 days: 50–100 mg/kg every 12 hours.
- Neonate 7 days to 20 days: 50–100 mg/kg every 8 hours.
- Neonate 21 days to 28 days: 50–100 mg/kg every 6 hours.
- Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

- **Cerebral abscess | Staphylococcal meningitis**
  - **By slow intravenous injection, or by intravenous infusion**

- Neonate up to 7 days: 50–100 mg/kg every 12 hours.
- Neonate 7 days to 20 days: 50–100 mg/kg every 8 hours.
- Neonate 21 days to 28 days: 50–100 mg/kg every 6 hours.
- Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

- **Staphylococcal lung infection in cystic fibrosis**
  - **By mouth**
  - Child: 25 mg/kg 4 times a day (max. per dose 1 g), alternatively 100 mg/kg daily in 3 divided doses; maximum 4 g per day
  - **By slow intravenous injection, or by intravenous infusion**
  - Child: 50 mg/kg every 6 hours (max. per dose 2 g every 6 hours)

- **Prevention of Staphylococcus aureus lung infection in cystic fibrosis—primary prevention**
  - **By mouth**
  - Neonate: 125 mg twice daily.
  - Child 1 month-3 years: 125 mg twice daily

- **Prevention of Staphylococcus aureus lung infection in cystic fibrosis—secondary prevention**
  - **By mouth**
  - Child: 50 mg/kg twice daily (max. per dose 1 g twice daily)

### Important Safety Information

- **Hepatic Disorders**
  - Cholestatic jaundice and hepatitis may occur very rarely, up to two months after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. Healthcare professionals are reminded that:
- **fluocloxacillin** should not be used in patients with a history of hepatic dysfunction associated with fluocloxacillin
- Fluocloxacillin should be used with caution in patients with hepatic impairment
- Careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials

**Side-effects**

With intravenous use, accumulation of electrolytes can occur with high doses - risk of kernicterus in jaundiced neonates when high doses given parenterally.

**Directions for Administration**

- With intravenous use: Accumulation of electrolytes can occur in patients with renal failure.
- **Effect on Laboratory Tests**: False-positive urinary glucose (if tested for reducing substances).

**Directions for Administration**

- With intravenous use: For intravenous infusion, dilute reconstituted solution in Glucose 5% or Sodium Chloride 0.9% and give intermittently over 30–60 minutes.

**Patient and Carer Advice**

Medicines for Children leaflet: Flucloxacillin for bacterial infections www.medicinesforchildren.org.uk/fluocloxacillin-for-bacterial-infections

**Medicinal Forms**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion

- **Capsule**
  - **CAUTIONARY AND ADVISORY LABELS 9, 23**
    - Fluocloxacillin (Non-proprietary)

    - **Flucloxacillin (as Flucloxacillin sodium) 500 mg**: Flucloxacillin 500mg powder for solution for injection vials | 10 vial POM £20.85
      - £24.50
    - **Flucloxacillin (as Flucloxacillin sodium) 1 gram**: Flucloxacillin 1g powder for solution for injection vials | 10 vial POM £41.75
      - £49.00

**Antibacterials > Polyoxinns**

- **Colistimethate sodium**
  - **(Colistin sulfometholate sodium)**
  - **Drug Action**: The polyoxin antibiotic, colistimethate sodium (colistin sulfometholate sodium), is active against Gram-negative organisms including *Pseudomonas aeruginosa*, *Acinetobacter baumanii*, and *Klebsiella pneumoniae*. It is not absorbed by mouth and thus needs to be given by injection for a systemic effect.

- **Indications and Dose**
  - **Gram-negative infections resistant to other antibacterials, including those caused by Pseudomonas aeruginosa, Acinetobacter baumanii and Klebsiella pneumoniae**
    - **BySlowIntravenousInjection,orbyIntravenousInfusion**
      - **Child** (body-weight up to 60 kg): 50 000–75 000 units/kg daily in 3 divided doses, to be administered into a totally implantable venous access device when giving slow intravenous injection
      - **Child** (body-weight 60 kg and above): 1–2 million units 3 times a day, to be administered into a totally implantable venous access device when giving via slow intravenous injection; maximum 6 million units per day
  - **Adjunct to standard antibacterial therapy for Pseudomonas aeruginosa infection in cystic fibrosis**
    - **By Inhalation of Nebulised Solution**
      - **Child 1 month–1 year**: 0.5–1 million units twice daily, adjusted according to response, increased to 2 million units 3 times daily for subsequent respiratory isolates of *Pseudomonas aeruginosa*
      - **Child 2–17 years**: 1–2 million units twice daily, adjusted according to response, increased to 2 million units 3 times daily for subsequent respiratory isolates of *Pseudomonas aeruginosa*

**Promixin**

- **Gram-negative infections resistant to other antibacterials, including those caused by Pseudomonas aeruginosa, Acinetobacter baumanii, and Klebsiella pneumoniae**
  - **By Slow Intravenous Injection, or by Intravenous Infusion**
    - **Child** (body-weight up to 40 kg): 75 000–150 000 units/kg daily in 3 divided doses, to be administered into a totally implantable venous access device when giving slow intravenous injection
    - **Child** (body-weight 40 kg and above): 9 million units daily in 2–3 divided doses, to be administered into a totally implantable venous access device when giving via slow intravenous injection

**Promixin**

- **Management of chronic pulmonary infections due to Pseudomonas aeruginosain patients with cystic fibrosis**
  - **By Inhalation of Nebulised Solution**
    - **Child 1 month–1 year**: 0.5–1 million units twice daily, for specific advice on administration using nebulisers—consult product literature; maximum 2 million units per day
    - **Child 2–17 years**: 1–2 million units 2–3 times a day, for specific advice on administration using nebulisers—consult product literature; maximum 6 million units per day

**Contra-Indications**: Myasthenia gravis
Bacterial infection 327

Quinolones

Overview

Ciprofloxacin p. 328 is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including salmonella, shigella, campylobacter, neisseria, and pseudomonas. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as Streptococcus pneumoniae and Enterococcus faecalis; it should not be used for pneumococcal pneumonia. It is active against chlamydia and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin is licensed in children over 1 year of age for pseudomonal infections in cystic fibrosis, for complicated urinary-tract infections, and for treatment and prophylaxis of inhalation anthrax. When the benefits of treatment outweigh the risks, ciprofloxacin is licensed in children over 1 year of age for severe infections of the respiratory tract and of the gastrointestinal system (including typhoid fever). It is also used in the treatment of septicaemia caused by multi-resistant organisms (usually hospital acquired) and gonorrhoea (although resistance is increasing). Ciprofloxacin is also used in the prophylaxis of meningococcal disease.

ANTIBACTERIALS > QUINOLONES
Nalidixic acid p. 329 may be used in uncomplicated urinary-tract infections that are resistant to other antibiotics in children over 3 months of age. Many staphylococci are resistant to quinolones and their use should be avoided in MRSA infections. Oftocin eye drops p. 631 are used in ophthalmic infections. There is much less experience of the other quinolones in children; expert advice should be sought.

Quinolones

> **IMPORTANT SAFETY INFORMATION**
> The CSM has warned that quinolones may induce *convulsions* in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them.

**TENDON DAMAGE**
Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:
- quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use;
- the risk of tendon damage is increased by the concomitant use of corticosteroids;
- if tendinitis is suspected, the quinolone should be discontinued immediately.

**CONTRA-INDICATIONS**
History of tendon disorders related to quinolone use

**CAUTIONS**
Can prolong the QT interval. Children or adolescents (arthritis; arthropathy has developed in weight-bearing joints in young animals) - conditions that predispose to seizures - exposure to excessive sunlight should be avoided (discontinue if photosensitivity occurs) - G6PD deficiency - history of epilepsy - myasthenia gravis (risk of exacerbation)

**CAUTIONS, FURTHER INFORMATION**
Quinolones cause arthropathy in the weight-bearing joints of immature animals and are therefore generally not recommended in children and growing adolescents. However, the significance of this effect in humans is uncertain and in some specific circumstances short-term use of either ciprofloxacin or nalidixic acid may be justified in children.

**INTERACTIONS**
Appendix 1 (quinolones). 

**SIDE-EFFECTS**
- **Common or very common** Diarrhoea · dizziness · headache · nausea · vomiting
- **Uncommon** Abdominal pain · anorexia · anxiety · arthralgia · asthenia · blood disorders · confusion · depression · disturbances in taste · disturbances in vision · dyspepsia · eosinophilia · hallucinations · leucopenia · myalgia · rash · sleep disturbances · thrombocytopenia · tremor
- **Rare** Antibiotic-associated colitis · convulsions · disturbances in hearing · disturbances in smell · dysphoea · hepatic dysfunction · hepatitis · hypotension · interstitial nephritis · jaundice · photosensitivity · psychoses · renal failure · symptoms of peripheral neuropathy (sometimes irreversible) · tendon damage · tendon inflammation · vasculitis
- **Very rare** Stevens-Johnson syndrome · toxic epidermal necrolysis

**SIDE-EFFECTS, FURTHER INFORMATION**
The drug should be discontinued if psychiatric, neurological, or hypersensitivity reactions (including severe rash) occur.

**INDICATIONS AND DOSE**

**Fistulating Crohn’s disease**
- **BY MOUTH**
  - Child: 5 mg/kg twice daily
**Severe respiratory-tract infections, gastro-intestinal infection**
- **BY MOUTH**
  - Child: 20 mg/kg twice daily (max. per dose 750 mg)
  - **BY INTRAVENOUS INFUSION**
  - Neonate: 15 mg/kg twice daily.
  - Child: 10 mg/kg every 8 hours (max. per dose 400 mg), to be given over 60 minutes.
**Pseudomonal lower respiratory-tract infection in cystic fibrosis**
- **BY MOUTH**
  - Child: 20 mg/kg twice daily (max. per dose 750 mg)
  - **BY INTRAVENOUS INFUSION**
  - Child: 10 mg/kg every 8 hours (max. per dose 400 mg), to be given over 60 minutes
**Complicated urinary-tract infections**
- **BY MOUTH**
  - Neonate: 10 mg/kg twice daily.
  - Child: 10 mg/kg twice daily, dose to be doubled in severe infection (max. 750 mg twice daily)
  - **BY INTRAVENOUS INFUSION**
  - Neonate: 6 mg/kg every 12 hours, to be given over 60 minutes.
  - Child: 6 mg/kg every 8 hours; increased to 10 mg/kg every 8 hours (max. per dose 400 mg), in severe infection
**Gonorrhoea**
- **BY MOUTH**
  - Child 12-17 years: 500 mg for 1 dose
**Anthrax (treatment and post-exposure prophylaxis)**
- **BY MOUTH**
  - Child: 15 mg/kg twice daily (max. per dose 500 mg)
  - **BY INTRAVENOUS INFUSION**
  - Child: 10 mg/kg every 12 hours (max. per dose 400 mg)
**Prevention of secondary case of meningococcal meningitis**
- **BY MOUTH**
  - Neonate: 30 mg/kg (max. per dose 125 mg) for 1 dose.
  - Child 1 month–4 years: 30 mg/kg (max. per dose 125 mg) for 1 dose
  - Child 5–11 years: 250 mg for 1 dose
  - Child 12–17 years: 500 mg for 1 dose

**UNLICENSED USE**

**Ciprofloxacin**

**ALLERGY AND CROSS-SENSITIVITY**
Use of quinolones contra-indicated in quinolone hypersensitivity.

**PREGNANCY**
Avoid in pregnancy—shown to cause arthropathy in animal studies; safer alternatives are available.
Bacterial infection 329

● CAUTIONS

Acute myocardial infarction (risk factor for QT interval prolongation) - avoid excessive alkalinity of urine (risk of crystalluria). Bradycardia (risk factor for QT interval prolongation) - congenital long QT syndrome (risk factor for QT interval prolongation) - electrolyte disturbances (risk factor for QT interval prolongation) - ensure adequate fluid intake (risk of crystalluria) - heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) - history of symptomatic arrhythmias (risk factor for QT interval prolongation).

● INTERACTIONS

Caution if concomitant use with other drugs known to prolong the QT interval.

● SIDE-EFFECTS

▶ Common or very common

- With intravenous use Flutaneous - pain at injection site - phlebitis at injection site
- With oral use Flatulence

- Rare Abnormal dreams - chest pain - dysphagia - dyspnoea - erythema nodosum - hot flushes - hyperglycaemia - hyperglycaemia - oedema - pancreatitis - sweating - syncope - tachycardia

- Very rare Intracranial hypertension - movement disorders - tenosynovitis - tinnitus - vasculitis

- Frequency not known Peripheral neuropathy - polyneuropathy

● PREGNANCY

A single dose of ciprofloxacin may be used for the prevention of a secondary case of meningococcal meningitis.

● BREAST FEEDING

Amount too small to be harmful but manufacturer advises avoid.

● RENAL IMPAIRMENT

Reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m² – consult product literature.

● PRESCRIBING AND DISPENSING INFORMATION

Flavours of oral liquid formulations may include strawberry.

● PATIENT AND CARER ADVICE

Driving and skilled tasks

May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol.

Medicines for Children leaflet: Ciprofloxacin for bacterial infections www.medicinesforchildren.org.uk/ciprofloxacin-bacterial-infections-0

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Nalidixic acid**

● INDICATIONS AND DOSE

Treatment of urinary tract infection resistant to other antibiotics

- BY MOUTH

  - Child 3 months–11 years: 12.5 mg/kg 4 times a day for 7 days, then reduced to 7.5 mg/kg 4 times a day for prolonged therapy in chronic infections

  - Child 12–17 years: 900 mg 4 times a day for 7 days, then reduced to 600 mg 4 times a day for prolonged therapy in chronic infections

● Prophylaxis of urinary tract infections resistant to other antibiotics

- BY MOUTH

  - Child 3 months–11 years: 15 mg/kg twice daily

● UNLICENSED USE

Not licensed for use in children under 3 months of age.

● CAUTIONS

Acute myocardial infarction (risk factor for QT interval prolongation) - avoid in Acute porphyrias p. 562 - bradycardia (risk factor for QT interval prolongation) - congenital long QT syndrome (risk factor for QT interval prolongation) - electrolyte disturbances (risk factor for QT interval prolongation) - heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) - history of symptomatic arrhythmias (risk factor for QT interval prolongation).

● INTERACTIONS

Caution if concomitant use with other drugs known to prolong the QT interval.

● SIDE-EFFECTS

Cranial nerve palsy - increased intracranial pressure - metabolic acidosis - peripheral neuropathy - toxic psychosis

● BREAST FEEDING

Risk to infant very small but one case of haemolytic anaemia reported.

● HEPATIC IMPAIRMENT

Manufacturer advises caution in liver disease.

● RENAL IMPAIRMENT

Use with caution; avoid if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

Monitor blood counts, renal and liver function if treatment exceeds 2 weeks.
Infection

**ANTIBACTERIALS > SULFONAMIDES**

**Co-trimoxazole**

**DRUG ACTION** Sulfamethoxazole and trimethoprim are used in combination (as co-trimoxazole) because of their synergistic activity (the importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic).

**INDICATIONS AND DOSE**

**Treatment of susceptible infections**

- **BY MOUTH**
  - Child: 6 weeks–5 months: 120 mg twice daily, alternately 24 mg/kg twice daily
  - Child: 6 months–5 years: 240 mg twice daily, alternatively 24 mg/kg twice daily
  - Child: 6–11 years: 480 mg twice daily, alternatively 24 mg/kg twice daily
  - Child: 12–17 years: 960 mg twice daily

- **BY INTRAVENOUS INJECTION**
  - Child: 6 weeks–7 years: 18 mg/kg every 12 hours; increased to 27 mg/kg every 12 hours (max. per dose 1.44 g), increased dose used in severe infection

**Treatment of Pneumocystis jirovecii (Pneumocystis carinii) infections (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature)**

- **BY MOUTH, OR BY INTRAVENOUS INFUSION**
  - Child: 120 mg/kg daily in 2–4 divided doses for 14–21 days, oral route preferred for children

**Prophylaxis of Pneumocystis jirovecii (Pneumocystis carinii) infections**

- **BY MOUTH**
  - Child: 450 mg/m² twice daily (max. per dose 960 mg twice daily) for 3 days of the week (either consecutively or on alternate days), dose regimen may vary, consult local guidelines

**DOSE EQUIVALENCE AND CONVERSION**

480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg.

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Frequent**
  - Rhabdomyolysis reported in HIV-infected patients

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Frequent**
  - Rhabdomyolysis reported in HIV-infected patients

**INTERACTIONS** → Appendix 1 (trimethoprim, sulfamethoxazole).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

**CONTRA-INDICATIONS** Acute porphyrias p. 562

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry and strawberry.

**EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances).

**IMPORTANT SAFETY INFORMATION**

**RESTRICTIONS ON THE USE OF CO-TRIMOXAZOLE**

Co-trimoxazole is the drug of choice in the prophylaxis and treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia; it is also indicated for nocardiosis, *Stenotrophomonas maltophilia* infection [unlicensed indication], and toxoplasmosis. It should only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract when there is bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in acute otitis media in children when there is good reason to prefer it. Co-trimoxazole is also used for the treatment of infections caused by *Burkholderia cepacia* in cystic fibrosis [unlicensed indication].

**CAUTIONS** Asthma: avoid in blood disorders (unless under specialist supervision); avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus - G6PD deficiency (risk of haemolytic anaemia) - maintain adequate fluid intake - predisposition to folate deficiency

**REVIEWS** → Appendix 1 (trimethoprim, sulfamethoxazole).

**MONITORING REQUIREMENTS**

- Plasma concentration monitoring may be required with high doses; seek expert advice.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intermittent *intravenous infusion*, may be further diluted in glucose 5% and 10% or sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and the required dose infused over max. 60 minutes; check container for haze or precipitant during administration. In
severe fluid restriction may be given undiluted via a central venous line.

- **PRESCRIBING AND DISPENSING INFORMATION**
  - Co-trimoxazole is a mixture of trimethoprim and sulfamethoxazole (sulphamethoxazole) in the proportions of 1 part to 5 parts.
  - With oral use Flavours of oral liquid formulations may include banana, or vanilla.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.

  - **Tablet**

**Sulfadiazine** *(Sulphadiazine)*

- **DRUG ACTION**
  - Sulfadiazine is a short-acting sulphonamide with bacteriostatic activity against a broad spectrum of organisms. The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

- **INDICATIONS AND DOSE**
  - **Toxoplasmosis in pregnancy (in combination with pyrimethamine and folinic acid)**
    - **BY MOUTH**
      - Child 12-17 years: 1 g 3 times a day until delivery
      - Congenital toxoplasmosis (in combination with pyrimethamine and folinic acid)**
        - **BY MOUTH**
          - Neonate: 50 mg/kg twice daily for 12 months.

  - **UNLICENSED USE**
    - Not licensed for use in toxoplasmosis.

  - **CONTRA-INDICATIONS**
    - Acute porphyrias p. 562

  - **CAUTIONS**
    - Asthma - avoid in blood disorders (unless under specialist supervision) - avoid in infants under 6 weeks (except for treatment or prophylaxis of *pneumocystis pneumonia* because of the risk of kernicterus - G6PD deficiency (risk of haemolytic anaemia) - maintain adequate fluid intake - predisposition to folate deficiency

  - **INTERACTIONS**
    - Appendix 1 (sulfonamides).

- **SIDE-EFFECTS**
  - Common or very common Diarrhoea - headache - hyperkalaemia - nausea - rash
  - Uncommon Vomiting
  - Rare Agranulocytosis - bone marrow depression
  - Frequency not known Benign intracranial hypertension - hypothyroidism - optic neuropathy - rhabdomyolysis reported in HIV-infected patients

  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Blood disorders or rash Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity) develop.

  - **PREGNANCY**
    - Risk of neonatal haemolysis and methaemoglobinaemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.

  - **BREAST FEEDING**
    - Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.

  - **HEPATIC IMPAIRMENT**
    - Use with caution in mild to moderate impairment; avoid in severe impairment.

  - **RENAL IMPAIRMENT**
    - Use with caution in mild to moderate impairment; avoid in severe impairment; high risk of crystalluria.

  - **MONITORING REQUIREMENTS**
    - Monitor blood counts on prolonged treatment.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  - **Tablet**
    - **CAUTIONARY AND ADVISORY LABELS**
      - Sulfadiazine (Non-proprietary)
        - Sulfadiazine 500 mg Sulfadiazine 500mg tablets | 56 tablet (PDM) £85.55 DT price = £81.99

**ANTIBACTERIALS › TETRACYCLINES AND RELATED DRUGS**

**Tetracyclines**

**Overview**

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. In children under 12 years of age they are useful for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline p. 332 with either streptomycin p. 293 or rifampicin p. 342), and the spirochaete, *Borrelia burgdorferi* (See Lyme disease). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic respiratory diseases (because of their activity against *Haemophilus influenzae*), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin p. 310).

Microbiologically, there is little to choose between the various tetracyclines, the only exception being minocycline...
Infection

HEPATIC IMPAIRMENT

SIDE-EFFECTS

INTERACTIONS

Tetracyclines

CONTRA-INDICATIONS
Children under 12 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia).

CAUTIONS
Myasthenia gravis (muscle weakness may be increased).

INTERACTIONS
Appendix 1 (tetracyclines).

SIDE-EFFECTS
Rare

Antacids, and aluminium, calcium, iron, magnesium and zinc salts decrease the absorption of tetracyclines. Use with caution in those receiving potentially hepatotoxic drugs.

SIDE-EFFECTS
Exfoliative dermatitis

Frequency not known
 Antibiotic-associated colitis

Benign intracranial hypertension

PREGNANCY
Should not be given to pregnant women.

BREAST FEEDING
Should not be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).

HEPATIC IMPAIRMENT
Should be avoided or used with caution in patients with hepatic impairment.

HEPATIC IMPAIRMENT

SIDE-EFFECTS

INTERACTIONS

Photosensitivity more common than with other tetracyclines.

Milk reduces absorption.

Acute renal failure • reversible nephrogenic diabetes insipidus

Max. 1 g daily in divided doses.

May exacerbate renal failure and should not be given to patients with renal impairment.

Doxycline

INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 12-17 years: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily.

Severe infections (including refractory urinary-tract infections)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 12-17 years: 200 mg daily.

Acne

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 12-17 years: 100 mg once daily.

Early syphilis

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 12-17 years: 100 mg twice daily for 14 days.

Late latent syphilis

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 12-17 years: 100 mg twice daily for 28 days.

Uncomplicated genital chlamydia

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 12-17 years: 100 mg twice daily for 7 days.

Pelvic inflammatory disease

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 12-17 years: 100 mg twice daily for 14 days.

Lyme disease (under expert supervision)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 12-17 years: 100 mg twice daily for 10–14 days (for 28 days in Lyme arthritis).

Anthrax (treatment or post-exposure prophylaxis)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 1 month–11 years: 2.5 mg/kg twice daily (max. per dose 100 mg twice daily), only to be used in children under 12 years if alternative antibacterial cannot be given.

Child 12-17 years: 100 mg twice daily.

Prophylaxis of malaria

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 12-17 years: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years.

Adjunct to quinine in treatment of Plasmodium falciparum malaria

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 12-17 years: 200 mg daily for 7 days.

Periodontitis (as an adjunct to gingival scaling and root planing)

BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Child 12-17 years: 20 mg twice daily for 3 months.

**CAUTIONS** Alcohol dependence

**INTERACTIONS** The metabolism of doxycycline may be influenced by antiepileptics.

**SIDE-EFFECTS** Anorexia • anxiety • dry mouth • flushing • fungal superinfection (when used for periodontitis) • tinnitus

**PREGNANCY** When travel to malarious areas is unavoidable during pregnancy, doxycycline can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks’ gestation.

**RENAI IMPAIRMENT** Use with caution (avoid excessive doses).

**MONITORING REQUIREMENTS** When used for periodontitis, monitor for superficial fungal infection, particularly if predisposition to oral candidiasis.

**DIRECTIONS FOR ADMINISTRATION** Capsules and Tablets should be swallowed whole with plenty of fluid, while sitting or standing. Capsules should be taken during meals.

**PATIENT AND CARER ADVICE** Counselling on administration advised (posture). Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.

**PROFESSION SPECIFIC INFORMATION**

Dental practitioners’ formulary

Doxycycline Capsules 100 mg may be prescribed. Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets. Tablets may be prescribed as Doxycycline Tablets 20 mg.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution containing the same drug.

**INDICATIONS AND DOSE**

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

- **BY MOUTH**
  - Child 12-17 years: 408 mg twice daily, increased to 1.224–1.632 g daily, (in severe infection)

Acne

- **BY MOUTH**
  - Child 12-17 years: 408 mg daily for at least 8 weeks

**RENAI IMPAIRMENT** May exacerbate renal failure and should not be given to patients with renal impairment.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**CAUTIONARY AND ADVISORY LABELS 6, 9**

- **Lymecycline (Non-proprietary)**
  - Lymecycline 408 mg Lymecycline 408mg capsules 28 capsule [POM] £8.11 DT price = £7.23 / 56 capsule [POM] £16.22
  - Tetralysal (Goldera (UK) Ltd)
  - Tetralysal 408 mg Tetralysal 300 capsules 28 capsule [POM] £6.95 DT price = £7.23 / 56 capsule [POM] £11.53

**Minocycline**

**INDICATIONS AND DOSE**

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg twice daily

Acne

- **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg once daily, alternatively 50 mg twice daily

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
  - Child 12-17 years: 100 mg daily

**CAUTIONS** Systemic lupus erythematosus

**SIDE-EFFECTS**

- Rare Acute renal failure • alopecia • anorexia • hypoaesthesia • impaired hearing • paraesthesia • pigmentation (sometimes irreversible) • tinnitus

- Very rare Discoloration of conjunctiva • discoloration of sweat • discoloration of tears • systemic lupus erythematosus

- Frequency not known Dizziness (more common in women) • vertigo (more common in women)

**RENAI IMPAIRMENT** Use with caution (avoid excessive doses).

**MONITORING REQUIREMENTS** If treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens.

**DIRECTIONS FOR ADMINISTRATION** Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing.

**PATIENT AND CARER ADVICE** Counselling on administration advised (posture).

**LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing (compared with other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome; it sometimes causes irreversible pigmentation).
**Tetracycline**

**INDICATIONS AND DOSE**

Susceptible infections (e.g. chlamydia, rickettsia, mycoplasma)

- **BY MOUTH**
  - Child 12-17 years: 250 mg 4 times a day, increased if necessary to 500 mg 3–4 times a day, increased dose used in severe infections

Acne

- **BY MOUTH**
  - Child 12-17 years: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer

Non-gonococcal urethritis

- **BY MOUTH**
  - Child 12-17 years: 500 mg 4 times a day for 7–14 days (21 days if failure or relapse after first course)

**INTERACTIONS**

- Milk reduces absorption.

**SIDE-EFFECTS**

- Acute renal failure - skin discoloration

**HEPATIC IMPAIRMENT**

- Max. 1 g daily in divided doses.

**RENAL IMPAIRMENT**

- May exacerbate renal failure and should not be given to patients with renal impairment.

