Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop haematemesis, convulsions, and supraventricular and tachycardia, and hyperglycaemia. More serious effects are intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are delirium, coma, convulsions, ventricular arrhythmias, hyperthermia, rhabdomyolysis, acute renal failure, acute hepatitis, disseminated intravascular coagulation, adult respiratory distress syndrome, hyperreflexia, hypotension and intracerebral haemorrhage; hyponatraemia has also been associated with ecstasy use and syndrome of inappropriate antidiuretic hormone secretion (SIADH) can occur.

Treatment of methylenedioxyethylamphetamines poisoning is supportive, with diazepam to control persistent convulsions and close monitoring including ECG. For the management of agitation, seek specialist advice. Self-induced water intoxication should be considered in patients with ecstasy poisoning.

Theophylline

Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are delirium, coma, convulsions, ventricular arrhythmias, hyperthermia, rhabdomyolysis, acute renal failure, acute hepatitis, disseminated intravascular coagulation, adult respiratory distress syndrome, hyperreflexia, hypotension and intracerebral haemorrhage; hyponatraemia has also been associated with ecstasy use and syndrome of inappropriate antidiuretic hormone secretion (SIADH) can occur.

Treatment of methylenedioxyethylamphetamines poisoning is supportive, with diazepam to control persistent convulsions and close monitoring including ECG. For the management of agitation, seek specialist advice. Self-induced water intoxication should be considered in patients with ecstasy poisoning.

**Cyanides**

Oxygen should be administered to children with cyanide poisoning. The choice of antidote depends on the severity of poisoning, certainty of diagnosis, and the cause. Dicobalt edetate p. 793 is the antidote of choice when there is a strong clinical suspicion of severe cyanide poisoning, but it should not be used as a precautionary measure. Dicobalt edetate itself is toxic, associated with anaphylactoid reactions, and is potentially fatal if administered in the absence of cyanide poisoning. A regimen of sodium nitrite p. 793 followed by sodium thiosulfate p. 793 is an alternative if dicobalt edetate is not available.

Hydroxocobalamin p. 534 (Cyanokit®—no other preparation of hydroxocobalamin is suitable) can be considered for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

**Ethylene glycol and methanol**

Fomepizole (available from ‘special-order’ manufacturers or specialist importing companies) is the treatment of choice for ethylene glycol and methanol (methyl alcohol) poisoning. If necessary, ethanol (by mouth or by intravenous infusion) can be used, but with caution. Advice on the treatment of ethylene glycol and methanol poisoning should be obtained from the National Poisons Information Service. It is important to start antidote treatment promptly in cases of suspected poisoning with these agents.

**Heavy metals**

Heavy metal antidotes include succimer (DMSA) [unlicensed], unithiol (DMPS) [unlicensed], sodium calcium edetate [unlicensed], and dimercaprol. Dimercaprol in the management of heavy metal poisoning has been superseded by other chelating agents. In all cases of heavy metal poisoning, the advice of the National Poisons Information Service should be sought.

**Noxious gases**

**Carbon monoxide**

Carbon monoxide poisoning is usually due to inhalation of smoke, car exhaust, or fumes caused by blocked flues or incomplete combustion of fuel gases in confined spaces.

Immediate treatment of carbon monoxide poisoning is essential. The patient should be moved to fresh air, the airway cleared, and high-flow oxygen 100% administered as soon as available. Artificial respiration should be given as necessary and continued until adequate spontaneous breathing starts, or stopped only after persistent and efficient treatment of cardiac arrest has failed. The child should be admitted to hospital because complications may arise after a delay of hours or days. Cerebral oedema may occur in severe poisoning and is treated with an intravenous infusion of mannitol p. 133. Referral for hyperbaric oxygen treatment should be discussed with the National Poisons Information Service if the patient is pregnant or in cases of severe poisoning such as if the patient is or has been unconscious, or has psychiatric or neurological features other than a headache or has myocardial ischaemia or an arrhythmia, or has a blood carboxyhaemoglobin concentration of more than 20%.

**Sulfur dioxide, chlorine, phosgene, ammonia**

All of these gases can cause upper respiratory tract and conjunctival irritation. Pulmonary oedema, with severe breathlessness and cyanosis may develop suddenly up to
36 hours after exposure. Death may occur. Patients are kept under observation and those who develop pulmonary oedema are given oxygen. Assisted ventilation may be necessary in the most serious cases.

**CS spray**

CS spray, which is used for riot control, irritates the eyes (hence ‘tear gas’) and the respiratory tract; symptoms normally settle spontaneously within 15 minutes. If symptoms persist, the patient should be removed to a well-ventilated area, and the exposed skin washed with soap and water after removal of contaminated clothing. Contact lenses should be removed and rigid ones washed (soft ones should be discarded). Eye symptoms should be treated by irrigating the eyes with physiological saline (or water if saline is not available) and advice sought from an ophthalmologist. Patients with features of severe poisoning, particularly respiratory complications, should be admitted to hospital for symptomatic treatment.

**Nerve agents**

Treatment of nerve agent poisoning is similar to organophosphorus insecticide poisoning, but advice must be sought from the National Poisons Information Service. The risk of cross-contamination is significant; adequate decontamination and protective clothing for healthcare personnel are essential. In emergencies involving the release of nerve agents, kits (‘NAAS pods’) containing pralidoxime chloride p. 794 can be obtained through the Ambulance Service from the National Blood Service (or the Welsh Blood Service in South Wales or designated hospital pharmacies in Northern Ireland and Scotland—see TOXBASE for list of designated centres).

**Pesticides**

**Organophosphorus insecticides**

Organophosphorus insecticides are usually supplied as powders or dissolved in organic solvents. All are absorbed through the bronchi and intact skin as well as through the gut and inhibit cholinesterase activity, thereby prolonging and intensifying the effects of acetylcholine. Toxicity between different compounds varies considerably, and onset may be delayed after skin exposure. Anxiety, restlessness, dizziness, headache, miosis, nausea, hypersalivation, vomiting, abdominal colic, diarrhoea, bradycardia, and sweating are common features of organophosphorus poisoning. Muscle weakness and fasciculation may develop and progress to generalised flaccid paralysis, including the ocular and respiratory muscles. Convulsions, coma, pulmonary oedema with copious bronchial secretions, hypoxia, and arrhythmias occur in severe cases. Hyperpyrexia and glycosuria without ketonuria may also be present.

Further absorption of the organophosphorus insecticide should be prevented by moving the child to fresh air, removing soiled clothing, and washing contaminated skin. In severe poisoning it is vital to ensure a clear airway, frequent removal of bronchial secretions, and adequate ventilation and oxygenation; gastric lavage may be considered provided that the airway is protected. Atropine sulfate p. 764 will reverse the muscarinic effects of acetylcholine and is given by intravenous injection until the skin becomes flushed and dry, the pupils dilate, and bradycardia is abolished. Pralidoxime chloride, a cholinesterase reactivator, is used as an adjunct to atropine sulfate in moderate or severe poisoning. It improves muscle tone within 30 minutes of administration. Pralidoxime chloride is continued until the patient has not required atropine sulfate for 12 hours. Pralidoxime chloride can be obtained from designated centres, the names of which are held by the National Poisons Information Service.

**Snake bites and animal stings**

**Snake bites**

Envenoming from snake bite is uncommon in the UK. Many exotic snakes are kept, some illegally, but the only indigenous venomous snake is the adder (Vipera berus). The bite may cause local and systemic effects. Local effects include pain, swelling, bruising, and tender enlargement of regional lymph nodes. Systemic effects include early anaphylactic symptoms (transient hypotension with syncope, angioedema, urticaria, abdominal colic, diarrhoea, and vomiting), with later persistent or recurrent hypotension, ECG abnormalities, spontaneous systemic bleeding, coagulopathy, adult respiratory distress syndrome, and acute renal failure. Fatal envenoming is rare but the potential for severe envenoming must not be underestimated.

Early anaphylactic symptoms should be treated with adrenaline/epinephrine p. 128. Indications for European viper snake venom antiserum treatment p. 798 include systemic envenoming, especially hypotension, ECG abnormalities, vomiting, haemostatic abnormalities, and marked local envenoming such that after bites on the hand or foot, swelling extends beyond the wrist or ankle within 4 hours of the bite. For those children who present with clinical features of severe envenoming (e.g. shock, ECG abnormalities, or local swelling that has advanced from the foot to above the knee or from the hand to above the elbow within 2 hours of the bite), a higher initial dose of the european viper snake venom antiserum is available for supply in an emergency, telephone the National Poisons Information Service. Whenever possible the TOXBASE entry should be read, and relevant information collected, before telephoning the National Poisons Information Service.

**Insect stings**

Stings from ants, wasps, hornets, and bees cause local pain and swelling but seldom cause severe direct toxicity unless many stings are inflicted at the same time. If the sting is in the mouth or on the tongue local swelling may threaten the upper airway. The stings from these insects are usually treated by cleaning the area with a topical antiseptic. Bee stings should be removed as quickly as possible. Anaphylactic reactions require immediate treatment with intramuscular adrenaline/epinephrine; self-administered (or administered by a carer) intramuscular adrenaline/epinephrine (e.g. EpiPen ®) is the best first-aid treatment for patients with severe hypersensitivity. An inhaled bronchodilator should be used for asthmatic reactions, see also the management of anaphylaxis. A short course of an oral antihistamine or a topical corticosteroid may help to reduce inflammation and relieve itching. A vaccine containing extracts of bee and wasp venom can be used to reduce the risk of anaphylaxis and systemic reactions in patients with systemic hypersensitivity to bee or wasp stings.

**Marine stings**

The severe pain of weeverfish (Trachinus vipera) and Portuguese man-o’-war stings can be relieved by immersing the stung area immediately in uncomfortably hot, but not scalding, water (not more than 45°C). People stung by jellyfish and Portuguese man-o’-war around the UK coast should be removed from the sea as soon as possible. Adherent tentacles should be lifted off carefully (wearing
1 Active elimination from the gastro-intestinal tract

**ANTIDOTES AND CHELATORS**

**INTestinal ADSORBENTS**

**Charcoal, activated**

- **INDICATIONS AND DOSE**
  Reduction of absorption of poisons in the gastro-intestinal system
  - BY MOUTH
    - Neonate: 1 g/kg.
    - Child 1 month-11 years: 1 g/kg (max. per dose 50 g)
    - Child 12-17 years: 50 g
  - Active elimination of poisons
    - BY MOUTH
      - Neonate: 1 g/kg every 4 hours, dose may be reduced and the frequency increased if not tolerated, reduced dose may compromise efficacy.
      - Child 1 month-11 years: 1 g/kg every 4 hours (max. per dose 50 g), dose may be reduced and the frequency increased if not tolerated, reduced dose may compromise efficacy.
      - Child 12-17 years: Initially 50 g, then 50 g every 4 hours, reduced if not tolerated to 25 g every 2 hours, alternatively 12.5 g every 1 hour, reduced dose may compromise efficacy.

- **CAUTIONS** Comatose patient (risk of aspiration—ensure airway is protected) • Drowsy patient (risk of aspiration—ensure airway protected) • Reduced gastrointestinal motility (risk of obstruction)
- **SIDE-EFFECTS** Black stools
- **DIRECTIONS FOR ADMINISTRATION** Suspension or reconstituted powder may be mixed with soft drinks (e.g. caffeine-free diet cola) or fruit juices to mask the taste.
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Granules
    - Carbomix (Beacon Pharmaceuticals Ltd)
      - Activated charcoal 813 mg per 1 gram Carbomix 81.3% granules sugar-free | 50 gram £11.90
    - Actidose-Aqua Advance (Alliance Pharmaceuticals Ltd)
      - Activated charcoal 208 mg per 1 ml Actidose-Aqua Advance 1mg/5ml oral suspension | 240 ml £12.89
  - Oral suspension
    - Actidose-Aqua Advance (Teva UK Ltd)
      - Activated charcoal 200 mg per 1 ml Charcodote 200mg/ml oral suspension sugar-free | 250 ml £11.88

**DICOBALT ETEDATE**

- **INDICATIONS AND DOSE**
  - Severe poisoning with cyanides
    - BY INTRAVENOUS INJECTION
    - Child: Consult the National Poisons Information Service
- **CAUTIONS** Owing to toxicity to be used only for definite cyanide poisoning when patient tending to lose, or has lost, consciousness
- **SIDE-EFFECTS** Anaphylactoid reactions • Cardiac abnormalities • Facial oedema • Hypotension • Laryngeal oedema • Tachycardia • Vomiting
- **EXCEPTIONS TO LEGAL CATEGORY** Prescription only medicine restriction does not apply where administration is for saving life in emergency.
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug.
  - Solution for injection
    - Dicobalt edetate (Non-proprietary)
      - Dicobalt edetate 15 mg per 1 ml Dicobalt edetate 300mg/20ml solution for injection ampoules | 6 ampoule £117.20

**SODIUM NITRITE**

- **INDICATIONS AND DOSE**
  - Poisoning with cyanides (used in conjunction with sodium thiosulfate)
    - BY INTRAVENOUS INJECTION
    - Child: 4–10 mg/kg (max. per dose 300 mg), to be given over 5–20 minutes followed by sodium thiosulphate injection
- **DOSE EQUIVALENCE AND CONVERSION**
  - 4–10 mg/kg equates to 0.13–0.33 mL/kg of a 3% solution.
  - Dose max. of 300 mg equates to 10 mL of a 3% solution.
- **SIDE-EFFECTS**
  - Flushing (due to vasodilatation) • Headache (due to vasodilatation)
- **EXCEPTIONS TO LEGAL CATEGORY**
  - Prescription only medicine restriction does not apply where administration is for saving life in emergency.
- **MEDICINAL FORMS**
  - There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**SODIUM THIOSULFATE**

- **INDICATIONS AND DOSE**
  - Poisoning with cyanides (used in conjunction with sodium nitrite)
    - BY INTRAVENOUS INJECTION
    - Child: 400 mg/kg (max. per dose 12.5 g), to be given over 10 minutes, dose may be repeated in severe cyanide poisoning if dicobalt edetate not available
- **DOSE EQUIVALENCE AND CONVERSION**
  - 400 mg/kg equates to 0.8 mL/kg of a 50% solution.
  - 12.5 g equates to 25 mL of a 50% solution.
Emergency treatment of poisoning

2.2 Organophosphorus toxicity

**ANTIDOTES AND CHELATORS**

**Pralidoxime chloride**

**INDICATIONS AND DOSE**

Adjunct to atropine in the treatment of poisoning by organophosphorus insecticide or nerve agent

- **BY INTRAVENOUS INJECTION**
  - Child: Initially 30 mg/kg, to be given over 20 minutes, followed by 8 mg/kg/hour; maximum 12 g per day

**UNLICENSED USE**

Pralidoxime chloride doses may differ from those in product literature. Licensed for use in children (age range not specified by manufacturer).

**CONTRA-INDICATIONS**

Poisoning with carbamates - poisoning with organophosphorus compounds without anticholinesterase activity

**CAUTIONS**

Myasthenia gravis

**SIDE-EFFECTS**

Disturbances of vision - dizziness - drowsiness - headache - hyperventilation - muscular weakness - nausea - tachycardia

**RENAL IMPAIRMENT**

Use with caution.

**DIRECTIONS FOR ADMINISTRATION**

The loading dose may be administered by intravenous injection (diluted to a concentration of 50 mg/mL with water for injections) over at least 5 minutes if pulmonary oedema is present or if it is not practical to administer an intravenous infusion.

- With intravenous use For intravenous infusion, reconstitute each vial with 20 mL Water for Injections, then dilute to a concentration of 10–20 mg/mL with Sodium Chloride 0.9%.

**PRESCRIBING AND DISPENSING INFORMATION**

Available from designated centres for organophosphorus insecticide poisoning or from the National Blood Service (or Welsh Ambulance Services for Mid West and South East Wales) — see TOXBASE for list of designated centres.

**EXCEPTIONS TO LEGAL CATEGORY**

Prescription only medicine restriction does not apply where administration is for saving life in emergency.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**

- Pralidoxime chloride (Non-proprietary)
  - Pralidoxime chloride 1 gram: Protopam Chloride 1g powder for solution for injection vials | 6 vial pack | no price available

**CONTRA-INDICATIONS**

Life-threatening condition (e.g. raised intracranial pressure, status epilepticus) controlled by benzodiazepines

**CAUTIONS**

Avoid rapid injection following major surgery - avoid rapid injection in high-risk or anxious patients - benzodiazepine dependence (may precipitate withdrawal symptoms) - children - ensure neuromuscular blockade cleared before giving - head injury (rapid reversal of benzodiazepine sedation may cause convulsions) - history of panic disorders (risk of recurrence) - prolonged benzodiazepine therapy for epilepsy (risk of convulsions) - short-acting (repeat doses may be necessary — benzodiazepine effects may persist for at least 24 hours)

**SIDE-EFFECTS**

- Common or very common Nausea - vomiting
- Uncommon Anxiety - fear - palpitation
- Frequency not known Agitation - chills - convulsions (particularly in those with epilepsy) - dizziness - flushing - sensory disturbance - sweating - tachycardia - transient hypertension

**PREGNANCY**

Not known to be harmful.

**BREAST FEEDING**

Avoid breast-feeding for 24 hours.

**HEPATIC IMPAIRMENT**

Carefully titrate dose.

**DIRECTIONS FOR ADMINISTRATION**

With intravenous use For continuous intravenous infusion, dilute with Glucose 5% or Sodium Chloride 0.9%.
3.2 Digoxin toxicity

**ANTIDOTES AND CHELATORS** → **ANTIBODIES**

Digoxin-specific antibody

**INDICATIONS AND DOSE**

Treatment of known or strongly suspected life-threatening digoxin toxicity associated with ventricular arrhythmias or bradycardia unresponsive to atropine and when measures beyond the withdrawal of digoxin and correction of any electrolyte abnormalities are considered necessary

- **BY INTRAVENOUS INFUSION**
- **Child:** Serious cases of digoxin toxicity should be discussed with the National Poisons Information Service (consult product literature)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Solution for injection**
  - Flumazenil (non-proprietary)
  - Flumazenil 100 microgram per 1 ml Flumazenil 500micrograms/5ml solution for injection ampoules
    
  - 5 ampoule £55.50-£72.46
  - **DigiFab** Powder for solution for infusion vials 1 vial £750.00 (Hospital only)

3.3 Heparin toxicity

**ANTIDOTES AND CHELATORS**

Protamine sulfate

**INDICATIONS AND DOSE**

Overdosage with intravenous injection or intravenous infusion of unfractionated heparin (less than 30 minutes lapsed since overdose)

- **BY INTRAVENOUS INJECTION**
- **Child:** 1 mg (max. per dose 50 mg), to be administered at a rate not exceeding 5 mg/minute, to neutralise each 100 units of unfractionated heparin

Overdosage with intravenous injection or intravenous infusion of unfractionated heparin (if 30–60 minutes lapsed since overdose)

- **BY INTRAVENOUS INJECTION**
- **Child:** 500–750 micrograms (max. per dose 50 mg), to be administered at a rate not exceeding 5 mg/minute, to neutralise each 100 units of unfractionated heparin

Overdosage with intravenous injection or intravenous infusion of unfractionated heparin (if 60–120 minutes lapsed since overdose)

- **BY INTRAVENOUS INJECTION**
- **Child:** 375–500 micrograms (max. per dose 50 mg), to be administered at a rate not exceeding 5 mg/minute, to neutralise each 100 units of unfractionated heparin

**PREScribing and dispensing INFORMATION** The long half-life of low molecular weight heparins should be taken into consideration when determining the dose of protamine sulfate; the effects of low molecular weight heparins can persist for up to 24 hours after administration.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- **Protamine sulfate (Non-proprietary)**
  - Protamine sulfate 10 mg per 1 ml Protamine sulfate 100mg/10ml solution for injection ampoules 5 ampoule £80.00 price available
  - Protamine sulfate 50mg/5ml solution for injection ampoules 10 ampoule £49.55

**CAUTIONS** Excessive doses can have an anticoagulant effect

**SIDE-EFFECTS** Anaphylaxis · angioedema · back pain · bradycardia · dyspnoea · flushing · hypersensitivity reactions · hypertension · hypotension · lassitude · nausea · pulmonary oedema · rebound bleeding · vomiting

**ALLERGY AND CROSS-SENSITIVITY** Caution if increased risk of allergic reaction to protamine (includes previous treatment with protamine or protamine insulin, allergy to fish, men who are infertile or who have had a vasectomy and who may have antibodies to protamine).

**MONITORING REQUIREMENTS** Monitor activated partial thromboplastin time or other appropriate blood clotting parameters.

**DIRECTIONS FOR ADMINISTRATION**

- With intravenous use May be diluted if necessary with Sodium Chloride 0.9%.

**Overdosage with intravenous injection or intravenous infusion of unfractionated heparin (if over 120 minutes lapsed since overdose)**

- **BY INTRAVENOUS INJECTION**
- **Child:** 250–375 micrograms (max. per dose 50 mg), to be administered at a rate not exceeding 5 mg/minute, to neutralise each 100 units of unfractionated heparin

**Overdosage with subcutaneous injection of unfractionated heparin**

- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- **Child:** (max. per dose 50 mg), 50–100% of the total dose to be given by intravenous injection (rate not exceeding 5 mg/minute), then give any remainder of dose by intravenous infusion over 8–16 hours, 1 mg neutralises approx. 100 units of unfractionated heparin

**Overdosage with subcutaneous injection of low molecular weight heparin**

- **BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION**
- **Child:** (max. per dose 50 mg), to be administered by intermittent intravenous injection at a rate not exceeding 5 mg/minute or by continuous intravenous infusion, 1 mg neutralises approx. 100 units of low molecular weight heparin, consult product literature of low molecular weight heparin for details
3.4 Opioid toxicity

**OPIOID RECEPTOR ANTAGONISTS**

**Naloxone hydrochloride**

- **INDICATIONS AND DOSE**
  - **Overdosage with opioids**
    - **BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION**
      - **Neonate:** Initially 100 micrograms/kg, if no response, repeat at intervals of 1 minute to a total max. 2 mg, then review diagnosis; further doses may be required if respiratory function deteriorates.
      - **Child 1 month–11 years:** Initially 100 micrograms/kg, if no response, repeat at intervals of 1 minute to a total max. 2 mg, then review diagnosis; further doses may be required if respiratory function deteriorates.
      - **Child 12–17 years:** Initially 400 micrograms, then 800 micrograms for up to 2 doses at 1 minute intervals if no response to preceding dose, then increased to 2 mg for 1 dose if still no response (4 mg dose may be required in seriously poisoned patients), then review diagnosis; further doses may be required if respiratory function deteriorates.
  - **BY CONTINUOUS INTRAVENOUS INFUSION**
    - **Neonate:** Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory ventilation for at least 15 minutes.
    - **Child:** Using an infusion pump, adjust rate according to response (initially, rate may be set at 60% of the initial resuscitative intravenous injection dose per hour). The initial resuscitative intravenous injection dose is that which maintained satisfactory ventilation for at least 15 minutes.

- **Reversal of postoperative respiratory depression**
  - **INITIALLY BY INTRAVENOUS INJECTION**
    - **Neonate:** 1 microgram/kg, repeated every 2–3 minutes if required.
    - **Child 1 month–11 years:** 1 microgram/kg, repeated every 2–3 minutes if required.
    - **Child 12–17 years:** Initially 100–200 micrograms, alternatively (by intravenous injection) initially 1.5–3 micrograms/kg, if response inadequate, give subsequent doses, (by intravenous injection) 100 micrograms every 2 minutes, alternatively (by intramuscular injection) 100 micrograms every 1–2 hours.

- **Reversal of respiratory and CNS depression resulting from opioid administration to mother during labour**
  - **BY INTRAMUSCULAR INJECTION**
    - **Neonate:** 200 micrograms, alternatively 60 micrograms/kg, to be given as a single dose at birth.
  - **BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION**
    - **Neonate:** 10 micrograms/kg, repeated every 2–3 minutes if required.

**PHARMACOKINETICS**

Naloxone has a short duration of action; repeated doses or infusion may be necessary to reverse effects of opioids with longer duration of action.

**IMPORTANT SAFETY INFORMATION**

**SAFE PRACTICE**

Doses used in acute opioid overdosage may not be appropriate for the management of opioid-induced respiratory depression and sedation in those receiving palliative care and in chronic opioid use.

**CAUTIONS**

Cardiovascular disease or those receiving cardiotonic drugs (serious adverse cardiovascular effects reported) - maternal physical dependence on opioids (may precipitate withdrawal in newborn) - pain - physical dependence on opioids (precipitates withdrawal)

**CAUTIONS, FURTHER INFORMATION**

- Titration of dose In postoperative use, the dose should be titrated for each patient in order to obtain sufficient respiratory response; however, naloxone antagonises analgesia.

**SIDE-EFFECTS**

- **Common or very common** Cardiac arrest - dizziness - dyspnoea - headache - hypertension - hyperventilation - hypotension - nausea - pulmonary oedema - tachycardia - ventricular fibrillation - vomiting
- **Uncommon** Agitation - diarrhoea - dry mouth - excitement - paraesthesia - sweating - tremor
- **Very rare** Erythema multiforme - seizures

**PREGNANCY**

Use only if potential benefit outweighs risk.

**BREAST FEEDING**

Not orally bioavailable.

**DIRECTIONS FOR ADMINISTRATION**

For continuous intravenous infusion, dilute to a concentration of up to 200 micrograms/ml with Glucose 5% or Sodium Chloride 0.9%.

**MEDITACION FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Naloxone hydrochloride (Non-proprietary)**
  - **Naloxone hydrochloride 20 microgram per 1 ml** Naloxone 40 micrograms/2ml solution for injection ampoules | 10 ampoule (PBN) £5.00
  - **Naloxone hydrochloride 400 microgram per 1 ml** Naloxone 400 micrograms/1ml solution for injection Minijet pre-filled syringes | 1 pre-filled disposable injection (PBN) £20.40
  - **Naloxone hydrochloride 4000 microgram per 1 ml** Naloxone 4000 micrograms/1ml solution for injection Minijet pre-filled syringes | 1 pre-filled disposable injection (PBN) £20.40
  - **Naloxone hydrochloride 1 microgram per 1 ml** Naloxone 2mg/5ml solution for injection Minijet pre-filled syringes | 1 pre-filled disposable injection (PBN) £16.80
  - **Prenoxad (Martindale Pharmaceuticals Ltd)**
    - **Naloxone hydrochloride 1 microgram per 1 ml** Prenoxad 2mg/2ml solution for injection pre-filled syringes | 1 pre-filled disposable injection (PBN) £15.30

**UNLICENSED USE**

Naloxone doses in BNF may differ from those in product literature.
3.5 Paracetamol toxicity

**ANTIDOTES AND CHELATORS**

### Acetylcysteine

**INDICATIONS AND DOSE**

**Paracetamol overdose**
- **By intravenous infusion**
  - Neonate: Initially 150 mg/kg over 1 hour, dose to be administered in 3 mL/kg glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 7 mL/kg glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 14 mL/kg glucose 5%.
  - Child (body-weight up to 20 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 3 mL/kg glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 7 mL/kg glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 14 mL/kg glucose 5%.
  - Child (body-weight 20–39 kg): Initially 150 mg/kg over 1 hour, dose to be administered in 100 mL glucose 5%, followed by 50 mg/kg over 4 hours, dose to be administered in 200 mL glucose 5%, then 100 mg/kg over 16 hours, dose to be administered in 500 mL glucose 5%.
  - Child (body-weight 40 kg and above): 150 mg/kg over 1 hour, dose to be administered in 200 mL Glucose Intravenous Infusion 5%, then 50 mg/kg over 4 hours, to be started immediately after completion of first infusion, dose to be administered in 500 mL Glucose Intravenous Infusion 5%, then 100 mg/kg over 16 hours, to be started immediately after completion of second infusion, dose to be administered in 1 litre Glucose Intravenous Infusion 5%

**Meconium ileus**
- **By mouth**
  - Neonate: 200–400 mg up to 3 times a day if required.

**Treatment of distal intestinal obstructive syndrome**
- **By mouth**
  - Child 1 month–1 year: 0.4–3 g as a single dose
  - Child 2–6 years: 2–3 g as a single dose
  - Child 7–11 years: 4–6 g as a single dose

**Prevention of distal intestinal obstruction syndrome**
- **By mouth**
  - Child 1 month–1 year: 100–200 mg 3 times a day
  - Child 2–11 years: 200 mg 3 times a day
  - Child 12–17 years: 200–400 mg 3 times a day

**UNLICENSED USE**
- With oral use Not licensed for use in meconium ileus or for distal intestinal obstructive syndrome in children with cystic fibrosis.

**CAUTIONS**
- With intravenous use Asthma (see Side-effects for management of asthma but do not delay acetylcysteine treatment) atopy may slightly increase INR - may slightly increase prothrombin time
- With oral use Asthma - history of peptic ulceration

**SIDE-EFFECTS**
- With intravenous use Hypersensitivity-like reactions - rash - slight increase in INR and prothrombin time
- With oral use Anaphylaxis - hypersensitivity-like reactions - rash

**SIDE-EFFECTS, FURTHER INFORMATION**
- Hypersensitivity-like reactions
- With intravenous use Hypersensitivity-like reactions managed by reducing infusion rate or suspending until reaction settled (rash also managed by giving antihistamine; acute asthma managed by giving nebulised short-acting beta₂ agonist) contact the National Poisons Information Service if reaction severe.

**DIRECTIONS FOR ADMINISTRATION**
- With oral use For oral administration, use oral granules, or dilute injection solution (200 mg/mL) to a concentration of 50 mg/mL; orange or blackcurrant juice or cola drink may be used as a diluent to mask the bitter taste.
- With intravenous use Glucose 5% is preferred fluid; Sodium Chloride 0.9% is an alternative if Glucose 5% unsuitable.

**MEDICINAL FORMS**
- There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, effervescent tablet, capsule, granules, oral solution

**Tablet**
- Acetylcysteine (Non-proprietary) Acetylcysteine 600 mg Acetylcysteine 600mg tablets | 30 tablet £39.95 | 100 tablet no price available

**Effervescent tablet**
- Acetylcysteine (Non-proprietary) Acetylcysteine 600 mg Acetylcysteine 600mg effervescent tablets | 10 tablet no price available
- Flumicil 600 effervescent tablets | 10 tablet (PPh) no price available
- Flumicil 600 effervescent tablets | 10 tablet (PPh) no price available

**Orodispersible tablet**
- Acetylcysteine (Non-proprietary) Acetylcysteine 200 mg Flumicil 200mg orodispersible tablets | 20 tablet (PPh) no price available

**Capsule**
- Acetylcysteine (Non-proprietary) Acetylcysteine 600 mg Acetylcysteine 600mg capsules | 30 capsule £39.95 | 60 capsule no price available

**Granules**
- CAUTIONARY AND ADVISORY LABELS 13
- Acetylcysteine (Non-proprietary) Acetylcysteine 100 mg Flumicil N 100mg granules sachets | 20 sachet (PPh) no price available | 50 sachet (PPh) no price available
- Acetylcysteine 200 mg Flumicil N 200mg granules sachets | 20 sachet (PPh) no price available | 50 sachet (PPh) no price available | 100 sachet (PPh) no price available

**Oral solution**
- Acetylcysteine (Non-proprietary) Acetylcysteine 20 mg per 1 ml Solmucol 100mg/5ml syrup | 180 ml (PPh) no price available

**Solution for infusion**
- ELECTROLYTES: May contain Sodium
- Acetylcysteine (Non-proprietary) Acetylcysteine 200 mg per 1 ml Acetylcysteine 2g/10ml solution for infusion ampoules | 10 ampoule (PPh) £21.26–£24.99
- Parvoles (Phoenix Labs Ltd) Parvoles 2g/10ml concentrate for solution for infusion ampoules | 10 ampoule (PPh) £22.50
Emergency treatment of poisoning

4 Methaemoglobinemia

**ANTIDOTES AND CHELATORS**

**Methylthioninium chloride**
*(Methylene blue)*

- **INDICATIONS AND DOSE**
  - **Drug- or chemical-induced methaemoglobinemia**
    - By slow intravenous injection
  - **Neonate**: Seek advice from National Poisons Information Service.
  - **Child 1-2 months**: Seek advice from National Poisons Information Service
  - **Child 3 months-17 years**: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 7 mg/kg per course

**Aniline- or dapsone-induced methaemoglobinemia**

- **By slow intravenous injection**
  - **Child 3 months-17 years**: Initially 1–2 mg/kg, then 1–2 mg/kg after 30–60 minutes if required, to be given over 5 minutes, seek advice from National Poisons Information Service if further repeat doses are required; maximum 4 mg/kg per course

- **CAUTIONS**: Children under 3 months (more susceptible to methaemoglobinemia from high doses of methylthioninium) - chloride poisoning (reduces efficacy of methylthioninium) - G6PD deficiency (seek advice from National Poisons Information Service) - methaemoglobinemia due to treatment of cyanide poisoning with sodium nitrite (seek advice from National Poisons Information Service) - pulse oximetry may give false estimation of oxygen saturation

- **INTERACTIONS**: → Appendix 1 (methylthioninium).

- **PREGNANCY**: No information available, but risk to fetus of untreated methaemoglobinemia likely to be significantly higher than risk of treatment.

- **BREAST FEEDING**: Manufacturer advises avoid breastfeeding for up to 6 days after administration — no information available.

- **RENAI IMPAIRMENT**: Use with caution in severe impairment; dose reduction may be required.

- **DIRECTIONS FOR ADMINISTRATION**: For intravenous injection, may be diluted with Glucose 5% to minimise injection-site pain; not compatible with Sodium Chloride 0.9%.

- **MEDICINAL FORMS**: There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Methylthioninium chloride (Non-proprietary)**
  - Methylthioninium Chloride 5 mg per 1 ml Methylthioninium chloride Proveblue 50 mg/10 ml solution for injection ampoules | 5 ampoule [PHP] [£167.36]

5 Snake bites

**IMMUNE SERA AND IMMUNOGLOBULINS » ANTIOTOXINS**

**European viper snake venom antiserum**

- **INDICATIONS AND DOSE**
  - **Systemic envenoming from snake bites** | **Marked local envenoming**
    - **By intravenous injection, or by intravenous infusion**
      - **Child**: Initially 10 ml for 1 dose, then 10 ml after 1–2 hours if required, the second dose should only be given if symptoms of systemic envenoming persist after the first dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

  **Severe systemic envenoming from snake bites in patients presenting with clinical features**
    - **By intravenous injection, or by intravenous infusion**
      - **Child**: Initially 20 ml for 1 dose, if symptoms of systemic envenoming persist contact the National Poisons Information Service

- **DIRECTIONS FOR ADMINISTRATION**: By intravenous injection given over 10–15 minutes or by intravenous infusion over 30 minutes after diluting in sodium chloride 0.9% (use 5 mL diluent/kid body-weight).

- **PRESCRIBING AND DISPENSING INFORMATION**: To order, email immform@dh.gsi.gov.uk.

- **MEDICINAL FORMS**: There can be variation in the licensing of the different medicines containing the same drug.

**Solution for injection**

- **European viper snake venom antiserum (Non-proprietary)**
  - European viper snake venom antiserum 100 mg per 1 ml Viper venom antiserum, European (equine) 1P/10ml solution for injection vials | 1 vial [PHP] [£7.98] no price available
Appendix 1
Interactions

Two or more drugs given at the same time may exert their effects independently or may interact. The interaction may be potentiation or antagonism of one drug by another, or occasionally some other effect. Adverse drug interactions should be reported to the Medicines and Healthcare products Regulatory Agency (MHRA), through the Yellow Card Scheme (see Adverse Reactions to Drugs), as for other adverse drug reactions.

Drug interactions may be pharmacodynamic or pharmacokinetic.

Pharmacodynamic interactions
These are interactions between drugs which have similar or antagonistic pharmacological effects or side-effects. They may be due to competition at receptor sites, or occur between drugs acting on the same physiological system. They are usually predictable from a knowledge of the pharmacology of the interacting drugs; in general, those demonstrated with one drug are likely to occur with related drugs. They occur to a greater or lesser extent in most patients who receive the interacting drugs.

Pharmacokinetic interactions
These occur when one drug alters the absorption, distribution, metabolism, or excretion of another, thus increasing or reducing the amount of drug available to produce its pharmacological effects. They are not easily predicted and many of them affect only a small proportion of patients taking the combination of drugs. Pharmacokinetic interactions occurring with one drug cannot be assumed to occur with related drugs unless their pharmacokinetic properties are known to be similar.

Pharmacokinetic interactions are of several types:

Affecting absorption The rate of absorption or the total amount absorbed can both be altered by drug interactions. Delayed absorption is rarely of clinical importance unless high peak plasma concentrations are required (e.g. when giving an analgesic). Reduction in the total amount absorbed, however, may result in ineffective therapy.

Due to changes in protein binding To a variable extent most drugs are loosely bound to plasma proteins. Protein-binding sites are non-specific and one drug can displace another thereby increasing its proportion free to diffuse from plasma to its site of action. This only produces a detectable increase in effect if it is an extensively bound drug (more than 90%) that is not widely distributed throughout the body. Even so displacement rarely produces more than transient potentiation because this increased concentration of free drug results in an increased rate of elimination.

Displacement from protein binding plays a part in the potentiation of warfarin by sulfonamides and tolbutamide but the importance of these interactions is due mainly to the fact that warfarin metabolism is also inhibited.

Affecting metabolism Many drugs are metabolised in the liver. Induction of the hepatic microsomal enzyme system by one drug can gradually increase the rate of metabolism of another, resulting in lower plasma concentrations and a reduced effect. On withdrawal of the inducer plasma concentrations increase and toxicity may occur. Barbiturates, griseofulvin, many antiepileptics, and rifampicin are the most important enzyme inducers. Drugs affected include warfarin and the oral contraceptives. Conversely when one drug inhibits the metabolism of another higher plasma concentrations are produced, rapidly resulting in an increased effect with risk of toxicity. Some drugs which potentiate warfarin and phenytoin do so by this mechanism.

Isoenzymes of the hepatic cytochrome P450 system interact with a wide range of drugs. Drugs may be substrates, inducers or inhibitors of the different isoenzymes. A great deal of in-vitro information is available on the effect of drugs on the isoenzymes; however, since drugs are eliminated by a number of different metabolic routes as well as renal excretion, the clinical effects of interactions cannot be predicted accurately from laboratory data on the cytochrome P450 isoenzymes. Except where a combination of drugs is specifically contra-indicated, the BNF presents only interactions that have been reported in clinical practice. In all cases the possibility of an interaction must be considered if toxic effects occur or if the activity of a drug diminishes.

Affecting renal excretion Drugs are eliminated through the kidney both by glomerular filtration and by active tubular secretion. Competition occurs between those which share active transport mechanisms in the proximal tubule. For example, salicylates and some other NSAIDs delay the excretion of methotrexate; serious methotrexate toxicity is possible.

Relative importance of interactions
Many drug interactions are harmless and many of those which are potentially harmful only occur in a small proportion of patients; moreover, the severity of an interaction varies from one patient to another. Drugs with a small therapeutic ratio (e.g. phenytoin) and those which require careful control of dosage (e.g. anticoagulants, antihypertensives, and antiabeticdes) are most often involved.

Patients at increased risk from drug interactions include those with impaired renal or liver function.

Serious interactions The symbol ● has been placed against interactions that are potentially serious and where concomitant administration of the drugs involved should be avoided (or only undertaken with caution and appropriate monitoring).

Interactions that have no symbol do not usually have serious consequences.
List of drug interactions

The following is an alphabetical list of drugs and their interactions; to avoid excessive cross-referencing each drug or group is listed twice: in the alphabetical list and also against the drug or group with which it interacts.

Abacavir
- Analgesics: abacavir possibly reduces plasma concentration of METHADONE
- Antibacterials: plasma concentration of abacavir possibly reduced by RIFAMPICIN
- Antiepileptics: plasma concentration of abacavir possibly reduced by FOSPHENOTHION, PHENOBARBITAL, PHENYTOIN and PRIMIDONE

Antivirals: abacavir possibly reduces effects of ▶ RIBAVIRIN;
- Plasma concentration of abacavir reduced by ▶ TIPRANAVIR
- Orlistat: absorption of abacavir possibly reduced by ▶ ORLISTAT

Abiraterone
- Analgesics: abiraterone increases plasma concentration of DEXMETHORPHAN
- Antibacterials: plasma concentration of abiraterone possibly reduced by ▶ RIFABUTIN—manufacturer of abiraterone advises avoid concomitant use; plasma concentration of abiraterone reduced by ▶ RIFAMPICIN—manufacturer of abiraterone advises avoid concomitant use
- Antidepressants: plasma concentration of abiraterone possibly reduced by ▶ ST JOHN'S WORT—manufacturer of abiraterone advises avoid concomitant use
- Antibacterials: plasma concentration of abiraterone possibly reduced by ▶ CARBAMAZEPINE, ▶ FOSPHENOTHION, ▶ PHENOBARBITAL, ▶ PHENYTOIN and ▶ PRIMIDONE—manufacturer of abiraterone advises avoid concomitant use
- Diuretics: manufacturer of abiraterone advises avoid concomitant use
- Diuretics: increased risk of angioedema when ACE inhibitors given with ▶ EVEROLIMUS

Acenocumarol
- Enhanced hypotensive effect when ACE inhibitors given with ▶ ALPROSTADIL

ACE Inhibitors (continued)
- Anticoagulants: increased risk of hyperkalaemia when ACE inhibitors given with ▶ HEPARINS
- Antidepressants: hypotensive effect of ACE inhibitors possibly enhanced by MAOIs
- Antidiabetics: ACE inhibitors possibly enhance hypoglycaemic effect of INSULIN, METFORMIN and SULFONYLUREAS
- Antipsychotics: enhanced hypotensive effect when ACE inhibitors given with ▶ ANTIPSYCHOTICS
- Antipsychotics and hypnotics: enhanced hypotensive effect when ACE inhibitors given with ▶ ANXIOLYTICS AND HYPNOTICS
- Avanafil: enhanced hypotensive effect of enalapril possibly enhanced by ▶ AVANAFIL
- Azathioprine: increased risk of anaemia or leucopenia when captopril given with ▶ AZATHIOPRINE especially in renal impairment; increased risk of anaemia when enalapril given with ▶ AZATHIOPRINE especially in renal impairment
- Bee Venom Extracts: possible severe anaphylactoid reaction when ACE inhibitors given with ▶ BEE VENOM EXTRACTS
- Beta-blockers: enhanced hypotensive effect when ACE inhibitors given with ▶ BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when ACE inhibitors given with ▶ CALCIUM CHANNEL BLOCKERS
- Cardiac Glycosides: captopril possibly increases plasma concentration of ▶ DIGOXIN
- Cilostazol: increased risk of hyperkalaemia when ACE inhibitors given with ▶ CILOSTAZOL
- Clonidine: enhanced hypotensive effect when ACE inhibitors given with ▶ CLONIDINE; antihypertensive effect of captopril possibly delayed by previous treatment with ▶ CLONIDINE
- Corticosteroids: hypotensive effect of ACE inhibitors antagonised by ▶ CORTICOSTEROIDS
- Cytotoxics: increased risk of angioedema when ACE inhibitors given with ▶ EVEROLIMUS
- Diazoxide: enhanced hypotensive effect when ACE inhibitors given with ▶ DIAZOXIDE
- Diuretics: enhanced hypotensive effect when ACE inhibitors given with ▶ DIURETICS; increased risk of severe hyperkalaemia when ACE inhibitors given with ▶ AMILORIDE, ▶ POTASSIUM CANrenoate or ▶ TriAMterene; increased risk of severe hyperkalaemia when ACE inhibitors given with ▶ Eplerenone and ▶ SpiRonoLACTone—avoid concurrent use or use lowest possible doses of both drugs
- Dopaminergic: enhanced hypotensive effect when ACE inhibitors given with ▶ CO BENELDOPA, ▶ CO CARELDOPA or ▶ LEVODOPA
- Lithium: ACE inhibitors reduce excretion of ▶ LITHIUM (increased plasma concentration)
- Methyldopa: enhanced hypotensive effect when ACE inhibitors given with ▶ METHYLDOPA
- Moxisylyte: enhanced hypotensive effect when ACE inhibitors given with ▶ MOXISLYTE
- Moxonidine: enhanced hypotensive effect when ACE inhibitors given with ▶ MOXONIDINE
- Nitrites: enhanced hypotensive effect when ACE inhibitors given with ▶ NITRATES
- Oestrogens: hypotensive effect of ACE inhibitors antagonised by ▶ OESTROGENS
- Potassium Salts: increased risk of severe hyperkalaemia when ACE inhibitors given with ▶ POTASSIUM SALTS
- Prostaglandins: enhanced hypotensive effect when ACE inhibitors given with ▶ ALPROSTADIL
- Sacubitril: manufacturer of sacubitril advises avoid ACE inhibitors for 36 hours before or after ▶ SACUBITRIL
- Sodium Aurothiomalate: flushing and hypotension reported when ACE inhibitors given with ▶ SODIUM AUROMALATE
- Vasodilator: Antihypertensives: enhanced hypotensive effect when ACE inhibitors given with ▶ HYDRAZINE, ▶ MINOXIDIL or ▶ SODIUM NITROPRUSSIDE
- Wasp Venom Extracts: possible severe anaphylactoid reaction when ACE inhibitors given with ▶ WASP VENOM EXTRACTS

Acebutolol see Beta-blockers

Aceclofenac see NSAIDs

Acemactacin see NSAIDs
**Adrenergic Neurone Blockers**  
— Antidepressants: enhanced hypotensive effect when adrenergic neurone blockers given with MAOIs; hypotensive effect of adrenergic neurone blockers antagonised by TRICYCLICS  
— Antipsychotics: hypotensive effect of adrenergic neurone blockers antagonised by HALOPERIDOL; hypotensive effect of adrenergic neurone blockers antagonised by higher doses of CHLORPROMAZINE; enhanced hypotensive effect when adrenergic neurone blockers given with PHENOTHIAZINES  
— Antiarrhythmics: enhanced hypotensive effect when adrenergic neurone blockers given with ANTIARRHYTHMICS and HYPNOTICS  
— Beta-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with BETA-BLOCKERS  
— Calcium-channel blockers: enhanced hypotensive effect when adrenergic neurone blockers given with CALCIUM-CHANNEL BLOCKERS  
— Clonidine: enhanced hypotensive effect when adrenergic neurone blockers given with CLONIDINE  
— Corticosteroids: hypotensive effect of adrenergic neurone blockers antagonised by CORTICOSTEROIDS  
— Diazoxide: enhanced hypotensive effect when adrenergic neurone blockers given with DIAZOXIDE  
— Diuretics: enhanced hypotensive effect when adrenergic neurone blockers given with DIURETICS  
— Dopaminergics: enhanced hypotensive effect when adrenergic neurone blockers given with METHYLDopa  
— Moxonidine: enhanced hypotensive effect when adrenergic neurone blockers given with MOXIDONE  
— Muscle Relaxants: enhanced hypotensive effect when adrenergic neurone blockers given with BACLOfen or TIZANIDINE  
— Nitrates: enhanced hypotensive effect when adrenergic neurone blockers given with NITRATES  
— Oestrogens: hypotensive effect of adrenergic neurone blockers antagonised by OESTROGENS  
— Prazosin: hypotensive effect of adrenergic neurone blockers antagonised by PEZOTifen  
— Prostaglandins: enhanced hypotensive effect when adrenergic neurone blockers given with ALPROstadIL  
— Sym patheticomimetics: increased risk of hypertension when guanethidine given with ADRENALINE (EPINEPHRINE); hypotensive effect of guanethidine antagonised by DEXMETHAMINE and LISDAMETAMINE; hypotensive effect of adrenergic neurone blockers antagonised by EPHEDRINE, ISOMETHANEMINE, METAMINOL, METHYLPHENIDate, NORADRENALINE (NEPHINEPHRINE), OXYMETAZOLINE, PHENYLEPHRINE, PSEUDDOPHEDRINE and XYLOMETAZOLINE; avoidance of guanethidine advised by manufacturer of MIDODRINE  
— Vasodilator Antihypertensives: enhanced hypotensive effect when adrenergic neurone blockers given with HYDRAzALINE, MINOXIdIL or SODIum NITROPRUSsIDE  

**Adrenocoumarol — Afatinib**  
801

**Acenocoumarol** see Coumarins  
**Acetazolamide** see Diuretics  
**Aciclovir**  
— NOTE Interactions do not apply to topical aciclovir preparations  
— Aminophylline: aciclovir possibly increases plasma concentration of AMINOPHYLLINE  
— Ciclosporin: increased risk of nephrotoxicity when aciclovir given with CICLOSPORIN  
— Moxonidine: plasma concentration of aciclovir increased by MOXISYLYTE, also plasma concentration of inactive metabolite of moxonidine increased  
— Tacrolimus: possible increased risk of nephrotoxicity when aciclovir given with TACROLIMUS  
— Theophylline: aciclovir possibly increases plasma concentration of THEOPHYLLINE  

**Acitretin** see Retinoids  
**Acidinium** see Antimuscarinics  
**Acrivastine** see Antihistamines  
**Adalimumab**  
— Abatacept: increased risk of side-effects when adalimumab given with ABATACEPT  
— Anakinra: avoid concomitant use of adalimumab with ANAKINRA  
— Antipsychotics: avoid concomitant use of cytoxotics with CLOZAPINE (increased risk of agranulocytosis)  
— Vaccines: risk of generalised infections when monoclonal antibodies given with live VACCINES — avoid concomitant use  

**Adefovir**  
— Antivirals: avoidance of adefovir advised by manufacturer of TENOFIVIR  
— Interferons: manufacturer of adefovir advises caution with PEGINTERFERON ALFA  

**Adenosine**  
— NOTE Possibility of interaction with drugs tending to impair myocardial conduction  
— Aminophylline: anti-arrhythmic effect of adenosine antagonised by AMINOPHYLLINE—manufacturer of adenosine advises avoid aminophylline for 24 hours before adenosine  
— Anaesthetics: Local increased myocardial depression when anti-arrhythmics given with BUPIVACAINE, LEVOBUPIVACAINE, PRILOCAINE or ROPIVA CAINE  
— Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with ANTIARRHYTHMICS  
— Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with ANTIPSYCHOTICS that prolong the QT interval  
— Beta-blockers: increased myocardial depression when anti-arrhythmics given with BETA-BLOCKERS  
— Caffeine citrate: anti-arrhythmic effect of adenosine antagonised by CAFFEINE CITRATE — manufacturer of adenosine advises avoid caffeine citrate for at least 12 hours before adenosine  
— Dipyriramole: effect of adenosine enhanced and extended by DIPYRIDA MOLe (important risk of toxicity)—reduce dose of adenosine, see p. 75  
— Nicotine: effects of adenosine possibly enhanced by NICOTINE  
— Theophylline: anti-arrhythmic effect of adenosine antagonised by THEOPHYLLINE—manufacturer of adenosine advises avoid theophylline for 24 hours before adenosine  

**Adrenaline (epinephrine)** see Sympathomimetics  
**Adrenergic Neurone Blockers**  
— Alcohol: enhanced hypotensive effect when adrenergic neurone blockers given with ALCOHOL  
— Alpha-blockers: enhanced hypotensive effect when adrenergic neurone blockers given with ALPHA-BLOCKERS  
— Anaesthetics, General: enhanced hypotensive effect when adrenergic neurone blockers given with GENERAL ANAESTHETICS  
— Analgesics: hypotensive effect of adrenergic neurone blockers antagonised by NSAIDS  
— Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when adrenergic neurone blockers given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS  

**Afatinib**  
— Anti-arrhythmics: plasma concentration of afatinib possibly increased by AMIODARONE—manufacturer of afatinib advises separating administration of amiodarone by 6 to 12 hours  
— Antibacterials: plasma concentration of afatinib possibly increased by ETROTHROMYCIN—manufacturer of afatinib advises separating administration of erythromycin by 6 to 12 hours; plasma concentration of afatinib reduced by Rifampicin  
— Antifungals: plasma concentration of afatinib possibly increased by ITRACONAZOLE and KETOCONAZOLE—manufacturer of afatinib advises separating administration of itraconazole and ketoconazole by 6 to 12 hours  
— Antipsychotics: avoid concomitant use of cytoxotics with CLOZAPINE (increased risk of agranulocytosis)  
— Antivirals: plasma concentration of afatinib increased by RITONAVIR—manufacturer of afatinib advises separating administration of ritonavir by 6 to 12 hours; plasma
Afatinib
Antivirals (continued)
concentration of afatinib possibly increased by saquinavir— manufacturer of afatinib advises separating administration of saquinavir by 6 to 12 hours
▶ Calcineurin-channel Blockers: plasma concentration of afatinib possibly increased by Verapamil—manufacturer of afatinib advises separating administration of verapamil by 6 to 12 hours
▶ Ciclosporin: plasma concentration of afatinib possibly increased by Ciclosporin—manufacturer of afatinib advises separating administration of ciclosporin by 6 to 12 hours
▶ Tacrolimus: plasma concentration of afatinib possibly increased by Tacrolimus—manufacturer of afatinib advises separating administration of tacrolimus by 6 to 12 hours
Agalsidase Alfa and Beta
▶ Anti-arrhythmics: effects of agalsidase alfa and beta possibly inhibited by amiodarone (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
▶ Antibacterials: effects of agalsidase alfa and beta possibly inhibited by gentamicin (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
▶ Antimalarials: effects of agalsidase alfa and beta possibly inhibited by chloroquine and hydroxychloroquine (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
Agomelatine
▶ Antidepressants: metabolism of agomelatine inhibited by fluvoxamine (increased plasma concentration)
▶ Antimalarials: avoidance of antidepressants advised by manufacturer of artemether with lumefantrine and artemol with piperaquine
▶ Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine
Albendazole
▶ Antihelminths: plasma concentration of both drugs possibly enhanced by albendazole given with levamisole
▶ Antiepileptics: plasma concentration of albendazole reduced by carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone—consider increasing albendazole dose when given for systemic infections
▶ Antihelminths: active metabolite of albendazole reduced by ritonavir—consider increasing albendazole dose when given for systemic infections
▶ Corticosteroids: plasma concentration of active metabolite of albendazole increased by dexamethasone
▶ Grapefruit juice: plasma concentration of active metabolite of albendazole increased by grapefruit juice
▶ Ulcer-healing Drugs: effects of albendazole possibly enhanced by cimetidine
Albitiglutide see Antidiabetics
Alcohol
▶ ACE Inhibitors: enhanced hypotensive effect when alcohol given with ACE INHIBITORS
▶ Adrenergic Neurone Blockers: enhanced hypotensive effect when alcohol given with adrenergic neurone blockers
▶ Alpha-blockers: increased sedative effect when alcohol given with indoramin; enhanced hypotensive effect when alcohol given with alpha-blockers
▶ Analgesics: enhanced hypnotic and sedative effects when alcohol given with opioids analgesics
▶ Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alcohol given with angiotensin-II receptor antagonists
▶ Antihelminths: possibility of disulfiram-like reaction when alcohol given with levamisole
▶ Antiepileptics: disulfiram-like reaction when alcohol given with metronidazole; possibility of disulfiram-like reaction when alcohol given with tinidazole; increased risk of convulsions when alcohol given with cycloserine
▶ Anticoagulants: major changes in consumption of alcohol may affect anticoagulant control with Coumarins or Phenindione
▶ Alcohol (continued)
▶ Antidepressants: some beverages containing alcohol and some dealcoholised beverages contain tyramine which interacts with maois (hypertensive crisis)—if no tyramine, enhanced hypotensive effect; sedative effects possibly increased when alcohol given with SSRIs; increased sedative effect when alcohol given with mirtazapine, tricyclic-related antidepressants or tricyclics
▶ Antidiabetics: alcohol enhances hypoglycaemic effect of antidiabetics; increased risk of lactic acidosis when alcohol given with metformin
▶ Antiepileptics: alcohol possibly increases CNS side-effects of carbamazepine; chronic heavy consumption of alcohol possibly reduces plasma concentration of fosphenytoin and phenytoin; increased sedative effect when alcohol given with phenobarbital or primidone; increased risk of blurred vision when alcohol given with betablockers
▶ Antifungals: possibility of disulfiram-like reaction when alcohol given with ketoconazole; effects of alcohol possibly enhanced by griseofulvin
▶ Antihistamines: increased sedative effect when alcohol given with antihistamines (possibly less effect with non-sedating antihistamines)
▶ Antimuscarnics: increased sedative effect when alcohol given with hyoscine
▶ Antipsychotics: increased sedative effect when alcohol given with antipsychotics
▶ Anxiolytics and Hypnotics: increased sedative effect when alcohol given with anxiolytics and hypnotics
▶ Anti-inflammatories: possibility of disulfiram-like reaction when alcohol given with non-steroidal anti-inflammatory drugs
▶ Arnica: possible increased risk of bleeding when alcohol given with arnica
▶ Beta-blockers: enhanced hypotensive effect when alcohol given with beta-blockers
▶ Calcium-channel Blockers: enhanced hypotensive effect when alcohol given with calcium-channel blockers; plasma concentration of alcohol possibly increased by verapamil
▶ Clonidine: enhanced hypotensive effect when alcohol given with clonidine
▶ Cytotoxics: disulfiram-like reaction when alcohol given with procarbazine; avoidance of alcohol advised by manufacturer of trabectedin
▶ Dapoxetine: increased sedative effect when alcohol given with dapoxetine
▶ Diazoxide: enhanced hypotensive effect when alcohol given with diazoxide
▶ Disulfiram: disulfiram reaction when alcohol given with disulfiram
▶ Diuretics: increased hypotensive effect when alcohol given with diuretics
▶ Dopaminergics: alcohol reduces tolerance to bromocriptine
▶ Guanfacine: sedative effects possibly increased when alcohol given with guanfacine
▶ Lipid-regulating Drugs: avoidance of alcohol advised by manufacturer of lovastatin
▶ Lofexidine: increased sedative effect when alcohol given with lofexidine
▶ Methylpapaverine: enhanced hypotensive effect when alcohol given with methylpapaverine
▶ Metoclopromide: absorption of alcohol possibly increased by metoclopramide
▶ Moxonidine: enhanced hypotensive effect when alcohol given with moxonidine
▶ NICORANDIL: alcohol possibly enhances hypotensive effect of nicorandil
▶ Nitrites: enhanced hypotensive effect when alcohol given with nitrites
▶ Paraldehyde: increased sedative effect when alcohol given with paraldehyde
▶ Retinoids: presence of alcohol causes etretinate to be formed from acitretin (increased risk of teratogenicity in women of child-bearing potential)
▶ Sympathomimetics: alcohol possibly enhances effects of methylphenidate
Alcohol — Alpha-blockers 803

Alcohol (continued)

> Vasodilator Antihypertensives: enhanced hypotensive effect when alcohol given with HYDRAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Alfuzosin

> ACE Inhibitors: increased risk of hyperkalaemia, hypotension, and impaired renal function when alfuzosin given with ACE INHIBITORS

> Alpha-blockers: increased hypotensive effect when alfuzosin given with ALPHA-BLOCKERS

> Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alfuzosin given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS

> Antivirals: alfuzosin possibly increased plasma concentration of INDINAVIR

> Beta-blockers: enhanced hypotensive effect when alfuzosin given with BETA-BLOCKERS

> Calcium-channel Blockers: enhanced hypotensive effect when alfuzosin given with CLONIDINE

> Corticosteroids: manufacturer of alfuzosin advises avoid concomitant use with CORTICOSTEROIDS

> Cytoxics: manufacturer of alfuzosin advises avoid concomitant use with CYTOXICS, IDALIZUMAB, DIAZOXIDE and VINBLASTINE

> Diazoxide: enhanced hypotensive effect when alfuzosin given with DIAZOXIDE

> Diuretics: enhanced hypotensive effect when alfuzosin given with DIURETICS

> Methyldopa: enhanced hypotensive effect when alfuzosin given with METHYLDOPA

> Moxonidine: enhanced hypotensive effect when alfuzosin given with MOXONIDINE

> Nitrates: enhanced hypotensive effect when alfuzosin given with NITRATES

> Vasodilator Antihypertensives: enhanced hypotensive effect when alfuzosin given with HYDRAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Ameno
tuzab

> Antipsychotics: avoid concomitant use of cytoxotics with CLOzapine (increased risk of agranulocytosis)

> Vaccines: risk of generalised infections when monoclonal antibodies given with live VACCINES—avoid concomitant use

Alendronic Acid see Bisphosphonates

Alfacalcidol see Vitamins

Alfentanil see Opioid Analgesics

Alfuzosin see Alpha-blockers

Alimemazine see Antihistamines

Aliskiren

> ACE Inhibitors: increased risk of hyperkalaemia, hypotension, and impaired renal function when aliskiren given with ACE INHIBITORS—avoid concomitant use

> Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia, hypotension, and impaired renal function when aliskiren given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS—avoid concomitant use; plasma concentration of aliskiren possibly reduced by IRBESARTAN

> Antivirals: plasma concentration of aliskiren reduced by RIFAMPICIN

> Antibacterials: plasma concentration of aliskiren reduced by KETOCONAZOLE; plasma concentration of aliskiren increased by KETOCONAZOLE—avoid concomitant use

> Calcium-channel Blockers: plasma concentration of aliskiren increased by VERAPAMIL

> Cilostazol: plasma concentration of aliskiren increased by CYCLOSPORIN—avoid concomitant use

> Diuretics: aliskiren reduces plasma concentration of FUROSEMIDE; increased risk of hyperkalaemia when aliskiren given with POTASSUM-SPARING DIURETICS AND ALDOSTERONE ANTAGONISTS

> Grapefruit Juice: plasma concentration of aliskiren reduced by GRAPEFRUIT JUICE—avoid concomitant use

Aliskiren (continued)

> Potassium Salts: increased risk of hyperkalaemia when aliskiren given with POTASSUM SALTS

Alitretinoin see Retinoids

Alkylating Drugs see Bendamustine, Busulfan, Carmustine, Cyclophosphamide, Estramustine, Ifosfamide, Lomustine, Melphalan, and Thiopeta

Allopurinol

> ACE Inhibitors: manufacturers state possible increased risk of leucopenia and hypersensitivity reactions when allopurinol given with ACE INHIBITORS especially in renal impairment

> Aminophylline: allopurinol possibly increases plasma concentration of AMINOPHYLLINE

> Antibacterials: increased risk of rash when allopurinol given with AMOXICILLIN, AMPICILLIN or CO-AMOXICLAV

> Anticoagulants: allopurinol possibly enhances anticoagulant effect of COUMARINS

> Antivirals: allopurinol increases plasma concentration of Didanosine (risk of toxicity)—avoid concomitant use

> Azathioprine: allopurinol enhances effects and increases toxicity of AZATHIOPRINE (reduce dose of azathioprine to one quarter of usual dose)

> Ciclosporin: allopurinol possibly increases plasma concentration of CICLOSPORIN (risk of nephrotoxicity)

> Cytoxotics: avoidance of allopurinol advised by manufacturer of CAPECITABINE; allopurinol enhances effects and increases toxicity of MERCAPTOPURINE (reduce dose of mercaptopurine to one quarter of usual dose)

> Diuretics: increased risk of hypersensitivity when allopurinol given with THIAZIDES AND RELATED DIURETICS especially in renal impairment

> Theophylline: allopurinol possibly increases plasma concentration of THEOPHYLLINE

Almotriptan see 5HT1-A agonists—receptor Agonists (under HT)

Alogliptin see Antidiabetics

Alpha-2-adrenoceptor Stimulation see Apraclonidine, Brimonidine, Clonidine, and Methyldopa

Alpha-blockers

> ACE Inhibitors: enhanced hypotensive effect when alpha-blockers given with ACE INHIBITORS

> Adrenergic Neurone Blockers: enhanced hypotensive effect when alpha-blockers given with ADRENERGIC NEURONE BLOCKERS

> Alcohol: enhanced hypotensive effect when alpha-blockers given with ALCOHOL; increased sedative effect when indoramin given with ALCOHOL

> Aliskiren: enhanced hypotensive effect when alpha-blockers given with ALISKIREN

> Anaesthetics, General: enhanced hypotensive effect when alpha-blockers given with GENERAL ANAESTHETICS

> Analgesics: hypotensive effect of alpha-blockers antagonised by NSAIDS

> Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alpha-blockers given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS

> Antidepressants: manufacturer of indoramin advises avoid concomitant use with MAOIS; increased hypotensive effect when alpha-blockers given with MAOIS

> Antifungals: plasma concentration of alfuzosin possibly increased by KETOCONAZOLE; plasma concentration of tamsulosin increased by KETOCONAZOLE

> Antipsychotics: enhanced hypotensive effect when alpha-blockers given with ANTIpsYCHOTICS

> Antivirals: plasma concentration of doxazosin and tamsulosin possibly increased by BOCEPREVIR—manufacturer of boceprevir advises avoid concomitant use; plasma concentration of alfuzosin possibly increased by RITONAVIR—avoid concomitant use; avoidance of allopurinol advised by manufacturer of TELAPREVIR

> Anxiolytics and Hypnotics: enhanced hypotensive and sedative effects when alpha-blockers given with ANXIOLYTICS AND HYPNOTICS

> Avanafil: enhanced hypotensive effect when alpha-blockers given with AVANAFIL—when patient is stable on the alpha blocker initiate avanafil at the lowest possible dose
Alpha-blockers (continued)

- Beta-blockers: enhanced hypertensive effect when alpha-blockers given with **BETA-BLOCKERS**, also increased risk of first- and post-synaptic alpha-blocking such as prazosin
- Calcium-channel blockers: enhanced hypertensive effect when alpha-blockers given with **CALCIUM-CHANNEL BLOCKERS**, also increased risk of first-dose hypertension with post-synaptic alpha-blockers such as prazosin
- Cardiac Glycosides: prazosin increases plasma concentration of DIGOXIN
- Clonidine: enhanced hypertensive effect when alpha-blockers given with CLONIDINE
- Cobicistat: plasma concentration of alfuzosin possibly increased by Cobicistat—manufacturer of cobicistat advises avoid concomitant use
- Corticosteroids: hypertensive effect of alpha-blockers antagonised by CORTICOSTEROIDS
- Cytotoxics: avoidance of alfuzosin advised by manufacturer of IDEALISIB
- Diazoxide: enhanced hypertensive effect when alpha-blockers given with DIAZoxide
- Diuretics: enhanced hypertensive effect when alpha-blockers given with DIURETICS, also increased risk of first-dose hypertension with post-synaptic alpha-blockers such as prazosin
- Dopaminergics: enhanced hypertensive effect when alpha-blockers given with DOBUTAMINE or INDOMETHACIN
- Methyldopa: enhanced hypertensive effect when alpha-blockers given with METHYLDOPA
- Moxisylyte: possible severe postural hypotension when alpha-blockers given with MOXISLYTE
- Moxonidine: enhanced hypertensive effect when alpha-blockers given with MOXONIDINE
- Muscle Relaxants: enhanced hypertensive effect when alpha-blockers given with BACLOFEN or TIZANIDINE
- Nitrates: enhanced hypertensive effect when alpha-blockers given with NITRATES
- Oestrogens: hypertensive effect of alpha-blockers antagonised by OESTROGENS
- Prostaglandins: enhanced hypertensive effect when alpha-blockers given with ALPROSTADIL
- Sildenafil: enhanced hypertensive effect when alpha-blockers given with SILDENAFIL (avoid alpha-blockers for 4 hours after sildenafil)—when patient is stable on the alpha blocker initiate sildenafil at the lowest possible dose
- Sympathomimetics: avoid concomitant use of tolazoline with ADRENALINE (EPINEPHRINE) or DOPAMINE; alpha-blockers possibly antagonise effects of MIDDLE
- Tadalafil: enhanced hypertensive effect when alpha-blockers given with TADALAFIL—when patient is stable on the alpha blocker initiate tadalafil at the lowest possible dose; enhanced hypertensive effect when doxazosin given with TADALAFIL—manufacturer of tadalafil advises avoid concomitant use
- Uterine Relaxants: effects of tolazoline antagonised by Cimetidine and Ranitidine

Vardenafil: enhanced hypertensive effect when alpha-blockers given with VARDENAFIL—when patient is stable on the alpha blocker initiate vardenafil at the lowest possible dose—separate doses by 6 hours (except with tamsulosin)
- Vasodilators: Antiprostensivens: enhanced hypertensive effect when alpha-blockers given with HYDRAZINE, MINOXIDIL or SODIUM NITROPR USSIDE

Alpha-blockers (post-synaptic) see Alpha-blockers

Alprostadil see Prostaglandins

Aluminium Hydroxide see Antacids

Amantadine

- Antimalarials: plasma concentration of amantadine possibly increased by quinine
- Antipsychotics: increased risk of extrapyramidal side-effects when amantadine given with antipsychotics
- Bupropion: increased risk of side-effects when amantadine given with BUPROPION

Amantadine (continued)

- Memantine: increased risk of CNS toxicity when amantadine given with memantine (manufacturer of memantine advises avoid concomitant use); effects of dopaminergics possibly enhanced by memantine
- Methyldopa: increased risk of extrapyramidal side-effects when amantadine given with METHYLDOPA; antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA
- Tadalafil: increased risk of extrapyramidal side-effects when amantadine given with Tadalafil

Ambrisantan

- Antibacterials: plasma concentration of ambrisantan possibly increased by rifampicin
- Ciclosporin: plasma concentration of ambrisantan increased by ciclosporin (see under Ambrisantan, in BNF)

Amikacin see Aminoglycosides

Aminoflurane see Diuretics

Aminoglycosides

- Agalactoside Alfa and Beta: gentamicin possibly inhibits effects of Aagalactoside Alfa and Beta (manufacturers of agalactoside alfa and beta advise avoid concomitant use)
- Analgesics: plasma concentration of amikacin and gentamicin in neonates possibly increased by INDOMETACIN
- Antibacterials: neomycin reduces absorption of PHENOXYMETHYLPenicillin; increased risk of nephrotoxicity when aminoglycosides given with COLISTIMETHATE SODIUM or POLYMIXINS; increased risk of nephrotoxicity and otoxicity when aminoglycosides given with CAPREOMYCIN or VANCOMYCIN; possible increased risk of nephrotoxicity when aminoglycosides given with EPHALOPOSPORINS
- Anticoagulants: experience in anticoagulant clinics suggests that INR possibly altered when neomycin (given for local action on gut) is given with COUMARINS or PHENINDIONE
- Antidiabetics: neomycin possibly enhances hypoglycaemic effect of ACARBOSE, also severity of gastro-intestinal effects increased
- Antifungals: increased risk of nephrotoxicity when aminoglycosides given with AMPHOTERICIN
- Bisphosphonates: increased risk of hypocalcaemia when aminoglycosides given with BISPHOSPHONATES
- Cardiac Glycosides: gentamicin possibly increases plasma concentration of DIGOXIN; neomycin reduces absorption of DIGOXIN
- Ciclosporin: increased risk of nephrotoxicity when aminoglycosides given with ciclosporin
- Cytotoxics: neomycin possibly reduces absorption of METHOTREXATE; neomycin reduces bioavailability of SORAFENIB; increased risk of nephrotoxicity and possibly of otoxicity when aminoglycosides given with PLATINUM COMPOUNDS
- Diuretics: increased risk of otoxicity when aminoglycosides given with LOOP DIURETICS
- Mannitol: manufacturer of tobramycin advises avoid concomitant use with mannitol
- Muscle Relaxants: aminoglycosides enhance effects of non-depolarising muscle relaxants and suxamethonium
- Parasympathomimetics: aminoglycosides antagonise effects of neostigmine and pyridostigmine
- Tacrolimus: increased risk of nephrotoxicity when aminoglycosides given with tacrolimus
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNFC
- Vitamins: neomycin possibly reduces absorption of Vitamin A

Aminophylline

- Allopurinol: plasma concentration of aminophylline possibly increased by allopurinol
- Anaesthetics, General: increased risk of convulsions when aminophylline given with ketamine
- Anti-arhythmics: aminophylline antagonises anti-arhythmic effect of ADENOSINE—manufacturer of adenosine advises avoid aminophylline for 24 hours before adenosine; plasma concentration of aminophylline increased by propafenone
- Antibacterials: plasma concentration of aminophylline possibly increased by clarithromycin and isoniazid; plasma concentration of aminophylline increased by ERYTHROMYCIN (also aminophylline may reduce absorption of oral...
Aminophylline

- **Antibacterials** (continued)
  - erythromycin; plasma concentration of aminophylline increased by *CIPROFLOXACIN* and *NORFLOXACIN*; metabolism of aminophylline accelerated by *RIFAMPICIN* (reduced plasma concentration); possible increased risk of convulsions when aminophylline given with *QUINOLONES*
- **Antidepressants**: plasma concentration of aminophylline increased by *FLUOXETINE* (concomitant use should usually be avoided, but where not possible halve aminophylline dose and monitor plasma-aminophylline concentration); plasma concentration of aminophylline possibly reduced by *ST JOHN’S WORT*
- **Antiepileptics**: metabolism of aminophylline accelerated by *CARRAMAZEPINE*, *PHENOBARBITAL*, and *PRIMIDONE* (reduced effect); plasma concentration of both drugs reduced when aminophylline given with *FOSPHENYTIOIN* and *PHENYTOIN*
- **Antifungals**: plasma concentration of aminophylline possibly increased by *FLUCONAZOLE* and *KETOCONAZOLE*
- **Antihistamines**: plasma concentration of aminophylline possibly increased by *ACICLOVIR* and *VALACICLOVIR*; metabolism of aminophylline accelerated by *RITONAVIR* (reduced plasma concentration)
- **Antivirals**: increased risk of hypokalaemia when aminophylline given with *CORTICOSTEROIDS*
- **Cytoxics**: plasma concentration of aminophylline possibly increased by *METHOTREXATE*
- **Deferasirox**: plasma concentration of aminophylline increased by *DEFERASIROX* (consider reducing dose of aminophylline)
- **Diuretics**: plasma concentration of aminophylline possibly increased by *CALCULATION BLOCKERS* (enhanced effect); plasma concentration of aminophylline increased by *DILTIAZEM*; plasma concentration of aminophylline increased by *VERAPAMIL* (enhanced effect)
- **Doxapram**: increased CNS stimulation when aminophylline given with *DOXAPRAM*
- **Interferons**: metabolism of aminophylline inhibited by *INTERFERON ALFA* and *PEGINTERFERON ALFA* (consider reducing dose of aminophylline)
- **Leukotriene Receptor Antagonists**: plasma concentration of aminophylline possibly increased by *ZAFIRILUKAST*, also plasma concentration of zafirilukast reduced
- **Lithium**: aminophylline increases excretion of *LITHIUM* (reduced plasma concentration)
- **Oestrogens**: plasma concentration of aminophylline increased by *OESTROGENS* (consider reducing dose of aminophylline)
- **Pentoxifylline**: plasma concentration of aminophylline increased by *PENTOXIFYLLINE*
- **Roflumilast**: avoidance of aminophylline advised by manufacturer of *ROFLUMILAST*
- **Sulfinpyrazone**: plasma concentration of aminophylline reduced by *SULFINPYRAZONE*
- **Symptomatics**: manufacturer of aminophylline advises avoid concomitant use with *EPHEDRINE* in children
- **Symptomatics*, Beta-2 increased risk of hypokalaemia when aminophylline given with high doses of *BETA-, SYMPATHOMIMETICS*“
- **Ulcer-healing Drugs**: metabolism of aminophylline inhibited by *CIMETIDINE* (increased plasma concentration); absorption of aminophylline possibly reduced by *SUCRALFATE* (give at least 2 hours apart)
- **Vaccines**: plasma concentration of aminophylline possibly increased by *INFLUENZA VACCINE*

Aminosaliclylates see individual drugs

Amiodarone

**NOTE** Amiodarone has a long half-life; there is a potential for drug interactions to occur for several weeks (or even months) after treatment with it has been stopped
- **Agalsidase Alfa and Beta**: amiodarone possibly inhibits effects of *AGALSIDASE ALFA AND BETA* (manufacturers of agalsidase alfa and beta advise avoid concomitant use)
- **Anaesthetics, Local**: increased myocardial depression when anti-arrhythmics given with *BUPIVACAINE*, *LEVOBUPIVACAINE*, *PROMALCaine OR ropivacaïne*
- **Anti-arrhythmics**: increased myocardial depression when anti-arrhythmics given with other *ANTI-ARRHYTHMICS*; increased risk of ventricular arrhythmias when amiodarone given with *DISOPYRAMIDE OR DROPERIDOl—avoid concomitant use; amiodarone increases plasma concentration of *FLECAINIDE* (halve dose of flecainide)
- **Antibacterials**: increased risk of ventricular arrhythmias when amiodarone given with *pantamrSR* *ERYTHROMYCIN—avoid concomitant use; increased risk of ventricular arrhythmias when amiodarone given with *LEVOFLOXACIN*
- **Disulfiram**: *MOXIFLOXACIN—avoid concomitant use; possible increased risk of ventricular arrhythmias when amiodarone given with *SULTAMENOSAY*; manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole; increased risk of ventricular arrhythmias when amiodarone given with *DE Lamimid; avoidance of amiodarone advised by manufacturer of FIDAXOMICIN; possible increased risk of ventricular arrhythmias when amiodarone given with *INFLUENZA VACCINE*
- **Antihistamines**: increased risk of ventricular arrhythmias when amiodarone given with *CELIZAL*—avoid concomitant use
- **Anticoagulants**: increased risk of ventricular arrhythmias when amiodarone given with *FACOMARIN* and *PHENIDIONE* (enhanced effect); *amiodarone increases plasma concentration of *COUMARINS* and *PHENIDIONE* (enhanced anticoagulant effect); *amiodarone increases plasma concentration of* *DABIGATRAN* (see under Dabigatran Etexilate, in BNf)
- **Antidepressants**: avoidance of amiodarone advised by manufacturer of *CITALOPRAM*, *ESCITALOPRAM*, *ESCFadalTOLAPRAM and* *VENLAFAXINE* (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when amiodarone given with *TRICYCLICs—avoid concomitant use*
- **Antipsychotics**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE*
- **Antithyroid drugs**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Antivirals**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Beta-2 agonists**: increased risk of ventricular arrhythmias when amiodarone given with other *ANTI-B-2 AGONISTS*; increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Calcium-channel blockers**: increased risk of ventricular arrhythmias when amiodarone given with *BETA-2 AGONISTS*; increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Captopril**: *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Corticosteroids**: increased risk of ventricular arrhythmias when amiodarone given with *BETA-2 AGONISTS*; increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Cough suppressants**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Dabigatran**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Diuretics**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Ephedra**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Fosphenytoin**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Lithium**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Mexiletine**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Mycoplasma pneumoniae**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Nelfinavir**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Omeprazole**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Pentoxifylline**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Phenytoin**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Propafenone**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Reboxetine**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Tocainide**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Tolterodine**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Vaccines**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
- **Zidovudine**: increased risk of ventricular arrhythmias when amiodarone given with *ATOMICROPA* and *PHENINDIONE* (increased plasma concentration)
Amiodarone

Antivirals (continued)
- SAQUINAVIR—avoid concomitant use; possible increased risk of nephrotoxicity when amiodarone given with • SOFOSBUVIR—see under Amiodarone, in BNF; avoidance of amiodarone advised by manufacturer of • ELAPREVIR (risk of ventricular arrhythmias)
- Atomoxetine: increased risk of ventricular arrhythmias when amiodarone given with • ATOMOXETINE
- Beta-blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with • ETA-BLOCKERS; increased myocardial depression when anti-arrhythmics given with • ETA-BLOCKERS; increased risk of ventricular arrhythmias when amiodarone given with • SOLTOLOL—avoid concomitant use
- Calcium-channel Blockers: increased risk of bradycardia, AV block and myocardial depression when amiodarone given with • DILTIAZEM or • VERAPAMIL
- Cardiac Glicosides: amiodarone increases plasma concentration of • DIGOXIN (halve dose of digoxin)
- Cobicistat: plasma concentration of amiodarone possibly increased by • Cobicistat—manufacturer of cobicistat advises avoid concomitant use
- Colchicine: amiodarone possibly increases risk of • COLCHICINE toxicity
- Cytotoxic: amiodarone possibly increases the plasma concentration of • AFATINIB—manufacturer of afatinib advises separating administration of amiodarone by 6 to 12 hours; possible increased risk of ventricular arrhythmias when amiodarone given with • BOSSUTINIB; amiodarone possibly increases the plasma concentration of • IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, in BNF); avoidance of amiodarone advised by manufacturer of • IDELISIB; possible increased risk of ventricular arrhythmias when amiodarone given with • VANDETANIB—avoid concomitant use; possible increased risk of ventricular arrhythmias when amiodarone given with • Pemetrexed; increased sedative effect when general anaesthesia given with • APEXILIDINE; increased hypotensive effect when general anaesthesia given with • AMIODARONE; increased risk of hypokalaemia when amiodarone given after • SODIUM STIBOGLUCONATE—manufacturer of sodium stibogluconate advises giving 14 days apart
- Tacrolimus: increased risk of nephotoxicity when amiodarone given with • TACROLIMUS

Amphotericin (continued)
- Antibacterials: increased risk of nephrotoxicity when amphotericin given with • AMINGLYCOSIDES or • POLYMYXINS; possible increased risk of nephrotoxicity when amphotericin given with • VANCOMYCIN
- Antifungals: amphotericin reduces renal excretion and increases cellular uptake of • FLUCYTOSINE (toxicity possibly increased); effects of amphotericin possibly antagonised by • IMIDAZOLES and • TRIAZOLES; plasma concentration of amphotericin possibly increased by • MACAFUNGIN
- Cardiac Glycosides: hypokalaemia caused by amphotericin increases cardiac toxicity with • CARDIAC GLYCOSIDES
- Ciclosporin: increased risk of nephrotoxicity when amphotericin given with • CYCLOSPORIN
- Corticosteroids: increased risk of hypokalaemia when amphotericin given with • CORTICOSTEROIDS—avoid concomitant use unless corticosteroids needed to control reactions
- Cytotoxic: increased risk of ventricular arrhythmias when amphotericin given with • ARSENIC TRIOXIDE
- Diuretics: increased risk of hypokalaemia when amphotericin given with • LOOP DIURETICS or • THIAZIDES and RELATED DIURETICS
- Pentamidine i.V. or • TACROLIMUS

Ampicillin see Penicillins

Anabolic Steroids
- Antiadrenals: anabolic steroids enhance anticoagulant effect of • COUMARINS and • PHENINDIONE
- Antidiabetics: anabolic steroids possibly enhance hypoglycaemic effect of • ANTIAD DIABETICS

Anaesthetics, General

Note see also Surgery and Long-term Medication, under General Anaesthesia in BNF

ACE Inhibitors: enhanced hypotensive effect when general anaesthetics given with • ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when general anaesthetics given with • ADRENERGIC NEURONE BLOCKERS
- Alpha-blockers: enhanced hypotensive effect when general anaesthetics given with • ALPHA-BLOCKERS
- Aminophylline: increased risk of convulsions when ketamine given with • AMINOPHYLLINE
- Analgesics: metabolism of etomidate inhibited by • FENTANYL (consider reducing dose of etomidate); effects of thiopental possibly enhanced by • ASPIRIN; effects of intravenous general anaesthetics and volatile liquid general anaesthetics possibly enhanced by • OPIOID ANALGESICS
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when general anaesthetics given with • ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antibacterials: increased risk of hepatotoxicity when isoflurane given with • ISONIAZID; effects of thiopentol enhanced by • SULFONAMIDES; hypersensitivity-like reactions can occur when general anaesthetics given with • INTRAVENOUS VANCOMYCIN
- Antidepressants: increased risk of arrhythmias and hypotension when general anaesthetics given with • TRICYCLICS
- Antipsychotics: enhanced hypotensive effect when general anaesthetics given with • ANTIPSYCHOTICS; effects of thiopental enhanced by • DROPERIDOL
- Anxiolytics and Hypnotics: increased sedative effect when general anaesthetics given with • ANXIOLYTICS AND HYPNOTICS
- Beta-blockers: enhanced hypotensive effect when general anaesthetics given with • BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when general anaesthetics given with • CALCIUM-CHANNEL BLOCKERS; general anaesthetics enhance hypotensive effect of • VERAPAMIL (also AV delay)
- Clonidine: enhanced hypotensive effect when general anaesthetics given with • CLONIDINE

Amisulpride see Antipsychotics

Amitriptyline see Antidepressants, Tricyclic

Amiodapine see Calcium-channel Blockers

Amoxicillin see Penicillins

Amphotericin

Note Close monitoring required with concomitant administration of nephrotoxic drugs or cytotoxic drugs.
Anaesthetics, General (continued)

- Cytoxic: nitrous oxide increases antifolate effect of METHOTREXATE—avoid concomitant use
- Diazoxide: enhanced hypotensive effect when general anaesthetics given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when general anaesthetics given with DIURETICS
- Dopaminergics: increased risk of arrhythmias when volatile liquid general anaesthetics given with CO-BENEDYPE, CO-CARELDOPA, or LEVODOPA
- Doxapram: increased risk of arrhythmias when volatile liquid general anaesthetics given with DOXAPRAM—avoid doxapram for at least 10 minutes after volatile liquid general anaesthetics
- Msmantine: increased risk of CNS toxicity when ketamine given with MEMANTINE (manufacturer of memantine advises avoid concomitant use)
- Methylodopa: enhanced hypotensive effect when general anaesthetics given with METHYLDOPA
- Metoclopramide: effects of thiopental enhanced by METOCLOPRAMIDE
- Moxonidine: enhanced hypotensive effect when general anaesthetics given with MOXONIDINE
- Muscle Relaxants: increased risk of myocardial depression and bradycardia when propofol given with SUXAMETHONIUM; volatile liquid general anaesthetics given with NON-DEPOLARISING MUSCLE RELAXANTS and SUXAMETHONIUM; ketamine enhances effects of ATRACURIUM
- Nitrates: enhanced hypotensive effect when general anaesthetics given with NITRATES
- Oxytocin: oxytocic effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when volatile liquid general anaesthetics given with OXYTOCIN
- Sympathomimetics: manufacturer of dobutamine advises avoid concomitant use with SYMPATHOMIMETICS (risk of ventricular arrhythmias); increased risk of arrhythmias when volatile liquid general anaesthetics given with ADRENERGIC NEURONE BLOCKERS and NON-DEPOLARISING MUSCLE RELAXANTS and SUXAMETHONIUM; increased risk of hypertension when volatile liquid general anaesthetics given with MELPHEMIDATE
- Theophylline: increased risk of convulsions when ketamine given with THEOPHYLLINE
- Vasopressors: enhanced hypotensive effect when general anaesthetics given with HYDRAZALINE, MINOXIDIL or SODIUM NITROPRUSSIIDE

Anaesthetics, General (intravenous) see Anaesthetics, General Anaesthetics, General (volatile liquids) see Anaesthetics, General

Anaesthetics, Local see Bupivacaine, Chloroprocaine, Levobupivacaine, Lidocaine, Prilocaine, and Ropivacaine

Anagrelide

- Clostazol: manufacturer of clostazol advises avoid concomitant use with CLOSTAZOL
- Phosphodiesterase Type 3 Inhibitors: manufacturer of anagrelide advises avoid concomitant use with ENOXIMONE and MILIRNONE

Anakinra

- Cytoxic: avoid concomitant use of anakinra with ADALIMUMAB, CERTOLIZUMAB PEGOL, GOLIMUMAB or INFliximAB
- Etanercept: avoid concomitant use of anakinra with ETANERCEPT
- Vaccines: risk of generalised infections when anakinra given with live VACCINES—avoid concomitant use

Analgesics see Aspirin, Nefopam, NSAIDs, Opioid Analgesics, and Paracetamol

Angiotensin-II Receptor Antagonists

- ACE inhibitors: increased risk of hyperkalaemia, hypotension, and impaired renal function when angiotensin-II receptor antagonists given with ACE INHIBITORS—avoid concomitant use
- Adrenergic Neuron Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ALCOHOL

Angiotensin-II Receptor Antagonists (continued)

- Aldesleukin: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ALDESELUKIN
- Aliskiren: increased risk of hyperkalaemia, hypotension, and impaired renal function when angiotensin-II receptor antagonists given with ALISKIREN—avoid concomitant use; irbesartan possibly reduces plasma concentration of ALISKIREN
- Alpha-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ALPHA-BLOCKERS
- Anaesthetics, General: enhanced hypotensive effect when angiotensin-II receptor antagonists given with GENERAL ANAESTHETICS
- Analgesics: increased risk of renal impairment when angiotensin-II receptor antagonists given with NSAIDS, also hypotensive effect antagonised
- Antibacterials: plasma concentration of losartan and its active metabolite reduced by RIFAMPICIN; possible increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with TRIMETHOPRIM
- Anticoagulants: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with HEPARINS
- Antidepressants: hypotensive effect of angiotensin-II receptor antagonists antagonised by MAO INHIBITORS
- Antipsychotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ANTIPSYCHOTICS
- Antivirals: when given with valsartan manufacturer of VAPRALPREVIR advises reduce dose of paritaprevir
- Anxiolytics and Hypnotics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ANXIOLYTICS AND HYPNOTICS
- Beta-blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when angiotensin-II receptor antagonists given with CALCIUM CHANNEL BLOCKERS
- Ciclosporin: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with CICLOSPORIN
- Clonidine: enhanced hypotensive effect when angiotensin-II receptor antagonists given with CLONIDINE
- Corticosteroids: hypotensive effect of angiotensin-II receptor antagonists antagonised by CORTICOSTEROIDS
- Diazoxide: enhanced hypotensive effect when angiotensin-II receptor antagonists given with DIAZOXIDE
- Diuretics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with DIURETICS; valsalva reduces plasma concentration of FURLOMIDE; increased risk of severe hyperkalaemia when angiotensin-II receptor antagonists given with AMILORIDE, POTASSIUM CARBONATE or TRIAMETERENE; increased risk of severe hyperkalaemia when angiotensin-II receptor antagonists given with SPLENONE and SPIRONOLACTONE—avoid concurrent use or use lowest possible doses of both drugs
- Dopaminergics: enhanced hypotensive effect when angiotensin-II receptor antagonists given with CO-BENEDYPE, CO-CARELDOPA or LEVODOPA
- Lithium: angiotensin-II receptor antagonists reduce excretion of LITHIUM (increased plasma concentration)
- Methylodopa: enhanced hypotensive effect when angiotensin-II receptor antagonists given with METHYLDOPA
- Moxisylyte: enhanced hypotensive effect when angiotensin-II receptor antagonists given with MOXISYLYTE
- Nitrates: enhanced hypotensive effect when angiotensin-II receptor antagonists given with BACLOFEN or TIZANIDINE
- Potassium Salts: increased risk of hyperkalaemia when angiotensin-II receptor antagonists given with POTASSIUM SALTS
- Prostaglandins: enhanced hypotensive effect when angiotensin-II receptor antagonists given with ALPROSTADIL

Appendix 1
Antiangiotensin-II Receptor Antagonists — Antidepressants, SSRI

Antacids

Note: Antacids should preferably not be taken at the same time as other drugs since they may impair absorption

ACE inhibitors: antacids possibly reduce absorption of ACE INHIBITORS; antacids reduce absorption of CAPTOPRIL, ENALAPRIL and FOSINOPRIL

Analgesics: antacids possibly reduce absorption of ACETAMINOFEN; alkaline urine due to some antacids increases excretion of PHENOTYMPHATE.