**DIRECTIONS FOR ADMINISTRATION**

- Tablets should be swallowed whole with plenty of fluid while sitting or standing.

**PATIENT AND CARER ADVICE**

- Counselling on administration advised.

**PROFESSION SPECIFIC INFORMATION**

**Dental practitioners’ formulary**

- Tetracycline Tablets may be prescribed.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution

**Tablet**

- **Tetracycline (Non-proprietary)**
  - Tetracycline hydrochloride 250 mg | 28 tablet | £25.65 DT price = £2.04

**Oxytetracycline**

**INDICATIONS AND DOSE**

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

- **BY MOUTH**
  - Child 12-17 years: 250–500 mg 4 times a day

Acne

- **BY MOUTH**
  - Child 12-17 years: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer

**INTERACTIONS**

- Milk reduces absorption.

**RENAL IMPAIRMENT**

- May exacerbate renal failure and should not be given to patients with renal impairment.

**PROFESSION SPECIFIC INFORMATION**

- Dental practitioners’ formulary
  - Oxytetracycline Tablets may be prescribed.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

- **Oxytetracycline (Non-proprietary)**
  - Oxytetracycline 250mg tablets | 28 tablet | £12.50 DT price = £0.91 | 1000 tablet | no price available

**Chloramphenicol**

**DRUG ACTION**

- Chloramphenicol is a potent broad-spectrum antibiotic.

**INDICATIONS AND DOSE**

Life threatening infections particularly those caused by Haemophilus influenzae: Typhoid fever

- **BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
  - Child: 12.5 mg/kg every 6 hours, dose may be doubled in severe infections such as septicemia, meningitis and epiglottitis providing plasma-chloramphenicol concentrations are measured and high doses reduced as soon as indicated

- **BY INTRAVENOUS INJECTION**

  - Neonate up to 14 days: 12.5 mg/kg twice daily, doses should be checked carefully as overdosage can be fatal.

  - Neonate 14 days to 28 days: 12.5 mg/kg 2–4 times a day, doses should be checked carefully as overdosage can be fatal.
Cystic fibrosis for the treatment of respiratory Burkholderia cepacia infection resistant to other antibacterials

BY MOUTH, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION

Child: (consult product literature)

CONTRA-INDICATIONS Acute porphyrias p. 562

CAUTIONS Avoid repeated courses and prolonged treatment

INTERACTIONS → Appendix 1 (chloramphenicol).

SIDE-EFFECTS Blood disorders • depression • diarrhoea • dry mouth • erythema multiforme • glossitis • headache • nausea • nocturnal haemoglobinuria • optic neuritis • peripheral neuritis • reversible and irreversible aplastic anaemia (with reports of resulting leukaemia) • stomatitis • urticaria • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

With intravenous use in neonates Grey syndrome (abdominal distension, pallid cyanosis, circulatory collapse) may follow excessive doses in neonates with immature hepatic metabolism.

With intravenous use or oral use Associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections.

PREGNANCY Manufacturer advises avoid; neonatal ‘grey-baby syndrome’ if used in third trimester.

BREAST FEEDING Manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant; concentration in milk usually insufficient to cause ‘grey syndrome’.

HEPATIC IMPAIRMENT Avoid if possible—increased risk of bone-marrow depression. Reduce dose and monitor plasma-chloramphenicol concentration in hepatic impairment.

RENAL IMPAIRMENT Avoid in severe renal impairment unless no alternative; dose-related depression of haematopoiesis.

MONITORING REQUIREMENTS

Recommended peak plasma concentration (approx. 2 hours after administration by mouth, intravenous injection or infusion) 10–25 mg/litre; pre-dose (‘trough’) concentration should not exceed 15 mg/litre. Blood counts required before and periodically during treatment.

In neonates Plasma concentration monitoring required in neonates. Grey baby syndrome may follow excessive doses in neonates with immature hepatic metabolism.

DIRECTIONS FOR ADMINISTRATION

With intravenous use Displacement value may be significant for injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%.

MEDICINAL FORMS There can be variation in the licensing of different medicines containing the same drug.

Capsule

Chloramphenicol (Non-proprietary)
Chloramphenicol 250 mg Chloramphenicol 250mg capsules | 60 capsule [P] £37.70 67 price = £37.70
Powder for solution for injection
ELECTROLYTES: May contain Sodium

Kemicetine (Pfizer Ltd)
Chloramphenicol (as Chloramphenicol sodium succinate) 1 gram Kemicetine 1g powder for solution for injection vials | 1 vial [P] £1.39

Bacterial infection 335

Fosfomycin

DRUG ACTION Fosfomycin, a phosphonic acid antibacterial, is active against a range of Gram-positive and Gram-negative bacteria including Staphylococcus aureus and Enterobacteriaceae.

INDICATIONS AND DOSE

Osteomyelitis when first-line treatments are inappropriate or ineffective / Hospital-acquired lower respiratory-tract infections when first-line treatments are inappropriate or ineffective

BY INTRAVENOUS INFUSION

Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.

Neonate 40 weeks to 44 weeks corrected gestational age: 200 mg/kg daily in 3 divided doses.

Child 1-11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

Child 1-11 years (body-weight 10-39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

Child 12-17 years (body-weight 40 kg and above): 12–24 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

Complicated urinary-tract infections when first-line treatment ineffective or inappropriate

BY INTRAVENOUS INFUSION

Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.

Neonate 40 weeks to 44 weeks corrected gestational age: 200 mg/kg daily in 3 divided doses.

Child 1-11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

Child 1-11 years (body-weight 10-39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

Child 12-17 years (body-weight 40 kg and above): 12–16 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

Osteomyelitis when first-line treatments are inappropriate or ineffective

BY INTRAVENOUS INFUSION

Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.

Neonate 40 weeks to 44 weeks corrected gestational age: 200 mg/kg daily in 3 divided doses.

Child 1-11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

Child 1-11 years (body-weight 10-39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

Bacterial meningitis when first-line treatment ineffective or inappropriate

BY INTRAVENOUS INFUSION

Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.

Neonate 40 weeks to 44 weeks corrected gestational age: 200 mg/kg daily in 3 divided doses.

Child 1-11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

Child 1-11 years (body-weight 10-39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

Grey syndrome (abdominal distension, pallid cyanosis, circulatory collapse) may follow excessive doses in neonates with immature hepatic metabolism.

Anaemia (with reports of resulting leukaemia)
Fusidic acid

**DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

**INDICATIONS AND DOSE**

**Staphylococcal skin infection**
- **TO THE SKIN**
  - Child: Apply 3–4 times a day usually for 7 days
  - **BY MOUTH USING TABLETS**
  - Child 12–17 years: 250 mg every 12 hours for 5–10 days

**Penicillin-resistant staphylococcal infection including osteomyelitis** | **Staphylococcal endocarditis in combination with other antibacterials**
- **BY MOUTH USING ORAL SUSPENSION**
  - Neonate: 15 mg/kg 3 times a day.
  - Child 1–11 months: 15 mg/kg 3 times a day
  - Child 1–4 years: 250 mg 3 times a day
  - Child 5–11 years: 500 mg 3 times a day
  - Child 12–17 years: 750 mg 3 times a day

**DOSE EQUIVALENCE AND CONVERSION**
- With oral use Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets.

**CAUTIONS**
- With topical use Avoid contact of cream or ointment with eyes

**CAUTIONS, FURTHER INFORMATION**
- Avoiding resistance
- With topical use To avoid the development of resistance, fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital.

**INTERACTIONS**
- With oral use Abdominal pain · diarrhea · dizziness · drowsiness · dyspepsia · nausea · vomiting
- With oral use Anorexia · headache · malaise · pruritus · rash
- Rare
  - With topical use Hypersensitivity reactions
  - Frequency not known
    - With oral use Acute renal failure (usually with jaundice) · blood disorders · reversible jaundice especially after high dosage (withdraw therapy if persistent)

**PREGNANCY**
- With oral use Not known to be harmful; manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**
- With oral use Present in milk—manufacturer advises caution.

**HEPATIC IMPAIRMENT**
- With oral use Impaired biliary excretion; possibly increased risk of hepatotoxicity; avoid or reduce dose. Elimination may be reduced in hepatic impairment or biliary disease or biliary obstruction. Monitor liver function in hepatic impairment.

**MONITORING REQUIREMENTS**
- With oral use Monitor liver function with high doses or on prolonged therapy.

**PRESCRIBING AND DISPENSING INFORMATION**
- With oral use Flavours of oral liquid formulations may include banana and orange.
Linezolid

**DRUG ACTION**
Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including meticillin-resistant *Staphylococcus aureus* (MRSA), and glycopeptide-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is not active against common Gram-negative organisms; it must be given in combination with other antibacterials for mixed infections that also involve Gram-negative organisms.

**INDICATIONS AND DOSE**
Pneumonia (when other antibacterials e.g. a glycopeptide, such as vancomycin, cannot be used) (initiated under specialist supervision) | Complicated skin and soft-tissue infections caused by Gram-positive bacteria, when other antibacterials cannot be used (initiated under specialist supervision) | By mouth, or by intravenous infusion

- **By Mouth**
  - Neonate up to 7 days: 10 mg/kg every 12 hours, increased if necessary to 10 mg/kg every 8 hours, increased dose can be used if poor response.
  - Neonate 7 days to 28 days: 10 mg/kg every 8 hours.
  - Child 1 month-11 years: 10 mg/kg every 8 hours (max. per dose 600 mg)
  - Child 12-17 years: 600 mg every 12 hours

**UNLICENSED USE**
Not licensed for use in children.

**IMPORTANT SAFETY INFORMATION**

**CHM ADVICE (OPTIC NEUROPATHY)**
Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

**BLOOD DISORDERS**
Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:
- receive treatment for more than 10–14 days;
- have pre-existing myelosuppression;
- are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
- have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

**CAUTIONS**
Acute confusional states, bipolar depression, carcinoid tumour, phaeochromocytoma, schizophrenia, thyrotoxicosis, uncontrolled hypertension

**CAUTIONS, FURTHER INFORMATION**
- Close observation. Unless close observation and blood pressure monitoring is possible, linezolid should be avoided in uncontrolled hypertension, phaeochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states.

**INTERACTIONS**
- Appendix 1 (MAOIs).
- Monoamine oxidase inhibition. Linezolid is a reversible, non-selective monoamine oxidase inhibitor (MAOI). Patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, yeast extracts, undistilled alcoholic beverages, and fermented soybean products). In addition, linezolid should not be given with another MAOI or within 2 weeks of stopping another MAOI. Unless close observation and blood pressure monitoring is possible, avoid in those receiving SSRIs, 5HT, agonists (‘triptans’), tricyclic antidepressants, sympathomimetics, dopaminergics, buspirone, pethidine and possibly other opioid analgesics.

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**
- Common or very common: Diarrhoea, eosinophilia, headache, nausea, taste disturbances, vomiting
- Uncommon: Abdominal pain, blurred vision, constipation, diaphoresis, dizziness, dry mouth, dyspepsia, electrolyte disturbances, fatigue, fever, gastritis, glositis, hypertension, hypoaesthesia, insomnia, leucopenia, pancreatitis, paraesthesia, polyuria, pruritus, rash, stomatitis, thirst, thrombocytopenia, tinnitus, tongue discoloration
- Rare: Renal failure, tachycardia, transient ischaemic attacks
- Frequency not known: Anaemia, antibiotic-associated colitis, convulsions, hyponatraemia, lactic acidosis, optic neuropathy reported on prolonged therapy, pancycytopenia, peripheral neuropathy reported on prolonged therapy, Stevens-Johnson syndrome, tooth discoloration, toxic epidermal necrolysis

**SPECIFIC SIDE-EFFECTS**
- Uncommon
- With intravenous use: Injection-site reactions
Infection

MEDICINAL FORMS

PRESCRIBING AND DISPENSING INFORMATION

▶ With intravenous use

DIRECTIONS FOR ADMINISTRATION

MONITORING REQUIREMENTS

HEPATIC IMPAIRMENT

No dose adjustment necessary but metabolites may accumulate if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

PREGNANCY

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9, 10

- Linezolid (Non-proprietary)
- Linezolid 600 mg | Linezolid 600mg tablets | 10 tablet PBN £228.86–£445.00
- Zyvox (Pfizer Ltd)
- Linezolid 600 mg | Zyvox 600mg tablets | 10 tablet PBN £445.00

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9, 10

EXCipients: May contain Aspartame

- Zyvox (Pfizer Ltd)
- Linezolid 20 mg per 1 ml | Zyvox 100mg/5ml granules for oral suspension | 150 ml PBN £222.50

Infusion

EXCipients: May contain Glucose

ELECTROLYTES: May contain Sodium

- Linezolid 2 mg per 1 ml | Linezolid 600mg/300ml infusion bags | 10 bag PBN £445.00 (Hospital only)
- Zyvox (Pfizer Ltd)
- Linezolid 2 mg per 1 ml | Zyvox 600mg/300ml infusion bags | 10 bag PBN £445.00

Trimethoprim

INDICATIONS AND DOSE

Urinary-tract infections | Respiratory tract infections

BY MOUTH

- Neonate: Initially 3 mg/kg for 1 dose, then 1–2 mg/kg twice daily.

- Child 4–5 weeks: 4 mg/kg twice daily (max. per dose 200 mg)
- Child 6 weeks–5 months: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 25 mg twice daily
- Child 6 months–5 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 50 mg twice daily
- Child 6–11 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 100 mg twice daily
- Child 12–17 years: 200 mg twice daily

Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)

BY MOUTH

- Neonate: 2 mg/kg once daily, dose to be taken at night.

- Child 4–5 weeks: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night.
- Child 6 weeks–5 months: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 12.5 mg once daily, dose to be taken at night.
- Child 6 months–5 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 25 mg once daily, dose to be taken at night.
- Child 6–11 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 50 mg once daily, dose to be taken at night.
- Child 12–17 years: 100 mg once daily, dose to be taken at night.

Treatment of mild to moderate Pneumocystis jirovecii (Pneumocystis carinii) pneumonia in patients who cannot tolerate co-trimoxazole (in combination with dapsone)

BY MOUTH

- Child: 5 mg/kg every 6–8 hours

Shigellosis | Invasive salmonella infection

BY MOUTH

- Child: (consult product literature)

UNLICENSED USE

Not licensed for treatment of pneumocystis pneumonia.

Not licensed for use in children under 6 weeks.

CONTRA-INDICATIONS

Blood dyscrasias

CAUTIONS

Acute porphyrias p. 562. neonates (specialist supervision required) - predisposition to folate deficiency

INTERACTIONS → Appendix 1 (trimethoprim).

SIDE-EFFECTS

- Rare: Allergic reactions – anaphylaxis - angioedema - erythema multiforme - photosensitivity - toxic epidermal necrolysis
- Frequency not known: Aseptic meningitis - depression of haematopoiesis - gastro-intestinal disturbances - hyperkalaemia - nausea - pruritus - rashes - vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Trimethoprim has side-effects similar to co-trimoxazole but they are less severe and occur less frequently.

PREGNANCY

Teratogenic risk in first trimester (folate antagonist). Manufacturers advise avoid during pregnancy.

BREAST FEEDING

Present in milk—short-term use not known to be harmful.

REHN IMPAIRMENT

Use half normal dose after 3 days if estimated glomerular filtration rate 15–30 mL/minute/1.73 m². Use half normal dose if estimated glomerular filtration rate less than 15 mL/minute/1.73 m². Monitor plasma-trimethoprim concentration if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

MONITORING REQUIREMENTS

Manufacturer recommends blood counts on long-term therapy (but evidence of practical value unsatisfactory).

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Trimethoprim for bacterial infections www.medicinesforchildren.org.uk/trimethoprim-for-bacterial-infections

Blood disorders. On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.
• **MEDICINAL FORMS**
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

2.1 **ANTHRAX**

**Anthrax**

T**reatment and post-exposure prophylaxis**

*Inhalation or gastro-intestinal anthrax* should be treated initially with either ciprofloxacin p. 328 or, in patients over 12 years, doxycycline p. 332 [unlicensed indication] combined with one or two other antibacterials (such as amoxicillin p. 320, benzylpenicillin sodium p. 318, chloramphenicol p. 334, clarithromycin p. 309, clindamycin p. 307, imipenem with cilastatin p. 295, rifampicin p. 342 [unlicensed indication], and vancomycin p. 305). When the condition improves and the sensitivity of the *Bacillus anthracis* strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

*Cutaneous anthrax* should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] for 7 days. Treatment may be switched to amoxicillin if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for *post-exposure prophylaxis*. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of *B. anthracis* is susceptible. Vaccination against anthrax may allow the duration of antibacterial prophylaxis to be shortened.

2.2 **LYME DISEASE**

**Lyme disease**

**Treatment**

Lyme disease should generally be treated by those experienced in its management. Amoxicillin p. 320 [unlicensed indication], cefuroxime p. 300 (as cefuroxime axetil) or doxycycline p. 332 are the antibacterials of choice for *early Lyme disease* or *Lyme arthritis* but doxycycline should only be used in children over 12 years of age. If these antibacterials are contra-indicated, a **macrolide** (e.g. clarithromycin p. 309) can be used for early Lyme disease.

Intravenous administration of ceftriaxone p. 302, cefotaxime p. 301, or benzylpenicillin sodium p. 318 is recommended for Lyme disease associated with cardiac or neurological complications. The duration of treatment is usually 2–4 weeks; Lyme arthritis may require further treatment.

2.3 **Methicillin-resistant staphylococcus aureus**

**MRSA**

**Management**

Infection from *Staphylococcus aureus* strains resistant to meticillin [now discontinued] (meticillin-resistant *Staph. aureus*, MRSA) and to flucloxacillin p. 325 can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

Rifampicin p. 342 or fusidic acid p. 336 should not be used alone because resistance may develop rapidly. Clindamycin p. 307 alone or a combination of rifampicin and fusidic acid can be used for *skin* and *soft-tissue infections* caused by MRSA; a **tetracycline** is an alternative in children over 12 years of age. A **glycopeptide** (e.g. vancomycin p. 305) can be used for severe skin and soft-tissue infections associated with MRSA. A combination of a glycopeptide and fusidic acid or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial. Linezolid p. 337 should be reserved for skin and soft-tissue infections that have not responded to other antibacterials or for children who cannot tolerate other antibacterials.

A **glycopeptide** can be used for *pneumonia* associated with MRSA. Linezolid should be reserved for hospital-acquired pneumonia that has not responded to other antibacterials or for children who cannot tolerate other antibacterials.

Rifampicin p. 338 or nitrofurantoin p. 247 can be used for *urinary-tract infections* caused by MRSA; a **tetracycline** is an alternative in children over 12 years of age. A **glycopeptide** can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A **glycopeptide** can be used for *septicemia* associated with MRSA. See the management of endocarditis, osteomyelitis, or septic arthritis associated with MRSA.

Prophylaxis with vancomycin or teicoplanin p. 305 (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection after documented eradication;
- there is a risk that the patient’s MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

It is important that hospitals have infection control guidelines to minimise MRSA transmission, including policies on isolation and treatment of MRSA carriers and on hand hygiene. See eradication of nasal carriage of MRSA in *Nose* p. 648.
2.4 Tuberculosis

Tuberculosis

Treatment phases, overview

Tuberculosis is treated in two phases—an initial phase using 4 drugs and a continuation phase using 2 drugs in fully sensitive cases. Treatment requires specialised knowledge and supervision, particularly where the disease involves resistant organisms or non-respiratory organs.

There are two regimens recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen should be used; the two regimens should not be used concurrently. Compliance with therapy is a major determinant of its success. Treatment needs to be carefully monitored in families in whom concordance may be problematic.

Initial phase

The concurrent use of 4 drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as combination preparations, provided the respective dose of each drug is appropriate, unless the child is unable to swallow the tablets or one of the components cannot be given because of resistance or intolerance. The treatment of choice for the initial phase is the daily use of isoniazid p. 345, rifampicin p. 342, pyrazinamide p. 346 and ethambutol hydrochloride p. 345. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for 2 months. Where a positive culture for M. tuberculosis has been obtained, but susceptibility results are not available after 2 months, treatment with rifampicin, isoniazid, pyrazinamide and ethambutol hydrochloride should be continued until full susceptibility is confirmed, even if this is for longer than 2 months.

Streptomycin p. 293 is rarely used in the UK although it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced and ethambutol hydrochloride is contra-indicated.

Continuation phase

After the initial phase, treatment is continued for a further 4 months with isoniazid and rifampicin (preferably given as a combination preparation). Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

Unsupervised treatment

The following regimen should be used for those who are likely to take antituberculous drugs reliably without supervision by a healthcare worker. Children and families who are unlikely to comply with daily administration of antituberculous drugs should be treated with the regimen described under Supervised Treatment.

Pregnancy and breast-feeding

The standard unsupervised 6-month treatment regimen may be used during pregnancy. Streptomycin should not be given in pregnancy.

Unsupervised treatment

The standard unsupervised 6-month treatment regimen may be used during breast-feeding.

Neonates

Congenital tuberculosis is acquired from maternal extrapulmonary sites at birth, particularly the genital tract; if infection is suspected, the baby will require treatment with isoniazid, rifampicin, pyrazinamide, and ethambutol hydrochloride. Isoniazid, rifampicin, pyrazinamide, and ethambutol hydrochloride are used for 2 months during the initial phase of treatment. After the initial phase, treatment is continued for a further 4 months with isoniazid and rifampicin.

Supervised treatment

Drug administration needs to be fully supervised by a healthcare worker (directly observed therapy, DOT) in children or families who cannot comply reliably with the treatment regimen. These patients are given isoniazid, rifampicin, pyrazinamide and ethambutol hydrochloride (or streptomycin) 3 times a week under supervision for the first 2 months followed by isoniazid and rifampicin 3 times a week for a further 4 months.

Immunocompromised patients

Multi-resistant Mycobacterium tuberculosis may be present in immunocompromised children. The organism should always be cultured to confirm its type and drug sensitivity. Confirmed M. tuberculosis infection sensitive to first-line drugs should be treated with a standard 6-month regimen; after completing treatment, children should be closely monitored. The regimen may need to be modified if infection is caused by resistant organisms, and specialist advice is needed.

Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis in an HIV-positive individual; care is required in choosing the regimen and in avoiding potentially serious interactions. Starting antiretroviral treatment in the first 2 months of antituberculosis treatment increases the risk of immune reconstitution syndrome.

Infection may also be caused by other mycobacteria e.g. M. aviumcomplex in which case specialist advice on management is needed.

Corticosteroids

A corticosteroid should be given (in addition to antituberculosis therapy) for meningeal or pericardial tuberculosis.

Prevention of tuberculosis

Chemoprophylaxis may be required in children who are close contacts of a case of smear-positive pulmonary tuberculosis and who are severely immunosuppressed (including congenital immunodeficiencies, cytotoxic or immunosuppressive therapy) and in those who have evidence of latent tuberculosis and require treatment with immunosuppressants; expert advice should be sought.

Chemoprophylaxis involves use of either isoniazid alone for 6 months or of isoniazid and rifampicin for 3 months.

See prevention of tuberculosis in susceptible close contacts or those who have become tuberculin-positive. See advice on immunisation against tuberculosis and tuberculin testing.

Treatment failure

Major causes of treatment failure are incorrect prescribing by the physician and inadequate compliance by the child or their carer. Monthly tablet counts and urine examination (rifampicin imparts an orange-red coloration) may be useful indicators of compliance with treatment. Avoid both excessive and inadequate dosage. Treatment should be specialised by a specialist paediatrician.
Antituberculosis drugs

Isoniazid is cheap and highly effective. Like rifampicin it should always be included in any antituberculous regimen unless there is a specific contra-indication.

Rifampicin, a rifamycin, is a key component of any antituberculous regimen. Like isoniazid it should always be included unless there is a specific contra-indication.

During the first two months (‘initial phase’) of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease.

On intermittent treatment six toxicity syndromes have been recognised—flu-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in up to 20% of patients.

Rifabutin below is licensed in adults for the treatment of non-tuberculous mycobacterial disease and pulmonary tuberculosis. There is limited experience in children.

Pyrazinamide is a bactericidal drug only active against intracellular dividing forms of Mycobacterium tuberculosis; it exerts its main effect only in the first two or three months. It is particularly useful in tuberculous meningitis because of good meningeal penetration. It is not active against M. bovis.

Ethambutol hydrochloride p. 345 is included in a treatment regimen if isoniazid p. 345 resistance is suspected; it can be omitted if the risk of resistance is low.

Streptomycin p. 293 [unlicensed] is now rarely used in the UK except for resistant organisms.

Drug-resistant tuberculosis should be treated by a specialist paediatrician with experience in such cases, and where appropriate facilities for infection-control exist. Second-line drugs available for infections caused by resistant organisms, or when first-line drugs cause unacceptable side-effects, include amikacin p. 292, capreomycin, cycloserine p. 344, newer macrolides (e.g. azithromycin p. 308 and clarithromycin p. 309), quinolones (e.g. moxifloxacin p. 631) and protionamide (prothionamide; no longer on UK market). Availability of suitable formulations may limit choice in children.

ANTIMYCOBACTERIALS > RIFAMYCINS

Rifabutin

- **INDICATIONS AND DOSE**
  - **Prophylaxis of Mycobacterium avium complex infections in immunosuppressed patients with low CD4 count**
    - **BY MOUTH**
      - Child 1 month–11 years: 5 mg/kg once daily (max. per dose 300 mg), also consult product literature
      - Child 12–17 years: 300 mg once daily, also consult product literature
  - **Treatment of non-tuberculous mycobacterial disease, in combination with other drugs**
    - **BY MOUTH**
      - Child 1 month–11 years: 5 mg/kg once daily for up to 6 months after cultures negative
      - Child 12–17 years: 450–600 mg once daily for up to 6 months after cultures negative
  - **Treatment of pulmonary tuberculosis, in combination with other drugs**
    - **BY MOUTH**
      - Child 12–17 years: 150–450 mg once daily for at least 6 months

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Acute porphyrias p. 562 - discoulours soft contact lenses
- **INTERACTIONS** Appendix 1 (rifamycins).
- **SIDE-EFFECTS** Common or very common Anaemia - blood disorders - leucopenia - myalgia - nausea - pyrexia - rash - thrombocytopenia
Infection

PATIENT AND CARER ADVICE

PRESCRIBING AND DISPENSING INFORMATION

Blood counts should be monitored on prolonged therapy.

Renal function

MONITORING REQUIREMENTS

RENAL IMPAIRMENT

Use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

MOBILE MONITORING REQUIREMENTS

Renal function should be checked before treatment.

Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, jaundice or unexplained deterioration during treatment. However, hepatic function should be monitored on prolonged therapy.

Blood counts should be monitored on prolonged therapy.

PRESCRIBING AND DISPENSING INFORMATION

If treatment interruption occurs, re-introduce with low dosage and increase gradually.

PATIENT AND CARER ADVICE

Soft contact lenses. Patients or their carers should be advised that rifabutin discours soft contact lenses.