Anthelmintics: sodium bicarbonate reduces excretion of DIETHYLCARBAMAZINE

Antibacterials: antacids reduce absorption of CEFACLOR, ISOSUCCINIC ACID and RIFAMPICIN; antacids reduce absorption of AZITHROMYCIN (give at least 2 hours before or 1 hour after antacids); antacids reduce absorption of CIPROFLOXACIN and LEVOFLOXACIN (give at least 2 hours before or 4 hours after ciprofloxacin and levofloxacin); antacids reduce absorption of MOXIFLOXACIN (give at least 6 hours apart); antacids reduce absorption of OFLOXACIN (give at least 2 hours apart); avoid concomitant use of antacids with METHENAMINE; oral magnesium salts (as magnesium trisilicate) reduce absorption of NITROFURANTOIN; antacids possibly reduce absorption of TETRACYCLINES (give at least 2 to 3 hours apart)

Antiepileptics: antacids reduce absorption of FOSPHENYTONE, GABA MERPENTIN and PHENYTOIN

Antifungals: antacids reduce absorption of ITRACONAZOLE and KETOCONAZOLE

Antihistamines: antacids reduce absorption of FEXOFENADINE

Antimalarials: antacids reduce absorption of CHLOROQUINE and HYDROXYCHLOROQUINE; oral magnesium salts (as magnesium trisilicate) reduce absorption of PROGUANIL

Antipsychotics: antacids reduce absorption of PHENOTHIAZINES and SULPIRIDE

Antivirals: antacids reduce absorption of ATAZANAVIR (give at least 2 hours before or 1 hour after antacids); aluminium hydroxide reduces absorption of DOLOTEGRAVIR—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after aluminium hydroxide; oral magnesium salts reduce absorption of DOLOTEGRAVIR—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after oral magnesium salts; aluminium hydroxide reduces absorption of ELVITEGRAVIR (give at least 4 hours apart); oral magnesium salts reduce absorption of ELVITEGRAVIR (give at least 4 hours apart); separating administration from antacids by 4 hours advised by manufacturer of LEDIPASVIR; oral magnesium salts reduce plasma concentration of RALTEGRAVIR—manufacturer of raltegravir advises avoid concomitant use; aluminium hydroxide reduces plasma concentration of RALTEGRAVIR—manufacturer of raltegravir advises avoid concomitant use; manufacturer of rilpivirine advises give at least 2 hours before or 4 hours after RILPIVIRINE; antacids reduce absorption of BIPYRAMINE

Bile Acids: antacids possibly reduce absorption of BILE ACIDS; aluminium hydroxide probably reduces effects of CHOLIC ACID (manufacturer of cholic acid advises give at least 5 hours apart)

Bisphosphonates: antacids reduce absorption of BISPHOSPHONATES

Cardiac Glycosides: antacids possibly reduce absorption of DIGOXIN

Corticosteroids: antacids reduce absorption of DEFLAZACORT

Cytotoxics: aluminium hydroxide and oral magnesium salts possibly reduce absorption of ESTRAMUSTINE—manufacturer of estramustine advises avoid concomitant administration; separating administration with antacids by about 12 hours advised by manufacturer of BUSULIN; antacids possibly reduce plasma concentration of ERLOTINIB—give antacids at least 4 hours before or 2 hours after erlotinib

Antacids

Deferasirox: antacids containing aluminium possibly reduce absorption of DEFERASIROX (manufacturer of deferasirox advises avoid concomitant use)

Dipirona: antacids containing aluminium possibly reduce absorption of DEFERIPRONE (manufacturer of deferiprone advises avoid concomitant use)

Dipyriramole: antacids possibly reduce absorption of DIPYRIMIDONE

Eltrombopag: antacids reduce absorption of ELTROMBOPAG (give at least 4 hours apart)

Foletes: antacids possibly reduce absorption of FOLIC ACID (manufacturer of folic acid advises give at least 2 hours apart)

Iron Salts: oral magnesium salts (as magnesium trisilicate) reduce absorption of oral IRON SALTS

Lipid-regulating Drugs: antacids reduce absorption of ROSUVASTATIN

Lithium: sodium bicarbonate increases excretion of LITHIUM (reduced plasma concentration)

Misoprostol: antacids possibly reduce absorption of MISOPROSTOL

Mycofenolate: antacids reduce absorption of MYCOFENOLATE

Penicillamine: antacids reduce absorption of PENICILLAMINE

Polystyrene Sulfonate Resins: risk of intestinal obstruction when aluminium hydroxide given with POLYSTYRENE SULFONATE RESINS; risk of metabolic alkalosis when oral magnesium salts given with POLYSTYRENE SULFONATE RESINS

Riociguat: antacids reduce absorption of RIOCGUAT (give at least 2 hours before or 1 hour after riociguat)

Symptomatics; aluminium hydroxide possibly increases absorption of PSEUDOEPHEDRINE

Thyroid Hormones: antacids possibly reduce absorption of LEVOTHYROIDINE

Ucer-healing Drugs: antacids possibly reduce absorption of LANSOPRAZOLE

Antazoline see Antihistamines

Anthelmintics see individual drugs

Anthrax Vaccine see Vaccines

Anti-D Immunoglobulins see Immunglobulins

Anti-arthrythmics see Adenosine, Amiodarone, Disopyramide, Dronedarone, Flecaïnine, Lidocaine, and Propafenone

Antibacterials see individual drugs

Antibiotics (cytotoxic) see Bleomycin, Daunorubicin, Doxorubicin, Epirubicin, Idarubicin, Mitomycin, Mitoxantrone, and Pixauntrane

Anticoagulants see Apixaban, Argatroban, Bivalirudin, Coumarins, Dabigatran, Danaparoid, Edoxaban, Fondaparinux, Heparins, Phenindione, and Rivaroxaban

Antidepressants see Agomelatine; Antidepressants, SSRI; Antidepressants, Tricyclic; Antidepressants, Tricyclic (related); MAOIs; Mirtazapine; Moclobemide; Reboxetine; St John’s Wort; Venlafaxine; Vortioxetine

Antidepressants, Noradrenaline Re-uptake Inhibitors see Reboxetine

Antidepressants, SSRI

Note: see also Dapoxetine

Alcohol: sedative effects possibly increased when SSRIs given with ALCOHOL

Amitryptyline: fluoxetine increases plasma concentration of AMITRYPTYLINE (concomitant use should usually be avoided, but where not possible halve amitryptiline dose and monitor plasma-amitryptiline concentration)

Anaesthetic, Local: fluvoxamine inhibits metabolism of ROPIVACAINE—avoid prolonged administration of ropivacaine

Analgesics: increased risk of bleeding when SSRIs given with NSAIDS or ASPIRIN; possible increased serotoninergic effects when SSRIs given with FENTANYL; fluoxetine, fluvoxamine, paroxetine and sertraline possibly increase plasma concentration of METHADONE; increased risk of CNS toxicity when SSRIs given with TRAMADOL

Anti-arthrythmics: manufacturer of citalopram and escitalopram advises avoid concomitant use with AMIODARONE (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with DISOPYRAMIDE (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid
Antidepressants, SSRI — Antidepressants, SSRI

Antidepressants, SSRI

- Anti-arrhythmics (continued)
  - Concomitant use with o DRONERADONE (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of FLECAINIDE; fluoxetine and paroxetine possibly inhibit metabolism of PROPAPENONE
  - Antibacterials: manufacturer of citalopram and escitalopram advises avoid concomitant use with intravenous
    - ERYTHROMYCIN (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with MIOXFLOXACIN (risk of ventricular arrhythmias); possible increased risk of ventricular arrhythmias when citalopram given with TELITHROMYCIN
  - Anticoagulants: SSRIs possibly enhance anticoagulant effect of COUMARINS; possible increased risk of bleeding when SSRIs given with DABIGATRAN
  - Antidepressants: avoidance of fluvoxamine advised by manufacturer of o REDOXETINE; possible increased serotonergic effects when SSRIs given with DULOXETINE; fluvoxamine inhibits metabolism of DULOXETINE—avoid concomitant use; citalopram, escitalopram, fluvoxamine, paroxetine or sertraline should not be started until 2 weeks after stopping MAOIS, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluoxetine, paroxetine or sertraline; paroxetine should not be started until 2 weeks after stopping fluoxetine; CNS effects of SSRIs increased by MAOIS (risk of serious toxicity); increased risk of CNS toxicity when SSRIs given with MOLOBEMIDE, preferably avoid concomitant use; after stopping citalopram, fluvoxamine, paroxetine or sertraline do not start MOLOBEMIDE for at least 1 week; after stopping fluoxetine do not start MOLOBEMIDE for 5 weeks; increased serotonergic effects when SSRIs given with pindolol; fluvoxamine possibly increase concomitant use; after stopping fluoxetine, increase plasma concentration of AGOMELATINE (increased plasma concentration); possible increased serotonergic effects when fluoxetine or fluvoxamine given with MIRTAZAPINE; SSRIs increase plasma concentration of some TRICYCLICS; manufacturer of citalopram and escitalopram advises avoid concomitant use with TRICYCLICS (risk of ventricular arrhythmias); possible increased risk of convulsions when SSRIs given with VORTEXOTINE; fluoxetine and paroxetine possibly increase plasma concentration of VORTEXOTINE (consider reducing dose of voricontine)
  - Antiepileptics: SSRIs antagonise antiepileptic convulsant effect of o ANTIETEPILEPTICS (convulsive threshold lowered); fluoxetine and fluvoxamine increase plasma concentration of CARBAMAZEPINE; fluoxetine and fluvoxamine increase plasma concentration of ALPRAZOLAM—avoid concomitant use; fluvoxamine possibly increases plasma concentration of sertraline possibly reduced by FOSPHENTOIN and PHENYTOIN, also plasma concentration of fosphenytoin and phenytoin possibly increased; plasma concentration of paroxetine reduced by FOSPHENTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE; fluoxetine and fluvoxamine increase plasma concentration of PHENYTOIN
  - Antifungals: plasma concentration of paroxetine possibly increased by TERBINAFINE
    - Antihistamines: manufacturer of citalopram and escitalopram advises avoid concomitant use with MIZOLASTINE (risk of ventricular arrhythmias); antidepressant effect of SSRIs possibly antagonised by CYPROHEPATIDINE
  - Antimaterials: avoidance of antidepressants advised by manufacturer of o ARTEMETHER and ARTEMETHE WITH LUMEFANTRINE and ARTEMETHE WITH PIPERAQUE; possible increased risk of ventricular arrhythmias when citalopram or escitalopram given with ARTEMETHER WITH LUMEFANTRINE—avoid concomitant use; possible increased risk of ventricular arrhythmias when citalopram or escitalopram given with ARTEMETHE WITH PIPERAQUE—avoid concomitant use; possible increased risk of ventricular arrhythmias when citalopram or escitalopram given with CHLOROQUINE; possible increased risk of ventricular arrhythmias when citalopram or escitalopram given with QUININE—avoid concomitant use

Antidepressants, SSRI (continued)

- Antimuscarinics: paroxetine increases plasma concentration of DARIFENACIN AND PROCYCLIDINE
  - Antipsychotics: avoidance of fluoxetine, fluvoxamine and sertraline advised by manufacturer of o DOPAPERIDOL (risk of ventricular arrhythmias); manufacturer of citalopram and escitalopram advises avoid concomitant use with HALOPERIDOL (risk of ventricular arrhythmias); fluoxetine increases plasma concentration of CLOZAPINE, HALOPERIDOL AND RISPERIDONE; fluvoxamine possibly increases plasma concentration of ASENAPIRE AND HALOPERIDOL; paroxetine inhibits metabolism of PERPHENAZINE (reduce dose of perphenazine); fluoxetine and paroxetine possibly increase plasma concentration of ARIPIPRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of paroxetine possibly increased by ASENAPIRE; fluvoxamine, paroxetine and sertraline increase plasma concentration of CLOZAPINE; citalopram possibly increases plasma concentration of CLOZAPINE (increased risk of toxicity); fluvoxamine increases Plasma concentration of SSRIs; fluoxetine increases plasma concentration of some BENZODIAZEPINES; fluvoxamine increases plasma concentration of METOXAZONE; fluoxetine and paroxetine possibly increases plasma concentration of some BENZODIAZEPINES; fluvoxamine increases plasma concentration of MELATONIN—avoid concomitant use; sedative effects possibly increased when sertraline given with ZOLPIDEM
  - Atomoxetine: possible increased risk of convulsions when antidepressants given with ATOMOXETINE; fluoxetine and paroxetine possibly inhibit metabolism of ATOMOXETINE
  - Beta-blockers: citalopram and escitalopram increase plasma concentration of METOPROLOL; paroxetine possibly increases plasma concentration of METOPROLOL—increased risk of AV block (manufacturer of paroxetine advises avoid concomitant use in cardiac insufficiency); fluvoxamine increases plasma concentration of PROPAPENONE; increased risk of ventricular arrhythmias when citalopram given with SOTALOL—avoid concomitant use; manufacturer of escitalopram advises avoid concomitant use with SOTALOL (risk of ventricular arrhythmias)
  - Breziprop: plasma concentration of citalopram possibly increased by SUPROFEN
  - Calcium-channel blockers: fluoxetine possibly inhibits metabolism of NIFEDIPINE (increased plasma concentration)
  - Clopidogrel: fluoxetine and fluvoxamine possibly reduce antplatelet effect of o CLOPIDOGREL
  - Dapoxetine: possible increased risk of serotonergic effects when SSRIs given with DAPoxetine (manufacturer of dapoxetine advises SSRIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SSRIs)
  - Dopaminergics: increased risk of CNS toxicity when SSRIs given with RASAGILINE; fluoxetine should not be started until 2 weeks after stopping RASAGILINE; fluoxetine should not be started until 2 weeks after stopping RASAGILINE, also rasagiline should not be started until at least 5 weeks after stopping fluoxetine; avoidance of citalopram and escitalopram advised by manufacturer of SELEGILINE; increased risk of hypertension and CNS excitation when fluvoxamine or sertraline given with SELEGILINE (selegiline should not be started until 1 week after stopping fluvoxamine or sertraline; avoid fluvoxamine or sertraline for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when paroxetine given with SELEGILINE (selegiline
Antidepressants, SSRI (continued)
- Dopaminergics (continued)
  should not be started until 2 weeks after stopping paroxetine, avoid paroxetine for 2 weeks after stopping selegiline; increased risk of hypotension and CNS excitation when fluoxetine given with • selegiline (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline)
  - Grapefruit Juice: plasma concentration of sertraline possibly increased by GRAPEFRUIT JUICE
  - Hormone Antagonists: fluoxetine and paroxetine possibly inhibit metabolism of • tamoxifen to active metabolite (avoid concomitant use)
  - 5HT1-receptor Agonists: increased risk of CNS toxicity when citalopram given with • 5HT1, agonists (manufacturer of citalopram advises avoid concomitant use); fluvoxamine inhibits the metabolism of frovatriptan; possible increased serotoninergic effects when SSRIs given with naratriptan; CNS toxicity reported when sertraline given with sumatriptan; increased risk of CNS toxicity when citalopram, escitalopram, fluoxetine, fluvoxamine or paroxetine given with • sumatriptan; fluvoxamine possibly inhibits metabolism of zolmitriptan (reduce dose of zolmitriptan)
  - 5HT1-receptor Antagonists: possible increased serotoninergic effects when SSRIs given with • 5HT1, antagonists
  - Lipid-regulating Drugs: separating administration from fluoxetine and fluvoxamine by 12 hours advised by manufacturer of lomitapide
  - Lithium: increased risk of CNS effects when SSRIs given with • lithium (lithium toxicity reported)
  - Methylthioninium: risk of CNS toxicity when SSRIs given with • methylthioninium — avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)
  - Metoclopramide: CNS toxicity reported when SSRIs given with • metoclopramide
  - Muscle Relaxants: fluvoxamine increases plasma concentration of • tizanidine (increased risk of toxicity) — avoid concomitant use
  - Parasympathomimetics: paroxetine increases plasma concentration of • galantamine
  - Pentamidine isethionate: manufacturer of citalopram and escitalopram advises avoid concomitant use with • pentamidine isethionate (risk of ventricular arrhythmias)
  - Pirfenidone: fluvoxamine increases plasma concentration of • pirfenidone — manufacturer of pirfenidone advises avoid concomitant use
  - Pomalidomide: fluvoxamine increases plasma concentration of • pomalidomide
  - Ranolazine: paroxetine increases plasma concentration of • ranolazine
  - Roflumilast: fluvoxamine inhibits the metabolism of • roflumilast
  - Sympathomimetics: metabolism of SSRIs possibly inhibited by • methylphenidate
- Theophylline: fluvoxamine increases plasma concentration of • theophylline (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration)
  - Ticagrelor: possible increased risk of bleeding when citalopram, paroxetine or sertraline given with • ticagrelor
  - Ulcer-healing Drugs: plasma concentration of citalopram, escitalopram and sertraline increased by • cimetidine; fluvoxamine possibly increases plasma concentration of • lansovoprazole; plasma concentration of escitalopram increased by • omeprazole
Antidepressants, SSRI (related) see Duloxetine and Venlafaxine
Antidepressants, Tricyclic
- Adrenergic Neurone Blockers: tricyclics antagonise hypotensive effect of • adrenergic neurone blockers
- Alcohol: increased sedative effect when tricyclics given with • alcohol
- Alpha2-adrenoceptor Stimulants: avoidance of tricyclics advised by manufacturer of • apropaladondine and • brimonidine
- Anaesthetics, General: increased risk of arrhythmias and hypotension when tricyclics given with • general anaesthetics
Antidepressants, Tricyclic (continued)
- Analgesics: increased risk of CNS toxicity when tricyclics given with • tramadol; side-effects possibly increased when tricyclics given with • nefopam; sedative effects possibly increased when tricyclics given with • opioid analgesics
- Anti-arrhythmics: increased risk of ventricular arrhythmias when tricyclics given with • amiodarone — avoid concomitant use; increased risk of ventricular arrhythmias when tricyclics given with • disopyramide or • flecainide; avoidance of tricyclics advised by manufacturer of • dronedarone (risk of ventricular arrhythmias); increased risk of arrhythmias when tricyclics given with • propafenone
- Antibacterials: increased risk of ventricular arrhythmias when tricyclics given with • moxifloxacin — avoid concomitant use; possible increased risk of ventricular arrhythmias when tricyclics that prolong the QT interval given with • delamanid; possible increased risk of ventricular arrhythmias when tricyclics given with • telithromycin
- Anticoagulants: tricyclics may enhance or reduce anticoagulant effect of • coumarins
- Antidepressants: avoidance of tricyclics by manufacturer of • citalopram and • escitalopram (risk of ventricular arrhythmias); possible increased serotoninergic effects when amitriptyline or clomipramine given with • duloxetine; increased risk of hypotension and CNS excitation when tricyclics given with • moais, tricyclics should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine); after stopping tricyclics do not start • moclobemide for at least 1 week; plasma concentration of some tricyclics increased by • SSRIs; plasma concentration of amitriptyline reduced by • St John’s Wort; possible increased risk of convulsions when tricyclics given with • vortioxetine
- Antiepileptics: tricyclics antagonise anticonvulsant effect of • antiepileptics (convulsive threshold lowered); metabolism of tricyclics accelerated by • carbamazepine (reduced plasma concentration and reduced effect); plasma concentration of tricyclics possibly reduced by • fosphenytoin and • phenytoin; metabolism of tricyclics possibly accelerated by • phenobarbital and • primidone (reduced plasma concentration)
- Antifungals: plasma concentration of amitriptyline and nortriptiline possibly increased by • fluconazole; plasma concentration of tricyclics possibly increased by • terbinafine
- Antihistamines: increased antimuscarinic and sedative effects when tricyclics given with • antihistamines
- Antimalarials: avoidance of tricyclics advised by manufacturer of • artemether with lumefantrine and • artemetol with piperaquine
- Antimuscarnics: increased risk of antimuscarinic side-effects when tricyclics given with • antimuscarnics
- Antipsychotics: avoidance of tricyclics advised by manufacturer of • droperidol • fluphenazine, • haloperidol, • sulpiride and • zuclopenthixol (risk of ventricular arrhythmias); possible increased antimuscarinic side-effects when tricyclics given with • clozapine; increased risk of antimuscarinic side-effects when tricyclics given with • phenothiazines; possible increased risk of ventricular arrhythmias when tricyclics given with • risperidone
- Antivirals: plasma concentration of tricyclics possibly increased by • sirolimus; increased risk of ventricular arrhythmias when tricyclics given with • saquinavir — avoid concomitant use
- Anxiety and Hypnotics: increased sedative effect when tricyclics given with • anxiolytics and hypnotics
- Atropine: increased risk of ventricular arrhythmias when tricyclics given with • atropine; possible increased risk of convulsions when antidepressants given with • atropine
- Beta-blockers: plasma concentration of imipramine increased by • labetalol and • propranolol; increased risk of ventricular arrhythmias when tricyclics given with • tetalol
- Bupropion: plasma concentration of tricyclics possibly increased by • bupropion (possible increased risk of convulsions)
Antidepressants, Tricyclic (related) (continued)

- Anticoagulants: trazodone may enhance or reduce anticoagulant effect of WARFARIN

- Antidepressants: tricyclic-related antidepressants should not be started until 2 weeks after stopping MAOIs, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; after stopping tricyclic-related antidepressants do not start moclobemide for at least 1 week

- Antiepileptics: tricyclic-related antidepressants possibly antagonise anticonvulsant effect of ANTIEPILEPTICS (convulsive threshold lowered); plasma concentration of mianserin and trazodone reduced by CARBAMAZEPINE; plasma concentration of mianserin reduced by PHENYTOIN; metabolic interaction of mianserin accelerated by PHENOBARBITAL and PRIMODONE (reduced plasma concentration)

- Antihistamines: possible increased antimuscarinic and sedative effects when tricyclic-related antidepressants given with ANTHISTAMINES

- Antimalarials: avoidance of antidepressants advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE and ARTEMETIN WITH PIPERAQUINE

- Antimuscarinics: possible increased antimuscarinic side-effects when tricyclic-related antidepressants given with ANTIMUSCARINICS

- Antivirals: plasma concentration of trazodone increased by RITONAVIR (increased risk of toxicity); increased risk of ventricular arrhythmias when trazodone given with SAQUINAVIR—avoid concomitant use; plasma concentration of trazodone possibly increased by TELAPREVIR

- Anxiolytics and Hypnotics: increased sedative effect when tricyclic-related antidepressants given with ANXIOLYTICS AND HYPNOTICS

- Atomoxetine: possible increased risk of convulsions when antidepressants given with ATOMOXETINE

- Diazoxide: enhanced hypotensive effect when tricyclic-related antidepressants given with DIAZOXIDE

- Nitrates: tricyclic-related antidepressants possibly reduce effects of sublingual tablets of NITRATES (failure to dissolve under tongue owing to dry mouth)

- Vasodilator Antihypertensives: enhanced hypotensive effect when tricyclic-related antidepressants given with HYDRAZINE OR SODIUM NITROPRUSSIDE

Antidietics

NOTE Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after llixisenatide injection, or taken with a meal when llixisenatide is not administered, to minimise possible interference with absorption

NOTE Other drugs administered orally may need to be taken at least 1 hour before or 4 hours after exenatide injection, or taken with a meal when exenatide is not administered, to minimise possible interference with absorption

- ACE Inhibitors: hypoglycaemic effect of insulin, metformin and sulfonylureas possibly enhanced by ACE INHIBITORS

- Alcohol: hypoglycaemic effect of antidietics enhanced by ALCOHOL; increased risk of lactic acidosis when metformin given with ALCOHOL

- Anabolic Steroids: hypoglycaemic effect of antidietics possibly enhanced by ANABOLIC STEROIDS

- Analgesics: effects of sulfonylureas possibly enhanced by NSAIDS; llixisenatide possibly reduces the absorption of PARACETAMOL when given 1 to 4 hours before paracetamol

- Anti-arrrhythmics: hypoglycaemic effect of gliclazide, insulin and metformin possibly enhanced by DISOPYRAMIDE

- Antibacterials: hypoglycaemic effect of acarbose possibly enhanced by NEOMYCIN, also severity of gastro-intestinal effects increased; effects of repaglinide enhanced by CLARITHROMYCIN; effects of glibenclamide possibly enhanced by NORFLOXACIN; plasma concentration of canagliflozin and nateglinide reduced by RIFAMPICIN; effects of linagliptin possibly reduced by RIFAMPICIN; hypoglycaemic effect of repaglinide possibly antagonised by RIFAMPICIN; effects of sulfonylureas enhanced by CHLORAMPHENICOL; metabolism of sulfonylureas possibly accelerated by RIFAMPICIN (reduced effect), metabolism of tolbutamide accelerated by...
### Antidiabetics

- **Antibacterials (continued)**
  - Rifampicin (reduced effect); effects of sulfonylureas rarely enhanced by *Sulfonylurides* and *Thimetoprim*; hypoglycaemic effect of sulfonylureas possibly enhanced by *Tetracyclines*; hypoglycaemic effect of repaglinide possibly enhanced by *Thimetoprim*—manufacturer advises avoid concomitant use
  - Anticoagulants: enoxatine possibly enhances anticoagulant effect of *Warfarin*; hypoglycaemic effect of sulfonylureas possibly enhanced by *Coumarins*, also possible changes to anticoagulant effect
  - Antidepressants: hypoglycaemic effect of antidiabetics possibly enhanced by *MAOIs*; hypoglycaemic effect of insulin, metformin and sulfonylureas enhanced by *MAOIs*
  - Antidiabetics: manufacturer of dapagliflozin advises avoid concomitant use with *Pioglitazone*; plasma concentration of dulaglutide increased by *Sitagliptin*
  - Antiepileptics: tolbutamide transiently increases plasma concentration of fosphenytoin and phenytoin (possibility of toxicity); plasma concentration of gliclazide possibly reduced by *Topiramate*; plasma concentration of metformin possibly increased by *Topiramate*
  - Antifungals: plasma concentration of pioglitazone, saxagliptin and tolbutamide increased by *Ketoconazole*; plasma concentration of sulfonylureas increased by *Flucconazole* and *Micronozole*; hypoglycaemic effect of gliclazide and glipizide enhanced by *Micronozole*—avoid concomitant use; hypoglycaemic effect of nateglinide possibly enhanced by *Flucconazole*; hypoglycaemic effect of repaglinide possibly enhanced by *Itraconazole*; hypoglycaemic effect of glipizide possibly enhanced by *Posaconazole*; plasma concentration of sulfonylureas possibly increased by *Voriconazole*
  - Antiplatelets: thrombocyte count decreased when metformin given with *Ketoifen* (manufacturer of ketofen advises avoid concomitant use)
  - Antipsychotics: hypoglycaemic effect of sulfonylureas possibly enhanced by *Phenothiazines*
  - Antithrombotics: plasma concentration of metformin increased by *Dolutegravir*—consider reducing dose of metformin; plasma concentration of tolbutamide possibly increased by *Ritonavir*; plasma concentration of metformin increased by *Telaprevir* (consider reducing dose of metformin)
  - Aprepitant: plasma concentration of tolbutamide reduced by *Aprepitant*
  - Beta-blockers: warning signs of hypoglycaemia (such as tremor) with antidiabetics may be masked when given with *Beta-blockers*; hypoglycaemic effect of insulin enhanced by *Beta-blockers*
  - Bosentan: increased risk of hepatotoxicity when glibenclamide given with *Bosentan*—avoid concomitant use
  - Calcium-channel blockers: glucose tolerance occasionally impaired when insulin given with *Nifedipine*
  - Cardiac Glycosides: canagliflozin and sitagliptin increase plasma concentration of *Digoxin*; acarbose possibly reduces plasma concentration of *Digoxin*
  - Ciclosporin: hypoglycaemic effect of repaglinide possibly enhanced by *Ciclosporin*
  - Cortico steroids: hypoglycaemic effect of antidiabetics antagonised by *Corticosteroids*
  - Cytotoxics: avoidance of repaglinide advised by manufacturer of *Lapatinib*; plasma concentration of metformin possibly increased by *Vandetanib* (consider reducing dose of metformin)
  - Deferasirox: plasma concentration of repaglinide increased by *Deferasirox*
  - Diazoxide: hypoglycaemic effect of antidiabetics antagonised by *Diazoxide*
  - Diuretics: canagliflozin possibly enhances diuretic effect of *Diuretics*; hypoglycaemic effect of antidiabetics antagonised by *Loop Diuretics* and *Thiazides and Related Diuretics*; dapagliflozin possibly enhances diuretic effect of *Loop Diuretics and Thiazides and Related Diuretics*; manufacturer of canagliflozin advises avoid concomitant use with *Loop Diuretics*

### Antidiabetics (continued)

- Fosaprepitant: plasma concentration of tolbutamide reduced by *Fosaprepitant*
- Hormone Antagonists: requirements for antidiabetics possibly reduced by *Lanreotide*; *Octreotide* and *Pasireotide*
- Leflunomide: hypoglycaemic effect of tolbutamide possibly enhanced by *Leflunomide*
- Lipid-regulating Drugs: absorption of glibenclamide and glipizide reduced by *Colestyramine*; absorption of gliclazide reduced by *Colestvelam*—manufacturer of glibenclamide advises give at least 4 hours before colesvelam; hypoglycaemic effect of acarbose possibly enhanced by *Colestyramine*; hypoglycaemic effect of nateglinide possibly enhanced by *Gemfibrozil*; increased risk of severe hypoglycaemia when repaglinide given with *Gemfibrozil*—avoid concomitant use; plasma concentration of glibenclamide possibly increased by *Fluvastatin*; manufacturer of canagliflozin advises give at least 1 hour before or 4–6 hours after *Bile acid Sequestrants*; may be improved glucose tolerance and an additive effect when insulin or sulfonylureas given with *Fibrates*; separating administration from linagliptin by 12 hours advised by manufacturer of *Lomitapide*
- Oestrogens: hypoglycaemic effect of antidiabetics antagonised by *Oestrogens*
- Orlistat: avoidance of acarbose advised by manufacturer of *Orlistat*
- Pancreatin: hypoglycaemic effect of acarbose antagonised by *Pancreatin*
- Progestogens: hypoglycaemic effect of antidiabetics antagonised by *Progestogens*
- Sulfinpyrazone: effects of sulfonylureas enhanced by *Sulfinpyrazone*
- Teriflunomide: plasma concentration of repaglinide enhanced by *Teriflunomide*
- Testosterone: hypoglycaemic effect of antidiabetics possibly enhanced by *Testosteron*
- Ulcer-healing Drugs: excetration of metformin reduced by *Cimetidine* (increased plasma concentration); hypoglycaemic effect of sulfonylureas enhanced by *Cimetidine*

### Antiepileptics

- See Carbamazepine, Elicarbazepine, Ethosuximide, Fosphenytoin, Gabapentin, Lacosamide, Lamotrigine, Levetiracetam, Oxcarbazepine, Perampanel, Phenoobarbital, Phenytoin, Pregabalin, Primidone, Retigabine, Rufinamide, Sodium valproate, Stiripentol, Tiagabine, Topiramate, Valproic acid, Vigabatrin, and Zonisamide

### Antifungals, Imidazole

- Amphotericin; Antifungals, Imidazole; Antifungals, Triazole; Caspofungin; Fluconazole; Griseofulvin; Micafungin; Terbinafine

### Antidiabetics

- Alcohol: possibility of disulfiram-like reaction when ketoconazole given with *Alcohol*.
- Aliskiren: ketoconazole increases plasma concentration of *Aliskiren*.
- Alpha-blockers: ketoconazole possibly increases plasma concentration of *Alfuzosin*; ketoconazole increases plasma concentration of *Tamsulosin*.
- Aminophylline: ketoconazole possibly increases plasma concentration of *Aminophylline*.
- Analgesics: ketoconazole inhibits metabolism of *Buprenorphine* (reduce dose of buprenorphine); possible increased risk of ventricular arrhythmias when ketoconazole given with *Methadone*—manufacturer of ketoconazole advises avoid concomitant use; ketoconazole increases plasma concentration of *Oxycodeone*; manufacturer of ketoconazole advises avoid concomitant use with *Paracetamol*.
- Antacids: absorption of ketoconazole reduced by *Antacids*.
- Antihelmintics: ketoconazole increases plasma concentration of *Praziquantel*.
- Antiarrhythmics: increased risk of ventricular arrhythmias when ketoconazole given with *Disopyramide*—avoid concomitant use; ketoconazole increases plasma concentration of *Droperidone*—avoid concomitant use.
- Antibacterials: manufacturer of ketoconazole advises avoid concomitant use *Clarithromycin* in severe renal impairment;
Antifungals, Imidazole

- **Antimuscarinics:**
  - Antifungals:
    - **Antifungals, Imidazole**
      - Anticoagulants: ketoconazole increases plasma concentration of CICLOSPORIN (reduced plasma concentration); ketoconazole increases plasma concentration of Clopidogrel (reduced antiplatelet effect); ketoconazole possibly increases plasma concentration of Mefloquine.
      - Beta-blockers: ketoconazole increases plasma concentration of Nesiritide.
      - Carbamazepine: ketoconazole increases plasma concentration of Carbamazepine (increased plasma concentration).
      - Calcium-channel Blockers: ketoconazole increases plasma concentration of Lercanidipine.
      - Beta-blockers: ketoconazole increases plasma concentration of Lercanidipine.
      - Calcium-channel Blockers: ketoconazole increases plasma concentration of Telaprevir.
      - Beta-blockers: ketoconazole increases plasma concentration of Telaprevir.
      - Carbamazepine: ketoconazole increases plasma concentration of Cobicistat.
      - Calcium-channel Blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Beta-blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Carbamazepine: ketoconazole increases plasma concentration of Cobicistat.
      - Calcium-channel Blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Beta-blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Carbamazepine: ketoconazole increases plasma concentration of Cobicistat.
      - Calcium-channel Blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Beta-blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Carbamazepine: ketoconazole increases plasma concentration of Cobicistat.
      - Calcium-channel Blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Beta-blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Carbamazepine: ketoconazole increases plasma concentration of Cobicistat.
      - Calcium-channel Blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Beta-blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Carbamazepine: ketoconazole increases plasma concentration of Cobicistat.
      - Calcium-channel Blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Beta-blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Carbamazepine: ketoconazole increases plasma concentration of Cobicistat.
      - Calcium-channel Blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Beta-blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Carbamazepine: ketoconazole increases plasma concentration of Cobicistat.
      - Calcium-channel Blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Beta-blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Carbamazepine: ketoconazole increases plasma concentration of Cobicistat.
      - Calcium-channel Blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Beta-blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Carbamazepine: ketoconazole increases plasma concentration of Cobicistat.
      - Calcium-channel Blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Beta-blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Carbamazepine: ketoconazole increases plasma concentration of Cobicistat.
      - Calcium-channel Blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Beta-blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Carbamazepine: ketoconazole increases plasma concentration of Cobicistat.
      - Calcium-channel Blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Beta-blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Carbamazepine: ketoconazole increases plasma concentration of Cobicistat.
      - Calcium-channel Blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Beta-blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Carbamazepine: ketoconazole increases plasma concentration of Cobicistat.
      - Calcium-channel Blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Beta-blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Carbamazepine: ketoconazole increases plasma concentration of Cobicistat.
      - Calcium-channel Blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Beta-blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Carbamazepine: ketoconazole increases plasma concentration of Cobicistat.
      - Calcium-channel Blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Beta-blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Carbamazepine: ketoconazole increases plasma concentration of Cobicistat.
      - Calcium-channel Blockers: ketoconazole increases plasma concentration of Cobicistat.
      - Beta-blockers: ketoconazol...
Antifungals, Imidazole

- Cytotoxics (continued)
  - consider reducing dose of busulfin; ketoconazole increases plasma concentration of BORTezomib, CAbozantinib, DABrafenib, Etoposide, IDenisobazin, IMatinib, NINTedanib and PONtanib; ketoconazole increases plasma concentration of CRizotinib, LAPatinib, Nilotinib and REGrafenib—avoid concomitant use; ketoconazole possibly increases plasma concentration of DASatinib; ketoconazole inhibits metabolism of erlotinib and simvastatin (increased plasma concentration); ketoconazole increases plasma concentration of Everolimus—manufacturer of ketoconazole advises avoid concomitant use; ketoconazole increases plasma concentration of Brutinib—reduce dose of ibrutinib (see under ibritinib, in BNF); ketoconazole increases plasma concentration of Pazopanib (reduce dose of pazopanib); manufacturer of ruxolitinib advises dose reduction when ketoconazole given with; Ruxolitinib—consult ruxolitinib product literature; ketoconazole increases plasma concentration of active metabolite of Temsirolimus—avoid concomitant use; avoidance of ketoconazole advised by manufacturer of Cabazitaxel; in vitro studies suggest a possible interaction between ketoconazole and Docetaxel (consult docetaxel product literature); ketoconazole reduces plasma concentration of Irinotecan (but concentration of active metabolite of irinotecan increased)—avoid concomitant use; ketoconazole increases plasma concentration of Vinflunine—manufacturer of vinflunine advises avoid concomitant use; Dapoxetine: ketoconazole increases plasma concentration of Dapoxetine—manufacturer of dapoxetine advises avoid concomitant use; Diuretics: ketoconazole increases plasma concentration of Eplerenone—avoid concomitant use; Domperidone: manufacturer of ketoconazole advises avoid concomitant use with; Domperidone (risk of ventricular arrhythmias); Ergot Alkaloids: manufacturer of ketoconazole advises avoid concomitant use with; Ergot Alkaloids; increased risk of ergotism when imidazoles given with; Ergotamine; increased risk of toxicity; Fingolimod: ketoconazole increases plasma concentration of Fingolimod; Fosaprepitant: ketoconazole increases plasma concentration of Fosaprepitant; Guanfacine: ketoconazole increases plasma concentration of Guanfacine (halve dose of guanfacine); Hormone Antagonists: manufacturer of ketoconazole advises avoid concomitant use with; LHRH analogues; ShH2-receptor Agonists: ketoconazole increases plasma concentration of Almotriptan (increased risk of toxicity); ketoconazole increases plasma concentration of; Eletriptan (risk of toxicity)—avoid concomitant use; Ibavradine: ketoconazole increases plasma concentration of Ibavradine—avoid concomitant use; Ivacaftor: ketoconazole increases plasma concentration of Ivacaftor (see under Ivacaftor, p. 175); Lanthanum: absorption of ketoconazole possibly reduced by Lanthanum (give at least 2 hours apart); Lenalidomide: ketoconazole possibly increases plasma concentration of Lenalidomide (increased risk of toxicity); Lipid-regulating Drugs: possible increased risk of myopathy when imidazoles given with; Atorvastatin; possible increased risk of myopathy when ketoconazole given with; Atorvastatin—manufacturer of ketoconazole advises avoid concomitant use; increased risk of myopathy when ketoconazole given with; Simvastatin (avoid concomitant use); possible increased risk of myopathy when ketoconazole given with; Simvastatin; ketoconazole increases plasma concentration of Lomitapide—avoid concomitant use; Macitentan: ketoconazole increases plasma concentration of Macitentan; Mirabegron: when given with ketoconazole avoid or reduce dose of Mirabegron in hepatic or renal impairment—see Mirabegron, in BNF

Antifungals, Imidazole (continued)

- Netupitant: ketoconazole possibly increases plasma concentration of Netupitant; Oestrogens: anecdotal reports of contraceptive failure when imidazoles given with; Oestrogens; ketoconazole increases plasma concentration of Ethynylestradiol; Parasympathomimetics: ketoconazole increases plasma concentration of Galantamine; Progestogens: ketoconazole increases plasma concentration of Drospirenone; Ranolazine: ketoconazole increases plasma concentration of Ranolazine—avoid concomitant use; Retinoids: ketoconazole increases plasma concentration of Alitretinoin; ketoconazole possibly increases risk of Tretinoin toxicity; Riociguat: avoidance of ketoconazole advised by manufacturer of Riociguat; Sildenafil: ketoconazole increases plasma concentration of Sildenafil—reduce initial dose of sildenafil for erectile dysfunction and avoid concomitant use of sildenafil for pulmonary hypertension; Sirolimus: ketoconazole increases plasma concentration of Sirolimus—avoid concomitant use; miconazole increases plasma concentration of Sirolimus; Sympathomimetics, Beta-: ketoconazole increases plasma concentration of Olodaterol; ketoconazole inhibits metabolism of Salmeterol (increased plasma concentration); Tacrolimus: ketoconazole increases plasma concentration of Tacrolimus (consider reducing dose of tacrolimus); miconazole oral gel possibly increases plasma concentration of Tacrolimus; Tadalafil: ketoconazole increases plasma concentration of Tadalafil—avoid concomitant use of tadalafil for pulmonary hypertension; Theophylline: ketoconazole possibly increases plasma concentration of Theophylline; Ticagrelor: ketoconazole increases plasma concentration of Ticagrelor—manufacturer of ticagrelor advises avoid concomitant use; Tolvaptan: ketoconazole increases plasma concentration of Tolvaptan—manufacturer of ketoconazole advises avoid concomitant use; Uler-heeling Drugs: absorption of ketoconazole reduced by HISTamine H2-ANTAgonists, ProTon PUMP Inhibitors and Sucralfate; Ulipristal: ketoconazole increases plasma concentration of low-dose Ulipristal—manufacturer of low-dose ulipristal advises avoid concomitant use; Vardenafil: ketoconazole increases plasma concentration of Vardenafil—avoid concomitant use; Vardenafil; increased risk of toxicity; Vardenafil possibly reduces effects of Alfalfacalcidol, Calcitriol, Colecalciferol, Dihydroxycholesterol, Ergocalciferol, Paricalcitol and Vitamin D; ketoconazole possibly increases plasma concentration of Paricalcitol; AntiFungals, Polyene see Amphotercin Antifungals, Triazole

NOTE In general, fluconazole interactions relate to multiple-dose treatment; Aliskiren: itraconazole increases plasma concentration of Aliskiren—avoid concomitant use; Aminophylline: fluconazole possibly increases plasma concentration of Aminophylline; Analgesics: fluconazole increases plasma concentration of Celecoxib (halve dose of celecoxib); voriconazole increases plasma concentration of Diclofenac, Ibuprofen and Oxycodone; fluconazole increases plasma concentration of Flurbiprofen, Ibuprofen and Methadone; fluconazole increases plasma concentration of Parecoxib (reduce dose of parecoxib); voriconazole increases plasma concentration of Alfentanil and Methadone (consider reducing dose of alfentanil and methadone); fluconazole inhibits metabolism of Alfentanil (risk of prolonged or delayed respiratory depression); itraconazole possibly inhibits metabolism of Alfentanil; triazoles possibly increase plasma concentration of Fentanyl; itraconazole possibly increases plasma concentration of

Antifungals, Triazole

NOTE In general, fluconazole interactions relate to multiple-dose treatment; Aliskiren: itraconazole increases plasma concentration of Aliskiren—avoid concomitant use; Aminophylline: fluconazole possibly increases plasma concentration of Aminophylline; Analgesics: fluconazole increases plasma concentration of Celecoxib (halve dose of celecoxib); voriconazole increases plasma concentration of Diclofenac, Ibuprofen and Oxycodone; fluconazole increases plasma concentration of Flurbiprofen, Ibuprofen and Methadone; fluconazole increases plasma concentration of Parecoxib (reduce dose of parecoxib); voriconazole increases plasma concentration of Alfentanil and Methadone (consider reducing dose of alfentanil and methadone); fluconazole inhibits metabolism of Alfentanil (risk of prolonged or delayed respiratory depression); itraconazole possibly inhibits metabolism of Alfentanil; triazoles possibly increase plasma concentration of Fentanyl; itraconazole possibly increases plasma concentration of

Note interactions, Appendix 1

A1
Antifungals, Triazole

- Anticoagulants: plasma concentration of itraconazole reduced by clariTrimethoprime (risk of ventricular arrhythmias); itraconazole possibly increases plasma concentration of rifampicin; plasma concentration of itraconazole reduced by rifapentine; plasma concentration of itraconazole reduced by rifampicin (increased risk of ventricular arrhythmias); plasma concentration of voriconazole possibly increased when itraconazole given with fosfomycin (risk of ventricular arrhythmias); voriconazole possibly increases plasma concentration of solifenacin, see under solifenacin, in BNf.

- Antidepressants: itraconazole possibly increases plasma concentration of aripiprazole (reduce dose of aripiprazole—consult aripiprazole product literature); itraconazole, posaconazole and voriconazole possibly increase plasma concentration of lurisdinone—avoid concomitant use; voriconazole possibly increase plasma concentration of efavirenz; voriconazole possibly increase plasma concentration of efavirenz possibly increased when itraconazole given with darunavir; voriconazole possibly increase plasma concentration of efavirenz possibly increased when itraconazole given with dasabuvir; voriconazole possibly increase plasma concentration of efavirenz possibly increased when itraconazole given with efavirenz (increase dose of efavirenz); voriconazole possibly increase plasma concentration of efavirenz (possible increased risk of toxicity).

- Antihistamines: itraconazole inhibits metabolism of midolastine—avoid concomitant use.

- Antimalarials: avoidance of triazoles advised by manufacturer of darifenacin and tolterodine; manufacturer of fosotederine advises dose reduction when itraconazole given with fosotederine—consult fosotederine product literature; itraconazole possibly increases plasma concentration of solifenacin—see under solifenacin, in BNf.

- Antipsychotics: itraconazole possibly increases plasma concentration of haloperidol; itraconazole possibly increases plasma concentration of aripiprazole (reduce dose of aripiprazole—consult aripiprazole product literature); itraconazole, posaconazole and voriconazole possibly increase plasma concentration of lurisdinone—avoid concomitant use; voriconazole possibly increase plasma concentration of efavirenz; voriconazole possibly increase plasma concentration of efavirenz (increase dose of efavirenz); voriconazole possibly increase plasma concentration of efavirenz (possible increased risk of toxicity).

- Anxiolytics and Hypnotics: itraconazole increases plasma concentration of alprazolam; fluconazone and voriconazole increases plasma concentration of quetiapine (possible increased risk of ventricular arrhythmias).

- Antihistamines: itraconazole inhibits metabolism of midolastine—avoid concomitant use.
Antifungals, Triazole

- **Avanafil** (continued)

  advises avoid concomitant use; fluconazole possibly increases plasma concentration of **avanaFil**—see under Avanafil, in BNF
- **Bosentan**: fluconazole possibly increases plasma concentration of **bosentan**—avoid concomitant use; itraconazole possibly increases plasma concentration of **bosentan**
- **Calcium-Channel Blockers**: negative inotropic effect possibly increased when itraconazole given with **calcium-channel blockers**; itraconazole inhibits metabolism of **feDOPIne** (increased plasma concentration); avoidance of itraconazole advised by manufacturer of **Lercanidipine**; itraconazole possibly inhibits metabolism of **Dihydropiridines** (increased plasma concentration)
- **Cardiac Glycosides**: itraconazole increases plasma concentration of **digOkin**
- **Ciclosporin**: fluconazole, itraconazole, posaconazole and voriconazole inhibit metabolism of **ciclosporIn** (increased plasma concentration)
- **Cilostazol**: itraconazole possibly increases plasma concentration of **cilostazol** (increased plasma concentration)
- **Corticosteroids**: itraconazole possibly increases plasma concentration of **corticosteroids** and **Cyclosporin**
- **Ergot Alkaloids**: itraconazole increases risk of **ergotAlkaloids** (increased risk of ergotism); increased risk of ergotism when triazoles given with **ergotamine**—avoid concomitant use
- **Everolimus**: manufacturer of everolimus advises consider reducing dose of estradiol (risk of toxicity); itraconazole possibly increases risk of **everolimus** (risk of toxicity)
- **Fluvastatin**: itraconazole increases plasma concentration of **FluvasStatin**—possible increased risk of myopathy when fluconazole given with **atrovastatin** or **simvastatin**; flucloxacillin increases plasma concentration of **fluvastatin**—possible increased risk of myopathy; itraconazole increases plasma concentration of **rosuvastatin**—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when itraconazole or posaconazole given with **simvastatin** (avoid concomitant use); increased risk of myopathy when when itraconazole or posaconazole given with **simvastatin**; avoidance of triazoles advised by manufacturer of **Lomitapide** (plasma concentration of lomitapide possibly increased)
- **Ibuprofen**: increased risk of toxicity when itraconazole given with **ibuprofen**; increased risk of toxicity; itraconazole increases risk of **ibuprofen**—risk of toxicity
- **Itraconazole**: itraconazole increases plasma concentration of **Itraconazole**—avoid concomitant use; plasma concentration of itraconazole increased by **itraconazole**—risk of toxicity; itraconazole increases risk of **itraconazole**—risk of toxicity
- **Lapatinib**: manufacturer of lapatinib advises dose reduction when itraconazole given with **Lapatinib**—risk of toxicity; itraconazole increases risk of **lapatinib**—risk of toxicity
- **Leukotriene Receptor Antagonists**: itraconazole increases plasma concentration of **Leukotriene Receptor Antagonists**—risk of toxicity
- **Lenalidomide**: itraconazole possibly increases plasma concentration of **lenalidomide** (increased risk of toxicity)
- **Lercanidipine**: manufacturer of lercanidipine advises consider reducing dose of lercanidipine (risk of toxicity); itraconazole possibly increases risk of **lercanidipine**—risk of toxicity
- **Lidocaine**: itraconazole increases plasma concentration of **lidocaine**—risk of toxicity
- **Methyldopa**: itraconazole increases plasma concentration of **Methyldopa**—risk of toxicity
- **Methyprylon**: itraconazole increases plasma concentration of **Methyprylon**—risk of toxicity
- **Methylprednisolone**: itraconazole increases plasma concentration of **methylprednisolone**—risk of toxicity
- **Naproxen**: itraconazole increases plasma concentration of **Naproxen**—risk of toxicity
- **Neomycin (in BNF)**: manufacturer of neomycin advises dose reduction when itraconazole given with **neomycin**—risk of toxicity; itraconazole increases risk of **neomycin**—risk of toxicity
- **Ponatinib**: in BNF; manufacturer of ponatinib advises dose reduction when itraconazole given with **ponatinib**—risk of toxicity; itraconazole increases risk of **ponatinib**—risk of toxicity
- **Progestogens**: plasma concentration of voriconazole inhibited by **progestogens** (increased risk of toxicity); itraconazole increases plasma concentration of **progestogens**—risk of toxicity
- **Ranolazine**: manufacturer of ranolazine advises avoid concomitant use
- **Retinoids**: itraconazole increases plasma concentration of **Retinoids** (increased risk of toxicity)
- **Rosuvastatin (consult product literature)**: increased risk of myopathy when itraconazole or posaconazole given with **rosuvastatin** (consult product literature); increased risk of myopathy when itraconazole or posaconazole given with **ROSUVASTATIN** (see under Incafitor, p. 175); itraconazole increases plasma concentration of **rosuvastatin** (consult product literature)
Antifungals, Triazole – Antimuscarinics

Antifungals, Triazole (continued)

- Sirolimus: fluconazole and posaconazole possibly increase plasma concentration of sirolimus; itraconazole and voriconazole increase plasma concentration of sirolimus—avoid concomitant use
- Tacrolimus: fluconazole, itraconazole, posaconazole and voriconazole increase plasma concentration of tacrolimus (consider reducing dose of tacrolimus)
- Tadalafil: itraconazole possibly increases plasma concentration of tadalafil
- Theophylline: fluconazole possibly increases plasma concentration of theophylline
- Ulipristal: possible increased antimuscarinic side-effects when antimuscarinics given with antimuscarinics
- Vardenafil: increased sedative effect when antimuscarinics given with alcohol

Antihistamines

- Antivirals (continued) sedating antihistamines possibly increased by ritonavir; increased risk of ventricular arrhythmias when mizolastine given with ritonavir—avoid concomitant use
- Antihistamines and hypnotics: increased sedative effect when antimuscarinics given with antihistamines and hypnotics
- Beta-blockers: increased risk of ventricular arrhythmias when mizolastine given with sotalol—avoid concomitant use
- Betahistine: antimuscarinics theoretically antagonise effect of betahistine
- Cimetidine: increased sedative effect when antimuscarinics given with cimetidine
- Codeine: possible increased antimuscarinic side-effects when antimuscarinics given with codeine
- Diltiazem; increased risk of antimuscarinic side-effects when antimuscarinics given with diltiazem
- Dopa metabolites: possible increased antimuscarinic side-effects when antimuscarinics given with dopamine
- Lopinavir or ritonavir: possible increased antimuscarinic side-effects when antimuscarinics given with lopinavir or ritonavir
- Midodrine: increased sedative effect when antimuscarinics given with midodrine
- Noradrenaline: possible increased antimuscarinic side-effects when antimuscarinics given with noradrenaline
- Paroxetine: increased risk of antimuscarinic side-effects when antimuscarinics given with paroxetine
- Prazosin: increased risk of antimuscarinic side-effects when antimuscarinics given with prazosin
- Propranolol: increased risk of antimuscarinic side-effects when antimuscarinics given with propranolol
- Quetiapine: increased risk of antimuscarinic side-effects when antimuscarinics given with quetiapine
- Ritonavir: increased risk of antimuscarinic side-effects when antimuscarinics given with ritonavir
- Theophylline: increased risk of antimuscarinic side-effects when antimuscarinics given with theophylline
- Tegafur, and Tioguanine: increased risk of antimuscarinic side-effects when antimuscarinics given with tegafur, and tioguanine
- Tolterodine: possible increased antimuscarinic side-effects when antimuscarinics given with tolterodine
- Tramadol: possible increased antimuscarinic side-effects when antimuscarinics given with tramadol
- Tylosin: possible increased antimuscarinic side-effects when antimuscarinics given with tylosin
- Vancomycin: possible increased antimuscarinic side-effects when antimuscarinics given with vancomycin
- Verapamil: increased risk of antimuscarinic side-effects when antimuscarinics given with verapamil
- Ziprasidone: increased risk of antimuscarinic side-effects when antimuscarinics given with ziprasidone

Antihistamines, Sedating

- Antihistamines, sedating antihistamines. Interactions do not generally apply to antihistamines used for topical action (including inhalation)
- Alcohol: increased sedative effect when antihistamines given with alcohol (possibly less effect with non-sedating antihistamines)
- Analgesics: possible increased antimuscarinic side-effects when antimuscarinics given with analgesics
- Antidepressants: increased sedative effect when antimuscarinics given with antidepressants
- Antihistamines: possible increased antimuscarinic side-effects when antimuscarinics given with antihistamines
- Antihistamines and sympathomimetics: increased sedative effect when antimuscarinics given with sympathomimetics
- Antimicrobials: possible increased antimuscarinic side-effects when antimuscarinics given with antimicrobials
- Antivirals: increased sedative effect when antimuscarinics given with antivirals

Antimidicals

- Antimalarials see Artesether with Lumefantrine, Artemether with Piperaquine, Chloroquine, Hydroxychloroquine, Mefloquine, Primaquine, Proguanil, Pyrimethamine, and Quinine
- Antimetabolites see Capecitabine, Cldribrine, Cytarabine, Decitabine, Fluorarabine, Fluouracil, Gemcitabine, Mercaptopurine, Methotrexate, Pemetrexed, Raltitrexed, Tegafur, and Tioguanine

Antimuscarinics

- Analgesics: possible increased antimuscarinic side-effects when antimuscarinics given with analgesics
- Antidepressants: increased risk of antimuscarinic side-effects when antimuscarinics given with antidepressants
- Antihistamines: increased risk of antimuscarinic side-effects when antimuscarinics given with antihistamines
- Antihistamines and sympathomimetics: increased risk of antimuscarinic side-effects when antimuscarinics given with sympathomimetics
- Antimicrobials: possible increased antimuscarinic side-effects when antimuscarinics given with antimicrobials
- Antivirals: increased sedative effect when antimuscarinics given with antivirals
- Antihistamines, sedating antihistamines. Interactions do not generally apply to antihistamines used for topical action (including inhalation)
- Alcohol: increased sedative effect when antimuscarinics given with alcohol

Antihistamines, Non-sedating

- Antihistamines, non-sedating antihistamines. Interactions do not generally apply to antihistamines used for topical action (including inhalation)
- Alcohol: increased sedative effect when antihistamines given with alcohol (possibly less effect with non-sedating antihistamines)
- Analgesics: possible increased antimuscarinic side-effects when antimuscarinics given with analgesics
- Antidepressants: increased sedative effect when antimuscarinics given with antidepressants
- Antihistamines: possible increased antimuscarinic side-effects when antimuscarinics given with antihistamines
- Antihistamines and sympathomimetics: increased sedative effect when antimuscarinics given with sympathomimetics
- Antimicrobials: possible increased antimuscarinic side-effects when antimuscarinics given with antimicrobials
- Antivirals: increased sedative effect when antimuscarinics given with antivirals

Antisoluble

- Antimicrobials: possible increased antimuscarinic side-effects when antimuscarinics given with antimicrobials
- Antivirals: increased sedative effect when antimuscarinics given with antivirals

Antivirals

- Antimicrobials: possible increased antimuscarinic side-effects when antimuscarinics given with antimicrobials
- Antivirals: increased sedative effect when antimuscarinics given with antivirals

Antimonial

- Antimalarials see Artesether with Lumefantrine, Artemether with Piperaquine, Chloroquine, Hydroxychloroquine, Mefloquine, Primaquine, Proguanil, Pyrimethamine, and Quinine

Antimetabolites

- Capecitabine, Cldribrine, Cytarabine, Decitabine, Fluorarabine, Fluouracil, Gemcitabine, Mercaptopurine, Methotrexate, Pemetrexed, Raltitrexed, Tegafur, and Tioguanine

Antimuscarinics

- Analgesics: possible increased antimuscarinic side-effects when antimuscarinics given with analgesics
- Antidepressants: increased risk of antimuscarinic side-effects when antimuscarinics given with antidepressants
- Antihistamines: increased risk of antimuscarinic side-effects when antimuscarinics given with antihistamines
- Antihistamines and sympathomimetics: increased risk of antimuscarinic side-effects when antimuscarinics given with sympathomimetics
- Antimicrobials: possible increased antimuscarinic side-effects when antimuscarinics given with antimicrobials
- Antivirals: increased sedative effect when antimuscarinics given with antivirals

Antihistamines

- Analgesics: possible increased antimuscarinic side-effects when antimuscarinics given with analgesics
- Antidepressants: increased risk of antimuscarinic side-effects when antimuscarinics given with antidepressants
- Antihistamines: increased risk of antimuscarinic side-effects when antimuscarinics given with antihistamines
- Antihistamines and sympathomimetics: increased risk of antimuscarinic side-effects when antimuscarinics given with sympathomimetics
- Antimicrobials: possible increased antimuscarinic side-effects when antimuscarinics given with antimicrobials
- Antivirals: increased sedative effect when antimuscarinics given with antivirals

Antimuscarinics

- Analgesics: possible increased antimuscarinic side-effects when antimuscarinics given with analgesics
- Antidepressants: increased risk of antimuscarinic side-effects when antimuscarinics given with antidepressants
- Antihistamines: increased risk of antimuscarinic side-effects when antimuscarinics given with antihistamines
- Antihistamines and sympathomimetics: increased risk of antimuscarinic side-effects when antimuscarinics given with sympathomimetics
- Antimicrobials: possible increased antimuscarinic side-effects when antimuscarinics given with antimicrobials
- Antivirals: increased sedative effect when antimuscarinics given with antivirals
**Antimuscarinics**

- Antifungals (continued)
  - KETOCONAZOLE—consult fosoterodine product literature; plasma concentration of darifenacine increased by KETOCONAZOLE—avoid concomitant use; plasma concentration of solifenacine increased by KETOCONAZOLE—see under Solifenacine, in BNF; plasma concentration of oxybutynin increased by KETOCONAZOLE; manufacturer of tolterodine advises avoid concomitant use with IRACONAZOLE and • KETOCONAZOLE; manufacturer of darifenacine advises avoid concomitant use with IRACONAZOLE; plasma concentration of solifenacine possibly increased by • IRACONAZOLE—see under Solifenacine, in BNF

- Antihistamines: increased risk of antimuscarinic side-effects when antimuscarinics given with CLOZAPINE; antimuscarinics reduce plasma concentration of PHENOTHIAZINES, but risk of antimuscarinic side-effects increased.

- Antivirals: manufacturer of darifenacine advises avoid concomitant use with ATAZANAVIR, FOSAMPRENAVIR, INDINAVIR, LOPINAVIR, RITONAVIR, SAQUINAVIR and TIPRANAVIR; manufacturer of fosoterodine advises dose reduction when fosoterodine given with ATAZANAVIR, INDINAVIR, RITONAVIR and SAQUINAVIR—consult fosoterodine product literature; manufacturer of tolterodine advises avoid concomitant use with FOSAMPRENAVIR, INDINAVIR, LOPINAVIR, RITONAVIR and SAQUINAVIR; plasma concentration of solifenacine possibly increased by • IRACONAZOLE—see under Solifenacine, in BNF

- Beta-blockers: increased risk of ventricular arrhythmias when tolterodine given with • SOTALOL

- Calcium-Channel Blockers: plasma concentration of solifenacine increased by VERAPAMIL; manufacturer of darifenacine advises avoid concomitant use with VERAPAMIL

- Cardiac Glycosides: darifenacine possibly increases plasma concentration of DIGOXIN

- Ciclosporin: manufacturer of darifenacine advises avoid concomitant use with CICLOSPORIN

- Domperidone: antimuscarinics antagonise effects of DOMPERIDONE on gastro-intestinal activity

- Dopaminergics: antimuscarinics possibly reduce absorption of CO-BENZEDOPA, CO-CARDEDOPA and LEVODOPA

- Hormone Antagonists: possible increased risk of bradycardia when ipratropium or oxybutynin given with PASIREOTIDE

- Memantine: effects of antimuscarinics possibly enhanced by MEMANTINE

- Metoclopramide: antimuscarinics antagonise effects of METOCLOPRAMIDE on gastro-intestinal activity

- Nitrate: antimuscarinics possibly reduce effects of sublingual tablets of NITRATES (failure to dissolve under tongue owing to dry mouth)

- Parasympathomimetics: antimuscarinics antagonise effects of PARASYMPATOMIMETICS

**Antipsychotics**

**NOTE** Increased risk of toxicity with myelosuppressive drugs **NOTE** Avoid concomitant use of clozapine with drugs that have a substantial potential for causing agranulocytosis

- ACE Inhibitors: enhanced hypotensive effect when antipsychotics given with ACE INHIBITORS

- Adrenergic Neurone Blockers: enhanced hypotensive effect when phenothiazines given with ADRENERGIC NEURONE BLOCKERS; higher doses of chlorpromazine antagonise hypotensive effect of ADRENERGIC NEURONE BLOCKERS; haloperidol antagonises hypotensive effect of ADRENERGIC NEURONE BLOCKERS

- Adsorbents: absorption of phenothiazines possibly reduced by KAOLIN

- Alcohol: increased sedative effect when antipsychotics given with ALCOHOL

- Alpha-blockers: enhanced hypotensive effect when antipsychotics given with ALPHA-BLOCKERS

- Anaesthetics, General: droperidol enhances effects of THIOPENTAL; enhanced hypotensive effect when antipsychotics given with • GENERAL ANAESTHETICS

**Antipsychotics** (continued)

- Analgesics: possible severe drowsiness when haloperidol given with ACETAMIN or INDOMETACIN; increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with • METHADONE; increased risk of ventricular arrhythmias when amisulpride given with • METHADONE—avoid concomitant use; increased risk of convulsions when antipsychotics given with TRAMADOL; enhanced hypotensive and sedative effects when antipsychotics given with OPIOID ANALGESICS

- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when antipsychotics given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS

- Antacids: absorption of phenothiazines and sulphide reduced by ANTACIDS

- Anti-arrhythmics: increased risk of ventricular arrhythmias when antipsychotics that prolong the QT interval given with • ANTI-ARRHYTHMICS that prolong the QT interval; increased risk of ventricular arrhythmias when amisulpride, droperidol, haloperidol, phenothiazines, pimozone or zuclopenthixol given with • AMIODARONE—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with • AMIODARONE—manufacturer of benperidol advises avoid concomitant use; increased risk of ventricular arrhythmias when sulphide given with • AMIODARONE or • DISOPYRAMIDE; increased risk of ventricular arrhythmias when pimozide or zuclopenthixol given with • DISOPYRAMIDE—avoid concomitant use; possible increased risk of ventricular arrhythmias when haloperidol given with • DISOPYRAMIDE—avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines possibly enhanced by • DISOPYRAMIDE; avoidance of phenothiazines advised by manufacturer of • DRONEDARONE (risk of ventricular arrhythmias); increased risk of arrhythmias when clozapine given with • FLECAINIDE

- Antibacterials: plasma concentration of lurasidone possibly increased by • CLARITHROMYCIN and • TELITHROMYCIN—avoid concomitant use; increased risk of ventricular arrhythmias when pimozide given with • CLARITHROMYCIN, • MOXIFLOXACIN or • TELITHROMYCIN—avoid concomitant use; plasma concentration of quetiapine possibly increased by • CLARITHROMYCIN—manufacturer of quetiapine advises avoid concomitant use; plasma concentration of lurasidone possibly increased by • ERYTHROMYCIN (see under Lurasidone, in BNF); increased risk of ventricular arrhythmias when pimozide given with • ERYTHROMYCIN—avoid concomitant use; plasma concentration of clozapine possibly increased by • ERYTHROMYCIN (possible increased risk of convulsions); possible increased risk of ventricular arrhythmias when pimozide given with • ERYTHROMYCIN; enhanced hypotensive effect when antipsychotics given with • ERYTHROMYCIN—avoid concomitant use; plasma concentration of quetiapine increased by • ERYTHROMYCIN—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when sulpiptide given with parenteral • ERYTHROMYCIN; increased risk of ventricular arrhythmias when zuclopenthixol given with parenteral • ERYTHROMYCIN—avoid concomitant use; plasma concentration of clozapine increased by • CIPROFLOXACIN; plasma concentration of olanzapine possibly increased by • CIPROFLOXACIN; increased risk of ventricular arrhythmias when droperidol, haloperidol, phenothiazines or zuclopenthixol given with • MOXIFLOXACIN—avoid concomitant use; increased risk of ventricular arrhythmias when benperidol given with • MOXIFLOXACIN—manufacturer of benperidol advises avoid concomitant use; plasma concentration of aripiprazole possibly reduced by • RIFABUTIN and • RIFAMPICIN (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); plasma concentration of lurasidone reduced by • RIFAMPCIN—avoid concomitant use; plasma concentration of clozapine possibly reduced by • RIFAMPICIN—enhanced hypotensive and metabolism of haloperidol accelerated by • RIFAMPICIN (reduced plasma concentration); avoid concomitant use of clozapine with • CHLORPHENIRAMINE or • SULFONAMIDES (increased risk of agranulocytosis); increased risk of ventricular arrhythmias when droperidol, haloperidol or pimozone given with • DELAMANID; increased risk of
Antipsychotics

- **Antiepileptics** (continued)
  - ventricular arrhythmias when phenothiazines that prolong the QT interval given with [DELAMANIDE]; manufacturer of droperidol advises avoid concomitant use with [MACROLIDES] (risk of ventricular arrhythmias); plasma concentration of clozapine possibly increased by [CARBAMAZEPINE]; plasma concentration of haloperidol possibly reduced by [PHENOTYMIC]; plasma concentration of the drugs reduced when chlorpromazine given with [FOSPHENOTYMIC]; metabolism of haloperidol accelerated by [PHENOBARBITAL] and [PRIMIDONE]; plasma concentration of clozapine possibly reduced by [PHENOBARBITAL] and [PRIMIDONE]; metabolism of clozapine and quetiapine accelerated by [PHENOTYMIC] (reduced plasma concentration); plasma concentration of haloperidol increased by [CARBAMAZEPINE].

- **Antidepressants**:
  - plasma concentration of clozapine possibly increased by [CITALOPRAM] (increased risk of toxicity); avoidance of haloperidol, phenothiazines and pimozide advised by manufacturer of [CITALOPRAM] (risk of ventricular arrhythmias); avoidance of haloperidol, phenothiazines and pimozide advised by manufacturer of [CITALOPRAM] (risk of ventricular arrhythmias); plasma concentration of aripiprazole possibly reduced by [SERTRALINE] and [TRICYLICS] (risk of ventricular arrhythmias); plasma concentration of asenapine and haloperidol possibly increased by [FLUVAXOMINE]; plasma concentration of clozapine and olanzapine increased by [FLUVAXOMINE]; plasma concentration of haloperidol increased by [FLUVAXOMINE] (see under haloperidol BNF); plasma concentration of lurasidone possibly increased by [TRICYLICS] (increased risk of toxicity); metabolism of phe...
Antipsychotics — Antipsychotics

Antipsychotics (continued)

- Antivirals: plasma concentration of aripiprazole possibly increased by ATAZANAVIR, DURANAVIR, FOSAMPRENAVIR, INDINAVIR, LOPINAVIR, RITONAVIR, and SAQUINAVIR and TIPRANAVIR (reduce dose of aripiprazole—consult aripiprazole product literature); plasma concentration of quetiapine possibly increased by ATAZANAVIR, BOCEPRIVIR, DARUNAVIR, FOSAMPRENAVIR, INDINAVIR, LOPINAVIR, RITONAVIR, SAQUINAVIR and TIPRANAVIR—manufacturer of quetiapine advises avoid concomitant use; plasma concentration of pimozone possibly increased by ATAZANAVIR—avoid concomitant use; avoidance of pimozone advised by manufacturer of BOCEPRIVIR and TIPRANAVIR—manuf of pimozone reduces QT intervals—avoid concomitant use

- Calcium-channel Blockers: increased risk of ventricular arrhythmias when antipsychotics given with pimozone possibly increased by ATAZANAVIR—avoid concomitant use; increased risk of ventricular arrhythmias when haloperidol given with ARSENCI TIOXIDE; increased risk of ventricular arrhythmias when haloperidol given with ARSENCI TIOXIDE

- Beta-blockers: enhanced hypotensive effect when antipsychotics given with MIOMBITIN; increase in plasma concentration of antipsychotics possibly increased by ARSENCI TIOXIDE and quetiapine advised by manufacturer of AMIODARONE; possible increased risk of ventricular arrhythmias when amisulpride, chlorpromazine, haloperidol, pimozide, sulpiride or zuclopenthixol given with VANDANIAN—avoid concomitant use; increased risk of ventricular arrhythmias when amisulpride, chlorpromazine, haloperidol, pimozide, sulpiride or zuclopenthixol given with VANDANIAN—avoid concomitant use; increased risk of ventricular arrhythmias when haloperidol given with ARSENCI TIOXIDE

- Dopaminergics: increased risk of extrapyramidal side-effects when antipsychotics given with APOMPHINE, CO-BENEDOLPA, CO-CARELOPDA, LEVODOPA and PERGOLIDE; antipsychotics antagonise hypoprolactinaemic and antiparkinsonian effects of BROMOCRIPTINE and CABELERGOLINE; manufacturer of amisulpride advises avoid concomitant use of CO-BENEDOLPA, CO-CARELOPDA and LEVODOPA (agonism of effect); avoidance of antipsychotics advised by manufacturer of PRAMIPEXOLE, ROPINRILO and ROTIGOTINE (agonism of effect)

- Ergot alkaloids: lurasidone possibly increased plasma concentration of ERGOT ALKALOIDS (increased risk of toxicity)

- Fosaprepitant: avoidance of pimozone advised by manufacturer of FOSAPREPITANT

- Grapefruit Juice: manufacturer of lurasidone and pimozone advises avoid concomitant use with GRAPEFRUIT JUICE; plasma concentration of quetiapine possibly increased by GRAPEFRUIT JUICE—manufacturer of quetiapine advises avoid concomitant use

- Guanfacine: sedative effects possibly increased when antipsychotics given with GUANFACINE

- Histamine: antipsychotics theoretically antagonise effects of HISTAMINE—manufacturer of histamine advises avoid concomitant use

- Hormone Antagonists: manufacturer of droperidol advises avoid concomitant use with TAMOXIFEN (risk of ventricular arrhythmias)

- Ivabradine: increased risk of ventricular arrhythmias when pimozone given with IVABRADINE

- Lithium: increased risk of extrapyramidal side-effects and possibly neurotoxicity when clozapine, fluoxetine, haloperidol, phenothiazines, risperidone or zuclopenthixol given with LITHIUM; possible risk of toxicity when olanzapine given with LITHIUM; extrapyramidal side-effects of quetiapine possibly increased by LITHIUM; increased risk of extrapyramidal side-effects when sulpiride given with LITHIUM

- Memantine: effects of antipsychotics possibly reduced by MEMANTINE

- Metaphosphates: enhanced hypotensive effect when antipsychotics given with METHYLPAPA (also increased risk of extrapyramidal effects)

- Moxonidine: enhanced hypotensive effect when antipsychotics given with MOXONIDINE

- Muscle Relaxants: promazine possibly enhances effects of SUXAMETHONIUM

- Nitrates: enhanced hypotensive effect when antipsychotics given with NITRATES

- Cytotoxics: avoid concomitant use of clozapine with 5-Flouracil; increased risk of agranulocytosis; possible increased risk of ventricular arrhythmias when haloperidol given with BOSEZIPTI; caution with pimozone advised by
Antipsychotics  (continued)

- Penicillamine: increased risk of haematological toxicity when clonazepam given with  penicillamine — manufacturer of penicillamine advises avoid concomitant use
- Pemi matesine: increased risk of ventricular arrhythmias when amisulpride or droperidol given with  pemimatesine — avoid concomitant use; increased risk of ventricular arrhythmias when phenothiazines given with  pemimatesine
- Sodium Benzoate: haloperidol possibly reduces effects of  sodium benzoate
  - Sodium Oxolate: antipsychotics possibly enhance effects of  sodium oxylate
  - Sodium Phenylbutyrate: haloperidol possibly reduces effects of  sodium phenylbutyrate
- Symptomatics: antipsychotics antagonise hypertensive effect of  symptomatics; antipsychotic effects of chlorpromazine possibly antagonised by  symptomatics; chlorpromazine possibly reduces effects of  Lisdexamfetamine; side-effects of risperidone possibly increased by  methylphenidate
- Tacrolimus: manufacturer of droperidol advises avoid concomitant use with  tacrolimus (risk of ventricular arrhythmias)
  - Tetrabenazine: increased risk of extrapyramidal side-effects when antipsychotics given with  tetrabenazine
  - Ulcer-healing Drugs: effects of antipsychotics, chlorpromazine and clozapine possibly enhanced by  Ulcer-healing Drugs; plasma concentration of clozapine possibly reduced by  Ulcer-healing Drugs; absorption of sulpiride reduced by  Ulcer-healing Drugs
- Vasodilator Antihypertensives: enhanced hypotensive effect when phenothiazines given with  Vasodilator Antihypertensives, minoxidil or  Sodium nitroprusside

Antivirals see individual drugs

Anxiolytics and Hypnotics

- ACE Inhibitors: enhanced hypotensive effect when anxiolytics and hypnotics given with  ACE inhibitors
- Adrenergic Neurone Blockers: enhanced hypotensive effect when anxiolytics and hypnotics given with  adrenergic neurone blockers
- Alcohol: increased sedative effect when anxiolytics and hypnotics given with  alcohol
- Alphablockers: enhanced hypotensive and sedative effects when anxiolytics and hypnotics given with  alphablockers
- Aminophylline: effects of benzodiazepines possibly reduced by  aminophylline
- Anaesthetics, General: increased sedative effect when anxiolytics and hypnotics given with  anaesthetics
- Analgesics: metabolism of midazolam possibly inhibited by  analgesics; increased sedative effect when anxiolytics and hypnotics given with  analgesics
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when anxiolytics and hypnotics given with  angiotensin-II receptor antagonists
- Antibacterials: metabolism of midazolam inhibited by  antibacterials; metabolism of midazolam inhibited by  clarithromycin, erythromycin and  telithromycin (increased plasma concentration with increased sedation); plasma concentration of buspirone increased by  clarithromycin; manufacturer of clarithromycin advises avoid concomitant use with  clarithromycin; metabolism of zopiclone inhibited by  clarithromycin; manufacturer of zopiclone advises avoid concomitant use with  clarithromycin; metabolism of benzodiazepines possibly accelerated by  rifampicin (reduced plasma concentration); metabolism of diazepam and zaleplon accelerated by  rifampicin (reduced plasma concentration); metabolism of buspirone possibly accelerated by  rifampicin; metabolism of midazolam accelerated by  rifampicin (reduced plasma concentration and reduced effect); plasma concentration of zopiclone significantly reduced by  rifampicin; metabolism of diazepam inhibited by  isoniazid
- Anticoagulants: chloral may transiently enhance anticoagulant effect of  anticoagulants
- Antidepressants: plasma concentration of alprazolam increased by  fluoxetine; plasma concentration of melatonin increased by  fluoxetine — avoid concomitant use; plasma concentration of some benzodiazepines increased by  fluoxetine

Antidepressants (continued)

- Fluvoxamine: sedative effects possibly increased when zolpidem given with  fluvoxamine — manufacturer of fluvoxamine advises avoid concomitant use with  fluvoxamine; avoidance of buspirone for 14 days after stopping  fluvoxamine advised by manufacturer of tranylcypromine; plasma concentration of oral midazolam possibly reduced by  fluvoxamine — avoid concomitant use with  fluvoxamine; midazolam; increased sedative effect when anxiolytics and hypnotics given with  mirtazapine, tricyclic-related antidepressants or  tricyclics
- Antipsychotics: plasma concentration of midazolam reduced by  carbamazepine and  perampanel; plasma concentration of clonazepam often reduced by  carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone; benzodiazepines possibly increase or decrease plasma concentration of  carbamazepine, fosphenytoin and  phenytoin; diazepam increases or decreases plasma concentration of  carbamazepine, fosphenytoin and  phenytoin; increased sedative effect when anxiolytics and hypnotics given with  mirtazapine, tricyclic-related antidepressants or  tricyclics

Antipsychotics — Anxiolytics and Hypnotics

- Antidepressants (continued)
- Fluvoxamine: sedative effects possibly increased when zolpidem given with  fluvoxamine — manufacturer of fluvoxamine advises avoid concomitant use with  fluvoxamine; avoidance of buspirone for 14 days after stopping  fluvoxamine advised by manufacturer of tranylcypromine; plasma concentration of oral midazolam possibly reduced by  fluvoxamine — avoid concomitant use with  fluvoxamine; midazolam; increased sedative effect when anxiolytics and hypnotics given with  mirtazapine, tricyclic-related antidepressants or  tricyclics
- Antipsychotics: plasma concentration of midazolam reduced by  carbamazepine and  perampanel; plasma concentration of clonazepam often reduced by  carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone; benzodiazepines possibly increase or decrease plasma concentration of  carbamazepine, fosphenytoin and  phenytoin; diazepam increases or decreases plasma concentration of  carbamazepine, fosphenytoin and  phenytoin; increased sedative effect when anxiolytics and hypnotics given with  mirtazapine, tricyclic-related antidepressants or  tricyclics

- Antipsychotics: plasma concentration of midazolam reduced by  carbamazepine and  perampanel; plasma concentration of clonazepam often reduced by  carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone; benzodiazepines possibly increase or decrease plasma concentration of  carbamazepine, fosphenytoin and  phenytoin; diazepam increases or decreases plasma concentration of  carbamazepine, fosphenytoin and  phenytoin; increased sedative effect when anxiolytics and hypnotics given with  mirtazapine, tricyclic-related antidepressants or  tricyclics

- Antipsychotics: plasma concentration of midazolam reduced by  carbamazepine and  perampanel; plasma concentration of clonazepam often reduced by  carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone; benzodiazepines possibly increase or decrease plasma concentration of  carbamazepine, fosphenytoin and  phenytoin; diazepam increases or decreases plasma concentration of  carbamazepine, fosphenytoin and  phenytoin; increased sedative effect when anxiolytics and hypnotics given with  mirtazapine, tricyclic-related antidepressants or  tricyclics
Anxiolytics and Hypnotics (continued)

Aprepitant: plasma concentration of midazolam increased by APREPIVANT (risk of prolonged sedation)

Beta-blockers: enhanced hypertensive effect when anxiolytics and hypnotics given with β-BLOCKERS

Calcium-channel Blockers: enhanced hypertensive effect when anxiolytics and hypnotics given with CALCIUM-CHANNEL BLOCKERS; midazolam increases absorption of LERCANIDIPINE; metabolism of midazolam inhibited by DILTIAZEM and VERAPAMIL (increased plasma concentration with increased sedation); plasma concentration of buspirone increased by DILTIAZEM and VERAPAMIL (reduce dose of buspirone)

Cardiac Glycosides: alprazolam increases plasma concentration of DIGOXIN (increased risk of toxicity)

Clonidine: enhanced hypertensive effect when anxiolytics and hypnotics given with CLONIDINE

Cobicistat: avoidance of oral midazolam advised by manufacturer of COBICISTAT

Cytotoxics: plasma concentration of midazolam increased by CIZOTINIB and NILOTINIB; avoidance of oral midazolam advised by manufacturer of IDEALISIB

Deferasirox: plasma concentration of midazolam possibly reduced by DEFERASIROX

Diazoxide: enhanced hypertensive effect when anxiolytics and hypnotics given with DIAZOXIDE

Disulfiram: metabolism of benzodiazepines inhibited by DISULFIRAM (increased sedative effects); increased risk of temazepam toxicity when given with DISULFIRAM

Dietetics: enhanced hypertensive effect when anxiolytics and hypnotics given with DIURETICS; administration of chloral with parenteral FUROSEMIDE may displace thyroid hormone from binding sites

Dopaminergics: benzodiazepines possibly antagonise effects of CO-BENELDOPA, CO-CARELDOPA and LEVODOPA

Fosaprepitant: plasma concentration of midazolam increased by FOSAPREPIVANT (risk of prolonged sedation)

Grapefruit Juice: plasma concentration of oral midazolam possibly increased by GRAPEFRUIT JUICE; plasma concentration of buspirone increased by GRAPEFRUIT JUICE

Guanfacine: sedative effects possibly increased when anxiolytics and hypnotics given with GUANFACINE

Hormone Antagonists: plasma concentration of midazolam reduced by ENZALUTAMIDE

Ivacaftor: plasma concentration of midazolam increased by IVACAFTOR

Lipid-regulating Drugs: plasma concentration of Intravenous midazolam increased by ATORVASTATIN; separating administration from alprazolam by 12 hours advised by manufacturer of LOMITAPIDE

Lithium: increased risk of neurotoxicity when clonazepam given with LITHIUM

Lofexidine: increased sedative effect when anxiolytics and hypnotics given with LOFEXIDINE

Methyldopa: enhanced hypertensive effect when anxiolytics and hypnotics given with METHYLDOPA

Methylthioninium: possible risk of CNS toxicity when buspirone given with METHYLTHIONINIUM—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

Moxonidine: enhanced hypertensive effect when anxiolytics and hypnotics given with MOXONIDINE; sedative effects possibly increased when benzodiazepines given with MOXONIDINE

Muscle Relaxants: increased sedative effect when anxiolytics and hypnotics given with BACLOFEN or TIZANIDINE

Netupitant: plasma concentration of midazolam increased by NETUPITANT

Nitrates: enhanced hypertensive effect when anxiolytics and hypnotics given with NITRATES

Oestrogens: plasma concentration of melatonin increased by OESTROGENS; plasma concentration of chloridiazepoxide, diazepam and nitrazepam possibly increased by OESTROGENS; plasma concentration of lorazepam, oxazepam and temazepam possibly reduced by OESTROGENS

Progestogens: plasma concentration of chloridiazepoxide, diazepam and nitrazepam possibly increased by PROGESTOGENS

Sodium Oxybate: benzodiazepines enhance effects of SODIUM OXYBATE (avoid concomitant use)

Theophylline: effects of benzodiazepines possibly reduced by THEOPHYLLINE

Ulcere-healing Drugs: plasma concentration of melatonin increased by Cimetidine (increased plasma concentration); metabolism of diazepam possibly inhibited by ESOMEPRAZOLE and OMEPRAZOLE (increased plasma concentration)

Vasodilators: enhanced hypertensive effect when anxiolytics and hypnotics given with HYDRAZINE, MINOXIDIL or SODIUM MITROPRUSIDE

Apixaban

Analgesics: increased risk of haemorrhage when concomitant use with Intravenous diclofenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ketorolac (avoid concomitant use, including low-dose heparins)

Antibacterials: manufacturer of apixaban advises avoid concomitant use with clarithromycin and telithromycin; plasma concentration of apixaban possibly reduced by rifampicin—manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism

Anticoagulants: increased risk of haemorrhage when apixaban given with other anticoagulants (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with dabigatran, edoxaban and rivaroxaban (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)

Antidepressants: plasma concentration of apixaban possibly reduced by ST JOHN'S WORT—manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism

Antiepileptics: plasma concentration of apixaban possibly reduced by carbamazepine—manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism; plasma concentration of apixaban possibly reduced by fosphenytoin, phenobarbital, phenytoin and primidone

Antifungals: plasma concentration of apixaban increased by ketoconazole—manufacturer of apixaban advises avoid concomitant use; manufacturer of apixaban advises avoid concomitant use with itraconazole, posaconazole and voriconazole

Antivirals: manufacturer of apixaban advises avoid concomitant use with atazanavir, boceprevir, darunavir, fosamprenavir, indinavir, lopinavir, ritonavir, saquinavir, telaprevir and tipranavir

Cobicistat: manufacturer of apixaban advises avoid concomitant use with cobicistat

Sulfipyrazole: increased risk of bleeding when apixaban given with sulfipyrazole

Apomorphine

Antipsychotics: effects of apomorphine antagonised by antipsychotics

Dopemiperone: possible increased risk of ventricular arrhythmias when apomorphine given with domperidone

Dopaminergics: effects of apomorphine possibly enhanced by entacapone

5HT1-receptor Antagonists: possible increased hypertensive effect when apomorphine given with ondansetron—avoid concomitant use

Memantine: effects of dopaminergics possibly enhanced by memantine

Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa
Apraclonidine

> Antidepressants: manufacturer of apraclonidine advises avoid concomitant use with MAOIs, TRICYCLIC-RELATED ANTIDEPRESSANTS and TRICYCLES
> Sympathomimetics: manufacturer of apraclonidine advises avoid concomitant use with SYMPATHOMIMETICS

Apremilast

> Antidepressants: plasma concentration of apremilast reduced by RIFAMPICIN — avoid concomitant use
> Antipsychotics: plasma concentration of apremilast possibly reduced by ST JOHN’S WORT — avoid concomitant use
> Antiepileptics: plasma concentration of apremilast possibly reduced by CARBAMAZEPINE, PHENOBARBITAL and PHENYTOIN — avoid concomitant use

Aripiprazole

> Antidepressants: manufacturer of aripiprazole advises avoid concomitant use with ANTIDEPRESSANTS

Arsenic Trioxide

> Antibacterials: increased risk of ventricular arrhythmias when arsenic trioxide given with DELAMANID, ERYTHROMYCIN, LEVOFLOXACIN or MOXIFLOXACIN
> Antidepressants: increased risk of ventricular arrhythmias when arsenic trioxide given with AMITRIPTYLINE or CLOMPARIMINE
> Antifungals: increased risk of ventricular arrhythmias when arsenic trioxide given with AMPHOTERICIN
> Antimalarials: avoidance of arsenic trioxide advised by manufacturer of ARTENIMOL WITH PIPERAQUINE (possible risk of ventricular arrhythmias)
> Antiarrhythmics: increased risk of ventricular arrhythmias when arsenic trioxide given with ANTIARRHYTHMICS that prolong the QT interval; increased risk of ventricular arrhythmias when arsenic trioxide given with HALOPERIDOL; avoid concomitant use of cytotoxics with CLOZAPINE (increased risk of agranulocytosis)
> Beta-blockers: increased risk of ventricular arrhythmias when arsenic trioxide given with SOTALOL

Anticoagulants:

> Anticoagulants given with DISOPYRAMIDE (risk of prolonged sedation)
> Anticoagulants given with HISTAMINE — see under HISTAMINE
> Anticoagulants given with PRIMIDONE, CARBAMAZEPINE, CARBAMAZEPINE, PHENOBARBITAL, PHENOBARBITAL, CARBAMAZEPINE and PRIMIDONE

Antidepressants:

> Antidepressants: plasma concentration of aripiprazole increased by CLARITHROMYCIN and TELITHROMYCIN — plasma concentration of aripiprazole reduced by RIFAMPICIN
> Antidepressants: manufacturer of aripiprazole advises avoid concomitant use with ST JOHN’S WORT
> Antidepressants: plasma concentration of aripiprazole increased by hypokalaemia caused by ACE INHIBITORS, LOOP DIURETICS or THIAZIDES AND RELATED DIURETICS
> Antidepressants: increased risk of ventricular arrhythmias with arsenic trioxide given with SOTALOL

Antipsychotics:

> Antipsychotics: manufacturer of aripiprazole advises avoid concomitant use with AMIODARONE, DISOPYRAMIDE and FLECAINIDE (risk of ventricular arrhythmias)
> Antipsychotics: manufacturer of aripiprazole advises avoid concomitant use with MACROLIDES and QUINOLONES
> Antipsychotics: possible increased risk of ventricular arrhythmias when aripiprazole with lumeofantrine given with CITALOPRAM or ESCITALOPRAM — avoids concomitant use

Arsenic Trioxide (continued)

> Antipsychotics: manufacturer of aripiprazole advises avoid concomitant use with AMIODARONE or AMIODARONE
> Antipsychotics: avoidance of aripiprazole advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE (possible risk of ventricular arrhythmias)

Beta-blockers:

> Beta-blockers: manufacturer of aripiprazole advises avoid concomitant use with METOPROLOL and SOTALOL
> Beta-blockers: possible increased risk of ventricular arrhythmias when aripiprazole with lumeofantrine given with VANDENATANIB — avoid concomitant use

β-blockers: manufacturer of aripiprazole advises avoid concomitant use with CIMETIDINE

loxofantrine

> lumeprafene

Antimalarials:

> Antimalarials: lumeprafene with lumeofantrine advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE (possible risk of ventricular arrhythmias)
> Antimalarials: advice for lumeprafene with Artemether with Lumefantrine reduce dose of ibrutinib (see under Ibrutinib, in BNF)
> Antimalarials: Artemether with Lumefantrine advised by manufacturer of Artemether with Lumefantrine avoid concomitant use with ANTDEPRESSANTS
> Antimalarials: Artemether with Lumefantrine advised by manufacturer of Artemether with Lumefantrine avoid concomitant use with ANTIPSYCHOTICS
> Antimalarials: Artemether with Lumefantrine advised by manufacturer of Artemether with Lumefantrine avoid concomitant use with ATMALARIALS

Farnesyltransferase Inhibitors:

> Farnesyltransferase Inhibitors: Artemether with Lumefantrine advised by manufacturer of Artemether with Lumefantrine avoid concomitant use with ATMALARIALS

Histamine: avoidance of antimalarials advised by manufacturer of HISTAMINE

Interactions | Appendix 1

Artemether with Lumefantrine

> Artemether with Lumefantrine: manufacturer of Artemether with Lumefantrine advises avoid concomitant use with LITHIUM

Antipsychotics:

> Antipsychotics: manufacturer of Artemether with Lumefantrine advises avoid concomitant use with AMIODARONE, DISOPYRAMIDE and FLECAINIDE (risk of ventricular arrhythmias)

Ibrutinib:

> Ibrutinib: manufacturer of Artemether with Lumefantrine advises avoid concomitant use with ATMALARIALS

Beta-blockers:

> Beta-blockers: manufacturer of Artemether with Lumefantrine advises avoid concomitant use with IMMUNOSUPPRESSANTS and TRIAZOLES

Antipsychotics:

> Antipsychotics: manufacturer of Artemether with Lumefantrine advises avoid concomitant use with ATPSYCHOTICS

Antihistamines:

> Antihistamines: Artemether with Lumefantrine advised by manufacturer of Artemether with Lumefantrine avoid concomitant use with ATMALARIALS

Cytotoxics:

> Cytotoxics: Artemether with Lumefantrine advised by manufacturer of Artemether with Lumefantrine avoid concomitant use with ATMALARIALS

Diuretics:

> Diuretics: Artemether with Lumefantrine advised by manufacturer of Artemether with Lumefantrine avoid concomitant use with ATMALARIALS

Histamine:

> Histamine: Artemether with Lumefantrine advised by manufacturer of Artemether with Lumefantrine avoid concomitant use with ATMALARIALS

Antipsychotics:

> Antipsychotics: manufacturer of Artemether with Lumefantrine advises avoid concomitant use with ATMALARIALS

Cimetidine:

> Cimetidine: Artemether with Lumefantrine advised by manufacturer of Artemether with Lumefantrine avoid concomitant use with ATMALARIALS

Antihistamines:

> Antihistamines: Artemether with Lumefantrine advised by manufacturer of Artemether with Lumefantrine avoid concomitant use with ATMALARIALS

Antimalarials:

> Antimalarials: Artemether with Lumefantrine advised by manufacturer of Artemether with Lumefantrine avoid concomitant use with ATMALARIALS

Antidepressants:

> Antidepressants: manufacturer of Artemether with Lumefantrine advises avoid concomitant use with AMIODARONE, DISOPYRAMIDE and FLECAINIDE (risk of ventricular arrhythmias)

Antipsychotics:

> Antipsychotics: manufacturer of Artemether with Lumefantrine advises avoid concomitant use with AMIODARONE, DISOPYRAMIDE and FLECAINIDE (risk of ventricular arrhythmias)

Antimalarials:

> Antimalarials: Artemether with Lumefantrine advised by manufacturer of Artemether with Lumefantrine avoid concomitant use with ATMALARIALS

Antidepressants:

> Antidepressants: manufacturer of Artemether with Lumefantrine advises avoid concomitant use with AMIODARONE, DISOPYRAMIDE and FLECAINIDE (risk of ventricular arrhythmias)
Arteminol with Piperaquine

**Note:** Piperaquine has a long half-life; there is a potential for drug interactions to occur for up to 5 months after treatment has stopped.

- Analgesics: manufacturer of arteminol with piperaquine advises avoid concomitant use with **METHADONE** (possible risk of ventricular arrhythmias)
- Anti-arrhythmics: manufacturer of arteminol with piperaquine advises avoid concomitant use with **AMIODARONE** and **SULFINPYRAZONE** (possible risk of ventricular arrhythmias)
- Antibacterials: manufacturer of arteminol with piperaquine advises avoid concomitant use with **MACROLIDES** and **MOXIFLOXACIN** (possible risk of ventricular arrhythmias); manufacturer of arteminol with piperaquine advises avoid concomitant use with **HEPARINS**
- Antidepressants: possible increased risk of ventricular arrhythmias when arteminol with piperaquine given with **CITALOPRAM** or **ESCITALOPRAM**—avoid concomitant use; manufacturer of arteminol with piperaquine advises avoid concomitant use with **ANTIDEPRESSANTS**
- Antihistamines: avoidance of antimalarials advised by manufacturer of **ARTEMETHER WITH LUMEFANTRINE**
- Antipsychotics: manufacturer of arteminol with piperaquine advises avoid concomitant use with **HISTAMINE**—avoid concomitant use; **HALOPERIDOL**, **PHENOTHIAZINES**, and **PIMIDAZOLE** (possible risk of ventricular arrhythmias)
- Antivirals: manufacturer of arteminol with piperaquine advises avoid concomitant use with **SAQUINAVIR**—possible increased risk of ventricular arrhythmias
- Beta-blockers: manufacturer of arteminol with piperaquine advises avoid concomitant use with **SOTALOL** (possible risk of ventricular arrhythmias)
- Cytotoxics: manufacturer of arteminol with piperaquine advises avoid concomitant use with **ARSENIC TRIOXIDE** (possible risk of ventricular arrhythmias); manufacturer of arteminol with piperaquine advises avoid concomitant use with **VINBLASTINE**, **VINCRISTINE**, and **VINFLUNINE** and **VINORELBINE**
- Diuretics: manufacturer of arteminol with piperaquine advises avoid concomitant use with **D diapers** (possible risk of ventricular arrhythmias)
- Grapefruit Juice: manufacturer of arteminol with piperaquine advises avoid concomitant use with **GRAPEFRUIT JUICE**
- Histamine: avoidance of antimalarials advised by manufacturer of **HISTAMINE**
- Penicillamine: increased risk of haematological toxicity when antimalarials given with **PENCILLAMINE**—manufacturer of penicillamine advises avoid concomitant use
- Pentaamidine isteionate: manufacturer of arteminol with piperaquine advises avoid concomitant use with **PENTAMIDINE ISETIONATE** (possible risk of ventricular arrhythmias)
- Vaccines: antimalarials inactivate **ORAL Typhoid Vaccine**—see under Typhoid Vaccine in BNFC

**Ascorbic acid** see Vitamins

**Azeapin** see Antipsychotics

**Aspirin**

- Adsorbenrs: absorption of aspirin possibly reduced by **KAOLIN**
- Anaesthetics, General: aspirin possibly enhances effects of **THIOPENAL**
- Analgesics: avoid concomitant use of aspirin with **NSAIDS** (increased side-effects); antiplatelet effect of aspirin possibly reduced by **IBUPROFEN**
- Antacids: exceed of aspirin increased by alkaline urine due to some **ANTACIDS**
- Anticoagulants: increased risk of bleeding when aspirin given with **COUMARINS** or **PHENINDIONE** (due to antplatelet

**Aspirin**

- Anticoagulants: (continued) effect); increased risk of bleeding when high-dose aspirin given with **EDOXABAN**—avoid concomitant use; aspirin possibly enhances anticoagulant effect of **WARFARIN**
- Antidepressants: increased risk of bleeding when aspirin given with **SSRIS** or **VENLAFAXINE**—antiplatelet: aspirin enhances effects of **FOSPHENYTOIN**, **PHENTYNOIN**, **SODIUM VALPROATE** and **VALPROIC ACID**
- Anticoagulants: increased risk of bleeding when aspirin given with **CLOPIDOGREL**
- Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when aspirin given with **CORTICOSTEROIDS**, also corticosteroids reduce plasma concentration of salicylate
- Cytotoxics: aspirin reduces excretion of **METHOTREXATE** (increased risk of toxicity); aspirin possibly reduces renal excretion of **PEMETREXED**—consult product literature
- Diuretics: increased risk of toxicity when high-dose aspirin given with **ACEZOLAMIDE**; aspirin antagonises diuretic effect of **SPIRINOLACTONE**—possible increased risk of toxicity when high-dose aspirin given with **LOOP DIURETICS** (also possible reduced effect of loop diuretics)
- Iloprost: increased risk of bleeding when aspirin given with **ILOPROST**
- Leukotriene Receptor Antagonists: aspirin increases plasma concentration of **ZAFIRILUKAST**
- Metoclopramide: rate of absorption of aspirin increased by **METOCLOPRAMIDE** (enhanced effect)
- Niacinamide: increased risk of gastro-intestinal bleeding and ulceration when aspirin given with **NICORANDIL**
- Sulfinpyrazone: aspirin antagonises effects of **SULFINPYRAZONE**

**Atazanavir**

- Analgesics: atazanavir increases plasma concentration of **BUPRENORPHINE**
- Antacids: absorption of atazanavir reduced by **ANTACIDS** (give at least 2 hours before or 1 hour after antacid)
- **Anti-arrhythmics: atazanavir possibly increases plasma concentration of **AMIODARONE** and **LIDOCAINE**
- Antibacterials: plasma concentration of both drugs increased when atazanavir given with **CLARITHROMYCIN**; atazanavir increases plasma concentration of **RIFABUTIN** (reduce dose of rifabutin); plasma concentration of atazanavir reduced by **RIFAMPICIN**—avoid concomitant use; atazanavir increases or decreases the plasma concentration of **CARBAMAZEPINE**, **HEPARINS**, and **PHENYTOIN**
- **Anticoagulants: atazanavir may enhance or reduce anticoagulant effect of **WARFARIN**; avoidance of atazanavir advised by manufacturer of **APIXABAN** and **RIVAROXABAN**
- **Antidepressants: plasma concentration of atazanavir reduced by **ST JOHN’S WORT**—avoid concomitant use**
- Antifungals: plasma concentration of atazanavir increased by **POSACONAZOLE**; atazanavir increases or decreases the plasma concentration of **VORICONAZOLE** and plasma concentration of atazanavir also reduced
- **Antimalarials: caution with atazanavir advised by manufacturer of **ARTEMETHER WITH LUMEFANTRINE**; atazanavir possibly increases plasma concentration of **QUININE** (increased risk of toxicity)
- Antimuscariniccs: avoidance of atazanavir advised by manufacturer of **DARIFENACIN**; manufacturer of fesoterodine advises dose reduction when atazanavir given with **FESOTERODINE**—consult fesoterodine product literature
- Antipsychotics: atazanavir possibly increases plasma concentration of **ARIPIPRAZOLE** (reduce dose of aripiprazole—consult aripiprazole product literature); atazanavir possibly increases plasma concentration of **PIMIDAZOLE**—avoid concomitant use; atazanavir possibly increases plasma concentration of **QUETIAPINE**—manufacturer of quetiapine advises avoid concomitant use
- **Antivirals: plasma concentration of atazanavir reduced by **SOCEPREVIR**; atazanavir increases the plasma concentration of **DACLATASVIR**—reduce dose of daclatasvir (see under Daclatasvir, in BNFC); absorption of atazanavir reduced by **DIDANOSINE tablets** (give at least 2 hours before or 1 hour after didanosine tablets); manufacturer of atazanavir advises avoid concomitant use with **EPAVIREN** (plasma concentration of...
Atazanavir

- Antivirals (continued)
  - Atazanavir reduced; atazanavir boosted with ritonavir increases plasma concentration of elvitegravir (reduce dose of elvitegravir); avoid concomitant use of atazanavir with ritonavir; atazanavir increases plasma concentration of maraviroc (consider reducing dose of maraviroc); plasma concentration of atazanavir possibly reduced by
  - Nevirapine—avoid concomitant use; atazanavir increases plasma concentration of<sub>2</sub> maraviroc; increased risk of ventricular arrhythmias when atazanavir given with
  - Saquinavir—avoid concomitant use; atazanavir possibly reduces plasma concentration of telaprevir, also plasma concentration of atazanavir possibly increased; plasma concentration of atazanavir reduced by tenofovir, also plasma concentration of tenofovir possibly increased; atazanavir increases plasma concentration of tipranavir (also plasma concentration of atazanavir reduced)
- Anxiolytics and Hypnotics: atazanavir possibly increases plasma concentration of midazolam—avoid concomitant use of oral midazolam
- Calcium-channel Blockers: atazanavir increases plasma concentration of diltiazem (reduce dose of diltiazem); atazanavir possibly increases plasma concentration of verapamil
- Ciclosporin: atazanavir possibly increases plasma concentration of ciclosporin
- Colchicine: atazanavir possibly increases risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Cytotoxics: atazanavir possibly increases plasma concentration of axitinib (reduce dose of axitinib—consult axitinib product literature); atazanavir possibly increases the plasma concentration of bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; atazanavir possibly increases plasma concentration of crizotinib and everolimus—manufacturer of crizotinib and everolimus advises avoid concomitant use; atazanavir possibly increases the plasma concentration of ibritinib—reduce dose of ibritinib (see under possibly increased); atazanavir possibly increases plasma concentration of pazopanib (reduce dose of pazopanib); avoidance of atazanavir advised by manufacturer of cabazitaxel; atazanavir possibly inhibits metabolism of irinotecan (increased risk of toxicity)
- Dapoxetine: avoidance of atazanavir advised by manufacturer of dapoxetine (increased risk of toxicity)
- Ergot Alkaloids: atazanavir possibly increases plasma concentration of ergot alkaloids—avoid concomitant use
- Guanfacine: atazanavir possibly increases plasma concentration of guanfacine (halve dose of guanfacine)
- Lipid-regulating Drugs: possible increased risk of myopathy when atazanavir given with atorvastatin or pravastatin; atazanavir increases plasma concentration of rosuvastatin—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when atazanavir given with simvastatin (avoid concomitant use)
- Oestrogenergens: atazanavir increases plasma concentration of ethinylestradiol
- Orlistat: absorption of atazanavir possibly reduced by orlistat
- Progestogens: atazanavir increases plasma concentration of northerosterone
- Ranolazine: atazanavir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use
- Sirolimus: atazanavir possibly increases plasma concentration of sirolimus
- Sympathomimetics, Beta<sub>2</sub>: atazanavir possibly increases plasma concentration of salmeterol—manufacturer of atazanavir advises avoid concomitant use
- Tacrolimus: atazanavir possibly increases plasma concentration of tacrolimus
- Ticagrelor: atazanavir possibly increases plasma concentration of ticagrelor—manufacturer of ticagrelor advises avoid concomitant use