Hepatic function should be checked before treatment. Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

CAUTIONARY AND ADVISORY LABELS 8, 14

Mycobutin (Pfizer Ltd)

Rifabutin 150 mg Mycobutin 150mg capsules | 30 capsule £90.38

Rifampicin

INDICATIONS AND DOSE

Brucellosis in combination with other antibacterials

Legionnaires disease in combination with other antibacterials

Serious staphylococcal infections in combination with other antibacterials

BY MOUTH, OR BY INTRAVENOUS INFUSION

Neonate: 5–10 mg/kg twice daily.

Child 1-11 months: 5–10 mg/kg twice daily

Child 1-17 years: 10 mg/kg twice daily (max. per dose 600 mg)

Tuberculosis, in combination with other drugs

(intermittent supervised 6-month treatment) (under expert supervision)

BY MOUTH

Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

Tuberculosis, in combination with other drugs

(standard unsupervised 6-month treatment)

BY MOUTH

Child (body-weight up to 50 kg): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day

Child (body-weight 50 kg and above): 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day

Congenital tuberculosis

BY MOUTH

Neonate: 15 mg/kg once daily for 6 months (initial and continuation phases).

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, in combination with isoniazid

BY MOUTH

Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg daily for 3 months; maximum 450 mg per day

Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg daily for 3 months; maximum 600 mg per day

Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 3 months

Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 3 months

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant

BY MOUTH

Child 1 month–11 years (body-weight up to 50 kg): 15 mg/kg daily for 6 months; maximum 450 mg per day

Child 1 month–11 years (body-weight 50 kg and above): 15 mg/kg daily for 6 months; maximum 600 mg per day

Child 12–17 years (body-weight up to 50 kg): 450 mg daily for 6 months

Child 12–17 years (body-weight 50 kg and above): 600 mg daily for 6 months

Prevention of secondary case of Haemophilus influenzae type b disease

BY MOUTH

Child 1-2 months: 10 mg/kg once daily for 4 days

Child 3 months–11 years: 20 mg/kg once daily (max. per dose 600 mg) for 4 days

Child 12–17 years: 600 mg once daily for 4 days
Prevention of secondary case of meningococcal meningitis

**BY MOUTH**
- Neonate: 5 mg/kg every 12 hours for 2 days.
- Child 1–11 months: 5 mg/kg every 12 hours for 2 days
- Child 1–11 years: 10 mg/kg every 12 hours (max. per dose 600 mg), for 2 days
- Child 12–17 years: 600 mg every 12 hours for 2 days

**Pruritus due to cholestasis**
**BY MOUTH**
- Child: 5–10 mg/kg once daily (max. per dose 600 mg)

**UNLICENSED USE** Not licensed for use in children for pruritus due to cholestasis.

**CONTRA-INDICATIONS** Acute porphyrias
**CAUTIONS** Discolours soft contact lenses

**INTERACTIONS** → Appendix 1 (rifamycins).
Rifampicin induces hepatic enzymes which accelerate the metabolism of several drugs including oestrogens, corticosteroids, phenytoin, sulfonylureas, and anticoagulants.

**SIDE-EFFECTS**
**GENERAL SIDE-EFFECTS**
Acute renal failure • adrenal insufficiency • alterations of liver function • anorexia • antibiotic-associated colitis • body secretions coloured orange-red • collapse and shock • diarrhoea • disseminated intravascular coagulation • drowsiness • eosinophilia • exfoliative dermatitis • flushing • gastro-intestinal symptoms • haemolytic anaemia • headache • influenza-like symptoms (with chills, fever, dizziness, bone pain) • jaundice • leucopenia • menstrual disturbances • muscular weakness • myopathy • nausea • oedema • pemphigoid reactions • rashes • respiratory symptoms • saliva coloured orange-red • shortness of breath • Stevens-Johnson syndrome • thrombocytopenic purpura • toxic epidermal necrolysis • urine coloured orange-red • urticaria • vomiting

**SPECIFIC SIDE-EFFECTS**
- With intravenous use Thrombophlebitis reported if infusion used for prolonged period
- Discontinue permanently if serious side-effects develop.
- Intermittent therapy Side-effects that mainly occur with intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifamycin hypersensitivity.
- **CONCEPTION AND CONTRACEPTION** Important Effectiveness of hormonal contraceptive is reduced and alternative family planning advice should be offered.
- **PREGNANCY** Manufacturers advise very high doses teratogenic in animal studies in first trimester; risk of neonatal bleeding may be increased in third trimester.
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Avoid or do not exceed 8 mg/kg daily. Impaired elimination. In patients with pre-existing liver disease or hepatic impairment, monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.
- **RENAL IMPAIRMENT** Use with caution if doses above 10 mg/kg daily.

**MONITORING REQUIREMENTS**
- **Renal function** should be checked before treatment.
- **Hepatic function** should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, liver function should be monitored on prolonged therapy.
- **Blood counts** should be monitored in patients on prolonged therapy.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use Displacement value may be significant, consult local reconstitution guidelines; reconstitute with solvent provided. May be further diluted with Glucose 5% or Sodium chloride 0.9% to a final concentration of 1.2 mg/mL. Infuse over 2–3 hours.

**PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.
- With oral use In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children. Flavours of syrup may include raspberry.

**PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Rifampicin for meningococcal prophylaxis www.medicinesforchildren.org.uk/ rifampicin-for-meningococcal-prophylaxis
Soft contact lenses Patients or their carers should be advised that rifampicin discours soft contact lenses.
Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

**MEDICINAL FORMS**

Rifampicin with isoniazid

The properties listed below are those particular to the combination only. For the properties of the components please consider, rifampicin p. 342, isoniazid p. 345.

- **INDICATIONS AND DOSE**
  - Treatment of tuberculosis (continuation phase)
    - **BY MOUTH**
      - Child: Although not licensed in children, consideration may be given to use of Rifinah® in older children, provided the respective dose of each drug is appropriate for the weight of the child (consult local protocol).
  - **DOSE EQUIVALENCE AND CONVERSION**
    - Rifinah® Tablets contain rifampicin and isoniazid; the proportions are expressed in the form x/y where x and y are the strengths in milligrams of rifampicin and isoniazid respectively.
    - Each Rifinah® 150/100 Tablet contains rifampicin 150 mg and isoniazid 100 mg.
    - Each Rifinah® 300/150 Tablet contains rifampicin 300 mg and isoniazid 150 mg.

- **UNLICENSED USE** Not licensed for use in children.

ANTIMYCOBACTERIALS > OTHER

Cycloserine

- **INDICATIONS AND DOSE**
  - Tuberculosis resistant to first-line drugs, in combination with other drugs
    - **BY MOUTH**
      - Child 2-11 years: Initially 5 mg/kg twice daily (max. per dose 250 mg), then increased if necessary up to 10 mg/kg twice daily (max. per dose 500 mg), dose to be increased according to blood concentration and response
      - Child 12-17 years: Initially 250 mg every 12 hours for 2 weeks, then increased if necessary up to 500 mg every 12 hours, dose to be increased according to blood concentration and response

PHARMACOKINETICS
Cycloserine penetrates the CNS.

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).
- **CONTRA-INDICATIONS** Alcohol dependence · depression · epilepsy · psychotic states · severe anxiety
- **INTERACTIONS** Appendix 1 (cycloserine).
- **SIDE-EFFECTS** Allergic dermatitis · changes in liver function tests · confusion · convulsions · depression · dizziness · drowsiness · headache · heart failure at high doses · megaloblastic anaemia · psychosis · rashes · tremor · vertigo

SIDE-EFFECTS, FURTHER INFORMATION
> CNS toxicity Discontinue or reduce dose if symptoms of CNS toxicity occur.
> Rashes or allergic dermatitis Discontinue or reduce dose if rashes or allergic dermatitis develops.
> **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.
> **BREAST FEEDING** Present in milk—amount too small to be harmful.
> **RENAI IMPAIRMENT** Increase interval between doses if creatinine clearance less than 50 mL/minute/1.73 m². Monitor blood-cycloserine concentration if creatinine clearance less than 50 mL/minute/1.73 m².
> **MONITORING REQUIREMENTS**
  - Blood concentration should not exceed a peak concentration of 30 mg/litre (measured 3–4 hours after the dose).
  - Monitor haematological, renal, and hepatic function.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Capsule**
    - CYCLOSERINE (NON-PROPRIETARY)
      - Cycloserine 250 mg Cycloserine 250mg capsules | 100 capsule £402.63 DT price + £402.63

Rifampicin with isoniazid and pyrazinamide

The properties listed below are those particular to the combination only. For the properties of the components please consider, rifampicin p. 342, isoniazid p. 345, pyrazinamide p. 346.

- **INDICATIONS AND DOSE**
  - Initial treatment of tuberculosis (in combination with ethambutol)
    - **BY MOUTH**
      - Child: Although not licensed in children, consideration may be given to use of Rifater® in older children, provided the respective dose of each drug is appropriate for the weight of the child (consult local protocol).
  - **DOSE EQUIVALENCE AND CONVERSION**
    - Tablet quantities refer to the number of Rifater® Tablets which should be taken. Each Rifater® Tablet contains isoniazid 50 mg, pyrazinamide 300 mg and rifampicin 120 mg.

- **UNLICENSED USE** Not licensed for use in children.
**Ethambutol hydrochloride**

**INDICATIONS AND DOSE**

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

- **BY MOUTH**
  - Child: 20 mg/kg once daily for 2 months (initial phase)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

- **BY MOUTH**
  - Child: 30 mg/kg 3 times a week for 2 months (initial phase)

Congenital tuberculosis, in combination with other drugs

- **BY MOUTH**
  - Neonate: 20 mg/kg once daily for 2 months (initial phase).

**CONTRA-INDICATIONS** Optic neuritis · poor vision

**CAUTIONS** Young children

CAUTIONS, FURTHER INFORMATION

- Understanding warnings Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.

**INTERACTIONS** → Appendix 1 (ethambutol).

**SIDE-EFFECTS**

- Rare Pruritus · rash · thrombocytopenia · urticaria
- Frequency not known Colour blindness · loss of visual acuity · optic neuritis · peripheral neuritis · red/green colour blindness · restriction of visual fields · visual disturbances

**SIDE-EFFECTS, FURTHER INFORMATION**

- Ocular toxicity Ocular toxicity is more common where excessive dosage is used or if the patient’s renal function is impaired. Early discontinuation of the drug is almost always followed by recovery of eyesight.

**PREGNANCY** Not known to be harmful.

**BREAST FEEDING** Amount too small to be harmful.

**RENAL IMPAIRMENT** If creatinine clearance less than 30 ml/minute/1.73 m², use 15–25 mg/kg (max. 2.5 g) 3 times a week. Risk of optic nerve damage. Should preferably be avoided in patients with renal impairment. If creatinine clearance less than 30 ml/minute/1.73 m², monitor plasma-ethambutol concentration.

**MONITORING REQUIREMENTS**

- ‘Peak’ concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre); ‘trough’ (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre).

- Renal function should be checked before treatment.

- Visual acuity should be tested by Snellen chart before treatment with ethambutol.

- In young children, routine ophthalmological monitoring recommended.

**PATIENT AND CARER ADVICE**

Ocular toxicity The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

**Solution for infusion**

- Ethambutol hydrochloride (Non-proprietary)
  - Ethambutol hydrochloride 100 mg per 1 ml EMB-Fatol 1g/10ml concentrate for solution for infusion vials 10 vial [P] no price available

---

**Isoniazid**

**INDICATIONS AND DOSE**

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

- **BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
  - Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

- **BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
  - Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

Congenital tuberculosis, in combination with other drugs

- **BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
  - Neonate: 10 mg/kg daily for 6 months (initial and continuation phases).

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive

- **BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION**
  - Neonate: 10 mg/kg daily for 6 months.

- Child 1 month–11 years: 10 mg/kg daily (max. per dose 300 mg) for 6 months, alternatively 10 mg/kg daily (max. per dose 300 mg) for 3 months, to be taken in combination with rifampicin

- Child 12–17 years: 300 mg daily for 6 months, alternatively 300 mg daily for 3 months, to be taken in combination with rifampicin

**CONTRA-INDICATIONS** Drug-induced liver disease

**CAUTIONS** Acute porphyrias p. 562 · alcohol dependence · diabetes mellitus · epilepsy · history of psychosis · HIV infection · malnutrition · slow acetylator status (increased risk of side-effects)

CAUTIONS, FURTHER INFORMATION

- Peripheral neuropathy Peripheral neuropathy is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection. In patients at increased risk of peripheral neuropathy, pyridoxine hydrochloride p. 585 should be given prophylactically from the start of treatment.

**INTERACTIONS** → Appendix 1 (isoniazid).

When used with tyramine or histamine rich foods, tachycardia, palpitation, hypotension, flushing, headache, dizziness, and sweating reported.
Pyrazinamide

**INDICATIONS AND DOSE**

**Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)**

- **BY MOUTH**
  - Child (body-weight up to 50 kg): 35 mg/kg once daily for 2 months (initial phase); maximum 1.5 g per day
  - Child (body-weight 50 kg and above): 35 mg/kg once daily for 2 months (initial phase); maximum 2 g per day

**Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)**

- **BY MOUTH**
  - Child (body-weight up to 50 kg): 50 mg/kg 3 times a week (max. per dose 2 g 3 times a week) for 2 months (initial phase)
  - Child (body-weight 50 kg and above): 50 mg/kg 3 times a week (max. per dose 2.5 g 3 times a week) for 2 months (initial phase)

**Congenital tuberculosis, in combination with other drugs**

- **BY MOUTH**
  - Neonate: 35 mg/kg once daily for 2 months (initial phase).

**CAUTIONS**

- Diabetes

**INTERACTIONS**

- Appendix 1 (pyrazinamide)

**SIDE-EFFECTS**

- Anorexia • arthralgia • dysuria • fever • hepatomegaly • hepatotoxicity • jaundice • liver failure • nausea • photosensitivity • rash • sideroblastic anaemia • splenomegaly • thrombocytopenia • vomiting

**PREGNANCY**

- Manufacturer advises use only if potential benefit outweighs risk.

**BREAST FEEDING**

- Amount too small to be harmful.

**HEPATIC IMPAIRMENT**

- Idiosyncratic hepatotoxicity more common; avoid in severe hepatic impairment. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months.

**RENAI IMPAIRMENT**

- Risk of ototoxicity and peripheral neuropathy; prophylactic pyridoxine hydrochloride p. 585 recommended.

**MONITORING REQUIREMENTS**

- Renal function should be checked before treatment.
- Hepatic function should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.

**PRESCRIBING AND DISPENSING INFORMATION**

Doses may need to be recalculated to allow for weight gain in younger children.

- With oral use. In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet.

**PATIENT AND CARER ADVICE**

- Medicines for Children leaflet: Isoniazid for latent tuberculosis www.medicinesforchildren.org.uk/isoniazid-for-latent-tuberculosis

Hepatic disorders. Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

2.5 Urinary tract infections

Urinary-tract infections

Overview

Urinary-tract infection is more common in adolescent girls than in boys; when it occurs in adolescent boys there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage.

*Escherichia coli* is the most common cause of urinary-tract infection; *Staphylococcus saprophyticus* is also common in sexually active young women. Less common causes include *Proteus* and *Klebsiella* spp. *Pseudomonas aeruginosa* infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. *Staphylococcus epidermidis* and *Enterococcus faecalis* infection may complicate catheterisation or instrumentation.

A specimen of urine should be collected for culture and sensitivity testing before starting antibacterial therapy;

- in children under 3 years of age;
- in children with suspected upper urinary-tract infection, complicated infection, or recurrent infection;
- if resistant organisms are suspected;
- if urine dipstick testing gives a single positive result for leucocyte esterase or nitrite;
- if clinical symptoms are not consistent with results of dipstick testing;
- in pregnant women.

Treatment should not be delayed while waiting for results. The antibacterial chosen should reflect current local bacterial sensitivity to antibacterials.

Antibacterial therapy for urinary-tract infections

Urinary-tract infections in children require prompt antibacterial treatment to minimise the risk of renal scarring.

Children under 3 months of age should be transferred to hospital and treated initially with intravenous antibacterials such as amoxicillin p. 320 (or ampicillin p. 321) with gentamicin p. 293, or a cephalosporin (such as cefotaxime p. 301) alone, until the infection responds; full doses of oral antibacterials are then given for a further period.

Children over 3 months of age with uncomplicated lower urinary-tract infection, can be treated with trimethoprim p. 338 or nitrofurantoin below. Suggested duration of treatment 3 days. Re-assess child if they remain unwell 24–48 hours after initial assessment.

Alternatively, children over 3 months of age, with uncomplicated lower urinary-tract infection, may be treated with amoxicillin (or ampicillin) or oral first generation cephalosporin (e.g. cefalexin p. 298). Use amoxicillin only if micro-organism sensitive. Suggested duration of treatment 3 days. Re-assess child if unwell 24–48 hours after initial assessment.

Acute pyelonephritis in children over 3 months of age can be treated with a first generation cephalosporin or co-amoxiclav p. 323 for 7–10 days.

If the patient is severely ill, then the infection is best treated initially by intravenous injection of a broad-spectrum antibacterial such as cefotaxime or co-amoxiclav; gentamicin is an alternative.

Resistant infections

Widespread bacterial resistance to ampicillin, amoxicillin, and trimethoprim has been reported. Alternatives for resistant organisms include co-amoxiclav (amoxicillin with clavulanic acid), an oral cephalosporin, pivmecillinam hydrochloride p. 324, or a quinolone.

Antibacterial prophylaxis

Recurrent episodes of infection are an indication for imaging tests. *Antibacterial prophylaxis* with low doses of trimethoprim or nitrofurantoin may be considered for children with recurrent infection, significant urinary-tract anomalies, or significant kidney damage. Nitrofurantoin is contra-indicated in children under 3 months of age because of the theoretical possibility of haemolytic anaemia.

Pregnancy

Urinary-tract infection in pregnancy may be asymptomatic and requires prompt treatment to prevent progression to acute pyelonephritis. Penicillins and cephalosporins are suitable for treating urinary-tract infection during pregnancy. Nitrofurantoin may also be used but it should be avoided at term. Sulfonamides, quinolones, and tetracyclines should be avoided during pregnancy; trimethoprim should also preferably be avoided particularly in the first trimester.

Renal impairment

In *renal failure* antibacterials normally excreted by the kidney accumulate with resultant toxicity unless the dose is reduced. This applies especially to the aminoglycosides which should be used with great caution; tetracyclines, methenamine hippurate, and nitrofurantoin should be avoided altogether.

ANTIBACTERIALS > OTHER

Nitrofurantoin

- **INDICATIONS AND DOSE**

  - Acute uncomplicated urinary-tract infections
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 3 months–11 years: 750 micrograms/kg 4 times a day for 3–7 days
      - Child 12–17 years: 50 mg 4 times a day for 3–7 days
    - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
      - Child 12–17 years: 100 mg twice daily, dose to be taken with food

  - Severe chronic recurrent urinary-tract infections
    - **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
      - Child 12–17 years: 100 mg 4 times a day for 3–7 days
    - **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
      - Child 3 months–11 years: 1 mg/kg once daily, dose to be taken at night
      - Child 12–17 years: 50–100 mg once daily, dose to be taken at night

Continued →
Genito-urinary surgical prophylaxis

- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- Child 12-17 years: 100 mg twice daily on day of procedure and for 3 days after

- **CONTRA-INDICATIONS** Acute porphyrias p. 562 - G6PD deficiency - infants less than 3 months old
- **CAUTIONS** Anaemia - diabetes mellitus - electrolyte imbalance - folate deficiency - pulmonary disease - susceptibility to peripheral neuropathy - urine may be coloured yellow or brown - vitamin B deficiency
- **INTERACTIONS** → Appendix 1 (nitrofurantoin).
- **SIDE-EFFECTS**
  - Rare: Agranulocytosis - aplastic anaemia - arthralgia - benign intracranial hypertension - blood disorders - cholestatic jaundice - erythema multiforme - exfoliative dermatitis - hepatitis - pancreatitis - thrombocytopenia - transient alopecia
  - Frequency not known: Acute pulmonary reactions - anaphylaxis - angioedema - anorexia - chronic pulmonary reactions (pulmonary fibrosis reported; possible association with lupus erythematosus-like syndrome) - diarrhoea - hypersensitivity reactions - nausea - peripheral neuropathy - pruritus - rash - slialadenits - urticaria - vomiting
- **PREGNANCY** Avoid at term—may produce neonatal haemolysis.
- **BREAST FEEDING** Avoid; only small amounts in milk but enough to produce haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Use with caution; cholestatic jaundice and chronic active hepatitis reported.
- **RENAL IMPAIRMENT** Risk of peripheral neuropathy; antibacterial efficacy depends on renal secretion of the drug into urinary tract. Avoid if estimated glomerular filtration rate less than 45 mL/minute/1.73 m²; may be used with caution if estimated glomerular filtration rate 30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), for treatment of uncomplicated lower urinary-tract infection caused by suspected or proven multidrug-resistant bacteria and only if potential benefit outweighs risk.
- **MONITORING REQUIREMENTS** On long-term therapy, monitor liver function and monitor for pulmonary symptoms (discontinue if deterioration in lung function).
- **EFFECT ON LABORATORY TESTS** False positive urinary glucose if tested for reducing substances.
- **PATIENT AND CARER ADVICE**

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

### Antifungals, systemic use

#### Common fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. Local treatment is suitable for a number of fungal infections (genital, bladder, eye, ear, oropharynx, and skin).

**Aspergillosis**

Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole p. 355 is the treatment of choice for aspergillosis; liposomal amphotericin p. 351 is an alternative first-line treatment when voriconazole cannot be used. Caspofungin p. 350 or itraconazole p. 353 can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis (unlicensed indication).

**Candidiasis**

Many superficial candidial infections, including infections of the skin, are treated locally. Systemic antifungal treatment is required in widespread or intractable infection. Vaginal candidiasis can be treated with locally acting antifungals; alternatively, fluconazole p. 352 can be given by mouth. *Oropharyngeal candidiasis* generally responds to topical therapy. Fluconazole is sometimes given by mouth for unresponsive infections; it is reliably absorbed and is effective. Itraconazole may be used for infections that do not respond to fluconazole. Topical therapy may not be adequate in immunocompromised children and an oral triazole antifungal is preferred.

For invasive or disseminated candidiasis, either amphotericin by intravenous infusion or an echinocandin can be used. Fluconazole is an alternative for *Candida albicans* infection in clinically stable children who have not received an azole antifungal recently. Amphotericin should be considered for the initial treatment of CNS candidiasis. Voriconazole can be used for infections caused by fluconazole-resistant *Candida* spp. when oral therapy is required, or in children intolerant of amphotericin or an echinocandin. In refractory cases, flucytosine p. 356 can be used with intravenous amphotericin.

**Cryptococcosis**

Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is amphotericin by intravenous infusion and flucytosine by intravenous infusion for 2 weeks, followed by fluconazole by mouth for 8 weeks or until
cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

**Histoplasmosis**
Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons. Itraconazole can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. Amphotericin by intravenous infusion is used for the initial treatment of fulminant or severe infections, followed by a course of itraconazole by mouth. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

**Skin and nail infections**
Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy. Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis).

Oral imidazole or triazole antifungals (particularly itraconazole) and terbinafine p. 680 are used more frequently than griseofulvin p. 357 because they have a broader spectrum of activity and require a shorter duration of treatment. *Tinea capitis* is treated systemically; additional topical application of an antifungal may reduce transmission. Griseofulvin is used for tinea capitis in adults and children; it is effective against infections caused by *Trichophyton tonsurans*. Itraconazole is used for tinea capitis caused by *T. tonsurans* [unlicensed indication]. The role of terbinafine in the management of *Microsporum* infections is uncertain. Fluconazole or itraconazole are alternatives in the treatment of tinea capitis caused by *T. tonsurans* or *Microsporum* spp. [both unlicensed indications]. *Pityriasis versicolor* may be treated with itraconazole by mouth if topical therapy is ineffective; fluconazole by mouth is an alternative. Oral terbinafine is not effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. Terbinafine and itraconazole have largely replaced griseofulvin for the systemic treatment of onychomycosis, particularly of the toenail; they should be used under specialist advice in children. Although terbinafine is not licensed for use in children, it is considered effective for tinea capitis. Itraconazole can be administered as intermittent ‘pulse’ therapy. Topical antifungals also have a role in the treatment of onychomycosis.

**Immunocompromised children**
Immunocompromised children are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. Fluconazole is more reliably absorbed than itraconazole, but fluconazole is not effective against *Aspergillus* spp. Itraconazole is preferred in patients at risk of invasive aspergillosis. Micafungin p. 350 can be used for prophylaxis of candidiasis in patients undergoing haematopoietic stem cell transplantation when fluconazole or itraconazole cannot be used.

Amphotericin by intravenous infusion or caspofungin is used for the empirical treatment of serious fungal infections in immunocompromised children; caspofungin is not effective against fungal infections of the CNS.

**Triazole antifungals**
Triazole antifungal drugs have a role in the prevention and systemic treatment of fungal infections.

Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria. Itraconazole is active against a wide range of dermatophytes. There is limited information available on use in children. Itraconazole capsules require an acid environment in the stomach for optimal absorption. Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

Voriconazole is a broad-spectrum antifungal drug which is licensed in adults for use in life-threatening infections.

**Imidazole antifungals**
The imidazole antifungals include clotrimazole p. 481, p. 678, econazole nitrate p. 481, p. 678, ketoconazole p. 414, p. 678, and tioconazole p. 679. They are used for the local treatment of vaginal candidiasis and for dermatophyte infections. Miconazole p. 663 can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

**Polyene antifungals**
The polyene antifungals include amphotericin and nystatin p. 663; neither drug is absorbed when given by mouth. Nystatin p. 663 is used for oral, oropharyngeal, and perioral infections by local application in the mouth. Nystatin is also used for *Candida albicans* infection of the skin. Amphotericin p. 351 by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (Abelcet® and AmBisome®) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

**Echinocandin antifungals**
The echinocandin antifungals include caspofungin p. 350 and micafungin p. 350. They are only active against *Aspergillus* spp. and *Candida* spp.; however, micafungin is not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS. Echinocandin antifungals have a role in the prevention and systemic treatment of fungal infections.

**Other antifungals**
Flucytosine p. 356 is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. Flucytosine has a role in the treatment of systemic candidiasis and cryptococcal meningitis.