Atazanavir (continued)

- Ulcer-healing Drugs: manufacturer of atazanavir advises adjust doses of both drugs when atazanavir given with cimetidine and nizatidine—consult atazanavir product literature; plasma concentration of atazanavir reduced by<sub>1</sub> famotidine and<sub>1</sub> nizatidine (adjust doses of both drugs—consult atazanavir product literature); plasma concentration of atazanavir reduced by<sub>1</sub> proton pump inhibitors—avoid or adjust dose of both drugs (consult product literature)

Atropine see Antimuscarinics

Avanafil

- ACE Inhibitors: avanafil possibly enhances hypotensive effect of enalapril
- Alcohol: possible enhanced hypotensive effect when avanafil given with alcohol
- Alpha-blockers: enhanced hypotensive effect when avanafil given with alpha-blockers—when patient is stable on the alpha blocker initiate avanafil at the lowest possible dose
- Antibiotics: plasma concentration of avanafil possibly increased by clarithromycin and telithromycin—manufacturer of avanafil advises avoid concomitant use;
**Avanafil**

- **Antibacterials (continued)**
  - plasma concentration of avanafil increased by **ERYTHROMYCIN**—see under Avanafil, in BNF; plasma concentration of avanafil possibly reduced by **RIFAMPICIN**—manufacturer of avanafil advises avoid concomitant use
  - Antiepileptics: plasma concentration of avanafil possibly reduced by **CARBAMAZEPINE, PHENOBARBITAL and PRIMIDONE**—manufacturer of avanafil advises avoid concomitant use
  - Antiinfectives: plasma concentration of avanafil increased by **KETOKONAZOLE**—avoid concomitant use; plasma concentration of avanafil possibly increased by **FLUCONAZOLE**—see under Avanafil, in BNF; plasma concentration of avanafil possibly increased by **TROKAZOLE and Fluocinonide**—manufacturer of avanafil advises avoid concomitant use
  - Antivirals: plasma concentration of avanafil possibly reduced by **EFAVIRENZ**—manufacturer of avanafil advises avoid concomitant use; plasma concentration of avanafil possibly increased by **RIFABUTIN**—see under Avanafil, in BNF; plasma concentration of avanafil possibly increased by **SAQUINAVIR**—manufacturer of avanafil advises avoid concomitant use
  - Antipsychotics: plasma concentration of avanafil increased by **RISPERIDONE**—see under Avanafil, in BNF; plasma concentration of avanafil possibly increased by **COBICISTAT**—manufacturer of avanafil advises avoid concomitant use
  - Calcium-channel blockers: plasma concentration of avanafil increased by **DILTIAZEM** and **VERAPAMIL**—see under Avanafil, in BNF
  - Cobicistat: plasma concentration of avanafil possibly increased by **COBICISTAT**—avoid concomitant use
  - Bosentan: plasma concentration of avanafil possibly reduced by **BOSENTAN**—manufacturer of avanafil advises avoid concomitant use
  - Calcium-channel blockers: plasma concentration of avanafil increased by **LIGNITUDE** and **VERAPAMIL**—see under Avanafil, in BNF

**Axitinib**

- **Antibacterials**: plasma concentration of axitinib possibly increased by **CLARITHROMYCIN, ERYTHROMYCIN and TELITHROMYCIN** (reduce dose of axitinib—consult axitinib product literature); plasma concentration of axitinib possibly decreased by **RIFABUTIN** (increase dose of axitinib—consult axitinib product literature); plasma concentration of axitinib increased by **RIFAMPICIN** (increase dose of axitinib—consult axitinib product literature)
  - Antidepressants: plasma concentration of axitinib possibly reduced by **ST JOHN’S WORT**—consider increasing dose of axitinib
  - Antiepileptics: plasma concentration of axitinib possibly decreased by **CARBAMAZEPINE, FOSPHENYTINO, PHENOBARBITAL, PHENYTOIN and PRIMIDONE** (increase dose of axitinib—consult axitinib product literature)
  - Antifungals: plasma concentration of axitinib increased by **KETOCONAZOLE** (reduce dose of axitinib—consult axitinib product literature); plasma concentration of axitinib possibly increased by **TROKAZOLE** (reduce dose of axitinib—consult axitinib product literature)
  - Antipsychotics: avoid concomitant use of cytoxotics with **CLOZAPINE** (increased risk of agranulocytosis)
  - Antivirals: plasma concentration of axitinib possibly increased by **ATAZANAVIR, INDINAVIR, RITONAVIR and SAQUINAVIR** (reduce dose of axitinib—consult axitinib product literature)
  - Corticosteroids: plasma concentration of axitinib possibly decreased by **DEXAMETHASONE** (increase dose of axitinib—consult axitinib product literature)

**Axitinib** (continued)

- **Anticoagulants**: plasma concentration of axitinib possibly increased by **Grapefruit Juice: plasma concentration of axitinib possibly increased by GRAPEFRUIT JUICE**

**Azathioprine**

- **ACE Inhibitors**: increased risk of anaemia or leukopenia when azathioprine given with **CAPTOPRIL** especially in renal impairment; increased risk of anaemia when azathioprine given with **ENALAPRIL** especially in renal impairment
  - Allopurinol: enhanced effects and increased toxicity of azathioprine when given with **ALLOPURINOL** (reduce dose of azathioprine to one quarter of usual dose)
  - Analgesics: manufacturer of azathioprine advises possible increased risk of myelosuppression when azathioprine given with **INDOMETACIN**
  - Antifungals: increased risk of haematological toxicity when azathioprine given with **SULFAMETHOXAZOLE** (as co-trimoxazole); increased risk of haematological toxicity when azathioprine given with **TRIMETHOPRIM** (also with co-trimoxazole)
  - Anticoagulants: azathioprine possibly reduces anticoagulant effect of **ACENOCOUMAROL**; azathioprine reduces anticoagulant effect of **WARFARIN**
  - Antivirals: myelosuppressive effects of azathioprine possibly increased by **RIFABUTIN**
  - Rifampicin: avoidance of azathioprine advised by manufacturer of **RIFAMPICIN**
  - Ultracalving Drug: manufacturer of azathioprine advises possible increased risk of myelosuppression when azathioprine given with **CITOMIDINE**
  - Vaccines: risk of generalised infections when azathioprine given with live **VACCINES**—avoid concomitant use

**Azelastine** see Antihistamines

**Azelisartan** see Angiotensin-II Receptor Antagonists

**Azithromycin** see Macrolides

**Aztroenam**

- Anticoagulants: aztreonam possibly enhances anticoagulant effect of **COUMARINS**
  - Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNF

**Baclofen** see Muscle Relaxants

**Bambuterol** see Sympathomimetics, Beta-2

**Basilikimab**

- Antipsychotics: avoid concomitant use of cytotoxics with **CLOZAPINE** (increased risk of agranulocytosis)
  - Vaccines: risk of generalised infections when monoclonal antibodies given with live **VACCINES**—avoid concomitant use

**BCG Vaccine** see Vaccines

**Beclometasone** see Corticosteroids

**Bedaquiline**

- **Antibacterials**: plasma concentration of bedaquiline possibly increased by **CIPROFLOXACIN, CLARITHROMYCIN and ERYTHROMYCIN**—avoid concomitant use if ciprofloxacin, clarithromycin and erythromycin given for more than 14 days; manufacturer of bedaquiline advises avoid concomitant use with **MOXIFLOXACIN**; plasma concentration of bedaquiline possibly reduced by **RIFABUTIN**—manufacturer of bedaquiline advises avoid concomitant use; plasma concentration of bedaquiline reduced by **RIFAMPICIN**—manufacturer of bedaquiline advises avoid concomitant use; possible increased risk of ventricular arrhythmias when bedaquiline given with **CLOFAZIMINE**
  - Antidepressants: plasma concentration of bedaquiline possibly reduced by **ST JOHN’S WORT**—manufacturer of bedaquiline advises avoid concomitant use
  - Antiepileptics: plasma concentration of bedaquiline possibly reduced by **CARBAMAZEPINE, FOSPHENYTINO and PHENYTOIN**—manufacturer of bedaquiline advises avoid concomitant use
  - Anticoagulants: plasma concentration of bedaquiline possibly increased by **KETOCONAZOLE**—avoid concomitant use if ketoconazole given for more than 14 days; plasma concentration of bedaquiline possibly increased by **FLUCONAZOLE**—avoid concomitant use if fluconazole given for more than 14 days
  - Antivirals: plasma concentration of bedaquiline possibly increased by **EFAVIRENZ and ETARVIREN**—manufacturer of bedaquiline advises avoid concomitant use; plasma...
**Beta-blockers**

- **Antidepressants** (continued)
  - increased risk of ventricular arrhythmias; plasma concentration of propranolol increased by fluvoxamine; plasma concentration of metoprolol possibly increased by paroxetine; increased risk of AV block (manufacturer of paroxetine advises avoid concomitant use in cardiac insufficiency); labetalol and propranolol increase plasma concentration of imipramine; enhanced hypotensive effect when beta-blockers given with moxonidine; increased risk of ventricular arrhythmias when sotalol given with tricyclics
- **Antidiabetics**: beta-blockers may mask warning signs of hypoglycaemia (such as tremor) with antidiabetics; beta-blockers enhance hypoglycaemic effect of insulin
- **Antiepileptics**: plasma concentration of propranolol possibly reduced by phenobarbital and primidone
- **Antifungals**: plasma concentration of naldolol possibly increased by ketoconazole
- **Antihistamines**: increased risk of ventricular arrhythmias when sotalol given with mizolastine—avoid concomitant use
- **Antimalarias**: avoidance of metoprolol and sotalol advised by manufacturer of artemether with lumefantrine; avoidance of sotalol advised by manufacturer of artemisinin with piperaquine (possible risk of ventricular arrhythmias); increased risk of bradycardia when beta-blockers given with mefloquine
- **Antimycobacterials**: increased risk of ventricular arrhythmias when sotalol given with tolterodine
- **Antipsychotics**: increased risk of ventricular arrhythmias when sotalol given with droperidol or zopiclone—avoid concomitant use; possible increased risk of ventricular arrhythmias when sotalol given with haloperidol—avoid concomitant use; plasma concentration of both drugs may increase when propranolol given with chlorpromazine; increased risk of ventricular arrhythmias when sotalol given with amisulpride, phentolamines, pimozide or sulpiride; enhanced hypotensive effect when beta-blockers given with phentolamines; possible increased risk of ventricular arrhythmias when sotalol given with risperidone
- **Antivirals**: increased risk of ventricular arrhythmias when sotalol given with saquinavir—avoid concomitant use; avoidance of sotalol advised by manufacturer of efavirenz (risk of ventricular arrhythmias); avoidance of metoprolol for heart failure advised by manufacturer of tipranavir
- **Anxiolytics and Hypnotics**: enhanced hypotensive effect when beta-blockers given with anxiolytics and hypnotics
- **Atomoxetine**: increased risk of ventricular arrhythmias when sotalol given with atomoxetine
- **Calcium-channel Blockers**: enhanced hypotensive effect when beta-blockers given with calcium-channel blockers; possible severe hypotension and heart failure when beta-blockers given with nefopam; increased risk of AV block and bradycardia when beta-blockers given with del大战; asystole, severe hypotension and heart failure when beta-blockers given with verapamil (see under Verapamil, p. 101)
- **Cardiac Glycosides**: increased risk of AV block and bradycardia when beta-blockers given with cardiac glycosides
- **Ciclosporin**: carvedilol increases plasma concentration of ciclosporin
- **Clonidine**: increased risk of withdrawal hypertension when beta-blockers given with clonidine (withdraw beta-blockers several days before slowly withdrawing clonidine)
- **Corticosteroids**: hypotensive effect of beta-blockers antagonised by corticosteroids
- **Cytotoxics**: possible increased risk of ventricular arrhythmias when sotalol given with bosutinib; possible increased risk of bradycardia when beta-blockers given with crizotinib; possible increased risk of ventricular arrhythmias when sotalol given with Vandetanib—avoid concomitant use; increased risk of ventricular arrhythmias when sotalol given with arzoxifene; diazoxide: enhanced hypotensive effect when beta-blockers given with diazoxide
- **Diuretics**: enhanced hypotensive effect when beta-blockers given with diuretics; risk of ventricular arrhythmias with...
Beta-blockers

- Diuretics (continued)
  - Sotalol increased by hypokalaemia caused by 
    - LOOP DIURETICS
  - or 
    - THIACARBMIDE AND RELATED DIURETICS
  - Dopaminergics; enhanced hypotensive effect when beta-blockers given with 
    - CO-BENZOLOPA, CO-CARELLOPA or LEVODOPA
  - Ergot Alkaloids: increased peripheral vasoconstriction when beta-blockers given with 
    - ERGOT ALKALOIDS
  - Fingolimod: possible increased risk of bradycardia when beta-blockers given with 
    - FINGOLIMOD
  - Hormone Antagonists: possible increased risk of bradycardia when caroteneol, metoprolol, propranolol or sotalol given with 
    - PASITROZIDE
  - SRT, receptor Agonists; propranolol increases plasma concentration of 
    - RIZATRIPTAN
    - (manufacturer of rizatryptan)
  - Increased risk of ventricular arrhythmias when sotalol given with 
    - IVABRADINE

  - Methyldopa: enhanced hypotensive effect when beta-blockers given with 
    - METHYLDOPA
  - Mirabegron: plasma concentration of metoprolol increased by 
    - MIRABEGRON
  - Moxisylyte: possible severe postural hypotension when beta-blockers given with 
    - MOXISYLYTE
  - Moxonidine: enhanced hypotensive effect when beta-blockers given with 
    - MOXONIDINE
  - Muscle Relaxants: propranolol enhances effects of 
    - MUSCLE RELAXANTS; enhanced hypotensive effect when beta-blockers given with 
    - BACLOFEN; possible enhanced hypotensive effect and bradycardia when beta-blockers given with 
    - TIZANIDINE
  - Nitrate: enhanced hypotensive effect when beta-blockers given with 
    - NITRATES
  - Oestrone: enhanced hypotensive effect of beta-blockers antagonised by 
    - OESTROGENS
  - Parasympathomimetics: propranolol antagonises effects of 
    - NEOSTIGMINE and PYRIDOSTIGMINE; increased risk of 
    - arrhythmias when beta-blockers given with 
    - PILOCARPINE
  - Prostaglandins: enhanced hypotensive effect when beta-blockers given with 
    - ALPROSTADIL
  - Ranolazine: avoidance of sotalol advised by manufacturer of 
    - RANOLAZINE
  - Sympathomimetics: increased risk of severe hypertension and 
    - bradycardia when non-cardioselective beta-blockers given with 
    - ADRENALINE (EPINEPHRINE), also reponse to adrenaline 
    - (epinephrine) may be reduced; increased risk of severe hypertension and 
    - bradycardia when non-cardioselective beta-blockers given with 
    - TAMBUTAMINE; possible increased risk of 
    - severe hypertension and bradycardia when non-
    - cardioselective beta-blockers given with 
    - NORADRENALINE (NOREPINEPHRINE)
  - Thyroid Hormones: metabolism of propranolol accelerated by 
    - LEVOTHYROXINE
  - Ulcer-healing Drugs: plasma concentration of labetalol, 
    - metoprolol and propranolol increased by 
    - CIMETIDINE; plasma concentration of 
    - oral timolol possibly increased by 
    - CIMETIDINE
  - Vasodilator Antihypertensives: enhanced hypotensive effect when beta-blockers given with 
    - HYDRAZINE
    - MINOXIDIL
    - OR SODIUM NITROPRUSSIDE

Betahistine

- Antihistamines: effect of betahistine theoretically antagonised by 
  - ANTHISTAMINES
Betamethasone see Corticosteroids
Betaxolol see Beta-blockers
Betheconol see Parasympathomimetics
Bevacizumab

- Antipsychotics: avoid concomitant use of cytotoxics with 
  - CLOzapine (increased risk of agranulocytosis)
- Cytotoxics: avoidance of bevacinumab advised by manufacturer of 
  - PANITUMUMAB
- Vaccines: risk of generalised infections when monoclonal antibodies given with live 
  - VACCINES—avoid concomitant use

Bevacitane

- Antipsychotics: avoid concomitant use of cytotoxics with 
  - CLOzapine (increased risk of agranulocytosis)
- Lipid-regulating Drugs: plasma concentration of bevatarcene increased by 
  - GEMFIBROZIL—avoid concomitant use

Bezafibrate see Fibrates
Bicalutamide

- Anticoagulants: bicalutamide possibly enhances anticoagulant 
  - effect of COUMARINS
- Lipid-regulating Drugs: separating administration from 
  - bicalutamide by 12 hours advised by manufacturer of 
  - LOMTAPIDE
Bigniunides see Antiadipetics
Bilatine see Antihistamines
Bile Acid Sequestrants see Colesevelam, Colestipol, and 
- Colestryamine
Bile Acids

- Antacids: absorption of bile acids possibly reduced by 
  - ANTACIDS; effects of cholic acid probably reduced by 
  - ALUMINIUM HYDROXIDE
  - (manufacturer of cholic acid advises give at least 5 hours apart); absorption of bile acids possibly reduced by 
  - COLESTIPOLE and 
  - COLESTYRAMINE
Bisoprol see Beta-blockers
Bisphosphonates

- Antacids: absorption of bisphosphonates reduced by 
  - ANTACIDS
- Antibacterials: increased risk of hypocalcaemia when 
  - bisphosphonates given with 
  - AMINOLYGOSIDES
- Calcium Salts: absorption of bisphosphonates reduced by 
  - CALCIUM SALTS
- Cytotoxics: increased absorption of bisphosphonates reduced by 
  - ESTRAMUSTINE
- Iron Salts: absorption of bisphosphonates reduced by 
  - IRON SALTS
Bivalirudin

- Analgesics: increased risk of haemorrhage when 
  - anticoagulants given with 
  - DILOFENAC (avoid concomitant use, including low-dose heparins); increased risk of 
  - haemorrhage when anticoagulants given with 
  - KETOROLAC
  - (avoid concomitant use, including low-dose heparins)
- Anticoagulants: increased risk of haemorrhage when other 
  - anticoagulants given with 
  - APIXABAN, 
  - DABIGATRAN, 
  - EDOKABAN and 
  - RIVORAOKABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to 
  - maintain catheter patency)
Bleomycin

- Antipsychotics: avoid concomitant use of cytotoxics with 
  - CLOzapine (increased risk of agranulocytosis)
- Cardiac Glycosides: bleomycin possibly reduces absorption of 
  - DIGOXIN tablets
- Cytotoxics: increased risk of pulmonary toxicity when 
  - bleomycin given with 
  - BRENtuximab vedotin—an avoid concomitant use; increased pulmonary toxicity when 
  - bleomycin given with 
  - CISPLATIN
- Vaccines: risk of generalised infections when cytotoxic 
  - antibiotics given with live 
  - VACCINES—avoid concomitant use
Boceprevir

- Alpha-blockers: boceprevir possibly increases plasma 
  - concentration of 
  - DOXAZOSIN and 
  - TAMSULOSIN—manufacturer of 
  - boceprevir advises avoid concomitant use
- Analgesics: possible increased risk of prolonged sedation and respiratory depression when boceprevir given with 
  - BUPRENORPHINE; boceprevir possibly affects plasma 
  - concentration of METHADONE
- Antibacterials: manufacturer of boceprevir advises avoid 
  - concomitant use with 
  - RIFAMPICIN (plasma concentration of 
  - boceprevir possibly reduced)
- Anticoagulants: avoidance of boceprevir advised by 
  - manufacturer of 
  - APIXABAN
- Antipsychotics: manufacturer of boceprevir advises avoid 
  - concomitant use with 
  - CARBAMAZEPINE, 
  - FOSPHENTOIN, 
  - PHENOBARBITAL, 
  - PHENTOIN and 
  - PRIMIDONE (plasma 
  - concentration of boceprevir possibly reduced)
Boceprevir — Bosutinib

### Interactions

#### Boceprevir (continued)
- Antifungals: plasma concentration of boceprevir increased by
  - KETOCONAZOLE
- Antimalarials: manufacturer of boceprevir advises avoid concomitant use with
  - ARTETHER WITH LUMEFANTRINE
- Antipsychotics: boceprevir possibly increases plasma concentration of
  - LURASIDONE — avoid concomitant use; manufacturer of boceprevir advises avoid concomitant use with
  - PIMOZIDE; boceprevir possibly increases plasma concentration of
  - QUETAPINE — manufacturer of quetiapine advises avoid concomitant use
- Antivirals: boceprevir reduces plasma concentration of
  - ATAZANAVIR; boceprevir possibly increases the plasma concentration of
    - DACLATASVIR — reduce dose of daclatasvir (see under Daclatasvir, in BNF); avoid concomitant use with boceprevir with
    - DARUNAVIR; effects of both drugs possibly reduced when boceprevir given with ETAR VIRINE; avoidance of boceprevir advised by manufacturer of
    - FOSAMPRENAVIR, NEVIRAPINE and TIPRANAVIR; manufacturers advise avoid concomitant use of boceprevir with
    - LOPINAVIR; boceprevir increases plasma concentration of MARAVIROC (consider reducing dose of maraviroc); plasma concentration of both drugs reduced when boceprevir given with
    - RITONAVIR
- Anxiolytics and Hypnotics: boceprevir increases plasma concentration of
  - CICLOSPORIN
  - Cilostazol: boceprevir possibly increases plasma concentration of
    - CICLOSPORIN (see under Cilostazol, in BNF)
  - Cobicistat: avoidance of boceprevir advised by manufacturer of
    - Cobicistat
- Cytoxotics: boceprevir possibly increases the plasma concentration of
  - BOSUTINIB — manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; manufacturer of boceprevir advises avoid concomitant use with
    - JAKINIBS, 
    - ERLOTINIB, 
    - Gefitinib, 
    - IMATINIB, 
    - LAPATINIB, 
    - Nilotinib, 
    - PONAZOLE, 
    - SORAFENIB and
  - SUNITINIB; manufacturer of ruxolitinib advises dose reduction when boceprevir given with
    - RUXOLITINIB — consult ruxolitinib product literature; avoidance of boceprevir advised by manufacturer of
    - OLAPRIB
  - Domeridine: possible increased risk of ventricular arrhythmias when boceprevir given with
    - DOMERIDENE — avoid concomitant use
  - Ergot Alkaloids: manufacturer of boceprevir advises avoid concomitant use with
    - ERGOT ALKALOIDS
  - Guanifine: boceprevir possibly increases plasma concentration of
    - GUANIFACINE (halve dose of guanifacine)
- Lipid-regulating Drugs: boceprevir increases plasma concentration of
  - ATORVASTATIN (reduce dose of atorvastatin); boceprevir increases plasma concentration of
    - PRAVASTATIN; manufacturers advise avoid concomitant use of boceprevir with
    - SIMVASTATIN
- Progestogens: boceprevir increases plasma concentration of
  - DROSPRENONE (increased risk of toxicity)
  - Sirolimus: boceprevir increases plasma concentration of
    - SIROLIMUS (increased risk of toxicity — reduce sirolimus dose)
  - Tacrolimus: boceprevir increases plasma concentration of
    - TACROLIMUS (reduce dose of tacrolimus)

#### Bosutinib (continued)
- Antidepressants: plasma concentration of bosutinib reduced by
  - ST JOHN’S WORT — manufacturer of bosutinib advises avoid concomitant use
- Antiepileptics: plasma concentration of histamine possibly reduced by
  - CARBAMAZEPINE, 
  - PHENYTOIN, 
  - PHENOBARBITAL, 
  - PHENYTOIN and PRIMIDONE — manufacturer of bosutinib advises avoid concomitant use
- Antifungals: plasma concentration of bosutinib increased by
  - KETOCONAZOLE
- Antipsychotics: avoid concomitant use of cytotoxics with
  - CLOZAPINE (increased risk of agranulocytosis)

#### Bosentan
- Antibacterials: plasma concentration of bosentan reduced by
  - Rifampicin — avoid concomitant use
- Anticoagulants: manufacturer of bosentan recommends monitoring anticoagulant effect of
  - COUMARINS
- Antidiabetics: increased risk of hepatotoxicity when bosentan given with
  - GLUCENTAMIDE — avoid concomitant use
- Antifungals: plasma concentration of bosentan increased by
  - KETOCONAZOLE; plasma concentration of bosentan possibly increased by
    - FLUCONAZOLE — avoid concomitant use; plasma concentration of bosentan possibly increased by
    - ITRACONAZOLE
- Antivirals: avoidance of bosentan advised by manufacturer of
  - ELVITEGRAVIR and TIPRANAVIR; bosentan possibly reduces plasma concentration of
    - INDINAVIR; plasma concentration of bosentan increased by
    - ELOPINA VIN and
    - RITONAVIR (consider reducing dose of bosentan); bosentan possibly reduces plasma concentration of
    - TELAPRE VIR; also plasma concentration of bosentan possibly increased
    - Avanafil: bosentan possibly reduces plasma concentration of
      - AVANAFIL — manufacturer of avanafil advises avoid concomitant use
    - Ciclosporin: plasma concentration of bosentan increased by
      - CICLOSPORIN (also plasma concentration of ciclosporin reduced — avoid concomitant use)
    - Cobimetinib: avoidance of bosentan advised by manufacturer of
      - COBICISTAT
    - Cytoxotics: bosentan possibly reduces plasma concentration of
      - GUANIFACINE — increase dose of guanifacine
    - Lipid-regulating Drugs: bosentan reduces plasma concentration of
      - SIMVASTATIN
    - Oestrogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing
      - OESTROGENS (alternative contraception recommended)
    - Progestogens: bosentan possibly causes contraceptive failure of hormonal contraceptives containing
      - PROGESTOGENS (alternative contraception recommended)
    - Riociguat: bosentan reduces plasma concentration of
      - RIOCI GUAT
    - Sildenafil: bosentan reduces plasma concentration of
      - SILDENAFIL, also plasma concentration of bosentan increased
    - Tadalafil: bosentan reduces plasma concentration of
      - TADALAFIL

#### Bosutinib
- Analgesics: possible increased risk of ventricular arrhythmias when bosutinib given with
  - METHADONE
  - Antacids: manufacturer of bosutinib advises separating administration with
    - ANTACIDS by about 12 hours
  - Anti-arrhythmics: possible increased risk of ventricular arrhythmias when bosutinib given with
    - AMIODARONE and
    - DISOPYRAMIDE; plasma concentration of bosutinib possibly increased by
    - DRONEDAREN O — manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Antibacterials: plasma concentration of bosutinib possibly increased by
  - CIPROFLOXACIN, 
  - CLEIRITHROMYCIN, 
  - ERYTHROMYCIN and
  - TELITHROMYCIN — manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
- Antidepressants: plasma concentration of bosutinib reduced by
  - ST JOHN’S WORT — manufacturer of bosutinib advises avoid concomitant use
  - Antiepileptics: plasma concentration of bosutinib possibly reduced by
    - CARBAMAZEPINE, 
    - PHENOBARBITAL, 
    - PHENOBARBITAL, 
    - PHENYTOIN and
    - PRIMIDONE — manufacturer of bosutinib advises avoid concomitant use
- Antifungals: plasma concentration of bosutinib increased by
  - KETOCONAZOLE — manufacturer of bosutinib advises avoid or
Bosutinib

- Antifungals (continued)
  
  consider reducing dose of bosutinib; plasma concentration of bosutinib possibly increased by • FLUCONAZOLE, • ITRACONAZOLE, • POSACONAZOLE and • VORICONAZOLE—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
  
  Antimalariais: possible increased risk of ventricular arrhythmias when bosutinib given with • CHLOROQUINE and • PROCHLOROQUINE
  
  Antipsychotics: possible increased risk of ventricular arrhythmias when bosutinib given with • HALOPERIDOL; avoid concomitant use of cytoxotics with • CLOzapine (increased risk of agranulocytosis)
  
  Antihypertensives: plasma concentration of bosutinib possibly increased by • ATAZANAVIR, • BOCepePrIV, • DARUNAVIR, • FOSAMPRENAVIR, • INDINAVIR, • RitonAVIR, • SAAQuINAVIR and • TELAPREPrIV—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; plasma concentration of bosutinib possibly reduced by • METHYLDOPA—manufacturer of bosutinib advises avoid concomitant use
  
  Aprepitant: plasma concentration of bosutinib possibly increased by • APrEPTAINT—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
  
  Beta-blockers: possible increased risk of ventricular arrhythmias when bosutinib given with • SOTALol
  
  Bosantan: plasma concentration of bosutinib possibly reduced by • BOSANTEN—manufacturer of bosutinib advises avoid concomitant use
  
  Calcium-channel Blockers: plasma concentration of bosutinib possibly increased by • DILTaZAM and • VERAPamIL—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
  
  Cytotoxics: plasma concentration of bosutinib possibly increased by • MATINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
  
  Domperidone: manufacturer of bosutinib advises avoid concomitant use with • DOPERIDONE (risk of ventricular arrhythmias)
  
  Fosaprepitant: plasma concentration of bosutinib possibly increased by • FOSAPRPETANIT—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
  
  Grapefruit Juice: plasma concentration of bosutinib possibly increased by • GRAPEFRuIT JUICE—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib
  
  Modafinil: plasma concentration of bosutinib possibly reduced by • MODAFINIl—manufacturer of bosutinib advises avoid concomitant use
  
  Ulcer-healing Drugs: plasma concentration of bosutinib reduced by • LANSOPRAzOLE

Brentuximab vedotin

- Antibacterials: effects of brentuximab vedotin possibly reduced by • RifaBuTIN
  
  Antifungals: possible increased risk of neutropenia when brentuximab vedotin given with • KETOCONAZOLE
  
  Antipsychotics: avoid concomitant use of cytoxotics with • CLOzipINE (increased risk of agranulocytosis)
  
  Cytotoxics: increased risk of pulmonary toxicity when brentuximab vedotin given with • BLEOMYCIN—avoid concomitant use
  
  Vaccines: risk of generalised infections when monoclonal antibodies given with live • VACCINES—avoid concomitant use

Brimonidine

- Antidepressants: manufacturer of brimonidine advises avoid concomitant use with • MAOIs, TRICYCLIC-RELATED ANTIdePRESSANTS and TRICYCLICS

Brinzolamide see Diuretics

Bromocriptine

- Alcohol: tolerance of bromocriptine reduced by • ALCohol
  
  Antibacterials: plasma concentration of bromocriptine increased by • ERYTHROMYCIN (increased risk of toxicity); plasma concentration of bromocriptine possibly increased by • MACrolides (increased risk of toxicity)
  
  Antipsychotics: hypopro lactinaemic and antiparkinsonian effects of bromocriptine antagonised by • ATIPSychOTICS

Bromocriptine (continued)

- Dopemide: hypoprolactinaemic effect of bromocriptine possibly antagonised by • DOMPERIDONE
  
  Hormone Antagonists: plasma concentration of bromocriptine increased by • OCTeOTRIDE
  
  Memantine: effects of dopaminergics possibly enhanced by • MEMANTINE
  
  Methyldopa: antiparkinsonian effect of dopaminergics antagonised by • METHYLDOPA
  
  Metoclopramide: hypoprolactinaemic effect of bromocriptine antagonised by • METOCLOPRAMIDE
  
  Symptomatometrics: risk of toxicity when bromocriptine given with • ISOMETHyPETHyNE

Budesonide see Corticosteroids

Bumetanide see Diuretics

Bupivacaine

- Anti-arrhythmics: increased myocardial depression when bupivacaine given with • ANTI-ARRHYThmICS
  
  Beta-blockers: increased risk of bupivacaine toxicity when given with • PROPRANOLOL

Buprenorphine see Opioid Analgesics

Bupropion

- Antidepressants: bupropion possibly increases plasma concentration of • CITaPrynAM—manufacturer of bupropion advises avoid for 2 weeks after stopping • MAOIS; manufacturer of bupropion advises avoid concomitant use with • MOClOBEmIDe; bupropion possibly increases plasma concentration of • TRICYClES (possible increased risk of convulsions); bupropion increases plasma concentration of • VORTIXOTINE (consider reducing dose of vortioxetine)
  
  Anti-epileptics: plasma concentration of bupropion reduced by • CARBAMaZEPINE, • FOSPHENyTOIN and • PHENyTOIN—metabolism of bupropion inhibited by • SODIUm VALPraOTe and • VALPraOC ACID
  
  Antivirals: metabolism of bupropion accelerated by • SEFAMIRinzE and • VORtIXOTINE (reduced plasma concentration); plasma concentration of bupropion reduced by • RIToNAVIR
  
  Atomoxetine: possible increased risk of convulsions when bupropion given with • ATOMeXOTINE
  
  Dopaminergics: increased risk of side-effects when bupropion given with • ANMaTADINE, • CO-BENELDOPA, • CO-CARELDOPA or • LEVODOpa
  
  Hormone Antagonists: bupropion possibly inhibits metabolism of • TAMOXIFEn and • oACTAnol (avoid concomitant use)
  
  Methylthioninium: possible risk of CNS toxicity when bupropion given with • METHYLThIONININ—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

Buspirone see Anxiolytics and Hypnotics

Busulfan

- Analgesics: metabolism of • intravenous busulfan possibly inhibited by • PARACeTaMOl (manufacturer of • intravenous busulfan advises caution within 72 hours of paracetamol)
  
  Antibacterials: plasma concentration of busulfan increased by • METRONIDAZOLE (increased risk of toxicity)
  
  Anti-epileptics: plasma concentration of busulfan possibly reduced by • FOSPHENyTOIN and • PHENyTOIN
  
  Antifungals: metabolism of busulfan inhibited by • TRACONAZOLE (increased risk of toxicity)
  
  Antipsychotics: avoid concomitant use of cytoxotics with • CLOzipINE (increased risk of agranulocytosis)
  
  Cytotoxics: increased risk of hepatotoxicity when busulfan given with • THIOGUANINE

Butyrophonones see Antipsychotics

Cabazitaxel

- Antibacterials: plasma concentration of cabazitaxel possibly increased by • CLARThROMYCIN and • TERITHROMYCIN—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; manufacturer of cabazitaxel advises avoid concomitant use with • RIfABuTIN; plasma concentration of cabazitaxel reduced by • RIfAMPICIn—manufacturer of cabazitaxel advises avoid concomitant use
  
  Antidepressants: manufacturer of cabazitaxel advises avoid concomitant use with • ST JOHN’S WOrT
Cabazitaxel (continued)

- Antiepileptics: manufacturer of cabazitaxel advises avoid concomitant use with Diltiazem, Nifedipine, and Verapamil; plasma concentration of cabazitaxel possibly increased by Phenytoin.

- Antifungals: manufacturer of cabazitaxel advises avoid concomitant use with Itraconazole; plasma concentration of cabazitaxel possibly increased by itraconazole and Voriconazole.

- Antivirals: manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel.

- Antipsychotics: avoid concomitant use of cytoxotics with Clozapine (increased risk of agranulocytosis).

- Antihypertensives: manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel.

Calcium Salts (continued)

- Antivirals: calcium salts reduce absorption of Dolutegravir—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after calcium salts; separating administration from calcium salts by 4 hours advised by manufacturer of Ledipasvir; manufacturer of rilpivirine advises give calcium salts 2 hours before or 4 hours after Rilpivirine.

- Bisphosphonates: calcium salts reduce absorption of Bisphosphonates.

- Cardiac Glycosides: large intravenous doses of calcium salts can precipitate arrhythmias when given with Cardiac Glycosides.

- Corticosteroids: absorption of calcium salts reduced by CORTICOSTEROIDS.

- Cytotoxic: calcium salts reduce absorption of Estramustine (manufacturer of estramustine advises avoid concomitant administration).

- Diuretics: increased risk of hypercalcaemia when calcium salts given with Thiazides and Related Diuretics.

- Eltrombopag: calcium salts possibly reduce absorption of Eltrombopag (give at least 4 hours apart).

- Fluorides: calcium salts reduce absorption of Fluorides.

- Iron Salts: calcium salts reduce absorption of oral Iron Salts.

- Thyroid Hormones: calcium salts reduce absorption of Levothyroxine.

- Zinc: calcium salts reduce absorption of Zinc.

Calcium-channel blockers

- Dihydropyridine calcium-channel blockers include Amlodipine, Felodipine, Isradipine, Lercanidipine, Nicardipine, Nifedipine, and Nimodipine.

- ACE Inhibitors: enhanced hypotensive effect when calcium-channel blockers given with ACE INHIBITORS.

- Adrenergic Neurone Blockers: enhanced hypotensive effect when calcium-channel blockers given with Adrenergic Neurone Blockers.

- Alcohol: enhanced hypotensive effect when calcium-channel blockers given with Alcohol; verapamil possibly increases plasma concentration of Alcohol.

- Aldelesukin: enhanced hypotensive effect when calcium-channel blockers given with Aldelesukin.

- Afoxiran: verapamil increases plasma concentration of Afoxiran.

- Antihistamines: enhanced hypotensive effect when calcium-channel blockers given with Antihistamines.

- Anticoagulants: enhanced hypotensive effect when calcium-channel blockers given with Anticoagulants.

- Aminophylline: calcium-channel blockers possibly increase plasma concentration of Aminophylline.

- Amifostine: enhanced hypotensive effect when calcium-channel blockers given with Amifostine.

- Amiloride: enhanced hypotensive effect when calcium-channel blockers given with Amiloride.

- Amlodipine: calcium-channel blockers possibly increase plasma concentration of Amlodipine.

- Nimodipine: calcium-channel blockers possibly increase plasma concentration of Nimodipine.

- Nicardipine: calcium-channel blockers possibly increase plasma concentration of Nicardipine.

- Verapamil: calcium-channel blockers possibly increase plasma concentration of Verapamil.

- Reserpine: calcium-channel blockers possibly increase plasma concentration of Reserpine.

- Verapamil: calcium-channel blockers possibly increase plasma concentration of Verapamil.

- Erythromycin: calcium-channel blockers possibly increase plasma concentration of Erythromycin.

- Erythromycin: calcium-channel blockers possibly increase plasma concentration of Erythromycin.

- Rifampicin: calcium-channel blockers possibly increase plasma concentration of Rifampicin.

- Rifampicin: calcium-channel blockers possibly increase plasma concentration of Rifampicin.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.

- Diltiazem: increased plasma concentration of Diltiazem.
Calcium-channel Blockers

- **Antibacterials (continued)**
nimodipine and verapamil accelerated by rifampicin (plasma concentration significantly reduced); metabolism of isradipine and nicardipine possibly accelerated by rifampicin (possible significantly reduced plasma concentration); plasma concentration of felodipine possibly reduced by rifampicin; avoidance of verapamil advised by manufacturer of fidaxomycin.

- **Anticoagulants:** verapamil possibly increases plasma concentration of dabigatran (see under dabigatran etexilate, in BNF); verapamil increases plasma concentration of edoxaban.

- **Antidepressants:** metabolism of nifedipine possibly inhibited by fluoxetine (increased plasma concentration); diltiazem and verapamil increase plasma concentration of mirtapramine; enhanced hypotensive effect when calcium-channel blockers given with maoi; plasma concentration of amiodopine and felodipine possibly reduced by st john's wort; plasma concentration of verapamil significantly reduced by st john's wort; plasma concentration of nifedipine reduced by st john's wort; diltiazem and verapamil possibly increase plasma concentration of tricyclics.

- **Antidiabetics:** glucose tolerance occasionally impaired when nifedipine given with insulin.

- **Antinepletics:** effects of felodipine and isradipine reduced by carbamazepine; effects of diltiydropyridines, nicardipine and nifedipine probably reduced by carbamazepine; diltiazem and verapamil enhance effects of carbamazepine; manufacturer of nimodipine advises avoid concomitant use with carbamazepine, fosphenytoin and phenytoin (plasma concentration of nimodipine possibly reduced); effects of felodipine and verapamil reduced by fosphenytoin; diltiazem increases plasma concentration of fosphenytoin and phenytoin but also effect of diltiazem reduced; manufacturer of nimodipine advises avoid concomitant use with fosphenytoin, phenobarbital, phenytoin and primidone; effects of calcium-channel blockers probably reduced by phenobarbital and primidone; manufacturer of nimodipine advises avoid concomitant use with phenobarbital and primidone; phenytoin (plasma concentration of nimodipine reduced); effects of felodipine and verapamil reduced by phenytoin.

- **Antifungals:** metabolism of diltiydropyridines possibly inhibited by itraconazole and ketoconazole (increased plasma concentration); metabolism of felodipine is inhibited by ketoconazole (increased plasma concentration)—manufacturer of ketoconazole advises avoid concomitant use; manufacturer of lercanidipine advises avoid concomitant use with itraconazole and ketoconazole; negative inotropic effect possibly increased when calcium-channel blockers given with itraconazole; metabolism of felodipine inhibited by itraconazole (increased plasma concentration); plasma concentration of felodipine increased by micafungin.

- **Antimalarials:** possible increased risk of bradycardia when calcium-channel blockers given with mefloquine.

- **Antimuscarnics:** avoidance of verapamil advised by manufacturer of darifenacin; verapamil increases plasma concentration of solifenacin.

- **Antipsychotics:** enhanced hypotensive effect when calcium-channel blockers given with antipsychotics; verapamil possibly increases the plasma concentration of lurasidone (see under Lurasidone, in BNF); diltiazem increases the plasma concentration of lurasidone (see under Lurasidone, in BNF).

- **Antivirals:** plasma concentration of verapamil possibly increased by atazanavir; plasma concentration of diltiazem increased by atazanavir (reduce dose of diltiazem); plasma concentration of diltiazem reduced by efavirenz; manufacturer of lercanidipine advises avoid concomitant use with ritonavir; plasma concentration of amiodipine increased by ritonavir (reduce dose of amiodipine); plasma concentration of calcium-channel blockers possibly increased by ritonavir; caution with diltiazem, felodipine, nicardipine, nifedipine and verapamil advised by manufacturer of telaprevir; plasma concentration of amiodipine increased by telaprevir (consider reduce dose of amiodipine).

**Calcium-channel Blockers**

- **Antivirals (continued)**
amiodipine increased by telaprevir (consider reducing dose of amiodipine).

- **Antioxidants and hypotensives:** enhanced hypotensive effect when calcium-channel blockers given with antioxidants and hypnotics; diltiazem and verapamil inhibit metabolism of midazolam (increased plasma concentration with increased sedation); absorption of lercanidipine increased by midazolam; diltiazem and verapamil increase plasma concentration of buspirone (reduce dose of buspirone).

- **Anticoagulants:** plasma concentration of both drugs may increase when diltiazem given with aprepitant.

- **Antipsychotics:** diltiazem and verapamil possibly increase plasma concentration of lurasidone (see under Lurasidone, in BNF).

- **Antiepileptics:** beta-blockers: enhanced hypotensive effect when calcium-channel blockers given with beta-blockers; increased risk of AV block and bradycardia when diltiazem given with beta-blockers; asystole, severe hypotension and heart failure when verapamil given with beta-blockers (see under Dabigatran, p. 101); possible severe hypotension and heart failure when nifedipine given with beta-blockers.

- **Antidiabetics:** calcium-channel blockers: plasma concentration of both drugs may increase when diltiazem given with insulin.

- **Antinepletics:** calcium-channel blockers: plasma concentration of calcium-channel blockers may increase when diltiazem given with nitrofurantoin, also increased risk of AV block and bradycardia; diltiazem, lercanidipine and nicardipine increase plasma concentration of digoxin; nifedipine possibly increases plasma concentration of digoxin.

- **Antimuscarnics:** ciposporin: diltiazem, nicardipine and verapamil increase plasma concentration of ciposporin; combination of lercanidipine with ciposporin may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of nifedipine possibly increased by ciposporin (increased risk of toxicity including gingival hyperplasia).

- **Antimalarials:** clofazimine: diltiazem increases plasma concentration of clofazimine (consider reducing dose of clofazimine).

- **Antipsychotics:** clonidine: enhanced hypotensive effect when calcium-channel blockers given with clonidine.

- **Antioxidants and hypotensives:** colchicine: diltiazem and verapamil possibly increase risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment).

- **Antinepletics:** corticosteroids: hypotensive effect of calcaires (see under calcium-channel blockers antagonised by corticosteroids); diltiazem increases plasma concentration of methylprednisolone.

- **Antimuscarnics:** cytotoxics: verapamil possibly increases plasma concentration of doxorubicin; verapamil possibly increases the plasma concentration of afatinib—manufacturer of afatinib advises separating administration of verapamil by 6 to 12 hours; diltiazem and verapamil possibly increase the plasma concentration of bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; possible increased risk of bradycardia when diltiazem or verapamil given with crizotinib; plasma concentration of both drugs may increase when verapamil given with everolimus (consider reducing the dose of everolimus—consult everolimus product literature); diltiazem and verapamil possibly increase the plasma concentration of irubutinib—reduce dose of irubutinib (see under irubutinib, in BNF); nifedipine possibly inhibits metabolism of vincristine.

- **Antivirals:** dapoxetine: manufacturer of dapoxetine advises dose reduction when diltiazem and verapamil given with dapoxetine (see under Dapoxetine, in BNF).

- **Antimuscarnics:** dazoxifene: enhanced hypotensive effect when calcium-channel blockers given with dazoxifene.

- **Antinepletics:** diuretics: enhanced hypotensive effect when calcium-channel blockers given with diuretics; diltiazem and verapamil increase plasma concentration of eplerenone (reduce dose of eplerenone).

- **Antimuscarnics:** dopamine: enhanced hypotensive effect when calcium-channel blockers given with carteolol, Carvedilol, Co-Carvedilol or levodopa.