Griseofulvin p. 357 is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. Griseofulvin is used in the treatment of tinea capitis. It is the drug of choice for trichophyton infections in
Infection

ANTIFUNGALS

Caspofungin

- **INDICATIONS AND DOSE**
  - **Invasive aspergillosis** | **Invasive candidiasis** | **Empirical treatment of systemic fungal infections in patients with neutropenia**
  - **BY INTRAVENOUS INFUSION**
    - **Neonate**: 25 mg/m² once daily.
    - **Child 1-2 months**: 25 mg/m² once daily.
    - **Child 3-11 months**: 50 mg/m² once daily.
    - **Child 1-17 years**: 70 mg/m² once daily (max. per dose 70 mg) for 1 day, then 50 mg/m² once daily (max. per dose 70 mg); increased to 70 mg/m² once daily (max. per dose 70 mg), dose may be increased if lower dose tolerated but inadequate response

- **SIDE-EFFECTS**
  - **Common or very common**
    - Arthralgia
    - diarrhoea
    - dyspnoea
    - flushing
    - headache
    - hypokalaemia
    - hypomagnesaemia
    - hypotension
    - injection-site reactions
    - nausea
    - pruritus
    - rash
    - sweating
    - tachycardia
    - vomiting
  - **Uncommon**
    - Abdominal pain
    - anaemia
    - anorexia
    - anxiety
    - arrhythmia
    - ascites
    - blurred vision
    - bronchospasm
    - chest pain
    - cholestasis
    - constipation
    - cough
    - diarrhoea
    - dizziness
    - dry mouth
    - dyspepsia
    - dysphagia
    - erythema multiforme
    - fatigue
    - flatulence
    - heart failure
    - hepatic dysfunction
    - hyperglycaemia
    - hypertension
    - hypoaesthesia
    - hypocalcaemia
    - leucopenia
    - metabolic acidosis
    - muscular weakness
    - myalgia
    - palpitation
    - paraesthesia
    - renal failure
    - sleep disturbances
    - taste disturbances
    - thrombocytopenia
    - thrombophlebitis
    - tremor
  - **Frequency not known**
    - Acute respiratory distress syndrome
    - anaphylaxis
    - hypercalcaemia

- **PREGNANCY**
  - Manufacturer advises avoid unless essential—toxicity in animal studies.

- **BREAST FEEDING**
  - Present in milk in animal studies—manufacturer advises avoid.

- **HEPATIC IMPAIRMENT**
  - Usual initial dose, then use 70% of normal maintenance dose in moderate impairment. No information available for severe impairment.

- **DIRECTIONS FOR ADMINISTRATION**
  - For intravenous infusion (Candidias®), allow vial to reach room temperature; initially reconstitute 50 mg with 10.5 mL Water for Injections to produce a 5.2 mg/mL solution, or reconstitute 70 mg with 10.5 mL Water for Injections to produce a 7.2 mg/mL solution; mix gently to dissolve; dilute requisite dose to a final concentration not exceeding 500 micrograms/mL with Sodium Chloride 0.9%; give over 60 minutes; incompatible with glucose solutions.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - **Powder for solution for infusion**
    - **Cancidas** (Merck Sharp & Dohme Ltd)
      - Caspofungin (as Caspofungin acetate) 50 mg: Cancidas 50mg powder for solution for infusion vials | 1 vial [††] EU73267
      - Caspofungin (as Caspofungin acetate) 70 mg: Cancidas 70mg powder for solution for infusion vials | 1 vial [†††] EU41678

Micasfugin

- **INDICATIONS AND DOSE**
  - **Invasive candidiasis**
    - **BY INTRAVENOUS INFUSION**
      - **Neonate** (administered on expert advice): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate.
      - **Child** (body-weight up to 40 kg): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate
      - **Child** (body-weight 40 kg and above): 100 mg once daily for at least 14 days; increased if necessary to 200 mg once daily, increase dose if response inadequate
  - **Oesophageal candidiasis**
    - **BY INTRAVENOUS INFUSION**
      - **Child 16-17 years** (body-weight up to 40 kg): 3 mg/kg once daily
      - **Child 16-17 years** (body-weight 40 kg and above): 150 mg once daily
  - **Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days**
    - **BY INTRAVENOUS INFUSION**
      - **Neonate**: 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range.
      - **Child** (body-weight up to 40 kg): 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range
      - **Child** (body-weight 40 kg and above): 50 mg once daily continue for at least 7 days after neutrophil count is in desirable range

- **INTERACTIONS**
  - **Appendix 1** (micasfugin).

- **SIDE-EFFECTS**
  - **Common or very common**
    - Abdominal pain
    - anaemia
    - blood pressure changes
    - diarrhoea
    - fever
    - headache
    - hepatomegaly
    - hypokalaemia
    - hypomagnesaemia
    - myocardial infarction
    - nausea
    - phlebitis
    - rash
    - renal failure
    - tachycardia
    - thrombocytopenia
    - vomiting
  - **Uncommon**
    - Anorexia
    - anxiety
    - bradycardia
    - cholestasis
    - confusion
    - constipation
    - dizziness
    - dyspepsia
    - dysphagia
    - eosinophilia
    - flushing
    - hepatitis
    - hyperidrosis
    - hyperkaemia
    - hypoproteinaemia
    - hypophosphataemia
    - palpititation
    - pancytopenia
    - pruritus
    - sleep disturbances
    - tachycardia
    - taste disturbances
    - tremor
  - **Rare**
    - Haemolytic anaemia
  - **Frequency not known**
    - Disseminated intravascular coagulation
    - hepatotoxicity (potentially life-threatening; more common in children under 1 year) - Stevens-Johnson syndrome
    - toxic epidermal necrolysis
  - **PREGNANCY**
    - Manufacturer advises avoid unless essential—toxicity in animal studies.
  - **BREAST FEEDING**
    - Manufacturer advises use only if potential benefit outweighs risk—present in milk in animal studies.
  - **HEPATIC IMPAIRMENT**
    - Use with caution in mild to moderate impairment. Avoid in severe impairment.
  - **RENAI IMPAIRMENT**
    - Use with caution; renal function may deteriorate.
  - **MONITORING REQUIREMENTS**
    - Monitor renal function.
    - Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop.
  - **DIRECTIONS FOR ADMINISTRATION**
    - For intravenous infusion reconstitute each vial with 5 mL Glucose 5% or Sodium Chloride 0.9%; gently rotate vial, without shaking, to
dilute requisite dose to a concentration of 0.5–2 mg/mL with Glucose 5% or Sodium Chloride 0.9%; protect infusion from light; give over 60 minutes.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**
- Amphotericin (Ascalix Pharma Ltd)
  - Micafungin (as Micafungin sodium) 50 mg: Micafungin 50mg powder for solution for infusion vials | 1 vial (PMD) £196.08
  - Micafungin (as Micafungin sodium) 100 mg: Micafungin 100mg powder for solution for infusion vials | 1 vial (PMD) £341.00

**ANTI-INFECTIVE AGENTS**

**POLYENE ANTIFUNGALS**

**Amphotericin (Amphotericin B)**

**INDICATIONS AND DOSE**

**Abelcet**

**Severe invasive candidiasis** | **Severe systemic fungal infections** in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in HIV patients

- **BY INTRAVENOUS INFUSION**
  - Child: Test dose 100 micrograms/kg (max. per dose 1 mg), then 5 mg/kg once daily

**Ambisome**

**Severe systemic or deep mycoses** where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin; Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials

- **BY INTRAVENOUS INFUSION**
  - Neonate: 1 mg/kg once daily, increased if necessary to 3 mg/kg once daily; maximum 5 mg/kg per day.
  - Child: Test dose 100 micrograms/kg (max. per dose 1 mg), to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

**Visceral leishmaniasis** (unresponsive to the antimonial alone)

- **BY INTRAVENOUS INFUSION**
  - Child: 1–3 mg/kg/daily for 10–21 days to a cumulative dose of 21–30 mg/kg, alternatively 3 mg/kg for 5 consecutive days, followed by 3 mg/kg after 6 days for 1 dose

**Fungizone**

**Systemic fungal infections**

- **BY INTRAVENOUS INFUSION**
  - Neonate: 1 mg/kg once daily, increased if necessary to 1.5 mg/kg daily for 7 days, then reduced to 1–1.5 mg/kg once daily on alternate days if required.
  - Child: Test dose 100 micrograms/kg (max. per dose 1 mg), included as part of first dose of 250 micrograms/kg daily, then increased if tolerated to 1 mg/kg daily, dose is gradually increased over 2–4 days; in severe infection max. 1.5 mg/kg daily or on alternate days. Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

**UNLICENSED USE**

**Ambisome** not licensed for use in children under 1 month.

**Fungizone** Intra-venous conventional formulation amphotericin (Fungizone®) is licensed for use in children (age range not specified by manufacturer).

**CAUTIONS**

- Avoid rapid infusion (risk of arrhythmias) - when given parenterally, toxicity common (close supervision necessary and close observation required for at least 30 minutes after test dose)

**INTERACTIONS**

- **Appendix 1 (amphotericin).**
  - Caution—corticosteroids (avoid except to control reactions).

**SIDE-EFFECTS**

- **Common or very common** Abdominal pain - abnormal liver function (discontinue treatment) - anaemia - arthralgias - blood disorders - blood pressure changes - cardiovascular effects - chest pain - diarrhoea - disturbances in renal function - dyspnoea - electrolyte disturbances - febrile reactions - headache - hypokalaemia - hypomagnesaemia - nausea - rash - renal tubular acidosis - thrombocytopenia - vomiting
  - **Uncommon** Anaphylactoid reactions - bronchospasm - convulsions - diplopia - encephalopathy - hearing loss - neurological disorders - peripheral neuropathy - tremor
  - **Frequency not known** Anorexia - arthralgia - myalgia - Stevens-Johnson syndrome - toxic epidermal necrolysis

**PREGNANCY**

- Not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk.

**BREAST FEEDING**

- No information available.

**RENAI IMPAIRMENT**

- Use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation.

**MONITORING REQUIREMENTS**

- Hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required.

**DIRECTIONS FOR ADMINISTRATION**

**Abelcet** Amphotericin (lipid complex)

For intravenous infusion, allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20-mL syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute in Glucose 5% to a concentration of 2 mg/mL; preferably give via an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose given over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium chloride or other electrolyte solutions—flush existing intravenous line with Glucose 5% or use separate line.

**Ambisome** Amphotericin (liposomal)

For intravenous infusion, reconstitute each vial with 12 mL Water for Injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into Glucose 5% or 10% through the 5-micron filter provided, to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes; if non-anaphylactic infection-related reactions occur infuse over 2 hours (initial test dose given over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride solutions—flush existing intravenous line with Glucose 5% or 10%, or use separate line.
FUNGZONE® Amphotericin (as sodium deoxycholate complex)
For intravenous infusion, reconstitute each vial with 10 mL. Water for Injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in Glucose 5% to a concentration of 100 micrograms/mL (in fluid-restricted children, up to 400 micrograms/mL given via a central line); pH of glucose solution must not be below 4.2 (check each container—consult product literature for details of buffer); infuse over 4–6 hours, or if tolerated over a minimum of 2 hours (initial test dose given over 20–30 minutes); begin infusion immediately after dilution and protect from light; incompatible with Sodium Chloride solutions—flush existing intravenous line with Glucose 5% or use separate line; an in–line filter (pore size no less than 1 micron) may be used.

PRESCRIBING AND DISPENSING INFORMATION Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should not be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion
EXCIPIENTS: May contain Sucrose
ElecTROLYTES: May contain Sodium

Ambisome (Gilead Sciences International Ltd)
Amphotericin B liposomal 50 mg
Ambisome 50 mg powder for solution for infusion vials | 10 vial (PHN) £821.87
Fungizone (Bristol-Myers Squibb Pharmaceuticals Ltd)
Amphotericin B 50 mg
Fungizone Intravenous 50 mg powder for solution for infusion vials | 1 vial (PHN) £3.88

Suspension for infusion
ElecTROLYTES: May contain Sodium
Abelcet (Teva UK Ltd)
Amphotericin B (as Amphotericin B phospholipid complex) 5 mg per 1 mL Abelcet 100 mg/20 mL concentrate for suspension for infusion vials | 10 vial (PHN) £775.04 (Hospital only)

ANTIFUNGALS TRIAZOLE ANTIFUNGALS

Fluconazole

INDICATIONS AND DOSE
Candidal balanitis
BY MOUTH
Child 16–17 years: 150 mg for 1 dose
Vaginal candidiasis
BY MOUTH
Child 1 month–15 years: 150 mg for 1 dose, for use in patients who are post-puberty
Child 16–17 years: 150 mg for 1 dose
Vulvovaginal candidiasis (recurrent)
BY MOUTH
Child: Initially 150 mg every 72 hours for 3 doses, then 150 mg once weekly for 6 months, for use in patients who are post-puberty
Mucosal candidiasis (except genital)
BY MOUTH, OR BY INTRAVENOUS INFUSION
Neonate up to 14 days: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg every 72 hours.
Neonate 14 days to 28 days: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg every 48 hours.
Child 1 month–11 years: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg daily (max. per dose 100 mg) for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections)
Child 12–17 years: 50 mg daily for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections

Tinea capitis
BY MOUTH
Child 1–7 years: 6 mg/kg daily (max. per dose 300 mg) for 2–4 weeks

Tinea pedis, corporis, cruris, pityriasis versicolor | Dermal candidiasis
BY MOUTH
Child: 3 mg/kg daily (max. per dose 50 mg) for 2–4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks

Invasive candidal infections (including candidaemia and disseminated candidiasis) and cryptococcal infections (including meningitis)
BY MOUTH, OR BY INTRAVENOUS INFUSION
Neonate up to 14 days: 6–12 mg/kg every 72 hours, treatment continued according to response (at least 8 weeks for cryptococcal meningitis).
Neonate 14 days to 28 days: 6–12 mg/kg every 48 hours, treatment continued according to response (at least 8 weeks for cryptococcal meningitis).
Neonate 14 days to 28 days: 6–12 mg/kg every 24 hours, treatment continued according to response (at least 8 weeks for cryptococcal meningitis).

Prevention of fungal infections in immunocompromised patients
BY MOUTH, OR BY INTRAVENOUS INFUSION
Neonate up to 14 days: 3–12 mg/kg every 72 hours, dose given according to extent and duration of neutropenia.
Neonate 14 days to 28 days: 3–12 mg/kg every 48 hours, dose given according to extent and duration of neutropenia.
Child: 3–12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose given according to extent and duration of neutropenia

Prevention of fungal infections in immunocompromised patients (for patients with high risk of systemic infections e.g. following bone-marrow transplantation)
BY MOUTH, OR BY INTRAVENOUS INFUSION
Child: 12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range

Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy
BY MOUTH, OR BY INTRAVENOUS INFUSION
Child: 6 mg/kg daily (max. per dose 200 mg)

UNLICENSED USE Not licensed for tinea infections in children, or for vaginal candidiasis in girls under 16 years, or for prevention of relapse of cryptococcal meningitis after completion of primary therapy in children with HIV.

CONTRA-INDICATIONS Acute porphyrias p. 562

CAUTIONS Susceptibility to QT interval prolongation

INTERACTIONS → Appendix 1 (antifungals, triazole); in general, fluconazole interactions in Appendix 1 relate to multiple-dose treatment.
Caution with concomitant use of hepatotoxic drugs.

**SIDE-EFFECTS**
- Common or very common Abdominal discomfort, diarrhoea, flatulence, headache, nausea, rash
- Uncommon Alopecia, anaphylaxis, angioedema, dizziness, dyspepsia, hepatic disorders, hyperlipidaemia, pruritus, seizures, Stevens-Johnson syndrome, taste disturbance, toxic epidermal necrolysis, vomiting
- Frequency not known Hypokalaemia, leucopenia, thrombocytopenia

**SIDE-EFFECTS, FURTHER INFORMATION**
If rash occurs, discontinue treatment (or monitor closely if infection invasive or systemic); severe cutaneous reactions are more likely in patients with AIDS.

**PREGNANCY**
Manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses.

**BREAST FEEDING**
Present in milk but amount probably too small to be harmful.

**HEPATIC IMPAIRMENT**
Toxicity with related drugs.

**RENAI IMPAIRMENT**
Usual initial dose then halve subsequent doses if estimated glomerular filtration rate less than 50 ml/minute/1.73 m².

**MONITORING REQUIREMENTS**
Monitor liver function with high doses or extended courses—discontinue if signs or symptoms of hepatic disease (risk of hepatic necrosis).

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For intravenous infusion, give over 10–30 minutes; do not exceed an infusion rate of 5–10 ml/minute.

**PRESCRIBING AND DISPENSING INFORMATION**
Flavours of oral liquid formulations may include orange.

**PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulation
Fluconazole Capsules 50 mg may be prescribed.
Fluconazole Oral Suspension 50 mg/5 mL may be prescribed.

**EXCEPTIONS TO LEGAL CATEGORY**
Fluconazole capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg.

**MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.

**Capsule**
- CAUTIONARY AND ADVISORY LABELS 9 (50 mg and 200 mg strengths only)
  - Fluconazole (Non-proprietary) Fluconazole 50 mg | Fluconazole 50 mg capsules | 7 capsule | £0.86
  - Fluconazole 150 mg | Fluconazole 150 mg capsules | 1 capsule | £0.81
  - Fluconazole 200 mg | Fluconazole 200 mg capsules | 1 capsule | £0.81
  - Canesten (fluconazole) (Bayer Plc) Fluconazole 150 mg | Canesten 150 mg capsules | 1 capsule | £0.81
  - Diflucan (Pfizer Ltd) Fluconazole 50 mg | Fluconazole 50 mg capsules | 7 capsule | £0.86
  - Fluconazole 150 mg | Fluconazole 150 mg capsules | 1 capsule | £0.81
  - Fluconazole 200 mg | Fluconazole 200 mg capsules | 1 capsule | £0.81

**Oral suspension**
- CAUTIONARY AND ADVISORY LABELS 9
  - Fluconazole (Non-proprietary) Fluconazole 10 mg | Fluconazole 10 mg/5 mL oral suspension | 35 mL | £0.86
  - Fluconazole 40 mg | Fluconazole 40 mg/5 mL oral suspension | 35 mL | £0.86

**Solution for infusion**
- ELECTROLYTES: May contain Sodium
  - Fluconazole (Non-proprietary) Fluconazole 2 mg per 1 mL Fluconazole 100 mg/50 mL solution for infusion bottles | 5 bottle | £2.60
  - Fluconazole 40 mg/25 mL solution for infusion vials | 1 vial | £0.28
  - Fluconazole 2 mg per 1 mL Fluconazole 200 mg/100 mL solution for infusion vials | 1 vial | £0.28

**Itraconazole**

**INDICATIONS AND DOSE**

**Oropharyngeal candidiasis**
- **BY MOUTH**
  - Child 1 month–11 years: 3–5 mg/kg once daily for 15 days; maximum 100 mg per day
  - Child 12–17 years: 100 mg once daily for 15 days

**Oral candidiasis in patients with AIDS or neutropenia**
- **BY MOUTH**
  - Child 1 month–11 years: 3–5 mg/kg once daily for 15 days; maximum 200 mg per day
  - Child 12–17 years: 200 mg once daily for 15 days

**Systemic candidiasis where other antifungal drugs inappropriate or ineffective**
- **BY MOUTH**
  - Child: 5 mg/kg once daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 5 mg/kg twice daily (max. per dose 200 mg)
  - **BY INTRAVENOUS INFUSION**
    - Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days

**Pityriasis versicolor**
- **BY MOUTH**
  - Child 1 month–11 years: 3–5 mg/kg once daily (max. per dose 200 mg) for 7 days
  - Child 12–17 years: 200 mg once daily for 7 days

**Tinea pedis / Tinea manuum**
- **BY MOUTH**
  - Child 1 month–11 years: 3–5 mg/kg once daily (max. per dose 100 mg) for 30 days
  - Child 12–17 years: 100 mg once daily for 30 days, alternatively 200 mg twice daily for 7 days

**Tinea corporis / Tinea cruris**
- **BY MOUTH**
  - Child 1 month–11 years: 3–5 mg/kg once daily (max. per dose 100 mg) for 15 days
  - Child 12–17 years: 100 mg once daily for 15 days, alternatively 200 mg once daily for 7 days

**Tinea capitis**
- **BY MOUTH**
  - Child 1 year–7 years: 3–5 mg/kg once daily (max. per dose 200 mg) for 2–6 weeks

**Onychomycosis**
- **BY MOUTH**
  - Child 1–11 years: 5 mg/kg daily (max. per dose 200 mg) for 7 days, subsequent courses repeated after 21–day intervals; fingernails 2 courses, toenails 3 courses
  - Child 12–17 years: 200 mg once daily for 3 months, alternatively 200 mg twice daily for 7 days, continued →
Infection

**Systemic aspergillosis where other antifungal drugs inappropriate or ineffective**

- **BY INTRAVENOUS INFUSION**
  - Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for 12 days
- **BY MOUTH**
  - Child: 5 mg/kg once daily (max. per dose 200 mg), increased to 5 mg/kg twice daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis

**Histoplasmosis**

- **BY MOUTH**
  - Child: 5 mg/kg 1–2 times a day (max. per dose 200 mg)

**Systemic cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective**

- **BY MOUTH**
  - Child: 5 mg/kg once daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 5 mg/kg twice daily (max. per dose 200 mg)
- **BY INTRAVENOUS INFUSION**
  - Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days

**Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate**

- **BY MOUTH**
  - Child: 5 mg/kg once daily (max. per dose 200 mg), then increased to 5 mg/kg twice daily (max. per dose 200 mg), dose increased only if plasma-itraconazole concentration

**Prophylaxis of deep fungal infections (when standard therapy inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic**

- **BY MOUTH**
  - Child: 2.5 mg/kg twice daily, to be started before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers, safety and efficacy not established

**SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- **Common or very common** Abdominal pain - blood pressure changes - cough - diarrhoea - dyspnoea - headache - hepatitis - hypokalaemia - nausea - rash - taste disturbances - vomiting
- **Uncommon** Constipation - dizziness - dyspepsia - flatulence - menstrual disorder - myalgia - oedema - peripheral neuropathy (discontinue treatment)
- **Rare** Alopecia - deafness - erectile dysfunction - heart failure - hypertriglyceridaemia - leucopenia - pancreatitis - photosensitivity - Stevens-Johnson syndrome - tinnitus - toxic epidermal necrolysis - urinary frequency - visual disturbances
- **Frequency not known** Arthralgia - confusion - drowsiness - hepatotoxicity - renal impairment - thrombocytopenia - tremor

**SPECIFIC SIDE-EFFECTS**

- With intravenous use Hyperglycaemia

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hepatotoxicity Potentially life-threatening hepatotoxicity reported very rarely—discontinue if signs of hepatitis develop.
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and until the next menstrual period following end of treatment.
- **PREGNANCY** Manufacturer advises use only in life-threatening situations (toxicity at high doses in animal studies).
- **BREAST FEEDING** Small amounts present in milk—may accumulate; manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Dose reduction may be necessary. Use only if potential benefit outweighs risk of hepatotoxicity.
- **RENAL IMPAIRMENT** Risk of congestive heart failure.
- With oral use Bioavailability of oral formulations possibly reduced.
- With intravenous use Use intravenous infusion with caution if estimated glomerular filtration rate 30–80 mL/minute/1.73 m² (monitor renal function); avoid intravenous infusion if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

**MONITORING REQUIREMENTS**

- Absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary).
- Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, if history of hepatotoxicity with other drugs, or in hepatic impairment.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous infusion, dilute 250 mg with 50 mL Sodium Chloride 0.9% and give requisite dose through an in-line filter (0.2 micron) over 60 minutes.
- With oral use For oral liquid, do not take with food; swish around mouth and swallow, do not rinse afterwards.

**PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.

**PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop.

- With oral use Patients or carers should be given advice on how to administer itraconazole oral liquid.

**IMPORTANT SAFETY INFORMATION**

**HEART FAILURE**

- Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:
  - patients receiving high doses and longer treatment courses;
  - older adults and those with cardiac disease;
  - patients with chronic lung disease (including chronic obstructive pulmonary disease) associated with pulmonary hypertension;
  - patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers.
- Itraconazole should be avoided in patients with ventricular dysfunction or a history of heart failure unless the infection is serious.

**CONTRA-INDICATIONS** Acute porphyrias p. 562

**CAUTIONS** Active liver disease - history of hepatotoxicity with other drugs - susceptibility to congestive heart failure

**INTERACTIONS** → Appendix 1 (antifungals, triazole).

**UNLICENSED USE** Not licensed for use in children (age range not specified by manufacturer).
**Voriconazole**

### INDICATIONS AND DOSE

**Invasive aspergillosis**

S. aureus infections caused by *Scedosporium spp., Fusarium spp.*, or invasive fluconazole-resistant Candida spp. (including *C. krusei*)

**By mouth**

- Child 2–11 years: Treatment should be initiated with intravenous regimen, and oral regimen should be considered only after there is a significant clinical improvement; maintenance 9 mg/kg every 12 hours, adjusted in steps of 1 mg/kg and increased if necessary up to 350 mg every 12 hours, then adjusted in steps of 50 mg as required
- Child 12–14 years (body-weight up to 50 kg): Treatment should be initiated with intravenous regimen, and oral regimen should be considered only after there is a significant clinical improvement; maintenance 9 mg/kg every 12 hours, adjusted in steps of 1 mg/kg and increased if necessary up to 350 mg every 12 hours, then adjusted in steps of 50 mg as required
- Child 12–14 years (body-weight 50 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours
- Child 15–17 years (body-weight up to 40 kg): Initially 200 mg every 12 hours for 2 doses, then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours
- Child 15–17 years (body-weight 40 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours

**By intravenous infusion**

- Child 2–11 years: Initially 9 mg/kg every 12 hours for 2 doses, then 8 mg/kg every 12 hours; adjusted in steps of 1 mg/kg as required; for max. 6 months
- Child 12–14 years (body-weight up to 50 kg): Initially 9 mg/kg every 12 hours for 2 doses, then 8 mg/kg every 12 hours; adjusted in steps of 1 mg/kg as required; for max. 6 months
- Child 12–14 years (body-weight 50 kg and above): Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours; reduced if not tolerated to 3 mg/kg every 12 hours; for max. 6 months
- Child 15–17 years: Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours; reduced if not tolerated to 3 mg/kg every 12 hours; for max. 6 months

**Contra-indications**

Acute porphyria p. 562

**Caution**

Avoid exposure to sunlight - bradyarrhythmia - cardiomyopathy - electrolyte disturbances - history of QT interval prolongation - patients at risk of pancreatitis - symptomatic arthrhithiasms

**Interactions**

- Appendix 1 (antifungals, triazole).

Caution with concomitant use with other drugs that prolong QT interval.

**Side-effects**

- **General side-effects**

- **Rare**
  - Convulsions - discoid lupus erythematosus - extrapyramidal effects - hearing disturbances - hyperthyroidism - hypotension - hypothyroidism - insomnia - optic atrophy - pseudomembranous colitis - pseudophophria - retinal haemorrhage - taste disturbances (more common with oral suspension) - tinnitus - toxic epidermal necrolysis

- **Frequency not known**
  - On long term treatment, squamous cell carcinoma of skin (particularly in presence of phototoxicity) - periostitis (particularly in transplant patients)

**SPECIFIC SIDE-EFFECTS**

- **Common or very common**
  - With intravenous use Injection-site reactions

**SIDE-EFFECTS, FURTHER INFORMATION**

- Hepatotoxicity Hepatitis, cholestasis, and fulminant hepatic failure usually occur in the first 10 days; risk of hepatotoxicity increased in patients with haematological malignancy. Consider treatment discontinuation if severe abnormalities in liver function tests.
- Phototoxicity Phototoxicity occurs commonly. If phototoxicity occurs, consider treatment discontinuation; if treatment is continued, monitor for pre-malignant skin lesions and squamous cell carcinoma, and discontinue treatment if they occur.

**Conception and contraception**

Effective contraception required during treatment.

**Pregnancy**

Toxicity in animal studies — manufacturer advises avoid unless potential benefit outweighs risk.

**Breast feeding**

Manufacturer advises avoid — no information available.

**Hepatic impairment**

Child 12–17 years In mild to moderate hepatic cirrhosis use usual initial dose then halve subsequent doses. No information available for severe hepatic cirrhosis —
manufacturer advises use only if potential benefit outweighs risk.

**RENAL IMPAIRMENT**
- Child 2-12 years: No information available.
- Child 12-17 years: Intravenous vehicle may accumulate if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—use intravenous infusion only if potential benefit outweighs risk; and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required).

**MONITORING REQUIREMENTS**
- Monitor renal function.
- Monitor liver function before starting treatment, then at least weekly for 1 month, and then monthly during treatment.

**DIRECTIONS FOR ADMINISTRATION**
- With intravenous use: For intravenous infusion, reconstitute each 200 mg with 19 mL. Water for Injections or Sodium Chloride 0.9% to produce a 10 mg/mL solution; dilute dose to concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give intermittently at a rate not exceeding 3 mg/kg/hour.

**PRESCRIBING AND DISPENSING INFORMATION**
- Flavours of oral liquid formulations may include orange.

**PATIENT AND CARER ADVICE**
- Patients and their carers should be advised to keep the alert card with them at all times.
- Patients and their carers should be told how to recognise symptoms of liver disorder, and advised to seek immediate medical attention if symptoms such as nausea, vomiting, malaise or jaundice develop.

**CAUTIONS**
- Use normal dose every 10–14 hours.
- Use normal dose if creatinine clearance less than 10 mL/minute/1.73 m² and then adjust dose according to plasma concentration for optimum response (weekly in blood disorders).

**SIDE-EFFECTS**
- Diarrhoea, nausea, rashes, vomiting.
- Uncommon: Alterations in liver function tests—cardiotoxicity, confusion, convulsions, hallucinations, headache, sedation, toxic epidermal necrolysis, vertigo.
- Frequency not known: Aplastic anaemia, blood disorders—hepatic necrosis—hepatitis—leucopenia—thrombocytopenia.

**PREGNANCY**
- Teratogenic in animal studies; manufacturer advises use only if potential benefit outweighs risks.

**BREAST FEEDING**
- Manufacturer advises avoid.

**RENAL IMPAIRMENT**
- Use normal dose every 12 hours if creatinine clearance 20–40 mL/minute; use normal dose every 24 hours if creatinine clearance 10–20 mL/minute; use initial normal dose if creatinine clearance less than 10 mL/minute and then adjust dose according to plasma-flucytosine concentration. In renal impairment liver- and kidney-function tests and blood counts required weekly.

**MONITORING REQUIREMENTS**
- For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 μg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 μg/litre (620 micromol/litre).

**DIRECTIONS FOR ADMINISTRATION**
- For intravenous infusion, give over 20–40 minutes.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug.

3.1 Pneumocystis pneumonia

Pneumocystis pneumonia

Overview
Pneumonia caused by *Pneumocystis jiroveci* (*Pneumocystis carinii*) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

Treatment
The recommended duration of treatment is generally 14–21 days.

Mild to moderate disease
Co-trimoxazole p. 330 in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone p. 358 or a combination of dapsone p. 358 with trimethoprim p. 338 is given by mouth for the treatment of mild to moderate disease [unlicensed indication] in children who cannot tolerate co-trimoxazole.

A combination of clindamycin p. 307 and primaquine p. 374 may be used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

Severe disease
Co-trimoxazole in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate p. 358 given by intravenous infusion is an alternative for children who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion. If there is clinical improvement after 7–10 days of intravenous therapy with pentamidine isetionate, patients can be switched to oral treatment (e.g. atovaquone) to complete 21 days treatment. Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia.

Adjunctive therapy
In moderate to severe pneumocystis infections associated with HIV infection, prednisolone p. 413 is given by mouth for 5 days (alternatively, hydrocortisone p. 411 may be given parenterally); the dose is then reduced over the next 16 days and then stopped. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

Prophylaxis
Prophylaxis against pneumocystis pneumonia should be given to all children with a history of this infection, and to all HIV-infected infants aged 1 month–1 year. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised children. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the child has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

Prophylaxis should also be given to infants aged 1 month–1 year who are suspected to be HIV-positive, or whose mothers had a viral load greater than 1000 HIV RNA copies/ml between 36 weeks' gestation and delivery; prophylaxis should be continued until HIV infection is excluded or until immunity recovers.
Co-trimoxazole by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. Co-trimoxazole may be used in infants born to mothers with a high risk of transmission of infection.

Inhaled pentamidine isetionate is better tolerated than parenteral pentamidine isetionate. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in children unable to tolerate co-trimoxazole. It is effective but children may be prone to extrapulmonary infection. Alternatively, dapsone can be used.

**ANTIPROTOZOALS**

### Atovaquone

**INDICATIONS AND DOSE**

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients intolerant of co-trimoxazole

- **BY MOUTH**
  - Child 1-2 months: 15–20 mg/kg twice daily for 14–21 days, dose to be taken with food, particularly high fat food
  - Child 3 months–1 year: 22.5 mg/kg twice daily for 14–21 days, dose to be taken with food, particularly high fat food
  - Child 2-17 years: 15–20 mg/kg twice daily (max. per dose 750 mg) for 14–21 days, dose to be taken with food, particularly high fat food

- **UNLICENSED USE** Not licensed for use in children.

- **CAUTIONS** Other causes of pulmonary disease should be sought and treated - initial diarrhoea and difficulty in swallowing may be noted.

- **INTERACTIONS** → Appendix 1 (atovaquone).

- **SIDE-EFFECTS** Anaemia, diarrhoea, fever, headache, hypotension, insomina, nausea, neutropenia, pruritus, rash - Stevens-Johnson syndrome - vomiting

- **PREGNANCY** Manufacturer advises precautions. Monitor more closely in hepatic impairment.

- **BREAST FEEDING** Manufacturer advises precautions. Monitor more closely in hepatic and renal impairment.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral suspension**

())

- **Wellvone** (GlaxoSmithKline UK Ltd)
  - Atovaquone 150 mg per 1 ml: Wellvone 750mg/5ml oral suspension sugar-free 226 ml (PTE) £486.37

### Dapsone

**INDICATIONS AND DOSE**

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (in combination with trimethoprim)

- **BY MOUTH**
  - Child 1 month–11 years: 2 mg/kg once daily (max. per dose 100 mg)
  - Child 12-17 years: 100 mg once daily

- **UNLICENSED USE** Not licensed for treatment of pneumocystis (*P. jirovecii*) pneumonia. Monotherapy not licensed for children for prophylaxis of *P. jirovecii* pneumonia.

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Dapsone syndrome: If dapsone syndrome occurs (rash with fever and eosinophilia) - discontinue immediately (may progress to exfoliative dermatitis, hepatitis, haemolysis, methaemoglobinemia, psychosis and death).

- **PREGNANCY** Folic acid p. 533 (higher dose) should be given to mother throughout pregnancy; neonatal haemolysis and methaemoglobinemia reported in third trimester.

- **BREAST FEEDING** Haemolytic anaemia; although significant amount in milk, risk to infant very small unless infant is G6PD deficient.

- **PATIENT AND CARER ADVICE**
  - Blood disorders: On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

())

- **Wellvone** (GlaxoSmithKline UK Ltd)
- Dapsone 50 mg: Dapsone 50mg tablets 28 tablet (PTE) £64.77 DT price = £21.12
- Dapsone 100 mg: Dapsone 100mg tablets 28 tablet (PTE) £117.80 DT price = £104.60

### Pentamidine isetionate

**INDICATIONS AND DOSE**

**Prophylaxis of Pneumocystis jirovecii** (*Pneumocystis carinii*) pneumonia

- **BY INTRAVENOUS INFUSION**
  - Child: 4 mg/kg once daily for at least 7–10 days

- **Prophylaxis of Pneumocystis jirovecii** (*Pneumocystis carinii*) pneumonia (specialist use only)

- **BY INHALATION OF NEBULISED SOLUTION**
  - Child 5-17 years: 300 mg every 4 weeks, alternatively 150 mg every 2 weeks, using suitable equipment—consult product literature

**Visceral leishmaniasis** (specialist use only)

- **BY DEEP INTRAMUSCULAR INJECTION**
  - Child 1-7 years: 3–4 mg/kg once daily on alternate days, maximum total of 10 injections, course may be repeated if necessary
Cutaneous leishmaniasis (specialist use only)
▶ BY DEEP INTRAMUSCULAR INJECTION
▶ Child 1–7 years: 3–4 mg/kg 1–2 times a week until condition resolves

Trypanosomiasis (specialist use only)
▶ BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION
▶ Child 1–7 years: 4 mg/kg once daily or on alternate days for a total of 7–10 injections

- **UNLICENSED USE** Not licensed for prevention of pneumocystis pneumonia in children.
- **CAUTIONS** Anaemia · bradycardia · coronary heart disease · history of ventricular arrhythmias · hyperglycaemia · hypertension · hypoglycaemia · hypokalaemia · hypomagnesaemia · hypotension · leucopenia · risk of severe hypotension following administration · thrombocytopenia
- **INTERACTIONS** → Appendix 1 (pentamidine isetionate). Caution with concomitant use of other drugs that prolong the QT interval.
- **SIDE-EFFECTS**

  **GENERAL SIDE-EFFECTS** Abnormal liver-function tests · acute renal failure · anaemia · arrhythmias (can be severe and sometimes fatal) · azotaemia · dizziness · flushing · hyperglycaemia · hypokalaemia · hypocalcaemia · hypoglycaemia (can be severe and sometimes fatal) · hypotension (can be severe and sometimes fatal) · leucopenia · nausea · pancreatitis · rash · Stevens-Johnson syndrome · syncope · taste disturbances · thrombocytopenia · vomiting

  **SPECIFIC SIDE-EFFECTS**
  - When used by inhalation Bronchoconstriction (may be prevented by prior use of bronchodilators) · cough · shortness of breath
  - With intravenous use Injection site reactions (muscle necrosis, discomfort, pain, induration, abscess formation)
  - With intravenous use Injection site reactions (muscle necrosis, discomfort, pain, induration, abscess formation)
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Reduce intravenous dose for pneumocystis pneumonia if creatinine clearance less than 10 mL/minute: in life-threatening infection, use 4 mg/kg once daily for 7–10 days, then 4 mg/kg on alternate days to complete course of at least 14 doses; in less severe infection, use 4 mg/kg on alternate days for at least 14 doses.
- **MONITORING REQUIREMENTS**
  - Monitor blood pressure before starting treatment, during administration, and at regular intervals, until treatment concluded.
  - Carry out laboratory monitoring according to product literature.
- **DIRECTIONS FOR ADMINISTRATION** Patient should be lying down when receiving drug parenterally. Direct intravenous injection should be avoided whenever possible and never given rapidly; intramuscular injections should be deep and preferably given into the buttock. For intravenous infusion, reconstitute 300 mg with 3–5 mL Water for Injections (displacement value may be significant), then dilute required dose with 50–250 mL Glucose 5% or Sodium Chloride 0.9%; give over at least 60 minutes.
  - Powder for injection (dissolved in water for injection) may be used for nebulisation.
- **HANDLING AND STORAGE** Pentamidine isetionate is toxic and personnel should be adequately protected during handling and administration—consult product literature.

Medicinal forms
There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**
▶ Pentacrinat 300 mg Pentacrinat 300 mg powder for solution for injection vials | 5 vial (£35.86)

4 Helminth infection

Helminth infections

Specialist centres
Advice on prophylaxis and treatment of helminth infections is available from the following specialist centres:

| Birmingham | (0121) 424 0357 |
| Scotland | Contact local Infectious Diseases Unit |
| Liverpool | (0151) 705 3100 |
| London | 0845 155 5000 (treatment) |

Drugs for threadworms
Antihelmintics are effective in threadworm (pinworms, *Enterobius vermicularis*) infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment. Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole p. 361 is the drug of choice for treating threadworm infection in patients of all ages over 6 months. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

**Ascariasis (common roundworm infections)**
Mebendazole is effective against *Ascaris lumbricoides* and is generally considered to be the drug of choice.

Levamisole p. 361 [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is an alternative when mebendazole cannot be used. It is very well tolerated.

Drugs for tapeworm infections

**Taenicides**
Niclosamide [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastrointestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in *Taenia solium* infections have proved unfounded. All the same, an antimitic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel p. 362 [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is as effective as niclosamide.

**Hydatid disease**
Cysts caused by *Echinococcus granulosus* grow slowly and asymptomatic patients do not always require treatment.
Surgical treatment remains the method of choice in many situations. Albendazole below [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to E. multilocularis is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

**Drugs for hookworms**
Hookworms (anyclostomiasis, necatoriasis) live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia. Mebendazole has a useful broad-spectrum activity, and is effective against hookworms. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is an alternative. Levamisole is also effective in children.

**Schistosomicides (bilharziasis)**
Adult *Schistosoma haematobium* worms live in the genito-urinary veins and adult *S. mansoni* in those of the colon and mesentery. *S. japonicum* is more widely distributed in veins of the alimentary tract and portal system. *Praziquantel* [unlicensed] is available from Merck Serono (Cysticide®) and is effective against all human schistosomoses. No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

**Filaricides**
*Diethylcarbamazine* [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions, treatment in adults and children over 1 month, is commenced with a dose of diethylcarbamazine citrate on the first day and increased gradually over 3 days. Length of treatment varies according to infection type, and usually gives a radical cure for these infections. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin p. 361 [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is very effective in onchocerciasis and it is now the drug of choice; reactions are usually slight. Diethylcarbamazine or suramin should no longer be used for onchocerciasis because of their toxicity.

**Drugs for cutaneous larva migrans (creeping eruption)**
Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical tiabendazole (no commercial preparation available). Multiple infections respond to ivermectin, albendazole or *tiabendazole* (tiabendazole) by mouth [all unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies).

**Drugs for strongyloidiasis**
Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is the treatment of choice for chronic *Strongyloides* infection in adults and children over 5 years. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist importing companies) is an alternative given to adults and children over 2 years.

## ANTHELMinTICS

### Albendazole

- **INDICATIONS AND DOSE**
  - **Chronic *Strongyloides* infection**
    - **BY MOUTH**
      - Child 2-17 years: 400 mg twice daily for 3 days, dose may be repeated after 3 weeks if necessary
  - **Hydatid disease, in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases**
    - **BY MOUTH**
      - Child 2-17 years: 7.5 mg/kg twice daily (max. per dose 400 mg twice daily) for 28 days followed by 14-day break, repeated for up to 2-3 cycles
  - **Hookworm infections**
    - **BY MOUTH**
      - Child 2-17 years: 400 mg for 1 dose

- **UNLICENSED USE** Albendazole is an unlicensed drug.
- **INTERACTIONS** → Appendix 1 (*albendazole*).

### Medical forms
There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet, oral suspension

- **Tablet**
  - CAUTIONARY AND ADVISORY LABELS 9
  - Albendazole [Non-proprietary]
    - **Chewable tablet**
      - CAUTIONARY AND ADVISORY LABELS 9
        - Albendazole 400 mg Eskazole 400mg tablets | 60 tablet
          - no price available
  - **Chewable tablet**
    - CAUTIONARY AND ADVISORY LABELS 9
      - Albendazole 200 mg Zentel 200mg chewable tablets | 6 tablet
        - no price available
      - Albendazole 400 mg Zentel 400mg chewable tablets | 1 tablet
        - no price available | 3 tablet
          - no price available

### Diethylcarbamazone

- **INDICATIONS AND DOSE**
  - **Wuchereria bancrofti infections | Brugia malayi infections**
    - **BY MOUTH**
      - Child 1 month-9 years: Initially 1 mg/kg daily in divided doses on the first day, then increased to 3 mg/kg daily in divided doses, dose to be increased gradually over 3 days
      - Child 10-17 years: Initially 1 mg/kg daily in divided doses on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days
  - **Loa loa infections**
    - **BY MOUTH**
      - Child 1 month-9 years: Initially 1 mg/kg daily in divided doses on the first day, then increased to 3 mg/kg daily in divided doses, dose to be increased gradually over 3 days

---

**360 Helminth infection**

---
**Ivermectin**

- **INDICATIONS AND DOSE**
  - **Chronic Strongyloides infection**
    - BY MOUTH
    - Child 5-17 years: 200 micrograms/kg daily for 2 days
  - **Onchocerciasis**
    - BY MOUTH
    - Child 5-17 years: 150 micrograms/kg for 1 dose, retreatment at intervals of 6 to 12 months may be required depending on symptoms
  - **Scabies, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or ‘Norwegian’) scabies that does not respond to topical treatment alone**
    - BY MOUTH
    - Child: (consult product literature)

- **UNLICENSED USE** Ivermectin is an unlicensed drug.
- **INTERACTIONS** → Appendix 1 (diethylcarbamazine).
- **SIDE-EFFECTS** Aggravation of itching · aggravation of rash

- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet
  - **Tablet**
    - **Ivermectin (Non-proprietary)**
      - Ivermectin 3 mg Stromectol 3mg tablets | 4 tablet no price available | 20 tablet no price available

**Levamisole**

- **INDICATIONS AND DOSE**
  - **Roundworm infections**
    - BY MOUTH
    - Child: 2.5–3 mg/kg (max. per dose 150 mg) for 1 dose
  - **Hookworm infections**
    - BY MOUTH
    - Child: 2.5 mg/kg (max. per dose 150 mg) for 1 dose, dose to be repeated after 7 days if severe
  - **Nephrotic syndrome (initiated under specialist supervision)**
    - BY MOUTH
    - Child: 2.5 mg/kg once daily on alternate days (max. per dose 150 mg)

- **UNLICENSED USE** Not licensed.
- **CONTRA-INDICATIONS** Blood disorders
- **CAUTIONS** Epilepsy · juvenile idiopathic arthritis · Sjögren’s syndrome
- **INTERACTIONS** → Appendix 1 (levamisole).
- **SIDE-EFFECTS** Arthralgia (on prolonged treatment) · blood disorders (on prolonged treatment) · convulsions (on prolonged treatment) · diarrhoea · dizziness · headache · influenza-like syndrome (on prolonged treatment) · insomnia (on prolonged treatment) · myalgia (on prolonged treatment) · nausea · rash (on prolonged treatment) · taste disturbances (on prolonged treatment) · vasculitis (on prolonged treatment) · vomiting

- **PREGNANCY** Embryotoxic in animal studies, avoid if possible.
- **BREAST FEEDING** No information available.
- **HEPATIC IMPAIRMENT** Use with caution—dose adjustment may be necessary.
- **PATIENT AND CARER ADVICE**

**Mebendazole**

- **INDICATIONS AND DOSE**
  - **Threadworm infections**
    - BY MOUTH
    - Child 6 months–17 years: 100 mg for 1 dose, if reinfection occurs, second dose may be needed after 2 weeks
  - **Whipworm infections | Hookworm infections**
    - BY MOUTH
    - Child 1-17 years: 100 mg twice daily for 3 days
  - **Roundworm infections**
    - BY MOUTH
    - Child 1 year: 100 mg twice daily for 3 days
    - Child 2-17 years: 100 mg twice daily for 3 days, alternatively 500 mg for 1 dose

- **UNLICENSED USE** Not licensed for use in children under 2 years. Treatment of roundworm infections with mebendazole 500 mg as a single dose is an unlicensed dose.
- **INTERACTIONS** → Appendix 1 (mebendazole).
- **SIDE-EFFECTS**
  - Common or very common: Abdominal pain
  - Uncommon: Diarrhoea · flatulence
  - Rare: Alopecia · convulsions · dizziness · hepatitis · neutropenia · rash · Stevens-Johnson syndrome · toxic epidermal necrolysis · urticaria

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Amount present in milk too small to be harmful but manufacturer advises avoid.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana.
- **PATIENT AND CARER ADVICE**
  - Medicines for Children leaflet: Mebendazole for worm infections www.medicinesforchildren.org.uk/mebendazole-for-worm-infections

- **EXCEPTIONS TO LEGAL CATEGORY** Mebendazole tablets can be sold to the public if supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg.
Infection

Forms of amoebic dysentery and tinidazole are relatively ineffective. Diloxanide furoate is patients with amoebicides against amoebae which may have migrated to the liver. Also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver.

INTERACTIONS

Treatment with metronidazole (or tinidazole) is followed by destruction any amoebae in the gut.

Trichomonacides

Metronidazole is the treatment of choice for Trichomonas vaginalis infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole may be tried.

Antigiardial drugs

Metronidazole is the treatment of choice for Giardia lamblia infections. Tinidazole may be used as an alternative to metronidazole.

Leishmaniacides

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision. Sodium stibogluconate p. 363, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dosage varies with different geographical regions and expert advice should be obtained. Skin lesions can also be treated with sodium stibogluconate.

Amphotericin p. 351 is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (Ambisome®), Abelcet®, a lipid formulation of amphotericin is also likely to be effective but less information is available.

Pentamidine isethionate p. 358 (pentamidine isethionate) has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin (unlicensed) (available from ‘special-order’ manufacturers or specialist importing companies).

Trypanocides

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

Drugs for toxoplasmosis

Most infections caused by Toxoplasma gondii are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma chorioretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine p. 375 and sulfadiazine p. 331, given for several weeks (expert advice essential). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folinic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin p. 307 or clarithromycin p. 309 or azithromycin p. 308. Long-term

5 Protozoal infection

Antiprotozoal drugs

Amebicides

Metronidazole p. 313 is the drug of choice for acute invasive amoebic dysentery since it is very effective against vegetative forms of Entamoeba histolytica in ulcers. Tinidazole p. 315 is also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver. Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate p. 281.

Diloxanide furoate is the drug of choice for asymptomatic patients with E. histolytica cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For amoebic abscesses of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with large volumes of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

Praziquantel

INDICATIONS AND DOSE

Tapeworm infections (Taenia solium)

- By mouth
  - Child 4–17 years: 5–10 mg/kg for 1 dose, to be taken after a light breakfast

Tapeworm infections (Hymenolepis nana)

- By mouth
  - Child 4–17 years: 25 mg/kg for 1 dose, to be taken after a light breakfast

Schistosoma haematobium worm infections

- By mouth
  - Child 4–17 years: 20 mg/kg, followed by 20 mg/kg after 4–6 hours

Schistosoma japonicum worm infections

- By mouth
  - Child 4–17 years: 20 mg/kg 3 times a day for 1 day

UNLICENSED USE

Praziquantel is an unlicensed drug.

INTERACTIONS

MEDICAL FORMS

  - Praziquantel 500 mg Cysticide 500mg tablets | 90 tablet PBM no price available
secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus; specialist advice should be sought on management. Spiramycin (unlicensed) (available from ‘special-order’ manufacturers or specialist importing companies) may reduce the risk of transmission of maternal infection to the fetus. When there is evidence of placental or fetal infection, pyrimethamine may be given with sulfadiazine and folinic acid p. 515 after the first trimester.

In neonates without signs of toxoplasmosis, but born to mothers known to have become infected, spiramycin is given while awaiting laboratory results. If toxoplasmosis is confirmed in the infant, pyrimethamine and sulfadiazine are given for 12 months, together with folinic acid.

5.1 Leishmaniasis

ANTIPROTOZOALS

Sodium stibogluconate

- **INDICATIONS AND DOSE**
  - **Visceral leishmaniasis (specialist use only)**
  - BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
  - Child: 20 mg/kg daily for at least 20 days

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS** Heart disease (withdraw if conduction disturbances occur) • mucocutaneous disease • predisposition to QT interval prolongation • treat intercurrent infection (e.g. pneumonia)

- **INTERACTIONS** Appendix 1 (sodium stibogluconate).

- **SIDE-EFFECTS**
  - **Rare** Bleeding from gums • bleeding from nose • fever • flushing • jaundice • rash • substernal pain • sweating • vertigo
  - **Frequency not known** Abdominal pain • anaphylaxis • anorexia • arthralgia • coughing • diarrhoea • ECG changes • headache • lethargy • myalgia • nausea • pain on intramuscular injection • pain on intravenous administration • pancreatitis • thrombosis on intravenous administration • vomiting

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Amount probably too small to be harmful.

- **HEPATIC IMPAIRMENT** Use with caution.

- **RENAL IMPAIRMENT** Avoid in significant impairment.

- **MONITORING REQUIREMENTS** Monitor ECG before and during treatment.

- **DIRECTIONS FOR ADMINISTRATION** Intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain occur. Injection should be filtered immediately before administration using a filter of 5 microns or less.

5.2 Malaria

Antimalarials

Artemether with lumefantrine

Artemether with lumefantrine p. 370 is licensed for the treatment of acute non-complicated falciparum malaria.

Chloroquine

Chloroquine p. 372 is used for the prophylaxis of malaria in areas of the world where the risk of chloroquine-resistant falciparum malaria is still low. It is also used with proguanil hydrochloride p. 375 when chloroquine-resistant falciparum malaria is present but this regimen may not give optimal protection (see Recommended regimens for prophylaxis against malaria p. 366).

Chloroquine is no longer recommended for the treatment of falciparum malaria owing to widespread resistance, nor is it recommended if the infective species is not known or if the infection is mixed; in these cases treatment should be with quinine p. 376, *Malarone®*, or *Riamet®*. It is still recommended for the treatment of non-falciparum malaria.

Mefloquine

Mefloquine p. 373 is used for the prophylaxis of malaria in areas of the world where there is a high risk of chloroquine-resistant falciparum malaria (for details, see Recommended regimens for prophylaxis against malaria p. 366).

Mefloquine is now rarely used for the treatment of falciparum malaria because of increased resistance. It is rarely used for the treatment of non-falciparum malaria because better tolerated alternatives are available. Mefloquine should not be used for treatment if it has been used for prophylaxis.

Piperaquine with artenimol

Artenimol with piperaquine phosphate p. 371 is not recommended for the first-line treatment of acute uncomplicated falciparum malaria because there is limited experience of its use in travellers who usually reside in areas where malaria is not endemic. Piperaquine has a long half-life.

Primaquine

Primaquine p. 374 is used to eliminate the liver stages of *P. vivax* or *P. ovale* following chloroquine treatment.

Proguanil

Proguanil hydrochloride is used (usually with chloroquine, but occasionally alone) for the prophylaxis of malaria, (for details, see Recommended regimens for prophylaxis against malaria p. 366).

Proguanil hydrochloride used alone is not suitable for the treatment of malaria; however, *Malarone®* (a combination of atovaquone with proguanil hydrochloride p. 371) is licensed for the treatment of acute uncomplicated falciparum malaria. *Malarone®* is also used for the prophylaxis of falciparum malaria in areas of widespread mefloquine or chloroquine resistance. *Malarone®* is also used as an alternative to mefloquine or doxycycline p. 332. *Malarone®* is particularly suitable for short trips to highly chloroquine-resistant areas.
resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

**Pyrimethamine**
Pyrimethamine p. 375 should not be used alone, but is used with sulfadoxine. Pyrimethamine with sulfadoxine p. 375 is not recommended for the prophylaxis of malaria, but can be used in the treatment of falciparum malaria with (or following) quinine.