- **Antimuscarnics:** fingolimod: possible increased risk of bradycardia when diltiazem or verapamil given with fingolimod.
Calcium-channel Blockers (continued)

- Fosaprepitant: plasma concentration of both drugs may increase when diltiazem given with FOSAPREPTANT
- Grapefruit juice: plasma concentration of felodipine, isradipine, lacidipine, lercanidipine, nicardipine, nifedipine, nimodipine and verapamil increased by GRAPEFRUIT JUICE; plasma concentration of amldipine possibly increased by GRAPEFRUIT JUICE
- Guanfacine: diltiazem and verapamil increase plasma concentration of GUANFACINE (halve dose of guanfacine)
- Hormone Antagonists: diltiazem and verapamil increase plasma concentration of OUTASTERIDE; possible increased risk of bradycardia when diltiazem or verapamil given with PASIREOTIDE
- Iverabradine: diltiazem and verapamil increase plasma concentration of IVABRADINE—avoid concomitant use
- Lenalidomide: verapamil possibly increases plasma concentration of LENALIDOMIDE (increased risk of toxicity)
- Lipid-regulating Drugs: diltiazem increases plasma concentration of ATORVASTATIN—possible increased risk of myopathy; plasma concentration of verapamil increased by ATORVASTATIN, also possible increased risk of myopathy (consider reducing dose of atorvastatin); possible increased risk of myopathy when amldipine and diltiazem given with SIMVASTATIN (see under Simvastatin, p. 125); increased risk of myopathy when verapamil given with SIMVASTATIN (see under Simvastatin, p. 125); separating administration from amldipine and lacidipine by 12 hours advised by manufacturer of LOMITAPIDE; avoidance of diltiazem and verapamil advised by manufacturer of LOMITAPIDE (plasma concentration of lomitapide possibly increased)
- Lithium: neurotoxicity may occur when diltiazem or verapamil given with LITHIUM without increased plasma concentration of lithium
  - Magnesium (parenteral): profound hypotension reported with concomitant use of nifedipine and a PARENTERAL MAGNESIUM in pre-eclampsia
  - Methylxanthine: enhanced hypotensive effect when calcium-channel blockers given with METHYLXANTHINE
  - Moxisylyte: enhanced hypotensive effect when calcium-channel blockers given with MOXISLYTE
  - Moxonidine: enhanced hypotensive effect when calcium-channel blockers given with MOXONIDINE
- Muscle Relaxants: verapamil enhances effects of NON-DEPOLARISING MUSCLE RELAXANTS and SUXAMETHONIUM; enhanced hypotensive effect when calcium-channel blockers given with DIAZEPAM or TIZANIDINE; manufacturer of verapamil advises avoid concomitant use of INTRAVENOUS DANTROLENE—possible increased risk of ventricular arrhythmias when diltiazem given with INTRAVENOUS DANTROLENE—manufacturer of diltiazem advises avoid concomitant use; calcium-channel blockers possibly enhance effects of NON-DEPOLARISING MUSCLE RELAXANTS
- Nitrates: enhanced hypotensive effect when calcium-channel blockers given with NITRATES
- Oestrogens: hypotensive effect of calcium-channel blockers antagonised by OESTROGENS
- Prostaglandins: enhanced hypotensive effect when calcium-channel blockers given with PROSTAGLANDINS
- Ranolazine: diltiazem and verapamil increase plasma concentration of RANOLAZINE (consider reducing dose of ranolazine)
- Sildenafil: enhanced hypotensive effect when amldipine given with SILDENAFIL
- Sirolimus: diltiazem increases plasma concentration of SIROLIMUS; plasma concentration of both drugs increased when verapamil given with SIROLIMUS; nicardipine possibly increases plasma concentration of SIROLIMUS
- Sulfipyrazone: plasma concentration of verapamil reduced by SULFIPYRAZONE
- Tacrolimus: diltiazem, nicardipine and nifedipine increase plasma concentration of TACROLIMUS; felodipine and verapamil possibly increase plasma concentration of TACROLIMUS

Calcium-channel Blockers (continued)

- Theophylline: calcium-channel blockers possibly increase plasma concentration of THEOPHYLLINE; verapamil increases plasma concentration of THEOPHYLLINE; enhanced effect
- Ticagrelor: diltiazem increases plasma concentration of TICAGRELOR
- Ulcer-healing Drugs: metabolism of calcium-channel blockers possibly inhibited by CINOTHENAZINE (increased plasma concentration); plasma concentration of isradipine increased by CINOTHENAZINE (halve dose of isradipine)
- Urapidil: avoidance of verapamil advised by manufacturer of low-dose ULRIPRISTAL
- Vardenafil: enhanced hypotensive effect when nifedipine given with VARDENAFIL
- Vasodilator Antihypertensives: enhanced hypotensive effect when calcium-channel blockers given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE

Calcium-channel Blockers (dihydropyridines) see Calcium-channel Blockers

Canagliflozin see Antidiabetics

Canakinumab

- Antiinflammatory: avoid concomitant use of cytotoxics with CLOZAPINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live VACCINES—avoid concomitant use

Candesartan see Angiotensin-II Receptor Antagonists

Cannabis Extract

- Antiepileptics: plasma concentration of cannabis extract possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and FRIMIDONE—manufacturer of cannabis extract advises avoid concomitant use
- Antifungals: plasma concentration of cannabis extract increased by KETOCONAZOLE

Capetidine

- Allopurinol: manufacturer of capetidine advises avoid concomitant use with ALLOPURINOL
- Antibacterials: metabolism of capetidine inhibited by METRONIDAZOLE (increased toxicity)
- Anticoagulants: capetidine enhances anticoagulant effect of COUMARINS
- Antiepileptics: capetidine possibly inhibits metabolism of FOSPHENYTOIN and PHENYTOIN (increased risk of toxicity)
- Antipsychotics: avoid concomitant use of cytotoxics with CLOZAPINE (increased risk of agranulocytosis)
- Cytoxotics: capetidine possibly increases plasma concentration of ERLOTINIB
- Filgrastim: neutropenia possibly exacerbated when capetidine given with FILGRASTIM
- Folate: toxicity of capetidine increased by FOLIC ACID—avoid concomitant use
- Lipogalactomannan: neutropenia possibly exacerbated when capetidine given with LEPEFILGRASTIM
- Pegfilgrastim: neutropenia possibly exacerbated when capetidine given with PEGFILGRASTIM
- Uler-healing Drugs: metabolism of capetidine inhibited by CINOTHENAZINE (increased plasma concentration)

Capreomycin

- Antiinfectious: increased risk of nephrotoxicity when capreomycin given with AMINOGLYCOSIDES or AMINOGLYCOSIDES; increased risk of nephrotoxicity and ototoxicity when capreomycin given with AMINOGLYCOSIDES or AMINOGLYCOSIDES
- Cytoxotics: increased risk of nephrotoxicity and ototoxicity when capreomycin given with PLATINUM COMPOUNDS

---

A1 ---

Interactions | Appendix 1
Interactions

Appendix 1

834
Capreomycin – Carbamazepine

Capreomycin (continued)
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNFC

Captopril see ACE Inhibitors

Carbamazepine
- Alcohol: CNS side-effects of carbamazepine possibly increased by ALCOHOL
- Aminophylline: carbamazepine accelerates metabolism of AMINOPHYLLINE (reduced effect)
- Antigens: effects of carbamazepine enhanced by DEXTROPROPOPYLPHENE; carbamazepine possibly accelerates metabolism of FENTANYL (reduced effect); carbamazepine reduces plasma concentration of METHADONE; carbamazepine reduces effects of TRAMADOL; carbamazepine possibly accelerates metabolism of PARACETAMOL (also isolated reports of hepatotoxicity)
- Anthelmintics: carbamazepine reduces plasma concentration of ALBENDAZOLE and PRAZIQUANTEL—consider increasing albendazole and praziquantel dose when given for systemic antihelminthics
- Anti-arrhythmics: carbamazepine possibly reduces plasma concentration of DRONEDARONE—avoid concomitant use
- Antibacterials: plasma concentration of carbamazepine increased by CLARITHROMYCIN (consider reducing dose of carbamazepine); plasma concentration of carbamazepine increased by ERYTHROMYCIN; plasma concentration of carbamazepine reduced by Rifabutin; carbamazepine accelerates metabolism of DOXYCYCLINE (reduced effect); carbamazepine possibly reduces plasma concentration of Rifapentine—consider increasing dose of rifapentine and avoid concomitant use; avoidance of carbamazepine advised by manufacturer of Delamanid; plasma concentration of carbamazepine increased by ISONIAZID (also increased isoniazid hepatotoxicity); carbamazepine reduces plasma concentration of Edoxaban (avoid during and for 2 weeks after carbamazepine)
- Anticoagulants: carbamazepine possibly reduces plasma concentration of Apixaban—manufacturer of apixaban advises avoid concomitant use when given for treatment of deep-vein thrombosis or pulmonary embolism; carbamazepine accelerates metabolism of Coumarins (reduced anticoagulant effect); carbamazepine possibly reduces plasma concentration of Dabigatran—manufacturer of dabigatran advises avoid concomitant use; carbamazepine possibly reduces plasma concentration of Edoxaban; carbamazepine possibly reduces plasma concentration of Rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antidepressants: carbamazepine possibly reduces plasma concentration of Reboxetine; plasma concentration of carbamazepine increased by Fluoxetine and Fluvoxamine; carbamazepine reduces plasma concentration of Artemether, Mefloquine and Trazodone—anticonvulsant effect of antiepileptics possibly antagonised by MAOIS and Tricyclic-related Antidepressants (convulsive threshold lowered); manufacturer of carbamazepine advises avoid for 2 weeks after stopping MAOIS, also antagonism of anticonvulsant effect; anticonvulsant effect of antiepileptics antagonised by SSRIs and Tricyclics (convulsive threshold lowered); plasma concentration of carbamazepine possibly reduced by St John’s Wort; carbamazepine accelerates metabolism of Tricyclics (reduced plasma concentration and reduced effect); carbamazepine possibly reduces plasma concentration of Venlafaxine—consider increasing dose of venlafaxine
- Antiepileptics: carbamazepine possibly reduces plasma concentration of Eslicarbazepine but risk of side-effects increased; carbamazepine possibly reduces plasma concentration of Ethosuximide and Retigabine; plasma concentration of both drugs often reduced when carbamazepine given with Fosphenytoin or Phenytoin, also plasma concentration of fosphenytoin or phenytoin may be increased; carbamazepine often reduces plasma concentration of Lamotrigine, also plasma concentration of lamotrigine of carbamazepine sometimes raised (but evidence is conflicting); possible increased risk of carbamazepine toxicity when given with Levetiracetam;

Carbamazepine
- Antiepileptics (continued)
- Plasma concentration of carbamazepine sometimes reduced by Oxcarbazepine (but concentration of an active metabolite of carbamazepine may be increased), also plasma concentration of an active metabolite of oxcarbazepine often reduced; carbamazepine reduces plasma concentration of Perampanel (see under Perampanel, p. 193); carbamazepine possibly increases plasma concentration of Phenobarbital and Primidone; plasma concentration of both drugs possibly reduced when carbamazepine given with Rufinamide; carbamazepine reduces plasma concentration of Sodium Valproate and Valproic Acid, also plasma concentration of active metabolite of carbamazepine increased; plasma concentration of carbamazepine increased by St Etiripentol; carbamazepine reduces plasma concentration of Topiramate
- Antifungals: plasma concentration of carbamazepine possibly increased by Ketoconazole, also plasma concentration of ketoconazole possibly reduced; plasma concentration of carbamazepine possibly increased by Fluconazole and Miconazole; carbamazepine possibly reduces plasma concentration of Itraconazole and Posaconazole; carbamazepine possibly reduces plasma concentration of Voriconazole—avoid concomitant use; carbamazepine possibly reduces plasma concentration of Caspofungin—consider increasing dose of caspofungin
- Antimalarials: avoidance of carbamazepine advised by manufacturer of Artemether with Piperaquine, anticonvulsant effect of antiepileptics antagonised by Meloquine
- Antimuscarnics: carbamazepine possibly reduces plasma concentration of active metabolite of Fosfoterodine—manufacturer of fosfoterodine advises avoid concomitant use
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by Antipsychotics (convulsive threshold lowered); carbamazepine accelerates metabolism of Haloperidol, Olanzapine, Quetiapine and Risperidone (reduced plasma concentration); carbamazepine reduces plasma concentration of Aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); carbamazepine accelerates metabolism of Clozapine (reduced plasma concentration), also avoid concomitant use of drugs with substantial potential for causing agranulocytosis; carbamazepine possibly reduces plasma concentration of Lurasidone—avoid concomitant use; carbamazepine reduces plasma concentration of Paliperidone
- Antivirals: avoidance of carbamazepine advised by manufacturer of Boceprevir and Rilpivirine (plasma concentration of boceprevir and rilpivirine possibly reduced); carbamazepine possibly reduces plasma concentration of Daclatasvir and Simeprevir—manufacturer of daclatasvir and simeprevir advises avoid concomitant use; carbamazepine possibly reduces plasma concentration of Darunavir, Fosamprenavir, Lopinavir, Saquinavir and Tipranavir; carbamazepine reduces plasma concentration of Dasabuvir, Omipatvir and Paritaprevir—avoid concomitant use; carbamazepine reduces the plasma concentration of Doluitgratravir (see under Doluitgratravir, p. 387); plasma concentration of both drugs reduced when carbamazepine given with Efavirenz; avoidance of carbamazepine advised by manufacturer of Etiltrigratravir, Etiripentol, Ledipsavir and Telaprevir; carbamazepine possibly reduces plasma concentration of Indinavir, also plasma concentration of carbamazepine possibly increased; carbamazepine reduces plasma concentration of Nevirapine; plasma concentration of carbamazepine possibly increased by Nevirapine
- Anxiolytics and hypnotics: carbamazepine often reduces plasma concentration of Clozapine; carbamazepine reduces plasma concentration of Midazolam
- Apremilast: carbamazepine possibly reduces plasma concentration of Apremilast—avoid concomitant use
- Aprepitant: carbamazepine possibly reduces plasma concentration of Aprepitant

Antihistamines: carbamazepine possibly reduces plasma concentration of Captopril (continued)
Carbamazepine (continued)

- Auranofin: carbamazepine possibly reduces plasma concentration of AURANOFIN—manufacturer of auranofin advises avoid concomitant use
- Bupropion: carbamazepine reduces plasma concentration of BUPROPION
- Calcium-channel Blockers: carbamazepine reduces effects of FELODIPINE and ISRADIPINE; carbamazepine probably reduces effects of DIHYDROPYRIDINES, NICARDIPINE and NIFEDIPINE; avoidance of carbamazepine is advised by manufacturer of NIMODIPINE (plasma concentration of nimodipine possibly reduced); effects of carbamazepine enhanced by DILTAZEM and VERAPAMIL
- Cannabis Extract: carbamazepine possibly reduces plasma concentration of CANNABIS EXTRACT—manufacturer of cannabis extract advises avoid concomitant use
- Ciclosporin: carbamazepine accelerates metabolism of CYCLOSPORIN
- Clopidogrel: carbamazepine possibly reduces antiplatelet effect of CLOPIDOGREL
- Co-cistat: carbamazepine possibly reduces plasma concentration of CICARTIST—manufacturer of co-cistat advises avoid concomitant use
- Corticosteroids: carbamazepine possibly reduces plasma concentration of CORTICOSTEROIDS (reduced effect)
- Cytoxics: carbamazepine possibly decreases plasma concentration of AXITINIB (increase dose of axitinib—consult axitinib product literature); carbamazepine possibly reduces plasma concentration of BORTezOMIB, BOSUTINIB, CRIZOTINIB, IBRUTINIB, IDEALISIB and PONATINIB—manufacturer of bortezomib, bosutinib, crizotinib, ibrutinib, idealisib and ponatinib advises avoid concomitant use; carbamazepine possibly reduces plasma concentration of CARBOZANTINIB—avoid concomitant use; avoidance of carbamazepine advised by manufacturer of CABAZITAXEL, DABRAFENIB, GEFITINIB, OLAPARIB and VEMURAFENIB; avoidance of carbamazepine advised by manufacturer of DASATINIB, VANDETANIB and VISMODEGIB (plasma concentration of dasatinib, vandetanib and vismodegib possibly reduced); carbamazepine reduces plasma concentration of MATINIB and LAPATINIB—avoid concomitant use; carbamazepine possibly reduces plasma concentration of ERIBULIN; carbamazepine reduces plasma concentration of IRINOTECAN and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when carbamazepine given with PROCARBAZINE
- Diuretics: increased risk of hypotension when carbamazepine given with diuretics; plasma concentration of carbamazepine increased by ACETAZOLAMIDE; carbamazepine reduces plasma concentration of EPLERENONE—avoid concomitant use
- Fingolimod: carbamazepine reduces plasma concentration of FINGOLIMOD
- Fosaprepitant: carbamazepine possibly reduces plasma concentration of FOSAPRIPANT
- Guanfacine: carbamazepine possibly reduces plasma concentration of GUANFACINE—increase dose of guanfacine
- Hormone Antagonists: carbamazepine possibly reduces plasma concentration of ABRATERONE—manufacturer of abiraterone advises avoid concomitant use; metabolism of carbamazepine inhibited by DANOZOL (increased risk of toxicity); carbamazepine possibly accelerates metabolism of Toremifene (reduced plasma concentration of Toremifene) — SHT3 receptor Antagonists: carbamazepine accelerates metabolism of ONDANSETRON (reduced effect)
- Ixaciptor: carbamazepine possibly reduces plasma concentration of IXACIPTOR—manufacturer of ixaciptor advises avoid concomitant use
- Lipid-regulating Drugs: carbamazepine reduces plasma concentration of SIMVASTATIN—consider increasing dose of simvastatin
- Lithium: neurotoxicity may occur when carbamazepine given with lithium—within four weeks plasma concentration of lithium
- Macitentan: avoidance of carbamazepine advised by manufacturer of MACITENTAN

Carbamazepine (continued)

- Muscle Relaxants: carbamazepine antagonises muscle relaxant effect of NON-DEPOLARISING MUSCLE RELAXANTS (accelerated recovery from neuromuscular blockade)
- Oestrogens: carbamazepine accelerates metabolism of OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNFC)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ORLISTAT
- Progestogens: carbamazepine accelerates metabolism of PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNFC)
- Retinoids: plasma concentration of carbamazepine possibly reduced by ISOTRETINOIN
- Rofinastat: carbamazepine possibly inhibits effects of ROFLUMILAST (manufacturer of roflumilast advises avoid concomitant use)
- Theophylline: carbamazepine accelerates metabolism of THEOPHYLLINE (reduced effect)
- Thyroid Hormones: carbamazepine accelerates metabolism of THYROID HORMONES (may increase requirements for thyroid hormones in hypothyroidism)
- Tibolone: carbamazepine accelerates metabolism of TIBOLONE (reduced plasma concentration)
- Ticagrelor: carbamazepine possibly reduces plasma concentration of TICAGRELOR
- Ulcer-healing Drugs: metabolism of carbamazepine inhibited by CIMETIDINE (increased plasma concentration)
- Ulipristal: avoidance of carbamazepine advised by manufacturer of Ulipristal (contraceptive effect of ulipristal possibly reduced)
- Vitamins: carbamazepine possibly increases requirements for ALFALCALCIOID, CALCITRIOL, COLECALCIFEROL, DIHYDROTACHYSTEROL, ERGOCALCIFEROL, PARICALCITOL or VITAMIN D
- Carbapenems see Ertapenem, Imipenem with Cilastatin, and Meropenem

Carbamazepine

- Antiarrhythmics: carbamazepine possibly enhances antiarrhythmic effect of COUNMARINS
- Carbonic Anhydrase Inhibitors see Diuretics
- Carboplatin see Platinum Compounds
- Carboprost see Prostaglandins

Cardiac Glycosides

- ACE Inhibitors: plasma concentration of digoxin possibly increased by CAPTOPRIL
- Alpha-blockers: plasma concentration of digoxin increased by PRAZOSIN
- Amines: absorption of digoxin possibly reduced by ORLISTAT
- Anti-arrhythmics: plasma concentration of digoxin increased by AMIODARONE, DRONEDARONE and PROPafenone (halve dose of digoxin)
- Antibacterials: plasma concentration of digoxin possibly increased by TETRAMYCIN, TELITHROMYCIN and TRIMETHOPRIM; absorption of digoxin reduced by NEOMYCIN; plasma concentration of digoxin possibly reduced by RIFAMPICIN; plasma concentration of digoxin increased by MACROLIDES (increased risk of toxicity)
- Antidepressants: plasma concentration of digoxin reduced by ST JOHN’S WORT—avoid concomitant use
- Antidiabetics: plasma concentration of digoxin possibly reduced by ACARBOSIDE; plasma concentration of digoxin increased by CANAGLIFLOZIN and Sitagliptin
- Antiepileptics: plasma concentration of digoxin possibly reduced by FOSFENYTIOIN and PHENYTOIN
Cardiac Glycosides (continued)

- Antifungals: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with AMphotericin; plasma concentration of digoxin increased by IRaconazole.
- Antimicrobials: plasma concentration of digoxin possibly increased by CHloroquine and HYDROxyCHLORoquine; possible increased risk of bradycardia when digoxin given with coloMin; plasma concentration of digoxin increased by Quinine.
- Antimuscarinics: plasma concentration of digoxin possibly increased by DarifenACIN.
- Antivirals: side-effects of digoxin possibly increased by Boceprevir; plasma concentration of digoxin increased by Daclatasvir, ETRArinine, SiMepreVir and TelapreVir; plasma concentration of digoxin possibly increased by ParitapreVir (consider reducing dose of digoxin); plasma concentration of digoxin possibly increased by Ritonavirus.
- Anxiolytics and Hypnotics: plasma concentration of digoxin increased by ALPrazolAM (increased risk of toxicity).
- Beta-blockers: increased risk of AV block and bradycardia when cardiac glycosides given with Beta-blockers.
- Calcium Salts: arrhythmias can be precipitated when cardiac glycosides given with large intravenous doses of Calcium Salts.
- Calcium-Channel Blockers: plasma concentration of digoxin increased by Diltiazem, LErcanidipine and NICardipine; plasma concentration of digoxin possibly increased by Nifedipine; plasma concentration of digoxin increased by Verapamil, also increased risk of AV block and bradycardia.
- Ciclosporin: plasma concentration of digoxin increased by CycloSPORin (increased risk of toxicity).
- Cobicistat: plasma concentration of digoxin possibly increased by CObicistat—reduce initial dose of digoxin.
- Colchicine: possible increased risk of myopathy when digoxin given with Colchicine.
- Corticosteroids: increased risk of hypokalaemia when cardiac glycosides given with Corticosteroids.
- Cytotoxics: absorption of digoxin tablets possibly reduced by Bleomycin, CARMustine, CYCLOphosphamide, Cytarabine, DOxorubicin, Melphalan, Methotrexate, ProcABazine and VinCRistine; possible increased risk of bradycardia when digoxin given with CRIZOTINIB; manufacturer of digoxin advises give IbuiTINib at least 6 hours before or after ibritinib; plasma concentration of digoxin increased by Vandetanib—possible increased risk of bradycardia.
- Diuretics: increased cardiac toxicity with cardiac glycosides if hypokalaemia occurs with AcetAZolAMide, Loop Diuretics or ThiazideS and Related Diuretics; plasma concentration of digoxin possibly increased by Potassium CARCACCinate; plasma concentration of digoxin increased by SpiRanolACTone.
- Icvacafarin: plasma concentration of digoxin increased by IvacAfarin.
- Lenalidomide: plasma concentration of digoxin possibly increased by Lenalidomide.
- Lipid-regulating Drugs: absorption of cardiac glycosides possibly reduced by Colestipol and Colestyramine; plasma concentration of digoxin possibly increased by AtorvaStatin.
- MirabeRgon: plasma concentration of digoxin increased by MirabeRgon—reduce initial dose of digoxin.
- Muscle Relaxants: risk of ventricular arrhythmias when cardiac glycosides given with SuMAKhONium; possible increased risk of bradycardia when cardiac glycosides given with TizANidine.
- Penicillamine: plasma concentration of digoxin possibly increased by Penicillamine.
- Ranolazine: plasma concentration of digoxin increased by Ranolazine.
- Sympathomimetics: avoidance of digoxin advised by manufacturer of MIdoRidine.
- Sympathomimetics, Beta : Plasma concentration of digoxin possibly reduced by Salbutamol.
- Ticagrelor: plasma concentration of digoxin increased by Ticagrelor.
- TolVaptan: plasma concentration of digoxin increased by TolVaptAN (increased risk of toxicity).
- UrSe-HelIng Drugs: plasma concentration of digoxin possibly slightly increased by Proton Pump InHibitORS; absorption of cardiac glycosides possibly reduced by SucraLFate.
Chloramphenicol
- Antimicrobials: metabolism of chloramphenicol accelerated by rifampicin (reduced plasma concentration)
- Anticoagulants: chloramphenicol enhances anticoagulant effect of coumarins
- Antidiabetics: chloramphenicol enhances effects of sulfonylureas
- Antiepileptics: chloramphenicol increases plasma concentration of fosphenytoin and phenytoin (increased risk of toxicity); metabolism of chloramphenicol possibly accelerated by phenobarbital and primidone (reduced plasma concentration)
- Antipsychotics: avoid concomitant use of chloramphenicol with clozapine (increased risk of agranulocytosis)
- Antidepressants: absorption of chloramphenicol possibly increases plasma concentration of ciclosporin
- Antiarrhythmics: clopidogrel: chloramphenicol possibly reduces antiplatelet effect of clopidogrel
- Guanfacine: when given with chloramphenicol manufacturer of guanfacine advises halve dose
- Hydroxocobalamin: chloramphenicol reduces response to hydroxocobalamin
- Iron salts: chloramphenicol possibly inhibits effects of iron salts
- Tacrolimus: chloramphenicol possibly increases plasma concentration of tacrolimus
- Vaccines: antibacterials inactivate oral typhoid vaccine—see under Typhoid Vaccine in BNFC
Chloroquine see Anaesthetics and Hypnotics
Chlorproazine
- Antimicrobials: chloroprocaine possibly inhibits effects of sulphonamides (manufacturer of chloroprocaine advises avoid concomitant use)
- Antiarrhythmics: increased risk of ventricular arrhythmias when chloroquine given with amiodyarone—avoid concomitant use
- Antiarrhythmics: increased risk of ventricular arrhythmias when chloroquine given with mexitilene—avoid concomitant use
- Antidepressants: possible increased risk of ventricular arrhythmias when chloroquine given with clozapine—avoid concomitant use
- Antidiabetics: increased risk of ventricular arrhythmias when chloroquine given with metformin—avoid concomitant use
- Antiepileptics: avoidance of antiepileptics advised by manufacturer of temazepam and eszilopram
- Antimalarials: avoidance of antimalarials advised by manufacturer of arteether with lumefantrine; increased risk of convulsions when chloroquine given with mefloquine
- Antipsychotics: increased risk of ventricular arrhythmias when chloroquine given with droperidol—avoid concomitant use
- Cardiac glycosides: chloroquine possibly increases plasma concentration of digoxin
- Ciclosporin: chloroquine increases plasma concentration of ciclosporin (increased risk of toxicity)
- Cytotoxics: possible increased risk of ventricular arrhythmias when chloroquine given with rosuvastatin
- Histamine: avoidance of antimalarials advised by manufacturer of histamine
- Lanthanum: absorption of chloroquine possibly reduced by lanthanum (gives at least 2 hours apart)
- Laradione: chloroquine possibly inhibits effects of laradione (manufacturer of laradione advises avoid concomitant use)
- Parasympathomimetics: chloroquine has potential to increase symptoms of myasthenia gravis and thus diminish effect of neostigmine and pyridostigmine
- Penicillamine: increased risk of haematological toxicity when antimalarials given with penicillamine—manufacturer of penicillamine advises avoid concomitant use
- Ulce-healing Drugs: metabolism of chloroquine inhibited by cimetidine (increased plasma concentration)

Chloroquine (continued)
- Vaccines: antimalarials inactivate oral typhoid vaccine—see under Typhoid Vaccine in BNFC
Chlorothiazide see Diuretics
Chlorphenamine see Antihistamines
Chlorpromazine see Antipsychotics
Chlorotaldione see Diuretics
Cholera Vaccine see Vaccines
Cholic Acid see Bile Acids
Ciclesonide see Corticosteroids
Ciclesonax see Antiinfectives
Ciclosporin
- ACE inhibitors: increased risk of hyperkalaemia when ciclosporin given with amiloridine and propafenone
- Alikiren: ciclosporin increases plasma concentration of alikiren—avoid concomitant use
- Allopurinol: plasma concentration of ciclosporin possibly increased by allopurinol (risk of nephrotoxicity)
- Ambrisentan: ciclosporin increases plasma concentration of ambrisentan (see under Ambrisentan, in BNFC)
- Analgesics: increased risk of nephrotoxicity when ciclosporin given with NSAIDs; ciclosporin increases plasma concentration of diclofenac (halve dose of diclofenac)
- Angiotensin-II Receptor Antagonists: increased risk of hyperkalaemia when ciclosporin given with angiotensin-II receptor antagonists
- Antiarrhythmics: plasma concentration of ciclosporin possibly increased by amiodarone and propafenone
- Antimicrobials: plasma concentration of ciclosporin increased by azithromycin; metabolism of ciclosporin inhibited by clarithromycin and erythromycin (increased plasma concentration); metabolism of ciclosporin accelerated by rifampicin (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by sulfadiazine; increased risk of nephrotoxicity when ciclosporin given with aminoglycosides, polymyxins, quinolones, sulphonamides or vancomycin; plasma concentration of ciclosporin possibly increased by chloramphenicol and felitromycins; increased risk of myopathy when ciclosporin given with daptoomycin (preferably avoid concomitant use); avoidance of ciclosporin advised by manufacturer of fidaxomicin; metabolism of ciclosporin possibly inhibited by macrolides (increased plasma concentration); ciclosporin increases plasma concentration of rifaximin; increased risk of nephrotoxicity when ciclosporin given with trimethoprim, also plasma concentration of ciclosporin reduced by intravenous trimethoprim
- Anticoagulants: ciclosporin possibly increases plasma concentration of dabigatran—manufacturer of dabigatran advises avoid concomitant use; ciclosporin increases plasma concentration of edoxaban (reduce dose of edoxaban—see under Edoxaban, in BNFC)
- Antidepressants: plasma concentration of ciclosporin reduced by st john’s wort—avoid concomitant use
- Antidiabetics: ciclosporin possibly enhances hypoglycaemic effect of repaglinide
- Antiepileptics: metabolism of ciclosporin accelerated by carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone (reduced plasma concentration); plasma concentration of ciclosporin possibly reduced by oxicarbazine
- Antifungals: metabolism of ciclosporin inhibited by fluconazole, itraconazole, ketoconazole, posaconazole and voriconazole (increased plasma concentration); metabolism of ciclosporin possibly inhibited by miconazole (increased plasma concentration); increased risk of nephrotoxicity when ciclosporin given with amphotericin; ciclosporin increases plasma concentration of caspofungin (manufacturer of caspofungin recommends monitoring liver enzymes); plasma concentration of ciclosporin possibly reduced by griseofulvin and terbinafine; plasma concentration of ciclosporin possibly increased by micafungin
- Antimalarials: plasma concentration of ciclosporin increased by chloroquine and hydroxychloroquine (increased risk of toxicity)
Ciclosporin

- Antimycobacterics: avoidance of ciclosporin advised by manufacturer of DARIFENACIN
- Antivirals: increased risk of nephrotoxicity when ciclosporin given with ACICLOVIR or VALACLOVIR; plasma concentration of ciclosporin possibly increased by ATAZANAVIR and RITONAVIR; plasma concentration of ciclosporin increased by BOCEPREVIR, POSANEREAVIR and INDINAVIR; plasma concentration of ciclosporin possibly reduced by EFAVIRENZ; plasma concentration of both drugs increased when ciclosporin given with SAQUINAVIR; plasma concentration of both drugs increased when ciclosporin given with TELAPREVI
- Beta-blockers: plasma concentration of ciclosporin increased by
- Bile Acids: avoidance of ciclosporin advised by manufacturer of CHOLIC ACID; absorption of ciclosporin increased by CHOLIC ACID
- Bosentan: ciclosporin increases plasma concentration of bosentan (avoid concomitant use)
- Calcium-channel Blockers: combination of ciclosporin with LERCANIDIPINE may increase plasma concentration of either drug (or both)—avoid concomitant use; plasma concentration of ciclosporin increased by DILTIAZEM, NIFEDIPINE and VERAPAMIL; ciclosporin possibly increases plasma concentration of NIFEDIPINE (increased risk of toxicity including gingival hyperplasia)
- Cardiac Glycosides: ciclosporin increases plasma concentration of DIGOXIN (increased risk of toxicity)
- Colchicine: possible increased risk of nephrotoxicity and myotoxicity when ciclosporin given with COLCHICINE—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)
- Corticosteroids: plasma concentration of ciclosporin increased by high-dose METHYLPRERINSOLONE (risk of convulsions); ciclosporin increases plasma concentration of PRENISOLONE
- Cytotoxics: increased risk of nephrotoxicity when ciclosporin given with lomustine; increased risk of neurotoxicity when ciclosporin given with DOXORUBICIN; ciclosporin increases plasma concentration of EPIRUBICIN and IDARUBICIN; ciclosporin reduces excretion of mitoxantrone (increased plasma concentration); risk of toxicity when ciclosporin given with epirubicin or idarubicin; administration of AFATINIB—manufacturer of afatinib advises separating administration of ciclosporin by 6 to 12 hours; caution with ciclosporin advised by manufacturer of CRIXOTINIB; ciclosporin increases plasma concentration of EPIRUBICIN (consider reducing dose of everolimus—consult everolimus product literature); plasma concentration of ciclosporin possibly increased by MATINIB; in vitro studies suggest a possible interaction between ciclosporin and DOCETAXEL (consult docetaxel product literature); ciclosporin possibly increases plasma concentration of ETOPOSIDE (increased risk of toxicity)
- Dexrazoxane: increased risk of immunosuppression with ciclosporin advised by manufacturer of Dexrazoxane
- Diuretics: plasma concentration of ciclosporin possibly increased by ACETAZOLAMIDE; increased risk of hyperkalaemia when ciclosporin given with POTASSIUM-SPARING DIURETICS AND ALDOSTERONE ANTAGONISTS; increased risk of nephrotoxicity and possibly hypermagnesaemia when ciclosporin given with THIAZIDES AND RELATED DIURETICS
- Grapefruit Juice: plasma concentration of ciclosporin increased by GRAPEFRUIT JUICE (increased risk of toxicity)
- Hormone Antagonists: metabolism of ciclosporin inhibited by OMEPRAZOLE (increased plasma concentration); plasma concentration of ciclosporin reduced by LAMOTRIGINE and OCTREOTIDE; plasma concentration of ciclosporin possibly reduced by PASIRETIDONE
- Lenalidomide: ciclosporin possibly increases plasma concentration of LENALIDOMIDE (increased risk of toxicity)
- Lipid-regulating Drugs: absorption of ciclosporin reduced by COLESEVELAM; increased risk of renal impairment when ciclosporin given with BEZAFI BRATE or FENOFIBRATE; increased risk of myopathy when ciclosporin given with
- Lipid-regulating Drugs: (continued)
- Lipid-regulating Drugs: increased risk of nephrotoxicity when ciclosporin given with FLUVASTATIN or ROSUVASTATIN; increased risk of myopathy when ciclosporin given with SIMVASTATIN or ATORVASTATIN; plasma concentration of both drugs may increase when ciclosporin given with EZETIMIBE; separating administration from ciclosporin by 12 hours advised by manufacturer of Lomitapide
- Mannitol: possible increased risk of nephrotoxicity when ciclosporin given with MANNITOL
- Metoclopramide: plasma concentration of ciclosporin increased by METHOCLOPRAMIDE
- Mifamurtide: avoidance of ciclosporin advised by manufacturer of MIFAMURTIDE
- Modafinil: plasma concentration of ciclosporin possibly increased by MODAFINIL
- Oestrogens: plasma concentration of ciclosporin possibly increased by OESTROGENS
- Oralistat: absorption of ciclosporin possibly reduced by ORLISTAT
- Potassium Salts: increased risk of hyperkalaemia when ciclosporin given with POTASSIUM SALTS
- Progestogens: plasma concentration of ciclosporin possibly increased by PROGESTOGENS
- Ranolazine: plasma concentration of both drugs may increase when ciclosporin given with RANOLAZINE
- Sevelamer: plasma concentration of ciclosporin possibly reduced by SEVELAMER
- Sirolimus: ciclosporin increases plasma concentration of SIROLIMUS
- Sulfinpyrazone: plasma concentration of ciclosporin reduced by SULFINPYRAZONE
- Tacrolimus: plasma concentration of ciclosporin increased by TACROLIMUS (increased risk of nephrotoxicity)—avoid concomitant use
- Ticagrelor: ciclosporin increases plasma concentration of TICAGRELOR
- Ulcer-healing Drugs: plasma concentration of ciclosporin possibly increased by CIMETIDINE; plasma concentration of ciclosporin possibly affected by OMEPRAZOLE
- Vitamin E: plasma concentration of ciclosporin possibly affected by VITAMIN E

Cilostazol

- Anagrelide: avoidance of cilostazol advised by manufacturer of ANAGRELIDE
- Antibacterials: plasma concentration of cilostazol possibly increased by CLARITHROMYCIN (see under Cilostazol, in BNF); plasma concentration of cilostazol increased by ERYTHROMYCIN (see under Cilostazol, in BNF)
- Antifungals: plasma concentration of cilostazol increased by KETOCONAZOLE (see under Cilostazol, in BNF); plasma concentration of cilostazol possibly increased by ITRACONAZOLE (see under Cilostazol, in BNF)
- Antivirals: plasma concentration of cilostazol possibly increased by BOCEPREVIR, RITONAVIR and TELAPREVIR (see under Cilostazol, in BNF)
- Calcium-channel Blockers: plasma concentration of cilostazol increased by DILTIAZEM (consider reducing dose of cilostazol)
- Lipid-regulating Drugs: separating administration from cilostazol by 12 hours advised by manufacturer of Lomitapide
- Ulcer-healing Drugs: plasma concentration of cilostazol increased by OMEPRAZOLE (see under Cilostazol, in BNF)

Cimetidine

- see Histamine H₂-antagonists

Cinacalcet

- Antifungals: metabolism of cinacalcet inhibited by KETOCONAZOLE (increased plasma concentration)
- Hormone Antagonists: cinacalcet inhibited by TAMOXIFEN to active metabolite (avoid concomitant use)

Cinnarizine

- see Antihistamines

Ciprofibrate

- see Fibrates

Ciprofloxacin

- see Quinolones

Cisatracurium

- see Muscle Relaxants

Cisplatin

- see Platinum Compounds

Citalopram

- see Antidepressants, SSRIs
Clonidine
- Antidepressants: enhanced hypotensive effect when clonidine given with MAOIs; hypotensive effect of clonidine possibly antagonised by MIRTAZAPINE; hypotensive effect of clonidine antagonised by TRICYCLES, also increased risk of hypertension on clonidine withdrawal.
- Antipsychotics: enhanced hypotensive effect when clonidine given with PHENOTHIAZINES.
- Antihistamines and Hypnotics: enhanced hypotensive effect when clonidine given with DIAZEPAM.

Beta-blockers: increased risk of withdrawal hypertension when clonidine given with BETA-BLOCKERS (withdraw beta-blockers several days before slowly withdrawing clonidine).
- Calcium-channel Blockers: enhanced hypotensive effect when clonidine given with CALCIUM-CHANNEL BLOCKERS.
- Corticosteroids: hypotensive effect of clonidine antagonised by CORTICOSTEROIDS.
- Cytoxics: possible increased risk of bradycardia when clonidine given with CRIZOTINIB.
- Diazoxide: enhanced hypotensive effect when clonidine given with DIAZoxide.
- Diuretics: enhanced hypotensive effect when clonidine given with DIURETICS.
- Dopaminergics: enhanced hypotensive effect when clonidine given with CO-BENEDOLPA, CO-CARELDOPA or LEVODOPA.
- Histamine: avoidance of clonidine advised by manufacturer of HISTAMINE.
- Metyldopa: enhanced hypotensive effect when clonidine given with METHYLDOPA.
- Moxisylyte: enhanced hypotensive effect when clonidine given with MOXISLYLTE.
- Moxonidine: enhanced hypotensive effect when clonidine given with MOXONIDINE.
- Muscle Relaxants: enhanced hypotensive effect when clonidine given with BACLOFEN or TIZANIDINE.
- Nitrates: enhanced hypotensive effect when clonidine given with NITRATES.
- Oestrogens: hypotensive effect of clonidine antagonised by OESTROGENS.
- Prostaglandins: enhanced hypotensive effect when clonidine given with ALPROSTADIL.
- Sympathomimetics: possible risk of hypertension when clonidine given with ADRENALINE (EPINEPHRINE) or NOREPINEPHRINE; serious adverse events reported with concomitant use of clonidine and METHYLPHENIDATE (causality not established).
- Vasodilator Antihypertensives: enhanced hypotensive effect when clonidine given with HYDRAZINE, MINOXIDIL or SODIUM NITROPRUSIDE.

Clomipramine
- Antidepressants: enhanced hypotensive effect when clonidine given with TRICYCLICS; hypotensive effect of clonidine antagonised by MAOls and PHENINDIONE; increased risk of bleeding when clonidine given with HEPARINS.
- Antidepressants: antiplatelet effect of clotidogrel possibly reduced by chloramphenicol, ciprofloxacin and erythromycin.
- Adrenergic Neurone Blockers: antiplatelet action of clotidogrel enhances anti-coagulant effect of COUMARINS and PHENINDIONE.
- Anticoagulants: manufacturer of clotidogrel advises avoid concomitant use with warfarin; antiplatelet action of clotidogrel enhances anti-coagulant effect of coumarins and phenindion; increased risk of bleeding when clotidogrel given with heparins.
- Antidepressants: antiplatelet effect of clotidogrel possibly reduced by fluoxetine, furoxamine and moxidolmide.
- Antiepileptics: antiplatelet effect of clotidogrel possibly reduced by carbamazepine and oxcarbazepine.
- Antiinflammatories: antiplatelet effect of clotidogrel possibly reduced by flunoxonazole, irinobazole, ketoconozone and voronazole.
- Antivirals: antiplatelet effect of clotidogrel possibly reduced by etravirine.
- Dipyridamole: increased risk of bleeding when clotidogrel given with dipyridamole.
- Iloprost: increased risk of bleeding when clotidogrel given with iloprost.
- Lipid-regulating Drugs: clotidogrel increases plasma concentration of rosvastatin—adjust dose of rosvastatin (consult product literature).
- Prasugrel: possible increased risk of bleeding when clotidogrel given with prasugrel.
- Ulcer-healing Drugs: antiplatelet effect of clotidogrel possibly reduced by cimetidine, lansoprazole, pantoprazole and rebetaprazol; antiplatelet effect of clotidogrel reduced byesomeprazole and omeprazole.

Clotrimazole see Antifungals, Imidazoles.
Clozapine see Antipsychotics.
Co-amoxiclav see Penicillins.
Co-beneldopa
- ACE Inhibitors: enhanced hypotensive effect when co-beneldopa given with ACE INHIBITORS.
- Adrenergic Neurone Blockers: enhanced hypotensive effect when co-beneldopa given with ADRENERGIC NEURONE BLOCKERS.
- Alpha-blockers: enhanced hypotensive effect when co-beneldopa given with ALPHA-BLOCKERS.
- Antiarrhythmics: enhanced hypotensive effect when co-beneldopa given with volatile liquid general anaesthetics.
- Antihistamines: avoidance of clonidine advised by manufacturer of histamine.
- Metyldopa: enhanced hypotensive effect when clonidine given with methyldopa.
- Moxisylyte: enhanced hypotensive effect when clonidine given with MOXISLYLTE.
- Moxonidine: enhanced hypotensive effect when clonidine given with MOXONIDINE.
- Muscle Relaxants: enhanced hypotensive effect when clonidine given with BACLOFEN or TIZANIDINE.
- Prasugrel: antiplatelet effect of clotidogrel possibly reduced by clopidogrel, enhaces anticoagulant effect of clopidogrel.
- Proton-pump Inhibitors: antiplatelet effect of clotidogrel possibly reduced by rabeprazole and pantoprazole.
- Prasugrel: antiplatelet effect of clotidogrel possibly reduced by rosuvastatm, increases plasma concentration of rosuvastatin—adjust dose of rosuvastatin (consult product literature).
- Prasugrel: possible increased risk of bleeding when clotidogrel given with prasugrel.
- Ulcer-healing Drugs: antiplatelet effect of clotidogrel possibly reduced by cimetidine, lansoprazole, pantoprazole and rebetaprazol; antiplatelet effect of clotidogrel reduced by omeprazole andesomeprazole.
- Antithrombotic Drugs: risk of thromboembolic events when co-beneldopa given with antithrombotic drugs (consult product literature).
- Anticoagulants: manufacturer of clopidogrel advises avoid concomitant use with warfarin; antiplatelet action of clotidogrel enhances anti-coagulant effect of coumarins and phenindion; increased risk of bleeding when clotidogrel given with heparins.
- Antidepressants: antiplatelet effect of clotidogrel possibly reduced by fluoxetine, furoxamine and moxidolmide.
- Adrenergic Neurone Blockers: antiplatelet action of clotidogrel enhances anti-coagulant effect of COUMARINS and PHENINDIONE; increased risk of bleeding when clotidogrel given with HEPARINS.
- Anticoagulants: manufacturer of clotidogrel advises avoid concomitant use with warfarin; antiplatelet action of clotidogrel enhances anti-coagulant effect of coumarins and phenindion; increased risk of bleeding when clotidogrel given with heparins.
- Antidepressants: antiplatelet effect of clotidogrel possibly reduced by fluoxetine, furoxamine and moxidolmide.
- Antiepileptics: antiplatelet effect of clotidogrel possibly reduced by carbamazepine and oxcarbazepine.
- Antiinflammatories: antiplatelet effect of clotidogrel possibly reduced by flunoxonazole, irinobazole, ketoconozone and voronazole.
- Antivirals: antiplatelet effect of clotidogrel possibly reduced by etravirine.
- Dipyridamole: increased risk of bleeding when clotidogrel given with dipyridamole.
- Iloprost: increased risk of bleeding when clotidogrel given with iloprost.
- Lipid-regulating Drugs: clotidogrel increases plasma concentration of rosvastatin—adjust dose of rosvastatin (consult product literature).
- Prasugrel: possible increased risk of bleeding when clotidogrel given with prasugrel.
- Ulcer-healing Drugs: antiplatelet effect of clotidogrel possibly reduced by cimetidine, lansoprazole, pantoprazole and rebetaprazol; antiplatelet effect of clotidogrel reduced by omeprazole andesomeprazole.
Co-beneldopa – Co-careldopa

Cobicistat

- Antivirals (continued)
  - cobicistat possibly increases plasma concentration of • SIMEPREVIR — manufacturer of simeprevir advises avoid concomitant use; plasma concentration of both drugs reduced when cobicistat given with • TIPRANAVIR (avoid concomitant use)
  - Antioxidants and Hypotonic: manufacturer of cobicistat advises avoid concomitant use with oral • MIDAZOLAM
  - Avanafil: cobicistat possibly increases plasma concentration of • AVANAFIL — avoid concomitant use
  - Bosentan: manufacturer of cobicistat advises avoid concomitant use with • BOSENTAN
  - Cardiac Glycosides: cobicistat possibly increases plasma concentration of digoxin — reduced dose of digoxin
  - Cytotoxics: cobicistat possibly increases the plasma concentration of • IBRUTINIB — reduce dose of ibritinib (see under ibritinib, in BNFC)
  - Dopaminergics: enhanced hypotensive effect when cobicistat given with • DOPAMINE
  - Enhanced hypotensive effect when cobicistat given with • DOPAMINE
  - Dose augmentations: possible increased risk of ventricular arrhythmias when cobicistat given with • DOPAMINE — avoid concomitant use
  - Ergot Alkaloids: cobicistat possibly increases plasma concentration of • ERGOT ALKALOIDS — manufacturer of cobicistat advises avoid concomitant use
  - Lipid-regulating Drugs: cobicistat possibly increases plasma concentration of • ATORVASTATIN — manufacturer of cobicistat advises reduce dose of atorvastatin; manufacturer of cobicistat advises avoid concomitant use with • SIMVASTATIN
  - Oestrogens: cobicistat accelerates metabolism of • OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings — see Contraceptive Interactions in BNFC)
  - Prostaglandins: cobicistat increases plasma concentration of • NORTESTIMATE
  - Sildenafil: cobicistat possibly increases plasma concentration of • SILDENAFIL — manufacturer of cobicistat advises avoid concomitant use of sildenafil for pulmonary arterial hypertension or reduce dose of sildenafil for erectile dysfunction — consult cobicistat product literature
  - Vardenafil: cobicistat possibly increases plasma concentration of • VARDENAFIL — manufacturer of cobicistat advises reduce dose of vardenafil (consult cobicistat product literature)

Co-careldopa

- ACE Inhibitors: enhanced hypotensive effect when co-careldopa given with • ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when co-careldopa given with • ADRENERGIC NEURONE BLOCKERS
- Alpha-blockers: enhanced hypotensive effect when co-careldopa given with • ALPHA-BLOCKERS
- Anaesthetics, General: increased risk of arrhythmias when co-careldopa given with • VOLATILE LIQUID GENERAL ANAESTHETICS
- Angiotensin-II Receptor Antagonists; enhanced hypotensive effect when co-careldopa given with • ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antibacterials: effects of co-careldopa possibly reduced by • ISOAZIDE
- Antidepressants: risk of hypertensive crisis when co-careldopa given with • MAOIS, avoid co-careldopa for at least 2 weeks after stopping MAOIs; increased risk of side-effects when co-careldopa given with • MOLOMBIDE
- Antiepileptics: effects of co-careldopa possibly reduced by • FOSPHENTOIN and PHENYTOIN
- Antimuscarinics: absorption of co-careldopa possibly reduced by • ANTIMUSCARINICS
- Antipsychotics: effects of co-careldopa antagonised by • ANTIPSYCHOTICS; avoidance of co-careldopa advised by manufacturer of • AMISULPRIDE (antagonism of effect)
- Antipsychotics and Hypnotics: effects of co-careldopa possibly antagonised by • AMISULPRIDE; avoidance of co-careldopa advised by manufacturer of • BZDZIAZEPINES
- Beta-blockers: enhanced hypotensive effect when co-careldopa given with • BETA-BLOCKERS

A1

Interactions | Appendix 1

840 Co-beneldopa – Co-careldopa

BNFC 2016-2017
Co-careldopa – Colestyramine

Co-careldopa (continued)

- Bupropion: increased risk of side-effects when co-careldopa given with BUPROPION
- Calcium-channel Blockers: enhanced hypotensive effect when co-careldopa given with calcium-channel blockers.
- Clonidine: enhanced hypotensive effect when co-careldopa given with CLONIDINE.
- Diazoxide: enhanced hypotensive effect when co-careldopa given with DIAZOXIDE.
- Diuretics: enhanced hypotensive effect when co-careldopa given with DIURETICS.
- Dopaminergics: enhanced effects and increased toxicity of co-careldopa when given with selegiline (reduce dose of co-careldopa).
- Iron: absorption of co-careldopa possibly reduced by oral iron salts.
- Memantine: effects of dopaminergicics possibly enhanced by memantine.
- Muscle Relaxants: possible agitation, confusion and hallucinations when co-careldopa given with BACLOFEN.
- Nitrates: enhanced hypotensive effect when co-careldopa given with NITRATES.
- Vasodilator Antihypertensives: enhanced hypotensive effect when co-careldopa given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE.