**Quinine**
Quinine is not suitable for the prophylaxis of malaria. Quinine is used for the treatment of falciparum malaria or if the infective species is not known or if the infection is mixed (for details see Malaria, treatment p. 365).

**Tetracyclines**
Doxycycline is used in adults and children over 12 years for the prophylaxis of malaria in areas of widespread mefloquine or chloroquine resistance. Doxycycline is also used as an alternative to mefloquine or Malarone® (for details, see Recommended regimens for prophylaxis against malaria p. 366).

### Malaria, prophylaxis

#### Prophylaxis against malaria
The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists; the advice is aimed at residents of the UK who travel to areas of risk. The choice of drug for a particular individual should take into account:
- risk of exposure to malaria
- extent of drug resistance
- efficacy of the recommended drugs
- side-effects of the drugs
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen)

Prophylactic doses are based on guidelines agreed by UK malaria experts and may differ from advice in product literature. **Weight is a better guide than age.** If in doubt obtain advice from specialist centre (see under Malaria, treatment p. 365).

#### Protection against bites
**Prophylaxis is not absolute,** and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important. Mosquito nets impregnated with permethrin provide the most effective barrier protection against insects (infants should sleep with a mosquito net stretched over the cot or baby carrier); nets and vapourised insecticides are also useful. Diethyltoluamide (DEET) 20–50% in lotions, sprays, or roll-on formulations is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. When sunscreen is also required, DEET should be applied after the sunscreen. DEET reduces the SPF of sunscreen, so a sunscreen of SPF 30–50 should be applied. Long sleeves and trousers worn after dusk also provide protection against bites.

**Length of prophylaxis**
In order to determine tolerance and to establish habit, prophylaxis should generally be started one week (2–3 weeks in the case of mefloquine p. 373) before travel into an endemic area; Malarone® or doxycycline p. 332 prophylaxis should be started 1–2 days before travel. Prophylaxis should be continued for **4 weeks after leaving** (except for Malarone® prophylaxis which should be stopped 1 week after leaving). For extensive journeys across different regions, the traveller must be protected in all areas of risk.

In those requiring long-term prophylaxis, chloroquine p. 372 and proguanil hydrochloride p. 375 may be used for periods of over 5 years. Mefloquine is licensed for up to 1 year (although, if it is tolerated in the short term, there is no evidence of harm when it is used for up to 3 years). Doxycycline can be used for up to 2 years. Malarone® can be used for up to 1 year. Prophylaxis with mefloquine, doxycycline, or Malarone® may be considered for longer durations if it is justified by the risk of exposure to malaria. Specialist advice should be sought for long-term prophylaxis.

#### Return from malarial region
It is important to be aware that any illness that occurs within 1 year and **especially within 3 months of return might be malaria** even if all recommended precautions against malaria were taken. Travellers should be warned of this and told that if they develop any illness particularly within 3 months of their return they should go immediately to a doctor and specifically mention their exposure to malaria.

**Epilepsy**
Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In areas without chloroquine resistance proguanil alone is recommended; in areas with chloroquine resistance, doxycycline or Malarone® may be considered.

**Asplenia**
Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

**Renal impairment**
Avoidance (or dosage reduction) of proguanil hydrochloride is recommended since it is excreted by the kidneys. Malarone® should not be used for prophylaxis in patients with estimated glomerular filtration rate less than 30 mL/minute/1.73m². Chloroquine is only partially excreted by the kidneys and reduction of the dose for prophylaxis is not required except in severe impairment. Mefloquine is considered to be appropriate to use in renal impairment and does not require dosage reduction. Doxycycline is also considered to be appropriate.

**Pregnancy**
Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil hydrochloride can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined, particularly in Sub-Saharan Africa; in the case of proguanil hydrochloride, folic acid p. 533 (in doses greater than standard pregnancy prophylaxis) should be given for at least the first trimester. The centres listed (see Malaria, treatment p. 365) should be consulted for advice on prophylaxis in chloroquine-resistant areas. Although the manufacturer advises that mefloquine should not be used during pregnancy, particularly in the first trimester, unless the potential benefit outweighs the risk, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas. Doxycycline is contra-indicated during pregnancy; however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks’ gestation [unlicensed]. Malarone® should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative.
Breast-feeding
Prophylaxis is required in breast-fed infants; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

Anticoagulants
Travellers taking warfarin sodium p. 89 should begin chemoprophylaxis 2–3 weeks before departure. The INR should be stable before departure. It should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

Standby treatment
Children and their carers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be avoided if medical help is accessible.

In order to avoid excessive self-medication, the traveller should be provided with written instructions that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

Specific recommendations
Where a journey requires two regimens, the regimen for the higher risk area should be used for the whole journey. Those travelling to remote or little-visited areas may require expert advice. See also Recommended regimens for prophylaxis against malaria.

Important
Settled immigrants (or long-term visitors) to the UK may be unaware that any immunity they may have acquired while living in malarious areas is lost rapidly after migration to the UK, or that any non-malarious areas where they lived previously may now be malarious.

TREATMENT
Recommendations on the prophylaxis and treatment of malaria reflect guidelines agreed by UK malaria specialists. Choice will depend on the age of the child.

If the infective species is not known, or if the infection is mixed, initial treatment should be as for falciparum malaria with quinine p. 376, Malarone® (atovaquone with proguanil hydrochloride) or Riamet® (artemether with lumefantrine p. 370). Falciparum malaria can progress rapidly in unprotected individuals and antimalarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.

Falciparum malaria (treatment)
Falciparum malaria (malignant malaria) is caused by Plasmodium falciparum. In most parts of the world, P. falciparum is now resistant to chloroquine p. 372 which should not therefore be given for treatment. Quinine, Malarone® (atovaquone with proguanil hydrochloride), or Riamet® (artemether with lumefantrine can be given by mouth if the child can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given by intravenous infusion if the child is seriously ill or unable to take tablets. Mefloquine p. 373 is now rarely used for treatment because of concerns about resistance.

Oral quinine is well tolerated by children although the salts are bitter. Quinine is given by mouth together with or followed by clindamycin p. 307 [unlicensed indication] or, in children over 12 doxycycline p. 332.

If the parasite is likely to be sensitive, pyrimethamine with sulfadoxine p. 375 as a single dose [unlicensed] may be given (instead of either clindamycin or doxycycline) together with, or after, a course of quinine. Alternatively, Malarone®, or Riamet® may be given instead of quinine. It is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after Malarone® or Riamet® treatment.

If the child is seriously ill or unable to swallow tablets, or if more than 2% of red blood cell are parasitized, quinine should be given by intravenous infusion [unlicensed] (until patient can swallow tablets to complete the 7-day course together with or followed by either doxycycline in children over 12 years, or clindamycin).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for ‘named-patient’ use.

Pregnancy
Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The treatment doses of oral and intravenous quinine (including the loading dose) can safely be given in pregnancy. Clindamycin [unlicensed indication] should be given for 7 days with or after quinine. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development in fetus); pyrimethamine with sulfadoxine, Malarone®, and Riamet® are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for ‘named-patient’ use.

Non-falciparum malaria (treatment)

Non-falciparum malaria is usually caused by Plasmodium vivax and less commonly by P. ovale and P. malariae. P. knowlesi is also present in the Asia-Pacific region.

Chloroquine is the drug of choice for the treatment of non-falciparum malaria (but chloroquine-resistant P. vivax has been reported in the Indonesian archipelago, the Malay

Malarone

Vietnam).

Peninsula, including Myanmar, and eastward to Southern

Vietnam).

For the treatment of chloroquine-resistant non-falciparum

malaria, Malarone® [unlicensed indication], quinine, or

Riamet® [unlicensed indication] can be used; as with

chloroquine, primaquine p. 374 should be given for radical
cure.

Chloroquine alone is adequate for P. malariae and P.

knowlesi infections but in the case of P. vivax and P. ovale, a

radical cure (to destroy parasites in the liver and thus prevent

relapses) is required. This is achieved with primaquine

[unlicensed] given after chloroquine.

For a radical cure, primaquine [unlicensed] is then given to

children over 6 months of age; specialist advice should be

sought for children under 6 months of age.

Parenteral

If the child is unable to take oral therapy, quinine can be

given by intravenous infusion, changed to oral chloroquine

as soon as the patient’s condition permits.

Pregnancy

Treatment doses of chloroquine can be given for non-
falciparum malaria. In the case of P. vivax or P. ovale, however,

the radical cure with primaquine should be postponed until

the pregnancy is over; instead chloroquine should be

continued, given weekly, during the pregnancy.

ARTIPROTOZOLS > ANTIMALARIALS

Artemether with lumefantrine

> INDICATIONS AND DOSE

Treatment of acute uncomplicated falciparum malaria | Treatment of chloroquine-resistant non-falciparum malaria

> BY MOUTH

> Child (body-weight 5-14 kg): Initially 1 tablet, followed by 1 tablet for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 6 tablets over 60 hours)

> Child (body-weight 15-24 kg): Initially 2 tablets, followed by 2 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 12 tablets over 60 hours)

> Child (body-weight 25-34 kg): Initially 3 tablets, followed by 3 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 18 tablets over 60 hours)

> Child 12-17 years (body-weight 35 kg and above): Initially 4 tablets, followed by 4 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 24 tablets over 60 hours)

> UNLICENSED USE Use in treatment of non-falciparum malaria is an unlicensed indication.

> CONTRA-INDICATIONS Family history of congenital QT interval prolongation · family history of sudden death · history of arrhythmias · history of clinically relevant bradycardia · history of congestive heart failure accompanied by reduced left ventricular ejection fraction

> CAUTIONS Avoid in Acute porphyrias p. 562 · electrolyte disturbances

> INTERACTIONS → Appendix 1 (artemether with lumefantrine). Caution if concomitant use with other drugs known to cause QT-interval prolongation.
Piperaquine has a long half-life; there is a potential for drug interactions to occur for up to 3 months after treatment has been stopped. Concomitant use with other drugs known to prolong the QT interval contra-indicated.

**SIDE-EFFECTS**
- **Common or very common** Abdominal pain, anorexia, arthralgia, asthenia, cough, diarrhoea, diziness, headache, myalgia, nausea, palpititation, paraesthesia, prolonged QT interval, pruritus, rash, sleep disturbances, vomiting
- **Uncommon** Atenxia, clonus, hypoesthesia
- **PREGNANCY** Toxicity in animal studies with artemether. Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid breastfeeding for at least 1 week after last dose. Present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAlad INPAIRMENT** Manufacturer advises caution in severe impairment. In severe renal impairment monitor ECG and plasma potassium concentration.
- **MONITORING REQUIREMENTS** Monitor patients unable to take food (greater risk of recrudescence).
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed and mixed with water immediately before administration.
- **PATIENT AND CARER ADVICE**
  - **Driving and skilled tasks** Dizziness may affect performance of skilled tasks (e.g. driving).

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21
- **Riamet** (Novartis Pharmaceuticals UK Ltd)
  - Artemether 20 mg, Lumezantrine 120 mg Riamet tablets | 24 tablet [POD] £22.50

Artemisinol with piperaquine phosphate

(Piperaquine tetraphosphate with dihydroartemisinin)

**INDICATIONS AND DOSE**

**Treatment of uncomplicated falciparum malaria**

- **BY MOUTH**
  - Child 6 months–17 years (body-weight 7–12 kg): 0.5 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Child 6 months–17 years (body-weight 13–23 kg): 1 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Child 6 months–17 years (body-weight 24–35 kg): 2 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Child 6 months–17 years (body-weight 36–74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course
  - Child 6 months–17 years (body-weight 75–99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

**CONTRA-INDICATIONS**

Acute myocardial infarction - bradycardia - congenital long QT syndrome - electrolyte disturbances - family history of sudden death - heart failure with reduced left ventricular ejection fraction - history of symptomatic arthralgia - left ventricular hypertrophy - risk factors for QT interval prolongation - severe hypertension

**INTERACTIONS**

- Appendix 1 (artemisinol with piperaquine).
Child (body-weight 31–40 kg): 3 tablets once daily for 3 days
Child (body-weight 41 kg and above): 4 tablets once daily for 3 days

MALARONE® PAEDIATRIC Prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected

BY MOUTH
Child (body-weight 5–8 kg): 0.5 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
Child (body-weight 9–10 kg): 0.75 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
Child (body-weight 11–20 kg): 1 tablet once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
Child (body-weight 21–30 kg): 2 tablets once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
Child (body-weight 31–40 kg): 3 tablets once daily, to be started 1–2 days before entering endemic area and continued for 1 week after leaving
Child (body-weight 41 kg and above): Use Malarone® (standard) tablets.

Treatment of acute uncomplicated falciparum malaria

Initial therapy

BY MOUTH
Child (body-weight 5–8 kg): 2 tablets once daily for 3 days
Child (body-weight 9–10 kg): 3 tablets once daily for 3 days
Child (body-weight 11 kg and above): Use Malarone® (standard) tablets.

MALARONE® PAEDIATRIC

With oral use Tablets may be crushed and mixed with food or milky drink just before administration.

PATIENT AND CARER ADVICE

Medicines for Children leaflet: Malarone for prevention of malaria www.medicinesforchildren.org.uk/malarone-for-prevention-of-malaria

Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

NATIONAL FUNDING/ACCESS DECISIONS

NHS restrictions Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Malarone (GlaxoSmithKline UK Ltd) Proguanil hydrochloride 25 mg, Atovaquone 62.5 mg Malarone Paediatric tablets | 12 tablet | £6.26 Proguanil hydrochloride 100 mg, Atovaquone 250 mg Malarone tablets | 12 tablet | £25.21 07 price = £25.21

Chloroquine

INDICATIONS AND DOSE

Prophylaxis of malaria

INITIALLY BY MOUTH USING SYRUP

Child up to 6 weeks (body-weight up to 4.5 kg): 25 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
Child 6–11 months (body-weight 4.5–7 kg): 50 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
Child 1–2 years (body-weight 11–14 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
Child 3–4 years (body-weight 15–16.4 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
Child 4–7 years (body-weight 16.5–24 kg): 150 mg once weekly, alternatively (by mouth using tablets) 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
Child 8–13 years (body-weight 25–44 kg): 225 mg once weekly, alternatively (by mouth using tablets) 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

TREATMENT OF FALCIPARUM MALARIA

BY MOUTH

Child: Initially 10 mg/kg (max. per dose 620 mg), then 5 mg/kg after 6–8 hours (max. per dose 310 mg), then 5 mg/kg daily (max. per dose 310 mg) for 2 days

DOSE EQUIVALENCE AND CONVERSION

Doses expressed as chloroquine base. Chloroquine base 150 mg = chloroquine sulphate 200 mg = chloroquine phosphate 250 mg (approx.)

UNLICENSED USE

Chloroquine doses for the treatment and prophylaxis of malaria in BNF publications may differ from those in product literature.

CAUTIONS

Acute porphyrias p. 562 · G6PD deficiency · long-term therapy (regular ophthalmic examination recommended by manufacturers) · may aggravate myasthenia gravis · may exacerbate psoriasis · neurological disorders, especially epilepsy (avoid for prophylaxis of
malaria if history of epilepsy) • severe gastro-intestinal disorders

- INTERACTIONS  Appendix 1 (chloroquine). Avoid concurrent therapy with hepatotoxic drugs.

- SIDE-EFFECTS
  - Common or very common  Gastro-intestinal disturbances • headache • pruritus • rash • skin reactions
  - Uncommon  Convulsions • discoloration of mucous membranes • discoloration of nails • discoloration of skin • ECG changes • hair depigmentation • hair loss • keratopathy • otorrhea • retinal damage • visual changes
  - Rare  Acute generalised exanthematous pustulosis • agranulocytosis • angioedema • aplastic anaemia • blood disorders • bone marrow suppression • cardiomyopathy • emotional disturbances • exfoliative dermatitis • hepatic damage • hypersensitivity reactions • mental changes • myopathy • neuromyopathy • photosensitivity • psychosis • Stevens-Johnson syndrome • thrombocytopenia • urticaria
  - Frequency not known  Bronchospasm • diffuse parenchymal lung disease • drug rash with eosinophilia and systemic symptoms • extrapyramidal symptoms (associated with use in malaria) • hypotension • visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION
- Malaria prophylaxis and treatment  Serious skin reactions, ECG changes, visual effects, otorrhea, blood disorders, mental changes, myopathies and hepatic damage are not usually associated with malaria prophylaxis or treatment.

Overdose  Chloroquine is very toxic in overdosage; overdosage is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

- PREGNANCY  Benefit of use in prophylaxis and treatment in malaria outweighs risk. For rheumatoid disease, it is not necessary to withdraw an antimalarial drug during pregnancy if the disease is well controlled.

- BREAST FEEDING  Present in breast milk and breast-feeding should be avoided when used to treat rheumatic disease. Amount in milk probably too small to be harmful when used for malaria.

- RENAL IMPAIRMENT  Only partially excreted by the kidneys and reduction of the dose is not required for prophylaxis of malaria except in severe impairment. For rheumatoid arthritis and lupus erythematosus, reduce dose. Manufacturers advise caution.

- MONITORING REQUIREMENTS  Ophthalmic examination with long-term therapy.

- PATIENT AND CARER ADVICE  Warn travellers going to malarious areas about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

- NATIONAL FUNDING/ACCESS DECISIONS  NHS restrictions Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed

- EXCEPTIONS TO LEGAL CATEGORY  Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

### Chloroquine with proguanil

The properties listed below are those particular to the combination only. For the properties of the components please consider, chloroquine p. 372, proguanil hydrochloride p. 375.

- INDICATIONS AND DOSE
  - Prophylaxis of malaria  
    - BY MOUTH
    - Child: (consult product literature)

- EXCEPTIONS TO LEGAL CATEGORY  Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

### Mefloquine

- INDICATIONS AND DOSE
  - Treatment of malaria  
    - BY MOUTH
    - Child: (consult product literature)

- Prophylaxis of malaria  
    - BY MOUTH
    - Child (body-weight 5–15 kg): 62.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
    - Child (body-weight 16–24 kg): 125 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
    - Child (body-weight 25–44 kg): 187.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
    - Child (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving

- UNLICENSED USE  Mefloquine doses in BNF Publications may differ from those in product literature. Not licensed for use in children under 5 kg body-weight and under 3 months.

- CONTRA-INDICATIONS  Avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions • avoid for standby treatment if history of convulsions • history of blackwater fever

- CAUTIONS  Cardiac conduction disorders • epilepsy (avoid for prophylaxis) • not recommended in infants under 3 months (5 kg) • traumatic brain injury
Protozoal infection

Cautions, further information

- Neuropsychiatric reactions. Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodromal for a more serious event. If neuropsychiatric symptoms occur, patients should be advised to discontinue mefloquine and to seek immediate medical attention so that mefloquine can be replaced with an alternative antimalarial. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life. Mefloquine is contra-indicated for malaria prophylaxis in those with a history of psychiatric disorders or convulsions.

- Interactions. Appendices 1 (mefloquine).

- Side-effects
  - Common or very common Abdominal pain, diarrhoea, dizziness, headache, nausea, neuropsychiatric reactions, pruritus, visual disturbances, vomiting.
  - Very rare Optic neuropathy.
  - Frequency not known Alopecia, anemia, anorexia, arrhythmias, arthralgia, ataxia, blood disorders, bradycardia, cataract, chest pain, confusion, drowsiness, dyspepsia, dyspnoea, encephalopathy, fever, flushing, hepatic failure, hyperhidrosis, hypertension, hypotension, leucocytosis, leucopenia, malaise, motor neuropathies, muscle weakness, myalgia, oedema, palpitation, panic attacks, pneumonitis, rash, seizures, sensory neuropathies, speech disturbances, Stevens-Johnson syndrome, syncope, tachycardia, thrombocytopenia, tremor, vestibular disorders.

- Allergy and cross-sensitivity. Contra-indicated in patients with hypersensitivity to quinine.

- Conception and contraception. Manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in animal studies).

- Pregnancy. Manufacturer advises avoid (particularly in the first trimester) unless the potential benefit outweighs the risk; however, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas.

- Breast feeding. Present in milk but risk to infant minimal.

- Hepatic impairment. Elimination may be prolonged; avoid in severe impairment.

- Renal impairment. Manufacturer advises caution.

- Directions for administration. Tablet may be crushed and mixed with food such as jam or honey just before administration.

- Patient and carer advice. Inform travellers about adverse reactions of mefloquine and, if they occur, to seek medical advice on alternative antimalarials before the next dose is due. Also warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

- Driving and skilled tasks. Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping mefloquine.

- National funding/access decisions. NHS restrictions. Drugs for malaria prophylaxis not prescribed on the NHS; health authorities may investigate circumstances under which antimalarials prescribed.

Medicinal Forms

There can be variation in the licensing of different medicines containing the same drug.

- Tablet. CAUTIONARY AND ADVISORY LABELS 21, 27
  - Mefloquine (as Mefloquine hydrochloride) 250 mg Lariam 250mg tablets | 8 tablet pack £14.53

Primaquine

- Indications and dose. Adjunct in the treatment of non-falciparum malaria caused by *P.vivax* infection.
  - By mouth.
  - Child 6 months–17 years: 500 micrograms/kg daily (max. per dose 30 mg) for 14 days.

- Adjunct in the treatment of non-falciparum malaria caused by *P.ovale* infection.
  - By mouth.
  - Child 6 months–17 years: 250 micrograms/kg daily (max. per dose 15 mg) for 14 days.

- Adjunct in the treatment of non-falciparum malaria caused by *P.vivax* infection in patients with mild G6PD deficiency (administered on expert advice). Adjunct in *P.ovale* infection in patients with mild G6PD deficiency (administered on expert advice).
  - By mouth.
  - Child: 750 micrograms/kg once weekly for 8 weeks; maximum 45 mg per week.

- Treatment of mild to moderate pneumocystis infection (in combination with clindamycin).
  - By mouth.
  - Child: This combination is associated with considerable toxicity (consult product literature).

- Unlicensed use. Not licensed.

- Cautionary and advisory labels. G6PD deficiency - systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus).

- Interactions. Appendix 1 (primaquine).

- Side-effects.
  - Common or very common Abdominal pain, anorexia, nausea, vomiting.
  - Uncommon Haemolytic anaemia especially in G6PD deficiency, leucopenia, methaemoglobinemia.

- Pregnancy. Risk of neonatal haemolysis and methaemoglobinemia in third trimester.

- Breast feeding. No information available; theoretical risk of haemolysis in G6PD-deficient infants.

- Pre-treatment screening. Before starting primaquine, blood should be tested for glucose-6-phosphate dehydrogenase (G6PD) activity since the drug can cause haemolysis in G6PD-deficient patients. Specialist advice should be obtained in G6PD deficiency.

- Medicinal forms. There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension.

- Tablet.
  - Primaquine (Non-proprietary).
  - Primaquine (as Primaquine phosphate) 15 mg Primaquine 15mg tablets | 10 tablet pack | no price available.
Proguanil hydrochloride

**INDICATIONS AND DOSE**

**Prophylaxis of malaria**

- **BY MOUTH**
  - Child 4-11 weeks (body-weight up to 6 kg): 25 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 3-11 months (body-weight 6-9 kg): 50 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 1-3 years (body-weight 10-15 kg): 75 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 4-7 years (body-weight 16-24 kg): 100 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 8-12 years (body-weight 25-44 kg): 150 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving
  - Child 13-17 years (body-weight 45 kg and above): 200 mg once daily, dose to be started 1 week before entering endemic area and continued for 4 weeks after leaving

**SIDE-EFFECTS**

- **Common or very common**
  - Cholestasis
  - Hair loss
  - Skin reactions
  - Vasculitis
- **Rare**
  - Mouth ulcers
  - Stomatitis
- **PREGNANCY**
  - Benefit of prophylaxis in malaria outweighs risk. Adequate folate supplements should be given to mother.
- **BREAST FEEDING**
  - Amount in milk probably too small to be harmful when used for malaria prophylaxis.
- **RENAL IMPAIRMENT**
  - Use half normal dose if estimated glomerular filtration rate 20–60 mL/minute/1.73m². Use one-quarter normal dose on alternate days if estimated glomerular filtration rate 10–20 mL/minute/1.73m². Use one-quarter normal dose once weekly if estimated glomerular filtration rate less than 10 mL/minute/1.73m²; increased risk of haematological toxicity in severe impairment.
- **DIRECTIONS FOR ADMINISTRATION**
  - Tablet may be crushed and mixed with food such as milk, jam, or honey just before administration.
- **PARENT AND CARER ADVICE**
  - Warn travellers about importance of avoiding mosquito bites, importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - NHS restrictions Drugs for malaria prophylaxis not prescribeable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed
- **EXCEPTIONS TO LEGAL CATEGORY**
  - Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

| Paludrine (Alliance Pharmaceuticals Ltd) | Proguanil hydrochloride 100 mg | Paludrine 100mg tablets | 98 tablet | £11.95 0T | £11.95 |

Pyrimethamine

**INDICATIONS AND DOSE**

**Toxoplasmosis in pregnancy (in combination with sulfadiazine and folinic acid)**

- **BY MOUTH**
  - Child 12-17 years: 50 mg once daily until delivery

**Congenital toxoplasmosis (in combination with sulfadiazine and folinic acid)**

- **BY MOUTH**
  - Neonate: 1 mg/kg twice daily for 2 days, then 1 mg/kg once daily for 6 months, then 1 mg/kg 3 times a week for 6 months.

**Malaria**

- **BY MOUTH**
  - Child: No dose stated because not recommended alone

**SIDE-EFFECTS**

- **Common or very common**
  - Anaemia (with high doses) • blood disorders (with high doses) • diarrhea • dizziness • headache • leucopenia (with high doses) • nausea • rash • thrombocytopenia (with high doses) • vomiting
- **Uncommon**
  - Abnormal skin pigmentation • fever
- **Very rare**
  - Buccal ulceration • colic • convulsions
- **PREGNANCY**
  - Theoretical teratogenic risk in first trimester (folate antagonist). Adequate folate supplements should be given to the mother.
- **BREAST FEEDING**
  - Significant amount in milk—avoid administration of other folate antagonists to infant. Avoid breast-feeding during toxoplasmosis treatment.
- **HEPATIC IMPAIRMENT**
  - Manufacturer advises caution.
- **RENAL IMPAIRMENT**
  - Manufacturer advises caution.
- **MONITORING REQUIREMENTS**
  - Blood counts required with prolonged treatment.
- **LESS SUITABLE FOR PRESCRIBING**
  - Pyrimethamine should not be used alone for malaria, but is used with sulfadoxine.

**MEDICINAL FORMS**

- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Tablet**

Pyrimethamine with sulfadoxine

**INDICATIONS AND DOSE**

**Adjunct to quinine in treatment of Plasmodium falciparum malaria**

- **BY MOUTH**
  - Child 1 month–4 years (body-weight 5 kg and above): 12.5/250 mg for 1 dose
  - Child 5–6 years: 25/500 mg for 1 dose
  - Child 7-9 years: 37.5/750 mg for 1 dose
  - Child 10–13 years: 50/1000 mg for 1 dose
  - Child 14–17 years: 75/1500 mg for 1 dose
  - Malaria prophylaxis

- **BY MOUTH**
  - Child: Not recommended by UK malaria experts
**Dose equivalence and conversion**

Dose quantities are expressed in the form x/y where x and y are the strengths in milligrams of pyrimethamine and sulfadoxine respectively.