Codeine see Opioid Analgesics

Co-flumipicil see Penicillins

Colchicine

- Anti-arrhythmics: possible increased risk of colchicine toxicity when given with amiодaron.
- Antibacterials: possible increased risk of colchicine toxicity when given with azithromycin, clarithromycin, erythromycin and telithromycin—suspending or reducing dose of colchicine (avoid concomitant use in hepatic or renal impairment).
- Antifungals: possible increased risk of colchicine toxicity when given withitraconazole and ketoconazole—suspending or reducing dose of colchicine (avoid concomitant use in hepatic or renal impairment).
- Anti-virals: possible increased risk of colchicine toxicity when given with atazanavir, indinavir, ritonavir and telaprevir—suspending or reducing dose of colchicine (avoid concomitant use in hepatic or renal impairment).
- Cardiac glycosides: possible increased risk of myopathy when colchicine given with digoxin.
- Ciclosporin: possible increased risk of nephrotoxicity and myotoxicity when colchicine given with ciclosporin—suspending or reducing dose of colchicine (avoid concomitant use in hepatic or renal impairment).
- Grapefruit juice: possible increased risk of colchicine toxicity when given with grapefruit juice.
- Lipid-regulating Drugs: possible increased risk of myopathy when colchicine given with fibrates or statins.
- Netupitant: caution with colchicine advised by manufacturer of netupitant.

Colecaltiferol see Vitamins

Colesvelam

NOTE Other drugs should be taken at least 4 hours before or after colesvelam to reduce possible interference with absorption.

- Antidiabetics: colesvelam reduces absorption of glimepiride and glipizide; colesvelam reduces absorption of glimepiride—manufacturer of glimepiride advises at least 4 hours before colesvelam; manufacturer of canagliflozin advises give bile acid sequestrants at least 1 hour after or 4–6 before canagliflozin.

Colesvelam (continued)

- Anti-epileptics: colesvelam possibly reduces absorption of fosphenytoin and phenytoin.
- bile acids: colesvelam probably reduces effects of cholic acid (manufacturer of cholic acid advises give at least 5 hours apart).
- Ciclosporin: colesvelam reduces absorption of ciclosporin.
- Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of lomitapide (give at least 4 hours apart).
- Lovastatin: colesvelam reduces absorption of lovastatin.
- Thyroid Hormones: colesvelam reduces absorption of levothyroxine.
- Other drugs should be taken at least 1 hour before or 4–6 hours after colesvelam to reduce possible interference with absorption.
- Antibacterials: colesvelam possibly reduces absorption of tetracycline.
- Antidyspeptics: colesvelam possibly reduces absorption of antacids.
- Diuretics: colesvelam reduces absorption of thiazides and related diuretics (give at least 2 hours apart).
- Lipid-regulating Drugs: bile acid sequestrants possibly reduce absorption of lomitapide (give at least 4 hours apart).
- Thyroid Hormones: colesvelam reduces absorption of levothyroxine.
Colistimethate Sodium – Corticosteroids

Contraceptives, oral see Oestrogens and Progestogens

Corticosteroids

NOTE Interactions do not generally apply to corticosteroids used for topical action (including inhalation) unless specified

• ACE inhibitors: corticosteroids antagonise hypotensive effect of ACE INHIBITORS
• Adrenergic Neurone Blockers: corticosteroids antagonise hypotensive effect of ADRENERGIC NEURONE BLOCKERS
• Antacid: avoidance of corticosteroids advised by manufacturer of ALDESLINKIN
• Alpha-blockers: corticosteroids antagonise hypotensive effect of ALPHA-BLOCKERS
• Aminophylline: increased risk of hypokalaemia when corticosteroids given with AMINOPHYLLINE
• Analgesics: increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with NSAIDS; increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with ASPIRIN; also corticosteroids reduce plasma concentration of salicylate
• Angiotensin-II Receptor Antagonists: corticosteroids antagonise hypotensive effect of ANGIOTENSIN-II RECEPTOR ANTAGONISTS
• Antacids: absorption of deflazacort reduced by ANTACIDS
• Antidiabetics: corticosteroids reduce anticoagulant effect of COUMARINS; metabolism of corticosteroids may enhance or reduce anticoagulant effect of PHENINDIONE
• Antifungals: metabolism of methylprednisolone inhibited by KETOCONAZOLE; metabolism of methylprednisolone inhibited by ERITHROMYCIN; corticosteroids possibly reduce plasma concentration of ISOAZID; metabolism of corticosteroids antagonised by AZATHIOPRINE
• Anticoagulants: corticosteroids may enhance or reduce anticoagulant effect of COUMARINS (high-dose corticosteroids enhance anticoagulant effect); corticosteroids may enhance or reduce anticoagulant effect of PHENINDIONE
• Antifungals: metabolites of corticosteroids antagonise hypoglycaemic effect of ANTIDIABETICS
• Antiepileptics: metabolism of corticosteroids accelerated by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE (reduced effect)
• Anfinsol: metabolism of corticosteroids possibly inhibited by TIACONAZOLE and KETOCONAZOLE; plasma concentration of active metabolite of ciclesonide increased by CICLOSPORIN; concentration of ciclesonide increased by CICLOSPORIN and RANITIDINE; increased risk of hypokalaemia when corticosteroids given with aminophylline
• Antihistamines: corticosteroids antagonise hypotensive effect of ANTIHISTAMINES
• Antivirals: dexamethasone possibly reduces plasma concentration of dexamethasone increased by Ritonavir — increased risk of adrenal suppression; plasma concentration of dexamethasone (including intraoral, intranasal, and rectal budesonide) possibly increased by RITONAVIR — increased risk of adrenal suppression; plasma concentration of triamcinolone injection increased by RITONAVIR — increased risk of adrenal suppression; plasma concentration of inhaled budesonide and fluticasone possibly increased by TELAPREvir
• Aprepitant: metabolism of dexamethasone and methylprednisolone inhibited by APREPITANT (reduce dose of dexamethasone and methylprednisolone)
• Beta-blockers: corticosteroids antagonise hypotensive effect of BETA-BLOCKERS
• Calcium: corticosteroids reduce absorption of CALCIUM SALTS
• Calcium-channel Blockers: corticosteroids antagonise hypotensive effect of CALCIUM-CHANNEL BLOCKERS; plasma concentration of methylprednisolone increased by DILTIAZEM
• Cardiac Glycosides: increased risk of hypokalaemia when corticosteroids given with CARDIAC GLYCOSIDES
• Ciclosporin: high-dose methylprednisolone increases plasma concentration of CICLOSPORIN (risk of convulsions); plasma concentration of prednisolone increased by CICLOSPORIN
• Clonidine: corticosteroids antagonise hypotensive effect of CLONIDINE
• Cytotoxics: possible increased risk of hepatoxicity when dexamethasone given with high-dose METHOTREXATE; dexamethasone possibly decreases plasma concentration of AXITINIB (increase dose of axitinib — consult axitinib product literature); dexamethasone possibly reduces plasma concentration of CABOZANTINIB — manufacturer of cabozantinib advises avoid concomitant use
• Diazoxide: corticosteroids antagonise hypotensive effect of DIAZOXIDE
• Diuretics: corticosteroids antagonise diuretic effect of DIURETICS; increased risk of hypokalaemia when corticosteroids given with ACETAZOLAMIDE, LOOP DIURETICS or THIAZIDES and RELATED DIURETICS; increased risk of hypokalaemia when corticosteroids given with high doses of phosphorus; increased risk of hypokalaemia when corticosteroids given with high doses of potassium; increased risk of hypokalaemia when corticosteroids given with high doses of sodium; increased risk of hypokalaemia when corticosteroids given with high doses of chloride
• Dexamethasone; corticosteroids antagonise hypotensive effect of METHYLDOPA
• Milfturidine: avoidance of corticosteroids advised by manufacturer of MILFTURIDINE
• Mitelipristone: effect of corticosteroids (including inhaled corticosteroids) may be reduced for 3–4 days after MITELIPRISTONE
• Moxonidine: corticosteroids antagonise hypotensive effect of MOXONIDINE
• Muscle Relaxants: corticosteroids possibly antagonise effects of PANCURONIUM and VECURONIUM
• Netupitant: plasma concentration of dexamethasone increased by NETUPITANT (halve dose of dexamethasone)
• Nicorandil: increased risk of gastro-intestinal bleeding and ulceration when corticosteroids given with NICORANDIL
• Nitrates: corticosteroids antagonise hypotensive effect of NITRATES
• Oestrogens: plasma concentration of corticosteroids increased by oral contraceptives containing OESTROGENS
• Sodium Benzoate: corticosteroids possibly reduce effects of SODIUM BENZOATE
• Sodium Phenylbutyrate: corticosteroids possibly reduce effects of SODIUM PHENYLACETATE
• Somatropin: corticosteroids may inhibit growth-promoting effect of SOMATROPIN
• Symptomatics: metabolism of dexamethasone accelerated by EPHEDRINE; possible risk of hypertension when corticosteroids given with MIDODRINE
• Symptomatometrics, Beta: increased risk of hypokalaemia when corticosteroids given with high doses of BETA; SYMPTOMATOMETRICS
• Theophylline: increased risk of hypokalaemia when corticosteroids given with THEOPHYLLINE
Corticosteroids — Coumarins

Interactions | Appendix 1

### Coumarins (continued)

- Antiepileptics: metabolism of coumarins accelerated by **CARBAMAZEPINE**, **PHENOBARBITAL** and **PRIMODONE** (reduced anticoagulant effect); plasma concentration of warfarin reduced by **VALPROATE**; metabolism of coumarins accelerated by **PHENOBARBITAL** and **PHENYTOIN** (possibility of reduced anticoagulant effect, but enhancement also reported); anticoagulant effect of coumarins possibly enhanced by **SODIUM VALPROATE** and **VALPROIC ACID**

- Antibacterials: anticoagulant effect of coumarins enhanced by **LEVOFLOXACIN**, **ITRACONAZOLE**, **KETOCONAZOLE** and **VORICONAZOLE**; anticoagulant effect of coumarins greatly enhanced by **MICONAZOLE** (including oral gel and possibly vaginal and topical formulations)—avoid concomitant use if possible; anticoagulant effect of coumarins reduced by **GRISEOFULVIN**

- Antimalarials: isolated reports that anticoagulant effect of warfarin may be enhanced by **PROGUANIL**; plasma concentration of both drugs increased when warfarin given with **QUININE**

- Antivirals: anticoagulant effect of warfarin may be enhanced or reduced by **ATAZANAVIR**, **NEVIRAPINE** and **RITONAVIR**; plasma concentration of coumarins possibly affected by **EFAVIREN**; anticoagulant effect of coumarins may be enhanced or reduced by **FOSAMPRENAVIR**; anticoagulant effect of coumarins possibly enhanced by **RITONAVIR**; anticoagulant effect of warfarin possibly enhanced by **SAQUINAVIR**; plasma concentration of warfarin possibly affected by **TELAPREVIR**

- Anti暑tics and Hypnotics: anticoagulant effect of coumarins may transiently be enhanced by **CHLORAL**

- Antifungals: anticoagulant effect of warfarin possibly reduced by **APREPITANT**

- Azathioprine: anticoagulant effect of acenocoumarol possibly reduced by **AZATHIOPRINE**; anticoagulant effect of warfarin reduced by **AZATHIOPRINE**

- Bosentan: monitoring anticoagulant effect of coumarins recommended by manufacturer of **BOSENTAN**

- Carbimazole: anticoagulant effect of coumarins possibly enhanced by **CARBIMAZOLE**

- Clopidogrel: anticoagulant effect of coumarins enhanced due to antplatelet action of **CLOPIDOGREL**; avoidance of warfarin advised by manufacturer of **CLOPIDOGREL**

- Corticosteroids: anticoagulant effect of coumarins may be enhanced or reduced by **CORTICOSTEROIDS** (high-dose corticosteroids enhance anticoagulant effect)

- Cranberry Juice: anticoagulant effect of coumarins possibly enhanced by **CRANBERRY JUICE**—avoid concomitant use

- Cytostatics: anticoagulant effect of coumarins possibly enhanced by **ETOPOSIDE**, **IFOSFAMIDE** and **SORAFENIB**; anticoagulant effect of coumarins enhanced by **CAPECITABINE**, **FLUOROURACIL** and **TEGAFUR**; anticoagulant effect of warfarin possibly enhanced by **GEFITINIB**, **GMBCITABINE** and **VEMURAFENIB**; anticoagulant effect of coumarins possibly reduced by **MERCAPTOPURINE** and **MITOTANE**; plasma concentration of warfarin reduced by **DABRAFENIB**; increased risk of bleeding when warfarin given with **ERLOTINIB**; avoidance of coumarins advised by manufacturer of **IBRUTINIB**; replacement of warfarin with a heparin advised by manufacturer of **MATINIB** (possibility of enhanced warfarin effect); increased risk of bleeding when warfarin given with **REGORAFENIB**

- Dipyriramole: anticoagulant effect of coumarins enhanced due to antplatelet action of **DIPYRIDAMOLE**

- Disulfiram: anticoagulant effect of coumarins enhanced by **DISULFIRAM**

- Dopaminergics: anticoagulant effect of warfarin enhanced by **ENTACAPONE**

- Enteral Feeds: anticoagulant effect of coumarins antagonised by vitamin K (present in some **ENTERAL FEEDS**)

- Fosaprepitant: anticoagulant effect of warfarin possibly reduced by **FOSAPREPTANT**

- Glucocorticoids: anticoagulant effect of warfarin enhanced by **GLUCOSAMINE** (avoid concomitant use)

- Hormone Antagonists: anticoagulant effect of coumarins possibly enhanced by **BICALUTAMIDE** and **TOREMIFENE**; metabolism of coumarins inhibited by **DANAZOL** (enhanced...
Interactions

Appendix 1

Crizotinib

Analgesics: manufacturer of crizotinib advises caution with
- ALFENTANIL and • FENTANYL.

Antibacterials: plasma concentration of crizotinib possibly increased by • CLARITHROMYCIN and • TELITHROMYCIN—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib possibly reduced by RIFABUTIN—manufacturer of crizotinib advises avoid concomitant use; plasma concentration of crizotinib reduced by • RIFAMPICIN—manufacturer of crizotinib advises avoid concomitant use.

Antidepressants: plasma concentration of crizotinib possibly reduced by ST JOHN’S WORT—manufacturer of crizotinib advises avoid concomitant use.

Antiepileptics: plasma concentration of crizotinib possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE—manufacturer of crizotinib advises avoid concomitant use.

Antifungals: plasma concentration of crizotinib increased by • KETOCONAZOLE—avoid concomitant use; plasma concentration of crizotinib possibly increased by • ITRACONAZOLE and • VORICONAZOLE—manufacturer of crizotinib advises avoid concomitant use.

Antihistamines: possible increased risk of pruritus when crizotinib given with MIFELODINE.

Antipsychotics: avoid concomitant use with cytoxotics with • CLOzapine (increased risk of agranulocytosis); manufacturer of crizotinib advises caution with • PIMOZIDE.

Antimalarials: plasma concentration of crizotinib possibly increased by • ATAZANAVIR, • INDINAVIR, • RITONAVIR and • SAQUINAVIR—manufacturer of crizotinib advises avoid concomitant use.

Antioxidants: possible increased risk of hypotension when crizotinib given with • L-AMINOCITRULINE.

Antifungals: plasma concentration of crizotinib possibly reduced by • CICLAMYCIN, • CLOFUCOVID, • FLUCONAZOLE, • ITRACONAZOLE, • KOLOSTYMYCIN, • VORICONAZOLE and • L-TRAUNAZOLE.

Antivirals: possible increased risk of hepatotoxicity when crizotinib given with • LAMIVUDINE, • ADEZINEC, • VIDANIPLAVI and • TAFENAN.

Antibacterials: possible increased risk of hepatotoxicity when crizotinib given with • AMICIFLOXACIN, • ERTUMAZACIN, • LORACARFEN and • MICOFLOXACIN.

Antiepileptics: possible increased risk of neutropenia when crizotinib given with • PHTHALACIN.

Antipsychotics: possible increased risk of hypotension when crizotinib given with • FLUPHENAZIDE, • HALPENAZIDE and • THIOFLUPRAT.

Antimalarials: possible increased risk of toxicitiy to crizotinib when crizotinib given with • LAMIVUDINE.

Antipsychotics: possible increased risk of hypotension when crizotinib given with • ADEZINEC, • BUNIFLOXACIN, • CICLAMYCIN, • L-AMINOCITRULINE and • TAFENAN.

Antimalarials: possible increased risk of hepatotoxicity when crizotinib given with • LAMIVUDINE.

Antibacterials: possible increased risk of hepatotoxicity when crizotinib given with • ADEZINEC and • BUNIFLOXACIN.

Antiallergics: possible increased risk of neutropenia when crizotinib given with • ACEBUTOLOL, • ESOMEPRAZOLE and • PROCARBAMINE.

Antiepileptics: possible increased risk of hepatotoxicity when crizotinib given with • BUNIFLOXACIN and • CICLAMYCIN.

Antivirals: possible increased risk of hepatotoxicity when crizotinib given with • TAFENAN.

Antimicrobial: possible increased risk of bleeding when crizotinib given with • ERYTHROMYCIN and • STEPHANIN.

Antipsychotics: possible increased risk of hepatotoxicity when crizotinib given with • ADEZINEC, • BUNIFLOXACIN and • CICLAMYCIN.

Antimicrobial: possible increased risk of bleeding when crizotinib given with • TAFENAN.

Antimalarials: possible increased risk of hepatotoxicity when crizotinib given with • LAMIVUDINE.

Antibacterials: possible increased risk of hepatotoxicity when crizotinib given with • FLUOZACIN and • ITRACONAZOLE.

Antipsychotics: possible increased risk of hepatotoxicity when crizotinib given with • ADEZINEC, • CICLAMYCIN, • BUNIFLOXACIN and • L-AMINOCITRULINE.

Antimalarials: possible increased risk of hepatotoxicity when crizotinib given with • LAMIVUDINE.

Antiepileptics: possible increased risk of hepatotoxicity when crizotinib given with • FLUOZACIN, • ITRACONAZOLE and • L-AMINOCITRULINE.

Antiallergics: possible increased risk of hepatotoxicity when crizotinib given with • ESOMEPRAZOLE.

Antibacterials: possible increased risk of hepatotoxicity when crizotinib given with • L-AMINOCITRULINE.

Antimalarials: possible increased risk of hepatotoxicity when crizotinib given with • LAMIVUDINE.

Antipsychotics: possible increased risk of hepatotoxicity when crizotinib given with • ADEZINEC.

Antibacterials: possible increased risk of hepatotoxicity when crizotinib given with • CICLAMYCIN.

Antimalarials: possible increased risk of hepatotoxicity when crizotinib given with • LAMIVUDINE.

Antiallergics: possible increased risk of hepatotoxicity when crizotinib given with • ESOMEPRAZOLE.

Antibacterials: possible increased risk of hepatotoxicity when crizotinib given with • CICLAMYCIN.

Antiallergics: possible increased risk of hepatotoxicity when crizotinib given with • ESOMEPRAZOLE.

Antimalarials: possible increased risk of hepatotoxicity when crizotinib given with • LAMIVUDINE.

Antiallergics: possible increased risk of hepatotoxicity when crizotinib given with • ESOMEPRAZOLE.

Antiallergics: possible increased risk of hepatotoxicity when crizotinib given with • ESOMEPRAZOLE.
Cyproheptadine — Dactinomycin 845

Cyproheptadine see Antihistamines

Cytarabine
  ▶ Antifungals: cytarabine possibly reduces plasma concentration of FLUCYTOSINE
  ▶ Anticoagulants: avoid concomitant use of cytarabine with COBICISTAT (increased risk of agranulocytosis)
  ▶ Cardiac Glycosides: cytarabine possibly reduces absorption of DIGOXIN tablets
  ▶ Cytosines: intracellular concentration of cytarabine increased by FLUDARABINE

Cytotoxics see individual drugs

Dabigatran
  ▶ Analgesics: possible increased risk of bleeding when dabigatran given with NSAIDS; increased risk of haemorrhage when anticoagulants given with intravenous DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with KETOROLAC (avoid concomitant use, including low-dose heparins)
  ▶ Anti-arrhythmics: plasma concentration of dabigatran increased by AMIODARONE (see under Dabigatran Etxilate, in BNF); plasma concentration of dabigatran increased by DRONEDARONE — avoid concomitant use
  ▶ Antibacterials: possible increased risk of bleeding when dabigatran given with CLARITHROMYCIN, plasma concentration of dabigatran reduced by RIFAMPCIN — manufacturer of dabigatran advises avoid concomitant use
  ▶ Anticoagulants: increased risk of haemorrhage when dabigatran given with other ANTICOAGULANTS (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with APIXABAN, EDXOABAN and RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
  ▶ Antidepressants: possible increased risk of bleeding when dabigatran given with SSRIS-RELATED ANTIDEPRESSANTS or SSRIS; plasma concentration of dabigatran possibly reduced by ST JOHN’S WORT — manufacturer of dabigatran advises avoid concomitant use
  ▶ Antiepileptics: plasma concentration of dabigatran possibly reduced by CARBAMAZEPINE, FOSPHENYTOIN and PHENYTOIN — manufacturer of dabigatran advises avoid concomitant use
  ▶ Antifungals: plasma concentration of dabigatran increased by KETOCONAZOLE — avoid concomitant use; manufacturer of dabigatran advises avoid concomitant use
  ▶ Antivirals: manufacturers advise avoid concomitant use of dabigatran with DARUNAVIR; plasma concentration of dabigatran possibly increased by RILPIVIRINE and TELAPREVIR
  ▶ Calcium-channel Blockers: plasma concentration of dabigatran possibly increased by VERAPAMIL (see under Dabigatran Etxilate, in BNF)
  ▶ Ciclosporin: plasma concentration of dabigatran possibly increased by CICLOSPORIN — manufacturer of dabigatran advises avoid concomitant use
  ▶ Netupitant: caution with dabigatran advised by manufacturer of NETUPITAN
  ▶ Sulfapyrazine: possible increased risk of bleeding when dabigatran given with SULFOPYRAZONE
  ▶ Tacrolimus: plasma concentration of dabigatran possibly increased by TACROLIMUS — manufacturer of dabigatran advises avoid concomitant use
  ▶ Ticagrelor: plasma concentration of dabigatran increased by TICAGRELOR
  ▶ Ulipristal: manufacturer of ulipristal advises give dabigatran at least 1.5 hours before or after ULIPRISTAL

Dabrafenib
  ▶ Antibacterials: manufacturer of dabrafenib advises avoid concomitant use with RIFAMPCIN
  ▶ Anticoagulants: dabrafenib reduces plasma concentration of WARFARIN
  ▶ Antidepressants: manufacturer of dabrafenib advises avoid concomitant use with CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
  ▶ Antipsychotics: avoid concomitant use of cytarabine with CLOzapine (increased risk of agranulocytosis)
  ▶ Lipid-regulating Drugs: plasma concentration of dabrafenib reduced by ATAZANAVIR — avoid concomitant use, including low-dose heparins
  ▶ Progesterogens: manufacturer of dabrafenib advises concomitant use of dabrafenib reduces plasma concentration of PROGESTOGENS (avoid concomitant use, including low-dose heparins)

Dacarbazine
  ▶ Antipsychotics: avoid concomitant use of cytarabine with CLOzapine (increased risk of agranulocytosis)

Dactinomycin
  ▶ Antipsychotics: avoid concomitant use of cytarabine with CLOzapine (increased risk of agranulocytosis)

Dabrafenib (continued)
  ▶ Antifungals: plasma concentration of dabrafenib increased by KETOCONAZOLE — Antipsychotics: avoid concomitant use of cytarabine with CLOzapine (increased risk of agranulocytosis)
  ▶ Lipid-regulating Drugs: plasma concentration of dabrafenib increased by GEMFIBROZIL
  ▶ Oestrogens: manufacturer of dabrafenib advises contraceptive effect of hormonal contraceptives containing OESTROGENS possibly reduced (alternative contraceptive recommended)
  ▶ Progesterogens: manufacturer of dabrafenib advises contraceptive effect of hormonal contraceptives containing PROGESTOGENS possibly reduced (alternative contraceptive recommended)

Dabrafenib — Carcinustatin
  ▶ Antipsychotics: avoid concomitant use of cytarabine with CLOzapine (increased risk of agranulocytosis)

Dacarbazine — Carcinustatin
  ▶ Antipsychotics: avoid concomitant use of cytarabine with CLOzapine (increased risk of agranulocytosis)

Dactinomycin — Carcinustatin
  ▶ Antipsychotics: avoid concomitant use of cytarabine with CLOzapine (increased risk of agranulocytosis)

Dabrafenib — Carcinustatin
  ▶ Antipsychotics: avoid concomitant use of cytarabine with CLOzapine (increased risk of agranulocytosis)
Dactinomycin (continued)

» Vitamins: dactinomycin possibly reduces effects of ALFACALCIDOL, CALCIOTRIOL, COLECALCIFEROL, DIDIHYDROTACHYSTEROID, ERGOCALCIFEROL, PARICALCITOL and VITAMIN D

Dairy Products

» Antibacterials: dairy products reduce absorption of CIPROFLOXACIN (give at least 2 hours apart); dairy products reduce absorption of NORFLOXACIN; dairy products reduce absorption of TETRACYCLINES (except doxycycline and minocycline)

» Cytotoxics: dairy products possibly reduce plasma concentration of MERCAPTOPURINE —manufacturer of mercaptopurine advises give at least 1 hour before or 3 hours after dairy products

» Eltrombopag: dairy products possibly reduce absorption of ELTROMBOPAG (give at least 4 hours apart)

Dalfopristin see Heparins

Danaparoid

» Analgesics: increased risk of haemorrhage when anticoagulants given with intravenous DICLOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with KETOROLAC (avoid concomitant use, including low-dose heparins)

» Antibacterials: increased risk of haemorrhage with other anticoagulants given with APIXABAN, DABIGATRAN, EDOXABAN and RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)

Danazol

» Anticoagulants: danazol inhibits metabolism of COUMARINS (enhanced anticoagulant effect)

» Antiepileptics: danazol inhibits metabolism of CARBAMAZEPINE (increased risk of toxicity)

» Ciclosporin: danazol inhibits metabolism of CICLOSPORIN (increased plasma concentration)

» Lipid-regulating Drugs: possible increased risk of myopathy when danazol given with SIMVASTATIN —avoid concomitant use

» Tacrolimus: danazol possibly increases plasma concentration of TACROLIMUS

Dantrolene see Muscle Relaxants

Dapagliflozin see Antidiabetics

Dapoxetine

» Alcohol: increased sedative effect when dapoxetine given with ALCOHOL

» Analgesics: possible increased risk of serotoninergic effects when dapoxetine given with TRAMADOL —manufacturer of dapoxetine advises tramadol should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tramadol

» Antibacterials: manufacturer of dapoxetine advises dose reduction when dapoxetine given with CLARITHROMYCIN and ERYTHROMYCIN (see under Dapoxetine, in BNF); manufacturer of dapoxetine advises avoid concomitant use with TELITHROMYCIN (increased risk of toxicity)

» Antidepressants: possible increased risk of serotoninergic effects when dapoxetine given with SSRIS, ST JOHN’S WORT, DULOXETINE, TRICYCLES and VENLAFAXINE (manufacturer of dapoxetine advises SSRIS, ST JOHN’S WORT, duloxetine, tricyclics and venlafaxine should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SSRIS, ST JOHN’S WORT, duloxetine, tricyclics and venlafaxine); increased risk of serotoninergic effects when dapoxetine given with MAOIS (MAOIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping MAOIs)

» Antifungals: plasma concentration of dapoxetine increased by KETOCONAZOLE —manufacturer of dapoxetine advises avoid concomitant use; manufacturer of dapoxetine advises dose reduction when dapoxetine given with FLUCONAZOLE (see under Dapoxetine, in BNF); manufacturer of dapoxetine advises avoid concomitant use with ITRACONAZOLE (increased risk of toxicity)

» Antivirals: manufacturer of dapoxetine advises avoid concomitant use with ATAZANAVIR, RITONAVIR and Dapoxetine

» Antivirals (continued)

» SAQUINAVIR (increased risk of toxicity); manufacturer of dapoxetine advises dose reduction when dapoxetine given with Ritonavir (see under Dapoxetine, in BNF)

» Aprepitant: manufacturer of dapoxetine advises dose reduction when dapoxetine given with Aprepitant (see under Dapoxetine, in BNF)

» Calcium-channel blockers: manufacturer of dapoxetine advises dose reduction when dapoxetine given with Diltiazem and Verapamil (see under Dapoxetine, in BNF)

» SHT-receptor Agonists: possible increased risk of serotoninergic effects when dapoxetine given with SHT agonists (manufacturer of dapoxetine advises SHT agonists should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SHT agonists)

» Lithium: possible increased risk of serotoninergic effects when dapoxetine given with LITHIUM (manufacturer of dapoxetine advises lithium should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping lithium)

» Sildenafil: manufacturer of dapoxetine advises avoid concomitant use with SILDENAFIL

» Tadalafil: manufacturer of dapoxetine advises avoid concomitant use with TADALAFIL

» Vardenafil: manufacturer of dapoxetine advises avoid concomitant use with VARDENAFIL

Dapsona

» Antibacterials: plasma concentration of dapsona reduced by RIFAMYCINS; plasma concentration of both drugs may increase when dapsona given with TRIMETHOPRIM

» Antivirals: possible increased risk of ventricular arrhythmias when dapsona given with SAQUINAVIR —avoid concomitant use

» Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE —see under Typhoid Vaccine in BNFC

Daptomycin

» Clicosporin: increased risk of myopathy when daptomycin given with CICLOSPORIN (preferably avoid concomitant use)

» Lipid-regulating Drugs: increased risk of myopathy when daptomycin given with FIBRATES or STATINS (preferably avoid concomitant use)

» Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE —see under Typhoid Vaccine in BNFC

Darsipran see Antimuscarinics

Darunavir

» Anti-arrhythmics: darunavir possibly increases plasma concentration of LIDOCAINE —avoid concomitant use

» Antibacterials: darunavir increases plasma concentration of Rifabutin (reduce dose of rifabutin); plasma concentration of darunavir significantly reduced by Rifampicin —avoid concomitant use

» Anticoagulants: avoidance of darunavir advised by manufacturer of APIXABAN and RIVAROXABAN; manufacturers advise avoid concomitant use of darunavir with DABIGATRAN

» Antidepressants: darunavir possibly reduces plasma concentration of PAROXETINE and SERTRALINE; plasma concentration of darunavir reduced by ST JOHN’S WORT —avoid concomitant use

» Antiepileptics: plasma concentration of darunavir possibly reduced by CARBAMAZEPINE, FOSPHENTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE

» Antifungals: plasma concentration of both drugs increased when darunavir given with KETOCONAZOLE; darunavir possibly affects plasma concentration of VORICONAZOLE

» Antimalarials: plasma concentration of lumefantrine increased when darunavir given with ARTEMETHER WITH LUMEFANTRINE; darunavir possibly increases plasma concentration of QUININE (increased risk of toxicity)

» Antipsychotics: darunavir possibly increases plasma concentration of ARIPIPRAZOLE (consult aripiprazole product literature); darunavir possibly increases plasma concentration of QUETIAPINE —manufacturer of quetiapine advises avoid concomitant use

» Antivirals: avoid concomitant use of darunavir with BOCEPREVIR or TELAPREVIR; avoidance of darunavir advised
Darunavir

- Antivirals (continued)
  - by manufacturer of DACLATASVIR (plasma concentration of daclatasvir possibly increased); manufacturer of darunavir advises take DIDANOSINE 1 hour before or 2 hours after darunavir; plasma concentration of darunavir reduced by
    - EFAVIRENZ (adjust dose—consult product literature); plasma concentration of both drugs increased when darunavir given with INDINAVIR; concentration of darunavir reduced by
    - LOPINAVIR and SAQUINAVIR—avoid concomitant use; darunavir increases plasma concentration of MARAVIROC (consider reducing dose of maraviroc); darunavir increases plasma concentration of PARITAPREVIR and plasma concentration of darunavir decreased; increased risk of rash when darunavir given with HALTEGRAVIR; plasma concentration of both drugs increased when darunavir given with SIMPEPREVIR—manufacturer of simprevir advises avoid concomitant use
  - Cytotoxics: darunavir possibly increases the plasma concentration of BOSUTINIB—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; darunavir possibly increases plasma concentration of
    - EVEROLIMUS—manufacturer of everolimus advises avoid concomitant use; darunavir possibly increases the plasma concentration of
    - IBRUTINIB—reduce dose of ibrutinib (see under Ibrutinib, in BNF)
  - Ergot Alkaloids: increased risk of ergotism when darunavir given with ERGOT ALKALOIDS—manufacturer of darunavir advises avoid concomitant use
  - Lipid-regulating Drugs: possibly increased risk of myopathy when darunavir given with ATORVASTATIN; darunavir possibly increases plasma concentration of PRAVASTATIN (use lowest possible dose of pravastatin); darunavir increases plasma concentration of ROSUVASTATIN—adjust dose of rosuvastatin (consult product literature); avoidance of darunavir advised by manufacturer of LOMITAPIDE (plasma concentration of lomitapide possibly increased)
  - Orlistat: absorption of darunavir possibly reduced by ORLISTAT
  - Ranolazine: darunavir possibly increases plasma concentration of FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE (plasma concentration of both drugs increased when darunavir given with SIMPEPREVIR—manufacturer of simprevir advises avoid concomitant use)

Dasabuvir

- Antibacterials: manufacturer of dasabuvir advises avoid concomitant use with CLARITHROMYCIN and TELITHROMYCIN; plasma concentration of dasabuvir possibly reduced by
  - RIFAMPICIN—avoid concomitant use
  - Antidepressants: plasma concentration of dasabuvir possibly reduced by
    - ST JOHN'S WORT—manufacturer of dasabuvir advises avoid concomitant use
  - Antiepileptics: plasma concentration of dasabuvir reduced by
    - CARBAMAZEPINE—avoid concomitant use; plasma concentration of dasabuvir possibly reduced by
      - FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE—avoid concomitant use
  - Antifungals: plasma concentration of both drugs increased when dasabuvir given with KETOCONAZOLE—avoid concomitant use; plasma concentration of both drugs possibly increased when dasabuvir given with ITRACONAZOLE and POSACONAZOLE—avoid concomitant use
  - Antivirals: manufacturer of dasabuvir advises avoid concomitant use with
    - EFAVIRENZ, ETARIVIRINE and NEVIRAPINE
  - Cobicistat: manufacturer of dasabuvir advises avoid concomitant use with Cobicistat
  - Cytotoxics: manufacturer of dasabuvir advises avoid concomitant use with MITOTANE
  - Diuretics: dasabuvir increases plasma concentration of
    - FUROSEMIDE (reduce dose of furosemide)
  - Hormone Antagonists: manufacturer of dasabuvir advises avoid concomitant use with ENZALUTAMIDE
  - Lipid-regulating Drugs: manufacturer of dasabuvir advises avoid concomitant use with ATORVASTATIN, GEMFIBROZIL and SIMVASTATIN; dasabuvir increases plasma concentration of ROSUVASTATIN (reduce dose of rosuvastatin—see under Rosuvastatin, in BNF)

Dasabuvir (continued)

- Dystrogens: manufacturer of dasabuvir advises avoid concomitant use of ETHINYLESTRADIOL—use alternative form of contraception

Dasatinib

- Antibacterials: manufacturer of dasatinib advises avoid concomitant use with CLARITHROMYCIN, ERYTHROMYCIN and TELITHROMYCIN (plasma concentration of dasatinib possibly increased); metabolism of dasatinib accelerated by
  - RIFAMPICIN (reduced plasma concentration—avoid concomitant use)
- Antiepileptics: manufacturer of dasatinib advises avoid concomitant use with CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE (plasma concentration of dasatinib possibly increased)
  - Antifungals: plasma concentration of dasatinib possibly increased by KETOCONAZOLE; manufacturer of dasatinib advises avoid concomitant use with ITRACONAZOLE (plasma concentration of dasatinib possibly increased)
  - Antipsychotics: avoid concomitant use of cytoxics with CLOzapine (increased risk of agranulocytosis)
  - Antivirals: avoidance of dasatinib advised by manufacturer of BOCAPREVIR; manufacturer of dasatinib advises avoid concomitant use with ATIVONAR (plasma concentration of dasatinib possibly increased)
  - Grapefruit Juice: manufacturer of dasatinib advises avoid concomitant use with GRAPEFRUIT JUICE (plasma concentration of dasatinib possibly increased)
  - Lipid-regulating Drugs: dasatinib possibly increases plasma concentration of SIMVASTATIN
  - Ulcer-healing Drugs: plasma concentration of dasatinib possibly reduced by FAMOTIDINE

Daunorubicin

- Anticancer: avoid concomitant use of cytoxics with CLOzapine (increased risk of agranulocytosis)
- Cytotoxic: possible increased risk of cardiotoxicity when daunorubicin given with TRASTUZUMAB—avoid concomitant use for up to 28 weeks after stopping trastuzumab
- Vaccines: risk of generalised infections when cytotoxic antibiotics given with live VACCINES—avoid concomitant use

Decitabine

- Antipsychotics: avoid concomitant use of cytoxics with CLOzapine (increased risk of agranulocytosis)

Deferasirox

- Aminophylline: deferasirox increases plasma concentration of AMINOPHYLLINE (consider reducing dose of aminophylline)
- Antacids: absorption of deferasirox possibly reduced by ANTACIDS containing aluminium (manufacturer of deferasirox advises avoid concomitant use)
  - Antibacterials: plasma concentration of deferasirox reduced by RIFAMPICIN
  - Antidiabetics: deferasirox increases plasma concentration of REPAGLINIDE
  - Antipsychotics: manufacturer of deferasirox advises avoid concomitant use with CLOzapine
  - Anxiolytics and Hypnotics: deferasirox possibly reduces plasma concentration of MIDAZOLAM
  - Theophylline: deferasirox increases plasma concentration of THEOPHYLLINE (consider reducing dose of theophylline)

Deferiprone

- Antacids: absorption of deferiprone possibly reduced by ANTACIDS containing aluminium (manufacturer of deferiprone advises avoid concomitant use)

Deflazacort see Corticosteroids

Delamanid

- Analgesics: increased risk of ventricular arrhythmias when delamanid given with METHADONE
- Anti-arrhythmics: increased risk of ventricular arrhythmias when delamanid given with AMIODARONE or DISOPYRAMIDE
- Antibacterials: possible increased risk of ventricular arrhythmias when delamanid given with CLARITHROMYCIN and ERYTHROMYCIN; increased risk of ventricular arrhythmias when delamanid given with MOXIFLOXACIN; plasma
Delamandin

- Antibacterials (continued)
  - concentration of delamandin reduced by rifampicin; delamandin increases plasma concentration of ethambutol
  - Antidepressants: possible increased risk of ventricular arrhythmias when delamandin given with tricyclics that prolong the QT interval
  - Antiepileptics: manufacturer of delamandin advises avoid concomitant use with carbamazepine
  - Antipsychotics: increased risk of ventricular arrhythmias when delamandin given with droperidol, haloperidol or pimozide; increased risk of ventricular arrhythmias when delamandin given with phenothiazines that prolong the QT interval
  - Antivirals: plasma concentration of delamandin increased by lopinavir and ritonavir; increased risk of ventricular arrhythmias when delamandin given with saquinavir
  - Beta-blockers: increased risk of ventricular arrhythmias when delamandin given with sotalol
  - Cytotoxics: increased risk of ventricular arrhythmias when delamandin given with arsenic trioxide or vinblastine; possible increased risk of ventricular arrhythmias when delamandin given with vinblastine, vincristine, vindesine and vinorelbine
  - Domperidone: possible increased risk of ventricular arrhythmias when delamandin given with domperidone
  - Pentamidine isethionate: increased risk of ventricular arrhythmias when delamandin given with pentamidine isethionate
  - Vaccines: antibacterials inactivate oral typhoid vaccine—see under Typhoid Vaccine in BNFC

Demeclocycline see Tetracyclines

Desferrioxamine
- Antipsychotics: avoidance of desferrioxamine advised by manufacturer of levomepromazine; manufacturer of desferrioxamine advises avoid concomitant use with prochlorperazine

Desflurane see Anaesthetics, General

Desloratadine see Antihistamines

Desmopressin
- Analgesics: effects of desmopressin enhanced by indometacin
- Loperamide: plasma concentration of oral desmopressin increased by loperamide

Desogestrel see Progestogens

Dexamethasone see Corticosteroids

Dexametason see Symptomimetics

Dexibuprofen see NSAIDs

Dexketoprofen see NSAIDs

Dextrazone
- Antiepileptics: dextrazone possibly reduces absorption of fosphenytoin and phenytoin
- Ciclosporin: manufacturer of dextrazone advises increased risk of immunosuppression with ciclosporin
- Tacrolimus: manufacturer of dextrazone advises increased risk of immunosuppression with tacrolimus
- Vaccines: risk of generalised infections when dextrazone given with live vaccines—avoid concomitant use

Dextromethorphan see Opioid Analgesics

Dextropropoxyphene see Opioid Analgesics

Diazepam see Anxiolytics and Hypnotics

Diazoxide (continued)
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when diazoxide given with angiotensin-II receptor antagonists
- Antidepressants: enhanced hypotensive effect when diazoxide given with maois or tricyclic-related antidepressants
- Antidiabetics: diazoxide antagonises hypoglycaemic effect of antidiabetics
- Antiepileptics: diazoxide reduces plasma concentration of fosphenytoin and phenytoin, also effect of diazoxide may be reduced
- Antipsychotics: enhanced hypotensive effect when diazoxide given with phenothiazines
- Anxiolytics and Hypnotics: enhanced hypotensive effect when diazoxide given with anxiolytics and hypnotics
- Beta-blockers: enhanced hypotensive effect when diazoxide given with beta-blockers
- Calcium-channel Blockers: enhanced hypotensive effect when diazoxide given with calcium-channel blockers
- Clonidine: enhanced hypotensive effect when diazoxide given with clonidine
- Corticosteroids: hypotensive effect of diazoxide antagonised by corticosteroids
- Diuretics: enhanced hypotensive and hyperglycaemic effects when diazoxide given with diuretics
- Dopaminergics: enhanced hypotensive effect when diazoxide given with dopamine
- Methylfida: enhanced hypotensive effect when diazoxide given with methylfida
- Moxisylyte: enhanced hypotensive effect when diazoxide given with moxisylyte
- Morxone: enhanced hypotensive effect when diazoxide given with morxone
- Muscle Relaxants: enhanced hypotensive effect when diazoxide given with baclofen or tizanidine
- Nitrates: enhanced hypotensive effect when diazoxide given with nitrates
- Prostaglandins: enhanced hypotensive effect when diazoxide given with alprostadil
- Vasodilator Antihypertensives: enhanced hypotensive effect when diazoxide given with hydralazine, minoxidil or sodium nitroprusside

Didclofenac see NSAIDs

Dicyclomine see Antimuscarinics

Didanosine
- NOTE Antacids in tablet formulation might affect absorption of other drugs—give at least 2 hours apart
- Allopurinol: plasma concentration of didanosine increased by allopurinol (risk of toxicity)—avoid concomitant use
- Analgesics: plasma concentration of didanosine possibly reduced by methadone
- Antibacterials: didanosine tablets reduce absorption of ciprofloxacin (give at least 2 hours before or 4 hours after ciprofloxacin); manufacturer of moxifloxacin advises give didanosine tablets at least 2 hours before or after levofloxacin; manufacturer of moxifloxacin advises give didanosine tablets at least 6 hours before or after moxifloxacin; manufacturer of norfloxacin advises give didanosine at least 2 hours before or after norfloxacin
- Antivirals: didanosine tablets reduce absorption of atazanavir (give at least 2 hours before or 1 hour after didanosine tablets); manufacturer of darunavir advises take didanosine 1 hour before or 2 hours after darunavir; plasma concentration of didanosine possibly increased by ganciclovir and valganciclovir; didanosine tablets reduce absorption of indinavir (give at least 1 hour apart); increased risk of side-effects when didanosine given with ribavirin—avoid concomitant use; manufacturer of rilpivirine advises give didanosine 2 hours before or 4 hours after rilpivirine; manufacturer of ritonavir advises didanosine and ritonavir should be taken 2.5 hours apart; increased risk of side-effects when didanosine given with stavudine; plasma concentration of didanosine increased by tenofovir (increased risk of toxicity)—avoid concomitant use; plasma concentration of didanosine reduced by tipranavir—
Didanosine

- Antivirals (continued)
  - manufacturer of tipranavir advises tipranavir and didanosine capsules should be taken at least 2 hours apart
  - Cytotoxics: increased risk of toxicity when didanosine given with µHYDROXYCARBAMIDE—avoid concomitant use
  - Orlstat: absorption of didanosine possibly reduced by
    - ORLISTAT

Dienogest see Progestogens

Diethylocarbamazine

- Antacids: excretion of diethylocarbamazine reduced by SODIUM BICARBONATE

Digoxin see Cardiac Glycosides

Dihydrocodeine see Opoid Analgesics

Dihydropyrothione see Vitamins

Diltiazem see Calcium-channel Blockers

Dimethyl sulfoxide

- Analgesics: avoid concomitant use of dimethyl sulfoxide with
  - SULINDAC

Dinoprostone see Prostaglandins

Diphenoxylate see Opoid Analgesics

Diphertheria Vaccines see Vaccines

Dipipanone see Opoid Analgesics

Dipyridamole

- Antacids: absorption of dipyridamole possibly reduced by
  - ANTACID'S
- Anti-arrhythmics: dipyridamole enhances and extends effect of
  - ADENOSINE (important risk of toxicity)—reduce dose of adenosine, see p. 73
- Anticoagulants: antiplatelet action of dipyridamole enhances anticoagulant effect of COUMARINS and PHENINDIONE; dipyridamole enhances anticoagulant effect of HEPARINS
- Clopidogrel: increased risk of bleeding when dipyridamole given with CLOPIDOGREL
- Cytotoxics: dipyridamole possibly reduces effects of FLUDARABINE

Disopyramide

- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with BUPIVACAINE, LEVOBUPIVACAINE, PRILOCaine or ROPIVACAINE
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other Anti-arrhythmics; increased risk of ventricular arrhythmias when disopyramide given with
  - AMIODARONE or DRONEARONE—avoid concomitant use
- Antibacterials: plasma concentration of disopyramide possibly increased by µAZITHROMYCIN (increased risk of toxicity); plasma concentration of disopyramide possibly increased by
  - CLARITHROMYCIN (increased risk of ventricular arrhythmias); plasma concentration of disopyramide given by µERYTHROMYCIN (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with
  - MOXIFLOXACIN—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with
  - DELAMANID; metabolism of disopyramide accelerated by
  - RIFAMPICINS (reduced plasma concentration); possible increased risk of ventricular arrhythmias when disopyramide given with µTELITHROMYCIN
- Anticoagulants: disopyramide may enhance or reduce anticoagulant effect of WARFARIN
- Antidepressants: avoidance of disopyramide advised by manufacturer of µCITALOPRAM and µESCITALOPRAM (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when disopyramide given with µTRICYCLICS
- Antidiabetics: disopyramide possibly enhances hypoglycaemic effect of GLICLAZIDE, INSULIN and METFORMIN
- Antiepileptics: plasma concentration of disopyramide reduced by MOSPHENYTOIN and PHENYTIOIN; metabolism of disopyramide accelerated by PHENOBARBITAL and PRIMIDONE (reduced plasma concentration)
- Antiarrhythmics: increased risk of ventricular arrhythmias when disopyramide given with µKETOCONAZOLE—avoid concomitant use; avoidance of disopyramide advised by manufacturer of
  - ITROCONAZOLE
- Antihistamines: increased risk of ventricular arrhythmias when disopyramide given with µMILOXALINE—avoid concomitant use