- **Unlicensed use** Not licensed for use in children of body-weight under 5 kg.
- **Contra-indications** Acute porphyrias p. 562.
- **Caution** Asthma - avoid in blood disorders (unless under specialist supervision) - avoid in infants under 6 weeks - G6PD deficiency - history of seizures - avoid large loading doses - not recommended for prophylaxis (severe side-effects on long-term) - predisposition to folate deficiency

- **Interactions** → Appendix 1 (pyrimethamine, sulfonamides).
- **Side-effects**
  - Common or very common Diarrhoea - headache - hyperkalaemia - nausea - rash
  - Uncommon Vomiting
- **Frequency not known** Allergic alveolitis - eosinophilic alveolitis - pulmonary infiltrates

**Side-effects, further information**

Discontinue immediately if blood disorders or rash occur. Discontinue if cough or shortness of breath occurs.

- **Allergy and cross-sensitivity** Contra-indicated in patients with sulfonamide allergy.
- **Pregnancy** Possible teratogenic risk in first trimester (pyrimethamine a folate antagonist); in third trimester - risk of neonatal haemolysis and methaemoglobinemia. Fear of increased risk of kernicterus in neonates appears to be unfounded.
- **Breast-feeding** Small risk of kernicterus in jaundiced infants; risk of haemolysis in G6PD-deficient infants (due to sulfadoxine).
- **Monitoring requirements** Monitor blood counts on prolonged treatment.
- **Prescribing and dispensing information** Also known as Fansidar®.
- **Patient and carer advice** Patients should be advised to maintain adequate fluid intake.

**Medicinal forms**

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

**Quinine**

- **indications and dose**
  - **Non-falciparum malaria** → by intravenous infusion
  - Child: 10 mg/kg every 8 hours (max. per dose 700 mg), infused over 4 hours, given if patient is unable to take oral therapy. Changed to oral chloroquine as soon as the patient’s condition permits

**Falciparum malaria**

- **by mouth**
  - Child: 10 mg/kg every 8 hours (max. per dose 600 mg) for 7 days, together with or followed by either doxycycline (in children under 12 years), or clindamycin
- **by intravenous infusion**
  - Neonate: Loading dose 20 mg/kg (max. per dose 1.4 g), infused over 4 hours, the loading dose of 20 mg/kg should not be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can tolerate oral medication to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by clindamycin.
  - Child: Loading dose 20 mg/kg (max. per dose 1.4 g), infused over 4 hours, the loading dose of 20 mg/kg should not be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by either doxycycline (in children under 12 years), or clindamycin.

**Falciparum malaria (in intensive care unit)**

- **by intravenous infusion**
  - Neonate: Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by either doxycycline (in children under 12 years), or clindamycin.
  - Child: Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by either doxycycline (in children under 12 years), or clindamycin.

**Dose equivalence and conversion**

When using quinine for malaria, doses are valid for quinine hydrochloride, dihydrochloride, and sulfate; they are **not valid** for quinine bisulfate which contains a correspondingly smaller amount of quinine.

- Quinine (anhydrous base) 100 mg = quinine bisulfate 169 mg; quinine dihydrochloride 122 mg; quinine hydrochloride 122 mg; and quinine sulfate 121 mg.

Quinine bisulfate 300 mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulfate.

- **Unlicensed use** Injection not licensed.
- **Contra-indications** Haemoglobinuria - myasthenia gravis - optic neuritis - tinnitus
- **Caution** Atrial fibrillation (monitor ECG during parenteral treatment) - cardiac disease (monitor ECG during parenteral treatment) - conduction defects (monitor ECG during parenteral treatment) - G6PD deficiency - heart block (monitor ECG during parenteral treatment)
- **Interactions** → Appendix 1 (quinine).
- **Side-effects** Agitation - tinnitus - abdominal pain - acute renal failure - angioedema - blood disorders - cardiovascular effects - cinchonism - confusion - diarrhoea - dyspnoea -
flushed skin • headache • hearing impairment • hot skin • hypersensitivity reactions • hypoglycaemia (especially after parenteral administration) • intravascular coagulation • muscle weakness • nausea • phototoxicity • rashes • temporary blindness • thrombocytopenia • vertigo • visual disturbances • vomiting

**Overdose**

Quinine is very toxic in overdose; life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

For details on the management of poisoning, see Emergency treatment of poisoning p. 786.

**PREGNANCY**

High doses are teratogenic in first trimester, but in malaria benefit of treatment outweighs risk.

**BREAST FEEDING**

Present in milk but not known to be harmful.

**HEPATIC IMPAIRMENT**

- With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.

**RENA L IMPAIRMENT**

- With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.

**MONITORING REQUIREMENTS**

- With intravenous use Monitor blood glucose and electrolyte concentration during parenteral treatment.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous infusion, dilute to a concentration of 2 mg/mL (max. 30 mg/mL in fluid restriction) with Glucose 5% or Sodium Chloride 0.9% and give over 4 hours.

**PRESCRIBING AND DISPENSING INFORMATION**

- With intravenous use Intravenous injection of quinino is so hazardous that it has been superseded by infusion.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, containing the same drug.

### Table

- **Quinine (Non-proprietary)**
  - Quinine sulfate 200 mg: Quinine sulfate 200mg tablets | 28 tablet [Price] £6.05 DT price = £1.67
  - Quinine bisulfate 300 mg: Quinine bisulfate 300mg tablets | 28 tablet [Price] £4.80 DT price = £1.91
  - Quinine sulfate 300 mg: Quinine sulfate 300mg tablets | 28 tablet [Price] £5.05 DT price = £1.97 | 500 tablet [Price] no price available

### 6 Viral infection

#### 6.1 Hepatitis

**Hepatitis**

**Overview**

Treatment for viral hepatitis should be initiated by a specialist in hepatology or infectious diseases. The management of uncomplicated acute viral hepatitis is largely symptomatic. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. Active or passive immunisation against hepatitis A and B infections can be given.

**Chronic hepatitis B**

Interferon alfa p. 517, peginterferon alfa-2a, lamivudine p. 393, adefovir dipivoxil, entecavir, and tenofovir disoproxil p. 394 have a role in the treatment of chronic hepatitis B in adults, but their role in children has not been well established. Specialist supervision is required for the management of chronic hepatitis B.

Tenofovir disoproxil, or a combination of tenofovir disoproxil with either emtricitabine p. 392 or lamivudine, may be used with other antiretrovirals, as part of ‘highly active antiretroviral therapy’ in children who require treatment for both HIV and chronic hepatitis B. If children infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV. Management of these children should be co-ordinated between HIV and hepatology specialists.

**Chronic hepatitis C**

Treatment should be considered for children with moderate or severe liver disease. Specialist supervision is required and the regimen is chosen according to the genotype of the infecting virus and the viral load. A combination of ribavirin p. 378 with either interferon alfa or peginterferon alfa-2b is licensed for use in children over 3 years with chronic hepatitis C. A combination of peginterferon alfa p. 379 and ribavirin is preferred.

---

### 5.3 Toxoplasmosis

**Drugs used for Toxoplasmosis not listed below**

Pyrimethamine p. 375

**ANTIBACTERIALS ➤ MACROLIDES**

**Spiramycin**

- **INDICATIONS AND DOSE**
  - **Toxoplasmosis in pregnancy**
    - **BY MOUTH**
    - Child 12-17 years: 1.5 g twice daily until delivery
  - **Chemoprophylaxis of congenital toxoplasmosis**
    - **BY MOUTH**
    - Neonate: 50 mg/kg twice daily.

**DOSE EQUIVALENCE AND CONVERSION**

3000 units = 1 mg spiramycin.

---

### UNLICENSED USE

Not licensed.

### CAUTIONS

Arrhythmias • cardiac disease • predisposition to QT interval prolongation

### SIDE-EFFECTS

- **Rare** Prolongation of QT interval • thrombocytopenia • vasculitis
- **Frequency not known** Diarrhoea • dizziness • gastrointestinal disturbances • headache • hepatotoxicity • nausea • rash • vomiting

### ALLERGY AND CROSS-SENSITIVITY

Sensitivity to other macrolides.

### BREAST FEEDING

Present in breast milk.

### HEPATIC IMPAIRMENT

Use with caution.
6.2 Hepatitis infections

6.2a Chronic hepatitis C

**Drugs used for Chronic hepatitis C not listed below**
Interferon alfa, p. 517 • Peginterferon alfa, p. 379

**ANTIVIRALS**

**NUCLEOSIDE ANALOGUES**

**Ribavirin**

*(Tribivirin)*

**Indications and Dose**

**Bronchiolitis**
- **By Inhalation of Aerosol, or by Inhalation of Nebulised Solution**
  - Child 1–23 months: Inhale a solution containing 20 mg/mL for 12–18 hours for at least 3 days, maximum of 7 days, to be administered via small particle aerosol generator

**Life-threatening RSV, parainfluenza virus, and adenovirus infection in immunocompromised children (administered on expert advice)**
- **By Intravenous Infusion**
  - Child: 33 mg/kg for 1 dose, to be administered over 15 minutes, then 16 mg/kg every 6 hours for 4 days, then 8 mg/kg every 8 hours for 3 days

**REBETOL® Capsules**

Chronic hepatitis C (in combination with interferon alfa or peginterferon alfa) in previously untreated children without liver decompensation
- **By Mouth**
  - Child 3–17 years (body-weight up to 47 kg): 15 mg/kg daily in 2 divided doses
  - Child 3–17 years (body-weight 47–49 kg): 200 mg, dose to be given in the morning and 400 mg, dose to be given in the evening
  - Child 3–17 years (body-weight 50–64 kg): 400 mg twice daily
  - Child 3–17 years (body-weight 65–80 kg): 400 mg, dose to be given in the morning and 600 mg, dose to be given in the evening
  - Child 3–17 years (body-weight 81–104 kg): 600 mg twice daily
  - Child 3–17 years (body-weight 105 kg and above): 600 mg, dose to be given in the morning and 800 mg, dose to be given in the evening

**REBETOL® Oral Solution**

Chronic hepatitis C (in combination with interferon alfa or peginterferon alfa) in previously untreated children without liver decompensation
- **By Mouth**
  - Child 3–17 years (body-weight up to 47 kg): 15 mg/kg daily in 2 divided doses
  - Child 3–17 years (body-weight 47–49 kg): 200 mg daily, dose to be given in the morning and 400 mg daily, dose to be given in the evening
  - Child 3–17 years (body-weight 50–64 kg): 400 mg twice daily
  - Child 3–17 years (body-weight 65–80 kg): 400 mg daily, dose to be given in the morning and 600 mg daily, dose to be given in the evening
  - Child 3–17 years (body-weight 81–104 kg): 600 mg twice daily
  - Child 3–17 years (body-weight 105 kg and above): 600 mg daily, dose to be given in the morning and 800 mg daily, dose to be given in the evening

**Side-effects**

With oral use Abdominal pain, abnormal dreams, acne, alopecia, anxiety, aplastic anaemia, arrhythmias, arthralgia, asthenia, asthenia, ataxia, breast pain, cardiomyopathy, changes in blood pressure, cheilitis, chest pain, colitis, constipation, cough, dehydration, depression, diarrhoea, dizziness, dry eyes, dry mouth, dry skin, dyspepsia, dysphagia, dysphonia, dyspnoea, earache, epistaxis, eye pain, flatulence, flushing, gastrointestinal bleeding, gastroesophageal reflux, gingivitis, glossitis, growth retardation (including decrease in height and weight), haemolytic anaemia (anaemia may be improved by epoetin), hallucination, headache, hearing impairment, hyperaesthesia, hyperglycaemia, hyperkeratosis, hyperton, hypertriglyceridaemia, hyperuricaemia, hypoaesthesia, hypocalcaemia, impaired concentration and memory, increased sweating, influenza-like symptoms, interstitial pneumonitis, leucopenia, loose stools, lymphadenopathy, menstrual disturbance, micturition disorders, mood disorders, mouth ulcers, musculoskeletal pain, myalgia, myocardial infarction, nasal congestion, nausea, neutropenia, optic neuropathy, oral candidiasis, pallor, palpititation, pancreatitis, panic attack, paraesthesia, peptic ulcer, pericarditis, peripheral ischaemia, peripheral neuropathy, peripheral oedema, phototoxicity, pruritus, psoriasis, psychotic disorders, pulmonary embolism, rash, renal failure, respiratory infections, retinal haemorrhage, rheumatoid arthritis, sarcoidosis, seizures, sexual dysfunction, sinus congestion, skin discoloration, sleep disturbances, sore throat, Stevens-Johnson syndrome, stomatitis, stroke, suicidal ideation, syncope, systemic lupus erythematosus, tachycardia, tachypnoea, taste disturbance, testicular pain, thrombocytopenia, thyroid disorders, tinnitus, tooth disorder, toxic epidermal necrolysis, urinary tract infections, vertigo, virilism, visual disturbances, vomiting, weight loss, wheezing

**Side-Effects, Further Information**

With oral use Side effects listed are reported when oral ribavirin is used in combination with peginterferon alfa or interferon alfa, consult product literature for details.

**Unlicensed Use**
- When used by inhalation Inhilation licensed for use in children (age range not specified by manufacturer).
- With intravenous use Intravenous preparation not licensed.

**Contra-Indications**
- With systemic use Active severe psychiatric condition - autoimmune disease - autoimmune hepatitis - consult product literature for specific contra-indications when ribavirin above used in combination with other medicinal products - haemoglobinopathies - history of severe psychiatric condition - severe debilitating medical conditions - severe, uncontrolled cardiac disease in children with chronic hepatitis C

**Caution**
- When used by inhalation Maintain standard supportive respiratory and fluid management therapy
- With systemic use Cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration) - consult product literature for specific cautions when ribavirin above used in combination with other medicinal products - patients with a transplant—risk of rejection - risk of growth retardation - the reversibility of which is uncertain—if possible, consider starting treatment after pubertal growth spurt
**IMMUNOSTIMULANTS > INTERFERONS**

### Peginterferon alfa

- **DRUG ACTION** Polyethylene glycol-conjugated ('pegylated') derivatives of interferon alfa (peginterferon alfa-2a and peginterferon alfa-2b) are available; pegylation increases the persistence of the interferon in the blood.

- **INDICATIONS AND DOSE**
  - **PEGASYS®**
    - Chronic hepatitis C (in combination with ribavirin) in previously untreated children without liver decompensation
      - By subcutaneous injection
      - Child 5–17 years: (consult product literature)
  - **VIRAFERONPEG®**
    - Chronic hepatitis C (in combination with ribavirin) in previously untreated children without liver decompensation
      - By subcutaneous injection
      - Child 3–17 years: (consult product literature)

- **CONTRA-INDICATIONS** Severe psychiatric illness

- **CAUTIONS, FURTHER INFORMATION**
  - For contra-indications consult product literature.

- **SIDE-EFFECTS**
  - Common or very common
    - Anorexia
    - Influenza-like symptoms
    - Lethargy
    - Nausea
  - Frequency not known
    - Alopecia
    - Arthralgia
    - Cardiovascular problems
    - Confusion
    - Depression
    - Hepatotoxicity
    - Hyperglycaemia
    - Hypersensitivity reactions
    - Hypertension
    - Hypotension
    - Myelosuppression
    - Nephrotoxicity
    - Pneumonia
    - Pneumonitis
    - Psoriasiform rash
    - Pulmonary infiltrates
    - Reversible motor problems in young children
    - Seizures
    - Suicidal behaviour
    - Thyroid abnormalities

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - For information on side effects consult product literature.

- **INTERACTIONS** → Appendix 1 (interferons).

### MONITORING REQUIREMENTS

- When used by inhalation
  - **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include bubble-gum.

- **NATIONAL FUNDING/ACESS DECISIONS**

- **NICE technology appraisals (TAs)**
  - Peginterferon alfa and ribavirin for chronic hepatitis C (November 2013) NICE TA300
  - Peginterferon alfa in combination with ribavirin is recommended (within the marketing authorisation) as an option for treating chronic hepatitis C in children.

- **LESS SUITABLE FOR PRESCRIBING**
  - Ribavirin inhalation is less suitable for prescribing.

### MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug. No licensed solution for injection listed.

- **Capsule**
  - **CAUTIONARY AND ADVISORY LABELS** 21
  - **Rebetol** (Merck Sharp & Dohme Ltd)
    - Ribavirin 200 mg
    - Rebelt 200 mg capsules | 84 capsule | £160.69 | 140 capsule | £267.81 | 168 capsule | £321.38

- **Oral solution**
  - **CAUTIONARY AND ADVISORY LABELS** 21
  - **Rebetol** (Merck Sharp & Dohme Ltd)
    - Ribavirin 40 mg per 1 ml
    - Rebelt 40 mg/ml oral solution | 100 ml | £167.08
generally associated with herpes simplex virus serotype 2. Herpes simplex infections. The two most important herpesvirus pathogens are herpes simplex and varicella-zoster viruses.

  - Merck Sharp & Dohme Ltd
  - **Pegasys 20 microgram**
  - **Pegasys 50 microgram**

6.3 *Herpesvirus infections*

**Herpes simplex and varicella-zoster infection**

The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella-zoster virus.

**Herpes simplex infections**

Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection.

In individuals with good immune function, mild infection of the eye (ocular herpes) and of the lips (herpes labialis or cold sores) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics. Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. After completing parenteral treatment of neonatal herpes simplex encephalitis, oral suppression therapy with aciclovir p. 381 for 6 months can be considered on specialist advice. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance.

Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

**Varicella-zoster infections**

Regardless of immune function and the use of any immunoglobulins, neonates with chickenpox should be treated with a parenteral antiviral to reduce the risk of severe disease. Oral therapy in children is not recommended as absorption is variable. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

In pregnancy severe chickenpox may cause complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Neonates and children who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella-zoster immunoglobulin (see under Disease-specific Immunoglobulins). Prophylactic intravenous aciclovir should be considered for neonates whose mothers develop chickenpox 4 days before to 2 days after delivery.

In herpes zoster (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days.

Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management.

**Choice**

Aciclovir is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella-zoster and the systemic and topical treatment of herpes simplex infections of the skin and mucous membranes. It is used by mouth for severe herpetic stomatitis. Aciclovir eye ointment is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

Famiclovir, a prodrug of penciclovir, is similar to aciclovir and is licensed in adults for use in herpes zoster and genital herpes; there is limited information available on use in children.

Valaciclovir p. 383 is an ester of aciclovir, licensed in adults for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is
also licensed in children over 12 years for preventing cytomegalovirus disease following solid organ transplantation. Valaciclovir may be used for the treatment of mild herpes zoster in immunocompromised children over 12 years; treatment should be initiated under specialist supervision.

**Cytomegalovirus infection**

Ganciclovir p. 383 is related to aciclovir but it is more active against cytomegalovirus (CMV); it is also much more toxic than aciclovir and should therefore be prescribed under specialist supervision and only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the initial treatment of CMV infection. The use of ganciclovir may also be considered for symptomatic congenital CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine p. 394; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration.

Valaciclovir is licensed for use in children over 12 years for prevention of cytomegalovirus disease following renal transplantation.

Foscarnet sodium p. 384 is also active against cytomegalovirus; it is toxic and can cause renal impairment. It is deposited in teeth, bone and cartilage, and animal studies have shown that deposition is greater in young animals. Its effect on skeletal development in children is not known. Foscarnet sodium should be prescribed under specialist supervision.

**ANTIVIRALS**  >  **NUCLEOSIDE ANALOGUES**

**Aciclovir**  >  **(Acyclovir)**

**INDICATIONS AND DOSE**

**Herpes simplex, suppression**

- **BY MOUTH**
  - Child 12-17 years: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

**Herpes simplex, prophylaxis in the immunocompromised**

- **BY MOUTH**
  - Child 1-23 months: 100–200 mg 4 times a day
  - Child 2-17 years: 200–400 mg 4 times a day

**Herpes Simplex, treatment**

- **BY MOUTH**
  - Child 1-23 months: 100 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
  - Child 2-17 years: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
- **BY INTRAVENOUS INFUSION**
  - Neonate: 20 mg/kg every 8 hours for 14 days (for at least 21 days if CNS involvement—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment).

- **Child 1-2 months**: 20 mg/kg every 8 hours for 14 days (for at least 21 days if CNS involvement—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)

- **Child 3 months-11 years**: 250 mg/m² every 8 hours usually for 5 days
- **Child 12-17 years**: 5 mg/kg every 8 hours usually for 5 days

**Herpes Simplex, treatment, in immunocompromised or if absorption impaired**

- **BY MOUTH**
  - Child 1-23 months: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
  - Child 2-17 years: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

**Varicella zoster (chickenpox), treatment | Herpes zoster (shingles), treatment**

- **BY MOUTH**
  - Child 1-23 months: 200 mg 4 times a day for 5 days
  - Child 2-5 years: 400 mg 4 times a day for 5 days
  - Child 6-11 years: 800 mg 4 times a day for 5 days
  - Child 12-17 years: 800 mg 5 times a day for 7 days
- **BY INTRAVENOUS INFUSION**
  - Neonate: 10–20 mg/kg every 8 hours for at least 7 days.
  - Child 1-2 months: 10–20 mg/kg every 8 hours for at least 7 days
  - Child 3 months-11 years: 250 mg/m² every 8 hours usually for 5 days
  - Child 12-17 years: 5 mg/kg every 8 hours usually for 5 days

**Varicella zoster (chickenpox), treatment in immunocompromised | Herpes zoster (shingles), treatment in immunocompromised**

- **BY INTRAVENOUS INFUSION**
  - Child 3 months-11 years: 500 mg/m² every 8 hours usually for 5 days (given for at least 21 days in encephalitis—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)
  - Child 12-17 years: 10 mg/kg every 8 hours usually for 5 days (given for at least 14 days in encephalitis and for at least 21 days if also immunocompromised—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)

**Herpes zoster (shingles), treatment in immunocompromised**

- **BY MOUTH**
  - Child 1-23 months: 200 mg 4 times a day continued for 2 days after crusting of lesions
  - Child 2-5 years: 400 mg 4 times a day continued for 2 days after crusting of lesions
  - Child 6-11 years: 800 mg 4 times a day continued for 2 days after crusting of lesions
  - Child 12-17 years: 800 mg 5 times a day continued for 2 days after crusting of lesions

**Herpes zoster, treatment in encephalitis | Varicella zoster, treatment in encephalitis**

- **BY INTRAVENOUS INFUSION**
  - Neonate: 10–20 mg/kg every 8 hours for 10–14 days in encephalitis, possibly longer if also immunocompromised.
  - Child 1-2 months: 10–20 mg/kg every 8 hours for 10–14 days in encephalitis, possibly longer if also immunocompromised
Varicella zoster (chickenpox), attenuation of infection if varicella-zoster immunoglobulin not indicated

- **BY MOUTH**
- Child: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure

Varicella zoster (chickenpox), prophylaxis after delivery

- **BY INTRAVENOUS INFUSION**
- Neonate: 10 mg/kg every 8 hours continued until serological tests confirm absence of virus.

### DOSES AT EXTREMES OF BODY-WEIGHT
- With intravenous use: To avoid excessive dosage in obese patients parenteral dose should be calculated on the basis of ideal weight for height.

#### UNLICENSED USE
- With oral use: Tablets and suspension not licensed for suppression of herpes simplex or for treatment of herpes zoster in children (age range not specified by manufacturer). Aciclovir doses in BNF may differ from those in product literature. Attenuation of chickenpox is an unlicensed indication.

#### CAUTIONS
- Maintain adequate hydration (especially with infusion or high doses)

#### INTERACTIONS
- > Appendix 1 (aciclovir).

#### SIDE-EFFECTS
- **Common or very common** Abdominal pain, diarrhoea, fatigue, headache, nausea, photosensitivity, pruritus, rash, urticaria, vomiting
- **Very rare**
  - With systemic use: Agitation, fever, psychosis, severe local inflammation (sometimes leading to ulceration), tremors
  - With systemic use: Acute renal failure, anemia, ataxia, confusion, convulsions, dizziness, drowsiness, dysarthria, dysphonia, hallucinations, hepatitis, jaundice, leucopenia, neurological reactions, thrombocytopenia

#### PREGNANCY
- Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.

#### BREAST FEEDING
- Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.

#### RENAL IMPAIRMENT
- With intravenous use: Use normal intravenous dose every 12 hours if estimated glomerular filtration rate 25–50 mL/minute/1.73 m² (every 24 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m²). Consult product literature for intravenous dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- With oral use: For herpes zoster, use normal oral dose every 8 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73 m² (every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²). For herpes simplex, use normal dose every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- With systemic use: Risk of neurological reactions increased. Maintain adequate hydration (especially during renal impairment).

#### DIRECTIONS FOR ADMINISTRATION
- For intravenous infusion, reconstitute to 25 mg/mL with Water for Injections or Sodium Chloride 0.9% then dilute to concentration of 5 mg/mL with Sodium Chloride 0.9% or Sodium Chloride and Glucose and give over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and central venous access and given over 1 hour.

#### PRESCRIBING AND DISPENSING INFORMATION
- Flavours of oral liquid preparations may include banana, or orange.

#### PATIENT AND CARER ADVICE
- Medicines for Children leaflet: Aciclovir (oral) for viral infections [www.medicinesforchildren.org.uk/aciclovir-for-viral-infections](http://www.medicinesforchildren.org.uk/aciclovir-for-viral-infections)

#### PROFESSION SPECIFIC INFORMATION
- Dental practitioners’ formula
- With oral use: Aciclovir Tablets 200 mg or 800 mg may be prescribed. Aciclovir Oral Suspension 200 mg/5mL may be prescribed.

#### MEDICINAL FORMS

  - **Aciclovir (as Aciclovir sodium) 250 mg** Zovirax I.V. 250mg powder for solution for infusion vials | 5 vial (P) £16.70
  - **Aciclovir (as Aciclovir sodium) 500 mg** Zovirax I.V. 500mg powder for solution for infusion vials | 5 vial (P) £17.00
Valaciclovir

- **INDICATIONS AND DOSE**
  - Herpes zoster infection, treatment in immunocompromised patients
    - **BY MOUTH**
    - Child 12–17 years: 1 g 3 times a day for at least 7 days and continued for 2 days after crusting of lesions
  - Herpes simplex, treatment of first infective episode
    - **BY MOUTH**
    - Child 12–17 years: 500 mg twice daily for 5 days (longer if new lesions appear during treatment or healing is incomplete)
  - Herpes simplex infections treatment of first episode in immunocompromised or HIV-positive patients
    - **BY MOUTH**
    - Child 12–17 years: 1 g twice daily for 10 days
  - Herpes simplex, treatment of recurrent infections
    - **BY MOUTH**
    - Child 12–17 years: 500 mg twice daily for 3–5 days
  - Treatment of recurrent herpes simplex infections in immunocompromised or HIV-positive patients
    - **BY MOUTH**
    - Child 12–17 years: 1 g twice daily for 5–10 days
  - Herpes labialis treatment
    - **BY MOUTH**
    - Child 12–17 years: Initially 2 g, then 2 g after 12 hours
  - Herpes simplex, suppression of infections
    - **BY MOUTH**
    - Child 12–17 years: 500 mg daily in 1–2 divided doses, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences
  - Herpes simplex, suppression of infections in immunocompromised or HIV-positive patients
    - **BY MOUTH**
    - Child 12–17 years: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences
  - Prevention of cytomegalovirus disease following solid organ transplantation when valganciclovir or ganciclovir cannot be used
    - **BY MOUTH**
    - Child 12–17 years: 2 g 4 times a day usually for 90 days, preferably starting within 72 hours of transplantation

- **UNLICENSED USE** Not licensed for treatment of herpes zoster in children. Not licensed for treatment or suppression of herpes simplex infection in immunocompromised or HIV-positive children.
- **CAUTIONS** Maintain adequate hydration (especially with high doses).
- **INTERACTIONS** → Appendix 1 (valaciclovir).
- **SIDE-EFFECTS**
  - **Very rare** Acute renal failure, anaemia, ataxia, confusion, convulsions, dizziness, drowsiness, dysarthria, dysphonia, hallucinations, hepatitis, jaundice, leukopenia, neurological reactions, thrombocytopenia
  - **Frequency not known** Abdominal pain, diarrhoea, fatigue, headache, nausea, photosensitivity, pruritus, rash, urticaria, vomiting

SIDE-EFFECTS, FURTHER INFORMATION
Neurological reactions (including dizziness, confusion, hallucinations, convulsions, ataxia, dysarthria, and drowsiness) more frequent with higher doses.

- **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.

- **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution with high doses used for preventing cytomegalovirus disease—no information available in children.
- **RENAL IMPAIRMENT** For herpes zoster, 1 g every 12 hours if estimated glomerular filtration rate 30–50 mL/minute/1.73 m² (1 g every 24 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; 500 mg every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²). For treatment of herpes simplex, 500 mg (1 g in immunocompromised or HIV-positive children) every 24 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m². For treatment of herpes labialis, if estimated glomerular filtration rate 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if estimated glomerular filtration rate 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose; if estimated glomerular filtration rate less than 10 mL/minute/1.73 m², 500 mg as a single dose). For suppression of herpes simplex, 250 mg (500 mg in immunocompromised or HIV-positive children) every 24 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m². Reduce dose according to estimated glomerular filtration rate for cytomegalovirus prophylaxis following solid organ transplantation (consult product literature). Maintain adequate hydration.

- **PRESCRIBING AND DISPENSING INFORMATION** Valaciclovir is a pro-drug of aciclovir.

- **MEDICINAL FORMS**
  
  There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

  **Tablet**
  
  CAUTIONARY AND ADVISORY LABELS 9

6.3a Cytomegalovirus infections

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Ganciclovir

- **INDICATIONS AND DOSE**
  - Prevention of cytomegalovirus disease during immunosuppressive therapy following organ transplantation
    - **BY INTRAVENOUS INFUSION**
      - Child: 5 mg/kg every 12 hours for 7–14 days
  - Treatment of life-threatening or sight-threatening cytomegalovirus infections in immunocompromised patients only
    - **BY INTRAVENOUS INFUSION**
      - Child: Initially 5 mg/kg every 12 hours for 14–21 days, followed by maintenance 6 mg/kg daily on 5 days of the week, alternatively 5 mg/kg daily until adequate recovery of immunity, maintenance only for patients at risk of relapse of retinitis, if retinitis progresses initial induction treatment may be repeated continued →
**ANTIVIRALS > OTHER**

### Foscarnet sodium

#### INDICATIONS AND DOSE

**Cytomegalovirus disease**

- **BY INTRAVENOUS INFUSION**
  - Child (under expert supervision): Initially 60 mg/kg every 8 hours 2–3 weeks, then maintenance 60 mg/kg daily, increased if tolerated to 90–120 mg/kg daily, if disease progresses on maintenance dose, repeat induction regimen

**Mucocutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients**

- **BY INTRAVENOUS INFUSION**
  - Child (under expert supervision): 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal

#### SIDE-EFFECTS

- **Common or very common** Abdominal pain; abnormal thinking; anaemia; anorexia; anxiety; arthralgia; chest pain; confusion; constipation; convulsions; cough; depression; dermatitis; diarrhoea; dizziness; dyspepsia; dysphagia; dyspnoea; ear pain; eye pain; fatigue; flattulence; headache; hepatic dysfunction; injection; injection-site reactions; insomnia; leucopenia; macular oedema; myalgia; nausea; night sweats; pancytopenia; peripheral neuropathy; pruritus; pyrexia; renal impairment; retinal detachment; taste disturbance; thrombocytopenia; vitreous floaters; vomiting; weight loss

- **Uncommon** Alopoeia; anaphylactic reactions; arrhythmias; disturbances in hearing and vision; haematuria; hypotension; male infertility; mouth ulcers; pancreatitis; psychosis; tremor

#### ALLERGY AND CROSS-SENSITIVITY

Contra-indicated in patients hypersensitive to valganciclovir, aciclovir, or valaciclovir.

#### CONCEPTION AND CONTRACEPTION

Ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment.

#### PREGNANCY

Avoid—teratogenic risk.

#### BREAST FEEDING

Avoid—no information available.

#### RENAL IMPAIRMENT

Reduce dose if estimated glomerular filtration rate less than 70 mL/minute/1.73 m²; consult product literature.

#### MONITORING REQUIREMENTS

Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).

#### DIRECTIONS FOR ADMINISTRATION

Infuse into vein with adequate flow preferably using plastic cannula. For intravenous infusion, reconstitute with Water for Injections (500 mg/10 mL) then dilute to a concentration of not more than 10 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give over 1 hour.

#### HANDLING AND STORAGE

Caution in handling

Ganciclovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with soap and water.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- **Powder for solution for infusion**
  - **ELECTROLYTES:** May contain Sodium
  - **Foscavir (Clinigen Healthcare Ltd)**
    - Foscarnet sodium 24 mg per 1 mL
    - Foscavir 6g/250mL solution for infusion bottles | 1 bottle (PDT) £119.85 (Hospital only)
6.4 HIV infection

HIV infection

Overview

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. For HIV infection (antiretrovirals) may be associated with serious side-effects.

Although antiretrovirals increase life expectancy considerably and decrease the risk of complications associated with premature ageing, mortality and morbidity remain slightly higher than in uninfected individuals.

The natural progression of HIV disease is different in children compared to adults; drug treatment should only be undertaken by specialists within a formal paediatric HIV clinical network. Guidelines and dose regimens are under constant review and for this reason some dose recommendations have not been included in BNF for Children.

Further information on the management of children with HIV can be obtained from the Children’s HIV Association (CHIVA) www.chiva.org.uk; and further information on antiretroviral use and toxicity can be obtained from the Paediatric European Network for Treatment of AIDS (PENTA) website www.pentatrials.org.

Principles of treatment

Treatment is aimed at suppressing viral replication for as long as possible; it should be started before the immune system is irreversibly damaged. The need for early drug treatment should, however, be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and the child’s tolerance of treatment. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

Initiation of treatment

Treatment is started in all HIV infected children under 1 year of age regardless of clinical and immunological parameters. In children over 1 year of age, treatment is based on the child’s age, CD4 cell count, viral load, and symptoms. The choice of antiviral treatment for children should take into account the method and frequency of administration, risk of side-effects, compatibility of drugs with food, palatability, and the appropriateness of the formulation. Initiating treatment with a combination of drugs (‘highly active antiretroviral therapy’ which includes 2 nucleoside reverse transcriptase inhibitors with either a non-nucleoside reverse transcriptase inhibitor or a boosted protease inhibitor) is recommended. Abacavir p. 390 and lamivudine p. 393 are the nucleoside reverse transcriptase inhibitors of choice for initial therapy; however, zidovudine p. 394 and lamivudine are used in children who are positive for the HLA-B*5701 allele. Nevirapine p. 389 is the preferred non-nucleoside reverse transcriptase inhibitor in children under 3 years of age, but efavirenz p. 388 is preferred in older children.

Lopinavir with ritonavir p. 397 is the preferred boosted protease inhibitor for initial therapy. The metabolism of many antiretrovirals varies in young children; it may therefore be necessary to adjust the dose according to the plasma-drug concentration. Children who require treatment for both HIV and chronic hepatitis B should receive antivirals that are active against both diseases.

Switching therapy

Deterioration of the condition (including clinical, virological changes, and CD4 cell changes) may require a complete change of therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance, and the possibility of cross-resistance.

Pregnancy

Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although information on the teratogenic potential of most antiretroviral drugs is limited), to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. All treatment options require careful assessment by a specialist. Combination antiretroviral therapy maximises the chance of preventing transmission and represents optimal therapy for the mother. However, it may be associated with a greater risk of preterm delivery. Local protocols and national guidelines (www.bhiva.org) should be consulted for recommendations on treatment during pregnancy and the perinatal period. Pregnancies in HIV-positive women and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childhood at www.ucl.ac.uk/nshpc/ and to the Antiretroviral Pregnancy Registry at www.apregistry.com.

Breast-feeding

Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

Post-exposure prophylaxis

Children exposed to HIV infection through needlestick injury or by another route should be sent immediately to an accident and emergency department for post-exposure prophylaxis [unlicensed indication]. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Recommendations have been developed by the Children’s HIV Association, www.chiva.org.uk.

Drugs used for HIV infection

Zidovudine, a nucleoside reverse transcriptase inhibitor (or ‘nucleoside analogue’), was the first anti-HIV drug to be introduced. Other nucleoside reverse transcriptase inhibitors include abacavir, didanosine p. 392, emtricitabine p. 392, lamivudine, stavudine p. 393, and tenofovir disoproxil p. 394. There are concerns about renal toxicity and effects on bone mineralisation when tenofovir disoproxil is used in prepubertal children.

The protease inhibitors include atazanavir p. 396, darunavir p. 396, fosamprenavir p. 397 (a pro-drug of amprenavir), indinavir, lopinavir (available as lopinavir with ritonavir), ritonavir p. 397, and tipranavir p. 398. Indinavir is no longer recommended because it is associated with nephrolithiasis. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, lopinavir (available as lopinavir with ritonavir), and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects.

The non-nucleoside reverse transcriptase inhibitors efavirenz, etravirine p. 389, and nevirapine are active against the subtype HIV-1 but not HIV-2, a subtype that is rare in the UK. These drugs may interact with a number of drugs metabolised in the liver. Nevirapine is associated with a high incidence of rash (including Stevens-Johnson syndrome) and rarely fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz. CNS disturbances are often self-limiting and can be reduced by taking the dose.
at bedtime (especially in the first 2–4 weeks of treatment). Efavirenz has also been associated with an increased plasma cholesterol concentration. Etravirine is used in regimens containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors. Enfuvirtide, which inhibits the fusion of HIV to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs. Enfuvirtide should be combined with other potentially active antiretroviral drugs; it is given by subcutaneous injection.

Maraviroc p. 399 is an antagonist of the CCR5 chemokine receptor. It is used in patients exclusively infected with CCR5–tropic HIV.

Dolutegravir p. 387 and raltegravir p. 387 are inhibitors of HIV integrase. They are used for the treatment of HIV infection when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

**Immune reconstitution syndrome**

Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms; these reactions may occur within the first few weeks or months of initiating treatment. Autoimmune disorders (such as Graves’ disease) have also been reported many months after initiation of treatment.

**Lipodystrophy syndrome**

Metabolic effects associated with antiretroviral treatment include fat redistribution, insulin resistance, and dyslipidaemia; collectively these have been termed lipodystrophy syndrome. Children should be encouraged to lead a healthy lifestyle that reduces their long-term cardiovascular risk. Plasma lipids and blood glucose should be measured before starting antiretroviral therapy, after 3–6 months of treatment, and then at least annually. Insulin resistance and hyperglycaemia occur only rarely in children.

Fat redistribution (with loss of subcutaneous fat, increased abdominal fat, ‘buffalo hump’ and breast enlargement) is associated with regimens containing protease inhibitors and nucleoside reverse transcriptase inhibitors. Stavudine, and to a lesser extent zidovudine, are associated with a higher risk of lipoatrophy and should be used only if alternative regimens are not suitable.

Dyslipidaemia is associated with antiretroviral treatment, particularly with protease inhibitors; in children, hypercholesterolaemia appears to be more common than hypertriglyceridaemia. Protease inhibitors and some nucleoside reverse transcriptase inhibitors are associated with insulin resistance and hyperglycaemia, but they occur rarely in children. Of the protease inhibitors, atazanavir and darunavir are less likely to cause dyslipidaemia, while atazanavir is less likely to impair glucose tolerance.

**Osteonecrosis**

Osteonecrosis has been reported in children with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

**Neonates**

In order to prevent transmission of infection, neonates born to HIV-positive mothers should be given post-exposure prophylaxis as soon as possible after birth, but starting no later than 72 hours after birth. Zidovudine p. 394 alone should be given to neonates whose mothers had a viral load less than 50 HIV RNA copies/mL between 36 weeks’ gestation and delivery, or whose mothers underwent caesarean section while taking zidovudine monotherapy. Combination antiretroviral therapy should be given to neonates whose mothers had a viral load over 50 HIV RNA copies/mL at delivery or whose mothers are found to be HIV positive after delivery. Prophylaxis is continued for 4 weeks.

**ANTIVIRALS  HIV-FUSION INHIBITORS**

**Enfuvirtide**

- **DRUG ACTION** Enfuvirtide inhibits the fusion of HIV to the host cell.

- **INDICATIONS AND DOSE**
  - HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens
  - **BY SUBCUTANEOUS INJECTION**
  - Child 6–15 years: 2 mg/kg twice daily (max. per dose 90 mg)
  - Child 16–17 years: 90 mg twice daily

- **INTERACTIONS** → Appendix 1 (enfuvirtide).

- **SIDE-EFFECTS**
  - **Common or very common** Acne • anorexia • anxiety • asthenia • conjunctivitis • diabetes mellitus • dry skin • erythema • gastro-oesophageal reflux disease • haematuria • hypertriglyceridaemia • impaired concentration • influenza-like illness • injection-site reactions • irritability • lymphadenopathy • myalgia • nightmares • pancreatitis • peripheral neuropathy • pneumonia • renal calculi • sinussitis • skin papilloma • tremor • vertigo • weight loss
  - **Uncommon** Hypersensitivity reactions
  - **Frequency not known** Osteonecrosis

- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Hypersensitivity reactions
  - Hypersensitivity reactions including rash, fever, nausea, vomiting, chillis, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge.
  - Osteonecrosis For further information see HIV infection p. 385.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects).

- **DIRECTIONS FOR ADMINISTRATION** For subcutaneous injection, reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; do not shake or invert vial.

- **PATIENT AND CARER ADVICE**
  - Hypersensitivity reactions Patients or carers should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

- **ELECTROLYTES:** May contain Sodium
  - **Fuzeon (Roche Products Ltd)**
    - Enfuvirtide 108 mg Fuzeon 108mg powder and solvent for solution for injection vials | 60 vial £1,081.57
## Dolutegravir

**Drug Action**  Dolutegravir is an inhibitor of HIV integrase.

### Indications and Dose

**HIV infection resistant to multiple antiretrovirals, in combination with other antiretroviral drugs**
- **By mouth using tablets**
  - Child 6-17 years (body-weight 25 kg and above): 400 mg twice daily
  - Child 2-11 years (body-weight 12-13 kg): 75 mg twice daily
  - Child 2-11 years (body-weight 14-19 kg): 100 mg twice daily
  - Child 2-11 years (body-weight 20-27 kg): 150 mg twice daily
  - Child 2-11 years (body-weight 28-39 kg): 200 mg twice daily
  - Child 2-11 years (body-weight 40 kg and above): 300 mg twice daily

**Dose equivalence and conversion**

The bioavailability of Jsenstres® chewable tablets is higher than that of the ‘standard’ 400 mg tablets; the chewable tablets are not interchangeable with the ‘standard’ tablets on a milligram-for-milligram basis.

### Cautions

Psychiatric illness (may exacerbate underlying illness including depression) - risk factors for myopathy - risk factors for rhabdomyolysis

### Interactions

- **Appendix 1 (raltegravir).**
- **Side-effects**
  - Common or very common: Abdominal pain, abnormal dreams, diarrhea, dizziness, fatigue, flatulence, headache, insomnia, nausea, pruritus, raised creatinine kinase, rash, vomiting.
  - Uncommon: Hepatitis, hypersensitivity reactions.

### Side-effects, Further information

- Hypersensitivity reactions: Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop.
- Osteonecrosis: For further information see HIV infection p. 385.

### Pregnancy

Manufacturer advises use only if potential benefit outweighs risk.

### Hepatic impairment

Manufacturer advises caution in severe impairment — no information available.

### Directions for administration

Avoid antacids 6 hours before or 2 hours after taking dolutegravir.

### Patient and carer advice

Patients or carers should be given advice on how to administer dolutegravir tablets.

**Missed doses**

If a dose is more than 20 hours late on the once daily regimen (or more than 8 hours late on the twice daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

### Medicinal forms

- **Tablet**
  - Tivicay (ViiV Healthcare UK Ltd) ▼
    - Dolutegravir (as Dolutegravir sodium) 50 mg
    - Tivicay 50 mg tablets: 30 tablet £498.75

### Combinations available

Abacavir with dolutegravir and lamivudine, p. 391

Child 3 months–17 years (body-weight 7.5–14 kg): 200 mg once daily

Child 3 months–17 years (body-weight 15–19 kg): 250 mg once daily

Child 3 months–17 years (body-weight 20–24 kg): 300 mg once daily

Child 3 months–17 years (body-weight 25–32.4 kg): 350 mg once daily

Child 3 months–17 years (body-weight 32.5–39 kg): 400 mg once daily

Child 3 months–17 years (body-weight 40 kg and above): 600 mg once daily

BY MOUTH USING TABLETS

Child (body-weight 40 kg and above): 600 mg once daily

BY MOUTH USING ORAL SOLUTION

Child 3–4 years (body-weight 13–14 kg): 360 mg once daily

Child 3–4 years (body-weight 15–19 kg): 390 mg once daily

Child 3–4 years (body-weight 20–24 kg): 450 mg once daily

Child 3–4 years (body-weight 25–32.5 kg): 510 mg once daily

Child 5–7 years (body-weight 13–14 kg): 270 mg once daily

Child 5–7 years (body-weight 15–19 kg): 300 mg once daily

Child 5–7 years (body-weight 20–24 kg): 360 mg once daily

Child 5–7 years (body-weight 25–32.4 kg): 450 mg once daily

Child 5–7 years (body-weight 32.5–39 kg): 510 mg once daily

Child 5–7 years (body-weight 40 kg and above): 720 mg once daily

DOSE EQUIVALENCE AND CONVERSION

The bioavailability of Sustiva® oral solution is lower than that of the capsules and tablets; the oral solution is not interchangeable with either capsules or tablets on a milligram-for-milligram basis.

UNLICENSED USE

Opening capsules and adding contents to food is an unlicensed method of administration.

CAUTIONS

Acute porphyrias p. 562 · history of psychiatric disorders · history of seizures

INTERACTIONS

Appendix 1 (efavirenz)

SIDE-EFFECTS

Common or very common

Abdominal pain · abnormal dreams · anxiety · depression · diarrhoea · dizziness · fatigue · headache · impaired concentration · nausea · pruritus · rash · sleep disturbances · Stevens-Johnson syndrome · vomiting

Uncommon

Anemia · ataxia · blurred vision · convulsions · flushing · gynaecomastia · hepatitis · hypersensitivity · mania · pancreatitis · psychosis · suicidal ideation · tinutius · tremor · vertigo

Rare

Hepatic failure · photosensitivity · suicide

Frequency not known

Lipodystrophy syndrome · osteonecrosis · raised serum cholesterol

SIDE-EFFECTS, FURTHER INFORMATION

 Rash
Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month.

CNS effects
Administration at bedtime especially in first 2–4 weeks reduces CNS effects.

Lipodystrophy syndrome
For further information see HIV infection p. 385.

Osteonecrosis
For further information see HIV infection p. 385.

Immune Reconstitution Syndrome
For further information see HIV infection p. 385.

PREGNANCY
Reports of neural tube defects when used in first trimester.

HEPATIC IMPAIRMENT
Greater risk of hepatic side-effects in chronic hepatitis B or C. Avoid in severe impairment. In mild to moderate liver disease, monitor for dose-related side-effects (e.g. CNS effects) and liver function.

RENAL IMPAIRMENT
Manufacturer advises caution in severe renal failure—no information available.

MONITORING REQUIREMENTS
Monitor liver function if receiving other hepatotoxic drugs.

DIRECTIONS FOR ADMINISTRATION
Capsules may be opened and contents added to food (contents have a peppery taste).

PRESCRIBING AND DISPENSING INFORMATION
Flavours of oral liquid formulations may include strawberry and mint.

PATIENT AND CARER ADVICE
Psychiatric disorders. Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur.

MEDICINAL FORMS
There can be variation in the licensing of different medicines containing the same drug.

Nevirapine

HIV infection in combination with other antiretroviral drugs (initial dose)

- **by mouth using immediate-release medicines**
  - Child: Initially 150–200 mg/m² once daily (max. per dose 200 mg) for 14 days, initial dose titration using ‘immediate-release’ preparation should not exceed 28 days; if rash occurs and is not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the lower dose of the ‘immediate-release’ preparation for the first 14 days as for new treatment

HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)

- **by mouth using immediate-release medicines**
  - Child 1-month-2 years: 150–200 mg/m² twice daily (max. per dose 200 mg), alternatively 300–400 mg/m² once daily (max. per dose 400 mg)
  - Child 3-17 years: 150–200 mg/m² twice daily (max. per dose 200 mg)

HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)

- **by mouth using immediate-release medicines**
  - Child 3-17 years (body surface area 0.58–0.83 m²): 200 mg once daily
  - Child 3-17 years (body surface area 0.84–1.17 m²): 300 mg once daily
  - Child 3-17 years (body surface area 1.18 m² and above): 400 mg once daily
  - Child 3-17 years (body surface area 0.58–0.83 m²): 200 mg once daily
  - Child 3-17 years (body surface area 0.84–1.17 m²): 300 mg once daily
  - Child 3-17 years (body surface area 1.18 m² and above): 400 mg once daily

**side-effects**

- **common or very common** Abdominal pain, diarrhea, fatigue, fever, granulocytopenia, headache, hepatitis, hypersensitivity reactions (may involve hepatic reactions and rash), nausea, rash, Stevens-Johnson syndrome, toxic epidermal necrolysis, vomiting
- **uncommon** Anaemia, arthralgia, myalgia
- **frequency not known** Osteonecrosis

  - Child 3-17 years (body surface area 1.18 m² and above): 400 mg once daily

**side-effects**

- **common or very common** Abdominal pain, diarrhea, fatigue, fever, granulocytopenia, headache, hepatitis, hypersensitivity reactions (may involve hepatic reactions and rash), nausea, rash, Stevens-Johnson syndrome, toxic epidermal necrolysis, vomiting
- **uncommon** Anaemia, arthralgia, myalgia
- **frequency not known** Osteonecrosis
They should be used with caution in patients with hepatomegaly, hepatitis (especially hepatitis C treated with interferon alfa and ribavirin), liver–enzyme abnormalities and with other risk factors for liver disease and hepatic steatosis. Treatment with the nucleoside reverse transcriptase inhibitor should be discontinued in case of symptomatic hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function.

- **SIDE-EFFECTS** Abdominal pain, anaemia, anorexia, arthralgia, blood disorders, cough, diarrhoea, dizziness, dysphonia, fatigue, fever, flatulence, gastro-intestinal disturbances, headache, insomnia, lactic acidosis, lipodystrophy (Lipodystrophy Syndrome), liver damage, metabolic effects, myalgia, nausea, neutropenia, osteonecrosis, pancreatitis, rash, thrombocytopenia, urticaria, vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- Lipodystrophy syndrome For further information see HIV infection p. 385.
- Osteonecrosis For further information see HIV infection p. 385.
- PREGNANCY Mitochondrial dysfunction has been reported in infants exposed to nucleoside reverse transcriptase inhibitors in utero; the main effects include haematological, metabolic, and neurological disorders; all infants whose mothers received nucleoside reverse transcriptase inhibitors during pregnancy should be monitored for relevant signs or symptoms.
- **HEPATIC IMPAIRMENT** Use with caution in children with hepatic impairment (greater risk of hepatic side effects). However, some nucleoside reverse transcriptase inhibitors are used in children who also have chronic hepatitis B.

  - Child 12–17 years (body-weight 40 kg and above): 1 tablet once daily

**RENSAL IMPAIRMENT**

Avoid Triumeq® if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

Abacavir with lamivudine

The properties listed below are those particular to the combination only. For the properties of the components please consider, abacavir p. 390, lamivudine p. 393.

**PATIENT AND CARER ADVICE**

**Missed doses**

If a dose is more than 20 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Triumeq (ViiV Healthcare UK Ltd)**
  - Dolutegravir (as Dolutegravir sodium) 50 mg, Lamivudine 300 mg, Abacavir (as Abacavir sulfate) 600 mg
  - 30 tablet $179.16

**RENSAL IMPAIRMENT**

Avoid Kivexa® if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**
- **Abacavir with lamivudine (Non-proprietary)**
  - Lamivudine 300 mg, Abacavir (as Abacavir sulfate) 600 mg
  - 60 tablet $119.62
- **Kivexa (ViiV Healthcare UK Ltd)**
  - Lamivudine 300 mg, Abacavir (as Abacavir sulfate) 600 mg
  - 30 tablet $299.41

Symptoms usually appear in the first 6 weeks, but may occur at any time.

Discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction); discontinue if hypersensitivity cannot be ruled out, even when other diagnoses possible—if rechallenge necessary it must be carried out in hospital setting; if abacavir is stopped for any reason other than hypersensitivity, exclude hypersensitivity reaction as the cause and rechallenge only if medical assistance is readily available; care needed with concomitant use of drugs which cause skin toxicity.

Rash. More common in children.

**ALLERGY AND CROSS-SENSITIVITY**

Caution—increased risk of hypersensitivity reaction in presence of HLA-B*5701 allele.

**HEPATIC IMPAIRMENT**

Monitor closely in mild impairment (combination preparations not recommended as reduced abacavir dose may be required). Avoid in moderate impairment unless essential—close monitoring required. Avoid in severe impairment.

**RENSAL IMPAIRMENT**

Manufacturer advises avoid in end-stage renal disease.

**PRE-TREATMENT SCREENING**

Test for HLA-B*5701 allele before treatment or if restarting treatment and HLA-B*5701 status not known.

**MONITORING REQUIREMENTS**

Monitor for symptoms of hypersensitivity reaction every 2 weeks for 2 months.

**PRESCRIBING AND DISPENSING INFORMATION**

There can be variation in the licensing of different medicines containing the same drug.
Didanosine
(dd; DDI)

**INDICATIONS AND DOSE**

**HIV infection in combination with other antiretroviral drugs**

- **BY MOUTH**
  - Child 1-7 months: 50–100 mg/m² twice daily
  - Child 8 months–7 years: 180–240 mg/m² once daily; usual dose 200 mg/m² once daily; maximum 400 mg per day

**UNLICENSED USE**