Disopyramide (continued)

- Antimalarials: avoidance of disopyramide advised by manufacturer of µARTEMETHER WITH LUMEFANTRINE (risk of ventricular arrhythmias); avoidance of disopyramide advised by manufacturer of µARTEMET WITH PIPERAZINE (possible risk of ventricular arrhythmias)
- Antiinmunosuppressants: increased risk of antimuscarinic side-effects when disopyramide given with ANTINMUSCARINICS; increased risk of ventricular arrhythmias when disopyramide given with µTOLERODINE
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with
  - ANTIPLATFORMICS that prolong the QT interval; increased risk of ventricular arrhythmias when disopyramide given with
  - AMISULFPRIDE, DROPERIDOL, PIMOXIDE or
  - ZUCLOPENITHIOL—avoid concomitant use; possible increased risk of ventricular arrhythmias when disopyramide given with
  - HALOPERIDOL—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with
  - PENTHOTHALNES or RELATED DIURETICS
- Antivirals: plasma concentration of disopyramide possibly increased by µRITONAVIR (increased risk of toxicity); increased risk of ventricular arrhythmias when disopyramide given with µSAQUINAVIR—avoid concomitant use; avoidance of disopyramide advised by manufacturer of µTELAPREVIR (risk of ventricular arrhythmias)
- Atomoxetine: increased risk of ventricular arrhythmias when disopyramide given with µATOMOXETINE
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with µ-beta-blockers; increased risk of ventricular arrhythmias when disopyramide given with µSOTALOL—avoid concomitant use
- Calcium-channel Blockers: increased risk of myocardial depression and asystole when disopyramide given with µVERAPAMIL
- Cytotoxics: possible increased risk of ventricular arrhythmias when disopyramide given with µBOSUTINIB; possible increased risk of ventricular arrhythmias when disopyramide given with µVANDENABIR—avoid concomitant use; increased risk of ventricular arrhythmias when disopyramide given with
  - ARSENIC TRIOXIDE
- Diuretics: increased cardiac toxicity with disopyramide if hypokalaemia occurs with µACETAZOLAMIDE, LOOP DIURETICS or THIAZIDES AND RELATED DIURETICS
- Fingolimod: possible increased risk of bradycardia when disopyramide given with µFINGOLIMOD
- Ibradine: increased risk of ventricular arrhythmias when disopyramide given with µIBRADINE
- Nitrites: disopyramide reduces effects of sublingual tablets of NITRATES (failure to dissolve under tongue owing to dry mouth)
- Pentamidine isethionate: possible increased risk of ventricular arrhythmias when disopyramide given with µPENTAMIDINE ISETHIONATE
- Ranolazine: avoidance of disopyramide advised by manufacturer of µRANOLAZINE
- Sildenafil: manufacturer of disopyramide advises avoid concomitant use with SILDENAFIL (risk of ventricular arrhythmias)
- Tadalafil: manufacturer of disopyramide advises avoid concomitant use with TADALAFIL (risk of ventricular arrhythmias)
- Vardenafil: manufacturer of disopyramide advises avoid concomitant use with VARDENAFIL (risk of ventricular arrhythmias)

Disulfiram

- Alcohol: disulfiram reaction when disulfiram given with µALCOHOL
- Aminophylline: disulfiram inhibits metabolism of µAMINOPHYLLINE (increased risk of toxicity)
- Antibacterials: psychotic reaction reported when disulfiram given with µMETRONIDAZOLE; CNS effects of disulfiram possibly increased by µISONIAZID
- Anticoagulants: disulfiram enhances anticoagulant effect of µCOUMARINS
Disulfiram (continued)

- Antidepressants: increased disulfiram reaction with alcohol reported with concomitant AMITRIPTYLINE; disulfiram inhibits metabolism of TRICYCLICS (increased plasma concentration)
- Antiepileptics: disulfiram inhibits metabolism of FOSPHENYTOIN and PHENYTOIN (increased risk of toxicity)
- Anxiolytics and Hypnotics: disulfiram increases risk of TEMAZEPAM toxicity; disulfiram inhibits metabolism of BENZODIAZEPINES (increased sedative effects)
- Paraldehyde: risk of toxicity when disulfiram given with PARALDEHYDE
- Theophylline: disulfiram inhibits metabolism of THEOPHYLLINE (increased risk of toxicity)

Diuretics

**NOTE** Since systemic absorption may follow topical application of brinzolamide to the eye, the possibility of interactions should be borne in mind

Diuretics (continued)

- Diuretics, Potassium-sparing and Aldosterone Antagonists

- Progestogens: increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with DROSPIRENONE (monitor serum potassium during first cycle)
- Prostaglandins: enhanced hypotensive effect when diuretics given with ALPROSTADIL
- Sacubitril: plasma concentration of furosemide reduced by SACUBITRIL

- Sympathomimetics, Beta: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with high doses of BETA SYMPATHOMIMETICS
- Tacrolimus: increased risk of hyperkalaemia when potassium-sparing diuretics and aldosterone antagonists given with TACROLIMUS
- Theophylline: increased risk of hypokalaemia when acetazolamide, loop diuretics or thiazides and related diuretics given with THEOPHYLLINE

- Vasodilator Antihypertensives: enhanced hypotensive effect when diuretics given with HYDRAZINE, MINOXIDIL or SODIUM NITROPRIOUSSE

- Vitamins: increased risk of hypercalcaemia when thiazides and related diuretics given with ALFACALCIDOL, CALCITRIOl, COLECALCIFEROL, DIHYDROACTIVESTEROL, ERGOCALCIFEROL, PARICALCITOL or VITAMIN D

Diuretics, Loop see Diuretics

Diuretics, Thiazide and related see Diuretics

Dolutamine see Sympathomimetics

Docetaxel

- Antibacterials: plasma concentration of docetaxel possibly increased by CLARITHROMYCIN and TELITHROMYCIN—manufacturer of dolutegravir advises avoid concomitant use or consider reducing docetaxel dose
- Antifungals: in vitro studies suggest a possible interaction between dolutegravir and KETOCONAZOLE (consult dolutegravir product literature); plasma concentration of docetaxel possibly increased by TRICARAZONOL and Voriconazole—manufacturer of dolutegravir advises avoid concomitant use or consider reducing docetaxel dose
- Closopitin: plasma concentration of dolutegravir increased by CONJUATEX—manufacturer of dolutegravir advises avoid concomitant use or consider reducing docetaxel dose
- Ketoconazole: increased risk of neutropenia when docetaxel given with LAPATINIB; plasma concentration of docetaxel increased by SORAFENIB
- Netupitant: plasma concentration of dolutegravir increased by NETUPIRANT

Dolutegravir

- Antacids: absorption of dolutegravir reduced by ALUMINIUM HYDROXIDE and ORAL MAGNESIUM SALTS—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after aluminium hydroxide and oral magnesium salts
- Antidiabetics: plasma concentration of dolutegravir reduced by rifampicin (see under Dolutegravir, p. 387)
- Antidepressants: plasma concentration of dolutegravir possibly reduced by ST JOHN’S WORT (see under Dolutegravir, p. 387)
- Antidiabetic: dolutegravir increases the plasma concentration of METFORMIN—consider reducing dose of metformin
- Antiepileptics: plasma concentration of dolutegravir reduced by CARBAMAZEPINE—see under Dolutegravir, p. 387; plasma concentration of dolutegravir possibly reduced by FOSPHENYTOIN, OCARBEPENE, PHENOBARBITAL, PHENTOIN and PRIMIDONE—see under Dolutegravir, p. 387
- Antivirals: plasma concentration of dolutegravir reduced by EFAVIREN, ETARVIRINE and TIPRANAVIR—see under Dolutegravir, p. 387; plasma concentration of dolutegravir possibly reduced by NEVIRAPINE—see under Dolutegravir, p. 387
Dolutegravir (continued)

- Calcium Salts: absorption of dolutegravir reduced by Calcium Salts—manufacturer of dolutegravir advise at least 2 hours before or 6 hours after calcium salts
- Iron Salts: absorption of dolutegravir reduced by Iron Salts—manufacturer of dolutegravir advise at least 2 hours before or 6 hours after oral iron salts

Dorperidine

- Analgesics: effects of dorperidine on gastro-intestinal activity antagonised by opioid Analgesics
- Antibacterials: possible increased risk of ventricular arrhythmias when dorperidine given with Clarithromycin or Telithromycin—avoid concomitant use; plasma concentration of dorperidine increased by erythromycin (increased risk of ventricular arrhythmias—avoid concomitant use); possible increased risk of ventricular arrhythmias when dorperidine given with Delamanid
- Antifungals: avoidance of dorperidine advised by manufacturer of Ketoconazole (risk of ventricular arrhythmias) and Itraconazole or Voriconazole—avoid concomitant use
- Antimalarials: dorperidine possibly reduced by Cobicistat: possible increased risk of ventricular arrhythmias when dorperidine given with Cobicistat—avoid concomitant use
- Antivirals: dorperidine possibly increases the plasma concentration of Dronedarone possibly reduced by manufacturer of BOSUTINIB (risk of ventricular arrhythmias)
- Antituberculosis: possible increased risk of ventricular arrhythmias when dorperidine given with Amoxicillin; dorperidine possibly antagonises hypoprothrombinic effects of Bromocriptine and Cabergoline

Doxepin see Parasympathomimetics

Dopamine see Sympathomimetics

Dopaminergics see Amantadine, Amorphophene, Bromocriptine, Cabergoline, Entacapone, Levodopa, Pergolide, Pramipexole, Quinagolide, Rasagiline, Rotigotine, Selegiline, and Tolcapone

Dopexamine see Sympathomimetics

Dorzolamide see Diuretics

Doxil see Antidepressants, Tricyclic

Doxipram

- Alpha-2-agonists: doxipram possibly reduced by manufacturer of MDMA
- Sympathomimetics: increased CNS stimulation when doxipram given with Theophylline

Doxazosin see Alpha-blockers

Doxepin see Antidepressants, Tricyclic

Doxorubicin

- Antipsychotics: avoid concomitant use of cytoxotics with Clozapine (increased risk of agranulocytosis)
- Antivirals: doxorubicin possibly inhibits effects of stavudine
- Calcium-channel Blockers: plasma concentration of doxorubicin possibly increased by Verapamil
- Cardio Glicosides: doxorubicin possibly reduces absorption of digoxin tablets
- Ciclosporin: increased risk of neurotoxicity when doxorubicin given with Ciclosporin
- Ciclosporin: possible increased risk of cardiotoxicity when doxorubicin given with Trastuzumab—avoid concomitant use for up to 28 weeks after stopping trastuzumab; plasma concentration of doxorubicin increased by Sorafenib

Doxorubicin (continued)

- Ulcer-healing Drugs: plasma concentration of doxorubicin reduced by Cimetidine
- Vaccines: risk of generalised infections when cytotoxic antibiotics given with live vaccines—avoid concomitant use

Doxycycline see Tetracyclines

Dronedarone

- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with Bupivacaine, LevoBupivacaine, Prilocaine or Ropivacaine
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other Anti-arrhythmics; increased risk of ventricular arrhythmias when dronedarone given with Amiodarone or Disopyramide—avoid concomitant use
- Antibacterials: manufacturer of dronedarone avoids concomitant use with Clarithromycin (risk of ventricular arrhythmias); plasma concentration of dronedarone increased by Erythromycin (increased risk of ventricular arrhythmias—avoid concomitant use); plasma concentration of dronedarone reduced by manufacturer of Fidaxomicin; increased risk of ventricular arrhythmias when dronedarone given with Telithromycin—avoid concomitant use
- Anticoagulants: dronedarone possibly enhances anticoagulant effect of Coumarins and Phenindione; dronedarone increases plasma concentration of Dabigatran—avoid concomitant use; dronedarone increases plasma concentration of Edoxaban (reduce dose of edoxaban—see under Edoxaban, in BNFC); avoidance of dronedarone advised by manufacturer of Rivaroxaban
- Antidepressants: avoidance of dronedarone advised by manufacturer of Citalopram and Escitalopram (risk of ventricular arrhythmias); plasma concentration of dronedarone possibly reduced by St John’s Wort—avoid concomitant use; manufacturer of dronedarone advises avoid concomitant use with Tricyclines (risk of ventricular arrhythmias)
- Antiarrhythmics: plasma concentration of dronedarone possibly reduced by Carbamazepine, Rosphentoin, PhenoBarbital, Phentoiny and Primidone—avoid concomitant use
- Antifungals: plasma concentration of dronedarone increased by Ketoconazole—avoid concomitant use; manufacturer of dronedarone advises avoid concomitant use with Itraconazole, Posaconazole and Voriconazole
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval; manufacturer of dronedarone advises avoid concomitant use with Phenthothiazines (risk of ventricular arrhythmias)
- Antivirals: manufacturer of dronedarone advises avoid concomitant use with Ritonavir; increased risk of ventricular arrhythmias when dronedarone given with Saquinavir—avoid concomitant use
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with Beta-blockers; dronedarone possibly increases plasma concentration of Metoprolol and Propranolol; increased risk of ventricular arrhythmias when dronedarone given with Sotalol—avoid concomitant use
- Calcium-channel Blockers: plasma concentration of dronedarone increased by Nifedipine; increased risk of bradycardia and myocardial depression when dronedarone given with Dilatazem and Verapamil
- Cardio Glicosides: dronedarone increases plasma concentration of Digoxin (halve dose of digoxin)
- Cytoxotics: dronedarone possibly increases the plasma concentration of Bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; dronedarone possibly increases the plasma concentration of Ibrutinib—reduce dose of ibrutinib (see under Ibrutinib, in BNFC)
- Fingolimod: possible increased risk of bradycardia when dronedarone given with Fingolimod
- Grapefruit Juice: plasma concentration of dronedarone increased by Grapefruit Juice—avoid concomitant use
Duloxetine (continued)
- Lipid-regulating Drugs: duloxetine possibly increases plasma concentration of atorvastatin; duloxetine increases plasma concentration of rosvastatin—adj dose of rosvastatin (consult product literature); increased risk of myopathy when duloxetine given with simvastatin; avoidance of duloxetine advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased)
- Sirolimus: manufacturer of duloxetine advises caution with sirolimus
- Tacrolimus: manufacturer of duloxetine advises caution with tacrolimus

Droperidol see Antipsychotics
Drospirenone see Progestogens
Dulaglutide see Antidiabetics
Duloxetine
- Analgesics: possible increased serotonergic effects when SSR-lated antidepressants given with fentanyl; possible increased serotonergic effects when duloxetine given with paroxetine or tramadol
- Antibacterials: metabolism of duloxetine inhibited by ciprofloxacin—avoid concomitant use
- Anticoagulants: possible increased risk of bleeding when SSR-lated antidepressants given with dabigatran
- Antidepressants: metabolism of duloxetine inhibited by fluvoxamine—avoid concomitant use; possible increased serotonergic effects when duloxetine given with SSRIS, St John’s wort, amitriptyline, clomipramine, moclobemide or venlafaxine; duloxetine should not be started until 4 hours after stopping; MAOIs should not be started until at least 5 days after stopping duloxetine; after stopping SSR-lated antidepressants do not start moclobemide for at least 1 week; possible increased risk of convulsions when SSR-lated antidepressants given with vortioxetine
- Antimalarial: avoidance of antidepressants advised by manufacturer of artemether with lumefantrine and artemether with piperaquine
- Atomoxetine: possible increased risk of convulsions when antidepressants given with atomoxetine
- Dapoxetine: possible increased risk of serotonergic effects when duloxetine given with dapoxetine (manufacturer of dapoxetine advises duloxetine should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping duloxetine)
- \(5HT_1\) receptor Agonists: possible increased serotonergic effects when duloxetine given with \(5HT_1\) agonists
- \(5HT_2\) receptor Antagonists: possible increased serotonergic effects when SSR-lated antidepressants given with \(5HT_2\) antagonist
- Methylthionium: risk of CNS toxicity when SSR-lated antidepressants given with methylthionium—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration)

Dutasteride
- Calcium-channel Blockers: plasma concentration of dutasteride increased by dutazanav and verapamil

Dydrogesterone see Progestogens
Eadoxan
- Analgesics: increased risk of bleeding when edoxaban given with NSAIDs (manufacturer of edoxaban advises avoid long-term NSAIDs); increased risk of haemorrhage when anticoagulants given with intravenous dicyclfenac (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with ketorolac (avoid concomitant use, including low-dose heparins); increased risk of bleeding when edoxaban given with high-dose aspirin (avoid concomitant use)
- Anti-arrhythmics: plasma concentration of edoxaban increased by dronedarone (reduce dose of edoxaban—see under Eadoxan, in BNF)
- Antibacterials: plasma concentration of edoxaban increased by erythromycin (reduce dose of edoxaban—see under Eadoxan, in BNF); plasma concentration of edoxaban reduced by rifampicin

Edoxaban (continued)
- Anticoagulants: increased risk of haemorrhage when edoxaban given with other anticoagulants (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency); increased risk of haemorrhage when other anticoagulants given with apixaban, dabigatran and rivaroxaban (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antidepressants: plasma concentration of edoxaban possibly reduced by ST John’s wort
- Antiepileptics: plasma concentration of edoxaban possibly reduced by carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone
- Antifungals: plasma concentration of edoxaban increased by ketoconazole (reduce dose of edoxaban—see under Eadoxan, in BNF)
- Calcium-channel Blockers: plasma concentration of edoxaban increased by verapamil
- Ciclosporin: plasma concentration of edoxaban increased by ciclosporin (reduce dose of edoxaban—see under Eadoxan, in BNF)

Efavirenz
- Analgesics: efavirenz reduces plasma concentration of methadone
- Antidepressants: efavirenz reduces plasma concentration of clariithromycin, also plasma concentration of active metabolite of clarithromycin increased; efavirenz reduces plasma concentration of efavirenz—increase dose of rilbuvirtin; plasma concentration of efavirenz reduced by rifampicin—increase dose of efavirenz; efavirenz possibly reduces plasma concentration of bedaquiline—manufacturer of bedaquiline advises avoid concomitant use
- Antifungals: efavirenz possibly affects plasma concentration of coumarins
- Antidepressants: plasma concentration of efavirenz reduced by ST John’s wort—avoid concomitant use
- Antiepileptics: plasma concentration of both drugs reduced when efavirenz given with carbamazepine
- Antifungals: efavirenz reduces plasma concentration of itraconazole, ketoconazole and posaconazole; efavirenz reduces plasma concentration of voriconazole, also plasma concentration of efavirenz increased (increase voriconazole dose and reduce efavirenz dose); efavirenz possibly reduces plasma concentration of caspofungin—consider increasing dose of caspofungin
- Antimalarials: efavirenz reduces plasma concentration of artemether with lumefantrine; efavirenz possibly affects plasma concentration of proguanil
- Antipsychotics: efavirenz possibly reduces plasma concentration of aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); efavirenz possibly increases plasma concentration of pimozone (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antivirals: avoidance of efavirenz advised by manufacturer of atazanavir (plasma concentration of atazanavir reduced)
- Efavirenz reduces the plasma concentration of daclatasvir—increase dose of daclatasvir (see under Daclatasvir, in BNF); efavirenz reduces plasma concentration of darunavir (adjust dose—consult product literature); avoidance of efavirenz advised by manufacturer of dasabuvir, elvitegravir, ombitasvir and paritaprevir; efavirenz reduces the plasma concentration of dolugravir (see under Dolugravir, p. 387); efavirenz possibly reduces plasma concentration of etravirine—avoid concomitant use; efavirenz reduces plasma concentration of indinavir and simprevir; efavirenz reduces plasma concentration of lopinavir—consider increasing dose of lopinavir; efavirenz possibly reduces plasma concentration of maraviroc—consider increasing dose of maraviroc; plasma concentration of efavirenz reduced by nevirapine—avoid concomitant use; toxicity of efavirenz increased by ritonavir; monitor liver function tests—manufacturer of atipraza advises avoid concomitant use with high-dose ritonavir; efavirenz significantly reduces plasma concentration of saquinavir;
Efavirenz

- Antivirals: efavirenz reduces plasma concentration of • telaprevir—increase dose of telaprevir
- Anxiolytics and Hypnotics: increased risk of prolonged sedation when efavirenz given with • midazolam—avoid concomitant use
- Atovaquone: efavirenz reduces plasma concentration of • atovaquone—avoid concomitant use

Eltrombopag

- Antacids: efavirenz possibly reduces plasma concentration of • avana—manufacturer of avana advises avoid concomitant use
- Bupropion: efavirenz accelerates metabolism of bupropion (reduced plasma concentration)
- Calcium-channel blockers: efavirenz reduces plasma concentration of • diltiazem
- Ciclosporin: efavirenz possibly reduces plasma concentration of • ciclosporin
- Cytotoxics: efavirenz possibly reduces plasma concentration of • bosutinib—manufacturer of bosutinib advises avoid concomitant use
- Ergot Alkaloids: increased risk of ergotism when efavirenz given with • ergot alkaloids—avoid concomitant use
- Grapefruit juice: plasma concentration of efavirenz increased by grapefruit juice
- Guanfacine: efavirenz possibly reduces plasma concentration of • guanfacine—increase dose of guanfacine
- Lipid-regulating Drugs: efavirenz reduces plasma concentration of • atorvastatin, pravastatin and simvastatin
- Orlistat: absorption of efavirenz possibly reduced by • orlistat
- Progestogens: efavirenz possibly reduces contraceptive effect of • progestogens
- Tacrolimus: efavirenz possibly affects plasma concentration of • tacrolimus

Eliptiriptan: see SHT, -receptor Agonists (under HT)

Eltrombopag

- Antacids: absorption of eltrombopag reduced by • antacids (give at least 4 hours apart)
- Antivirals: plasma concentration of eltrombopag possibly reduced by • lopinavir
- Calcium Salts: absorption of eltrombopag possibly reduced by • calcium salts (give at least 4 hours apart)
- Dairy Products: absorption of eltrombopag possibly reduced by • dairy products (give at least 4 hours apart)
- Iron Salts: absorption of eltrombopag possibly reduced by • iron salts (give at least 4 hours apart)
- Lipid-regulating Drugs: eltrombopag increases plasma concentration of • rosvastatin—adjust dose of rosvastatin (consult product literature)
- Selenium: absorption of eltrombopag possibly reduced by • selenium (give at least 4 hours apart)
- Zinc: absorption of eltrombopag possibly reduced by • zinc (give at least 4 hours apart)

Elvitegravir

- Antacids: absorption of elvitegravir reduced by • aluminium hydroxide and • oral magnesium salts (give at least 4 hours apart)
- Antibacterials: plasma concentration of elvitegravir reduced by • rifabutin also plasma concentration of active metabolite of rifabutin increased—reduce dose of rifabutin; manufacturer of elvitegravir advises avoid concomitant use with • rifampicin
- Antidepressants: manufacturer of elvitegravir advises avoid concomitant use with • st john’s Wort
- Antiepileptics: manufacturer of elvitegravir advises avoid concomitant use with • carbamazepine, • fosphenytoin, • phenobarbital, • phenytoin and • primidone
- Antivirals: plasma concentration of elvitegravir increased by • atazanavir and • lopinavir boosted with ritonavir (reduce dose of elvitegravir); manufacturer of elvitegravir advises avoid concomitant use with • efavirenz and • nevirapine
- Bosentan: manufacturer of elvitegravir advises avoid concomitant use with • bosentan
- Orlistat: absorption of elvitegravir possibly reduced by • orlistat
- Progestogens: elvitegravir increases plasma concentration of • norgestimate
**Ergot Alkaloids**

- **Antibacterials (continued)**
  - Telithromycin: avoid concomitant use; increased risk of ergotism when given with tetracyclines
  - Antidepressants: possible risk of hypertension when ergotamine given with rebetidine
  - Antifungals: avoidance of ergot alkaloids advised by manufacturer of ketoconazole; avoidance of ergometrine given by manufacturer of itraconazole (increased risk of ergotism); increased risk of ulcer when ergotamine given with voriconazole—avoid concomitant use; increased risk of ergotism when ergotamine given with imidazole or triazoles

- **Antivirals:** plasma concentration of ergot alkaloids possibly increased by atazanavir—avoid concomitant use; avoidance of ergot alkaloids advised by manufacturer of boceprevir and telaprevir; increased risk of ergotism when ergot alkaloids given with efavirenz or ritonavir—avoid concomitant use; increased risk of ergotism when ergotamine given with fosamprenavir, indinavir or saquinavir—avoid concomitant use; increased risk of ergotism when ergotamine given with indinavir—avoid concomitant use

- **Beta-blockers:** increased peripheral vasodilatation when ergot alkaloids given with beta-blockers

- **Cobicistat:** plasma concentration of ergot alkaloids possibly increased by cobicistat—manufacturer of cobicistat advises avoid concomitant use

- **Cytotoxics:** caution with ergot alkaloids advised by manufacturer of idelalisib

- **HTR1a receptor Agonists:** increased risk of vasospasm when ergotamine given with almotriptan, rizatriptan, sumatriptan or zolmitriptan (avoid ergotamine for 6 hours after almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoidance of ergotamine given with eletriptan, frovatriptan or naratriptan (avoid ergotamine for 24 hours after eletriptan, frovatriptan or naratriptan, avoidance of ergotamine given with eletriptan, frovatriptan or naratriptan for 24 hours after ergotamine)

- **Sympathomimetics:** increased risk of ergotism when ergot alkaloids given with symathomimetics

- **Ticagrelor:** plasma concentration of ergot alkaloids possibly increased by ticagrelor

- **Ulcer-healing Drugs:** increased risk of ergotism when ergotamine given with cimetidine—avoid concomitant use

**Ergotamine** see Ergot Alkaloids

- **Eribulin**
  - Antibacterials: plasma concentration of eribulin possibly reduced by rifampicin
  - Antidepressants: plasma concentration of eribulin possibly reduced by St John’s Wort
  - Antiepileptics: plasma concentration of eribulin possibly reduced by carbamazepine, fosphenytoin and phenytoin
  - Antipsychotics: avoid concomitant use of cytoxics with clozapine (increased risk of agranulocytosis)

- **Erlotinib**
  - Antipsychotics: avoid concomitant use of cytoxics with clozapine (increased risk of agranulocytosis)
  - Antivirals: avoidance of erlotinib advised by manufacturer of boceprevir
  - Cytotoxics: plasma concentration of erlotinib possibly increased by capecitabine
  - Ulcer-healing Drugs: manufacturer of erlotinib advises avoid concomitant use with cimetidine, esomeprazole, famotidine, lansoprazole, rabeprazole and ranitidine—manufacturer of erlotinib advised to give at least 2 hours before or 10 hours after ranitidine; plasma concentration of erlotinib reduced by omeprazole—manufacturer of erlotinib advises avoid concomitant use

**Ertapenem**
- **Antiepileptics:** carbapenems reduce plasma concentration of sodium valproate and valproic acid—avoid concomitant use

- **Antibacterials:** plasma concentration of erlotinib possibly reduced by sulfa drugs

**Erythromycin** see Macrolides

**Escitalopram** see Antidepressants, SSRI

**E涉carbazepine**
- **Antiepileptics:** eskalarbazine reduces plasma concentration of warfarin
- **Antidepressants:** anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIs and tricyclics (convulsive threshold lowered)
- **Antiepileptics:** plasma concentration of eskalarbazine possibly reduced by carbamazepine but risk of side-effects increased; plasma concentration of eskalarbazine reduced by fosphenytoin and phenytoin, also plasma concentration of fosphenytoin and phenytoin increased; manufacturer of eskalarbazine advises avoid concomitant use with oscarbazepine

**Estraladiol** see Oestrogens

**Estradiol** see Progestin

**Estramustine**
- Antacids: absorption of estramustine possibly reduced by aluminum hydroxide and oral magnesium salts—manufacturer of estramustine advises avoid concomitant administration
- Antipsychotics: avoid concomitant use of cytoxics with clozapine (increased risk of agranulocytosis)
- Biphosphonates: plasma concentration of estramustine increased by sodium clodronate
- Calcium Salts: absorption of estramustine reduced by calcium salts (manufacturer of estramustine advises avoid concomitant administration)

**Estradiol** see Oestrogens

**Estrone** see Oestrogens
Etoracpet
- Abatacept: avoid concomitant use of etoracpet with
  - ABATACEPT
- Anakinra: avoid concomitant use of etoracpet with
  - ANAKINRA
- Vaccines: risk of generalised infections when etoracpet given with live VACCINES—avoid concomitant use

Ethambutol
- Antibacterials: plasma concentration of ethambutol increased by
  - DELAMANID
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNFC

Ethinylestradiol see Oestrogens

Ethosuximide
- Antibacterials: metabolism of ethosuximide inhibited by
  - ISONIAZID (increased plasma concentration and risk of toxicity)
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIS and TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: plasma concentration of ethosuximide possibly reduced by CITRUS FRUITS, ORACET, ETOMIDATE, ETOUDOLAC, ORLISTAT: anticonvulsant effect of antiepileptics antagonised by MELFLOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ANTIPSYCHOTICS (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ORLISTAT

Etodolac see NSAIDs

Etonidazole see Anaesthetics, General

Etonogestrel see Progestogens

Etoposide
- Anticoagulants: etoposide possibly enhances anticoagulant effect of COUMARINS
- Antiepileptics: plasma concentration of etoposide possibly reduced by FOSFOTHIONIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antifungals: plasma concentration of etoposide increased by KETOCONAZOLE
- Antipsychotics: avoid concomitant use of cytotoxics with etoposide (increased risk of agranulocytosis)
- Atovaquone: plasma concentration of etoposide possibly increased by ATOVAQUONE
- Ciclosporin: plasma concentration of etoposide possibly increased by CICLOSPORIN (increased risk of toxicity)
- Netupitant: plasma concentration of etoposide increased by NETUPITAN

Etoricoxib see NSAIDs

Etravirine
- Antivirals (continued): etravirine advised by manufacturer of DASABUVIR, OMBITASVIR, PARTITAPREVIR and SIMPEPREDV; etravirine reduces the plasma concentration of DASABUVIR (see under Dolutegravir, p. 387); plasma concentration of etravirin possibly reduced by EFFAVIRENZ and NEVIRAPINE—avoid concomitant use; etravirine increases plasma concentration of FOSEMPREVIR (consider reducing dose of fosamprenavir); etravirine possibly reduces plasma concentration of IMPARIBUVIR—avoid concomitant use; etravirine possibly reduces plasma concentration of MARAVIRI; plasma concentration of etravirine reduced by TIPRANAVIR, also plasma concentration of tipranavir increased (avoid concomitant use)
- Cardiac Glycosides: etravirine increases plasma concentration of DIGOXIN
- Clopidogrel: etravirine possibly reduces antiplatelet effect of CLOPIDOGREL
- Cytotoxics: etravirine possibly reduces plasma concentration of ATOVASTATIN and INDOMETHACIN—avoid concomitant use
- Guanfacine: etravirine possibly reduces plasma concentration of GUANAFECINE—增加 dose of guanfacine
- Lipid-regulating Drugs: etravirine possibly reduces plasma concentration of ATORVASTATIN
- Orlistat: absorption of etravirine possibly reduced by ORLISTAT
- Sildenafil: etravirine reduces plasma concentration of SILDENAFIL

Everolimus
- ACE inhibitors: increased risk of angioedema when everolimus given with ACE INHIBITORS
- Antibacterials: plasma concentration of everolimus possibly increased by CLARITHROMYCIN and Telithromycin—manufacturer of everolimus advises avoid concomitant use; plasma concentration of everolimus increased by ERYTHROMYCIN (consider reducing the dose of everolimus—consult everolimus product literature); plasma concentration of everolimus reduced by RIFAMPICIN (avoid concomitant use or consider increasing the dose of everolimus—consult everolimus product literature)
- Antidepressants: plasma concentration of everolimus possibly reduced by ST JOHN’S WORT—manufacturer of everolimus advises avoid concomitant use
- Antifungals: plasma concentration of everolimus increased by KETOCONAZOLE—manufacturer of ketoconazole advises avoid concomitant use; plasma concentration of everolimus possibly increased by ATOMICAZOLE and POSACONAZOLE
- Antipsychotics: avoid concomitant use of cytotoxics with everolimus (increased risk of agranulocytosis)
- Antivirals: plasma concentration of everolimus possibly increased by ATAZANAVIR, DARUNAVIR, INDINAVIR, RITONAVIR and SAQUINAVIR—manufacturer of everolimus advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of both drugs may increase when everolimus given with VERAPAMIL (consider reducing the dose of everolimus—consult everolimus product literature)
- Ciclosporin: plasma concentration of everolimus increased by CICLOSPORIN (consider reducing the dose of everolimus—consult everolimus product literature)
- Cytotoxics: plasma concentration of everolimus increased by IMATINIB (consider reducing the dose of everolimus—consult everolimus product literature)
- Grapefruit Juice: manufacturer of everolimus advises avoid concomitant use with GRAPEFRUIT JUICE

Exemestane
- Antibacterials: plasma concentration of exemestane possibly reduced by RIFAMPICIN

Exenatide see Antidiabetics

Ezetimibe
- Anticoagulants: ezetimibe possibly enhances anticoagulant effect of COUMARINS
**Ezetimibe**
- **(continued)**
  - Ciclosporin: plasma concentration of both drugs may increase when ezetimibe given with **CICLOSPORIN**
  - Lipid-regulating Drugs: ezetimibe increases plasma concentration of **ROSUVASTATIN**—adjust dose of rosuvastatin (consult product literature); increased risk of cholelithiasis and gallbladder disease when ezetimibe given with FIBRATES—discontinue if suspected

**Fampridine**
- Ulcer-healing Drugs: manufacturer of fampridine advises concomitant use with **CIMETIDINE**

**Fexofenadine**
- Azathioprine: manufacturer of fexofenadine advises avoid concomitant use with **AZATHIOPRINE**
- Anticytokines: manufacturer of fexofenadate advises avoid concomitant use with **MERCAPTOPURINE**

**Fidoxamicin**
- Calcium-channel Blockers: manufacturer of fidaxomicin advises avoid concomitant use with **VERAPAMIL**
- Ciclosporin: manufacturer of fidaxomicin advises avoid concomitant use with **CICLOSPORIN**
- Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNFC

**Flavoxate**
- Antimuscarinics: increased risk of ventricular arrhythmias when flavoxate given with **RINTAIZEM** or **VERAPAMIL**

**Flucytosine**
- Anti-neutrophils: possibly exacerbated when flucytosine given with **CEPACTIPE, FLUONOURACIL OR TEGAFUR**

**Fingolimod**
- Anti-arhythmic agents: increased risk of bradycardia when fingolimod given with **AMIODARONE, DISOPYRAMIDE or DRONE DARONE**
- Antidepressants: plasma concentration of fingolimod possibly reduced by **ST JOHN'S WORT**—manufacturer of fingolimod advises avoid concomitant use
- Antiepileptics: plasma concentration of fingolimod reduced by **CARBAMAZEPINE**
- Antifungals: plasma concentration of fingolimod increased by **KETOCONAZOLE**
- Beta-blockers: possible increased risk of bradycardia when fingolimod given with **BETA-BLOCKERS**
- Calcium-channel Blockers: possible increased risk of bradycardia when fingolimod given with **RINTAIZEM** or **VERAPAMIL**

**Flufenoxamine**
- Opioid Analgesics
- Calcium-channel Blockers
- NSAIDs
- Fibrates

**Fluroxen**
- See Furosemide

**Fluticasone**
- See F,H analogs

**Fluvastatin**
- Calcium-channel Blockers: manufacturer of fluvastatin advises avoid concomitant use with **VERAPAMIL**
- Ciclosporin: manufacturer of fluvastatin advises avoid concomitant use with **CICLOSPORIN**

**Flubucloxacin**
- See Penicillins

**Flunisolide**
- See F,H analogs

**Fluphenazine**
- See F,H analogs

**Fluticasone**
- See F,H analogs

**Fluticasone**
- See F,H analogs

**Fluvastatin**
- Calcium-channel Blockers: manufacturer of fluvastatin advises avoid concomitant use with **VERAPAMIL**
- Ciclosporin: manufacturer of fluvastatin advises avoid concomitant use with **CICLOSPORIN**

**Fluvoxamine**
- See F,H analogs

**Fluvastatin**
- Calcium-channel Blockers: manufacturer of fluvastatin advises avoid concomitant use with **VERAPAMIL**
- Ciclosporin: manufacturer of fluvastatin advises avoid concomitant use with **CICLOSPORIN**
- Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNFC

**Filtrostatin**
- Cytoxotics: neutropenia possibly exacerbated when filgrastim given with **CEPACTIPE, FLUONOURACIL OR TEGAFUR**

**Flucytosine**
- See Antimicrobials

**Flucloxacillin**
- See Penicillins

**Flucloxacillin**
- See Penicillins

**Flucloxacillin**
- See Penicillins

Interactions

**Fluoxetine**

- Analgesics:
  - Fosamprenavir

- Anticoagulants:
  - Dabigatran

- Ulcer-healing Drugs:
  - Lopinavir

- Calcium Salts:
  - Dapoxetine

- Seizure-Modifying Drugs:
  - Carbamazepine

- Anticoagulants:
  - Rivaroxaban

- Fosamprenavir (continued)
  - Anti-myocardial ischemia: fosamprenavir possibly increases plasma concentration of
    - Ajmaline
    - Bretylium
    - Disopyramide
    - Lidocaine
      - Avoid concomitant use

- Anticoagulants:
  - Rivaroxaban

- Fat-soluble vitamins and fats:
  - Ticagrelor

- Anticoagulants:
  - Apixaban

- Antipsychotics:
  - Quetiapine

- Antipsychotics:
  - Clozapine

- Antipsychotics:
  - Ziprasidone

- Antiepileptics:
  - Carbamazepine

- Antiepileptics:
  - Oxcarbazepine

- Antiepileptics:
  - Lamotrigine

- Antiepileptics:
  - Gabapentin

- Antiepileptics:
  - Tegafur

- Antiepileptics:
  - Valproic acid

- Antiepileptics:
  - Primidone

- Antiepileptics:
  - Ethosuximide

- Antiepileptics:
  - Levetiracetam

- Antiepileptics:
  - Tiagabine

- Antiepileptics:
  - Vigabatrin

- Antiepileptics:
  - Topiramate

- Antiepileptics:
  - Oxcarbazepine

- Antiepileptics:
  - Carbamazepine

- Antiepileptics:
  - Gabapentin

- Antiepileptics:
  - Lamotrigine

- Antiepileptics:
  - Valproic acid

- Antiepileptics:
  - Primidone

- Antiepileptics:
  - Ethosuximide

- Antiepileptics:
  - Levetiracetam

- Antiepileptics:
  - Tiagabine

- Antiepileptics:
  - Vigabatrin

- Antiepileptics:
  - Oxcarbazepine

- Antiepileptics:
  - Carbamazepine

- Antiepileptics:
  - Gabapentin

- Antiepileptics:
  - Lamotrigine

- Antiepileptics:
  - Valproic acid

- Antiepileptics:
  - Primidone

- Antiepileptics:
  - Ethosuximide

- Antiepileptics:
  - Levetiracetam

- Antiepileptics:
  - Tiagabine

- Antiepileptics:
  - Vigabatrin

- Antiepileptics:
  - Oxcarbazepine

- Antiepileptics:
  - Carbamazepine

- Antiepileptics:
  - Gabapentin

- Antiepileptics:
  - Lamotrigine

- Antiepileptics:
  - Valproic acid

  - Ethosuximide
Fosaprepitant

- Antibacterials: plasma concentration of fosaprepitant possibly increased by clarithromycin and troleandomycin; plasma concentration of fosaprepitant reduced by rifampicin.
- Anticoagulants: fosaprepitant possibly reduces anticoagulant effect of warfarin.
- Antidepressants: manufacturer of fosaprepitant advises avoid concomitant use with st john’s wort.
- Antidiabetics: fosaprepitant reduces plasma concentration of tolbutamide.
- Antiepileptics: plasma concentration of fosaprepitant possibly reduced by carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone.
- Antifungals: plasma concentration of fosaprepitant increased by ketoconazole.
- Antipsychotics: manufacturer of fosaprepitant advises avoid concomitant use with pimozide.
- Antivirals: plasma concentration of fosaprepitant possibly increased by ritonavir.
- Anxiolytics and Hypnotics: fosaprepitant increases plasma concentration of midazolam (risk of prolonged sedation).
- Avascular: fosaprepitant possibly increases plasma concentration of avanafil.
- Calcium-channel Blockers: plasma concentration of both drugs may increase when fosaprepitant given with diltiazem.
- Corticosteroids: fosaprepitant inhibits metabolism of dexamethasone and methylprednisolone (reduce dose of dexamethasone and methylprednisolone).
- Cytotoxics: fosaprepitant possibly increases the plasma concentration of bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib.
- Fosaprepitant possibly increases plasma concentration of ibrutinib.
- Guanfacine: fosaprepitant possibly increases plasma concentration of guanfacine (halve dose of guanfacine).
- Lipid-regulating Drugs: separating administration from fosaprepitant by 12 hours advised by manufacturer of lomitapide.
- Oestrogens: fosaprepitant possibly causes contraceptive failure of hormonal contraceptives containing oestrogens (alternative contraception recommended).
- Progestogens: fosaprepitant possibly causes contraceptive failure of hormonal contraceptives containing progestogens (alternative contraception recommended).
- Foscarnet
  - Pentamidine isetionate: increased risk of hypocalcaemia when foscarnet given with pentamidine.
- Fosfomycin
  - Metoclopramide: plasma concentration of fosfomycin reduced by metoclopramide.
  - Vaccines: antibacterials inactive—oral typhoid vaccine—see under Typhoid Vaccine in BNFC.
- Fosinopril see ACE Inhibitors

Fosphenytoin

- Alcohol: plasma concentration of fosphenytoin possibly reduced by chronic heavy consumption of alcohol.
- Aminophylline: plasma concentration of both drugs reduced when fosphenytoin given with aminophylline.
- Analgesics: excretion of fosphenytoin possibly reduced by acemetacin (increased risk of toxicity); fosphenytoin possibly accelerates metabolism of fentanyl (reduced effect).
- Antiepileptics: fosphenytoin reduces plasma concentration of almizadrone—possibility of toxicity; effects of fosphenytoin possibly increased by aspirin; fosphenytoin possibly accelerates metabolism of paracetamol (also isolated reports of hepatotoxicity).
- Antihistamines: manufacturer of fosphenytoin advises avoid or consider reducing dose of bosutinib; use; avoidance of fosamprenavir advised by manufacturer of metoclopramide: fosfampravir given with metoclopramide advisement.
- Progestogens: fosfampravir increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use.
- Sildenafil: fosfampravir possibly increases plasma concentration of tacrolimus.
- Fosfampravir possibly increases plasma concentration of tadalfil:
- Fosfampravir possibly increases plasma concentration of vardenaefil.

Fosampravir

- Lipid-regulating Drugs (continued)
  - Rosuvastatin—manufacturer of rosuvastatin advises avoid concomitant use; possible increased risk of myopathy when fosampravir given with simvastatin—avoid concomitant use; avoidance of fosampravir advised by manufacturer of lomitapide: plasma concentration of lomitapide possibly increased.
- Oralistat: absorption of fosampravir possibly reduced by oralistat.
- Ranolazine: fosampravir possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use.
- Sildenafil: fosampravir possibly increases plasma concentration of tadalafil.
- Tacrolimus: fosampravir increases plasma concentration of tacrolimus.
- Vardenafil: fosampravir possibly increases plasma concentration of vardenafil.

Interactions | Appendix 1
Fosphenytoin

- Antiepileptics: (continued)
  - Increased by: ETHOSUXIMIDE, also plasma concentration of ethosuximide possibly reduced; fosphenytoin reduces plasma concentration of LAMOTRIGINE, TIAGABINE and ZONISAMIDE; plasma concentration of fosphenytoin increased by OXCARBAZEPINE, also plasma concentration of an active metabolite of oxcarbazepine reduced; fosphenytoin reduces plasma concentration of PERAMAPANE (see under Perampanel, p. 195); fosphenytoin often increases plasma concentration of PHENOBARBITAL and PRIMIDONE, plasma concentration of fosphenytoin often reduced or may be increased; fosphenytoin possibly reduces plasma concentration of RETIGABINE; fosphenytoin possibly reduces plasma concentration of RUFINAMIDE, also plasma concentration of fosphenytoin increased; plasma concentration of fosphenytoin increased or possibly reduced when given with SODIUM VALPROATE and VALPROIC ACID, also plasma concentration of sodium valproate and valproic acid reduced; plasma concentration of fosphenytoin increased by STRIPATE; plasma concentration of fosphenytoin increased by TOPIRAMATE (also plasma concentration of topiramate reduced); plasma concentration of fosphenytoin reduced by VIGABATRIN.

- Antifungals: fosphenytoin reduces plasma concentration of KETOCONAZOLE and POSACONAZOLE; anticonvulsant effect of fosphenytoin enhanced by MICONAZOLE (plasma concentration of fosphenytoin increased); plasma concentration of fosphenytoin increased by FLUCONAZOLE (consider reducing dose of fosphenytoin); fosphenytoin reduces plasma concentration of ITRACONAZOLE—avoid concomitant use; plasma concentration of fosphenytoin increased by VORICONAZOLE, also fosphenytoin reduces plasma concentration of voriconazole (increase of voriconazole and also monitor for voriconazole toxicity); fosphenytoin possibly reduces plasma concentration of CASCOFUING—consider increasing dose of caspofungin.

- Antimalarials: avoidance of fosphenytoin advised by manufacturer of ARTEMISOM WITH PIPERAQUINE; anticonvulsant effect of antiepileptics antagonised by MELOQUINE; anticonvulsant effect of fosphenytoin antagonised by PYRIMETHAMINE, also increased antifolate effect.

- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ANTIPSYCHOTICS (convulsive threshold lowered); fosphenytoin reduces plasma concentration of HALOPERIDOL; plasma concentration of fosphenytoin possibly increased or decreased by CHLORPROMAZINE; fosphenytoin possibly reduces plasma concentration of ARIPIPRAZOLE (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); fosphenytoin accelerates metabolism of CLOZAPINE and QUETIAPINE (reduced plasma concentration); fosphenytoin possibly reduces plasma concentration of LURASIDONE—avoid concomitant use.

- Antituberculous: fosphenytoin possibly reduces plasma concentration of ABACAVIR, DURANIP, LOPINAVIR and SAQUINAVIR; avoidance of fosphenytoin advised by manufacturer of BOCREPREV and RILIPREVIR (plasma concentration of boc Lovirin and rilpivirine possibly reduced); fosphenytoin possibly reduces plasma concentration of DACLATASVIR and SIMEPREVIR—manufacturer of daclatasvir and simeprevir advises avoid concomitant use; fosphenytoin possibly reduces plasma concentration of DASABUVIR, DASAVIR AND SIMPEPREVIR—manufacturer of dasabuvir and simprevir (increased risk of toxicity); fosphenytoin increases antifolate effect of METHOTREXATE; plasma concentration of fosphenytoin possibly reduced by CISPLATIN; fosphenytoin possibly reduces plasma concentration of AATINIBIN (increase dose of aatinib—consult aatinib product literature); fosphenytoin possibly reduces plasma concentration of BORTEZOMIB, BOSUTINIB, CRIZOTINIB, IBRUTINIB, IDEALISIB and PONATINIB—manufacturer of bortezomib, bosutinib, crizotinib, ibrutinib, idealisib and ponatinib advises avoid concomitant use; fosphenytoin possibly reduces plasma concentration of CARBOZANTINIB—avoid concomitant use; avoidance of fosphenytoin advised by manufacturer of CABAZITAXEL, DABRAFENIB, GEFTINIB, LAPATINIB and VEMURAFENIB; avoidance of fosphenytoin advised by manufacturer of DASATINIB and VISMODEGIB (plasma concentration of dasatinib and vismodegib possibly reduced); fosphenytoin reduces plasma concentration of IMATINIB—avoid concomitant use; fosphenytoin reduces plasma concentration of IRINO_TREE and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when fosphenytoin given with PROCARBZINE.

- Dexrazoxane: absorption of fosphenytoin possibly reduced by DEXRAZOXANE.

- Diazoxide: plasma concentration of fosphenytoin reduced by DIAZOXIDE, also effect of diazoxide may be reduced.

- Disulfiram: metabolism of fosphenytoin inhibited by DISULFIRAM (increased risk of toxicity).

- Diuretics: plasma concentration of fosphenytoin possibly increased by ACETAZOLAMIDE; fosphenytoin antagonises effects of FUROSEMIDE; fosphenytoin reduces plasma concentration of EPLERENONE—avoid concomitant use; increased risk of osteomalacia when fosphenytoin given with CARBONIC ANHYDRASE INHIBITORS.

- Dopaminergics: fosphenytoin possibly reduces effects of COBENELDO, CO-CARELDO and LEVODOPO.

- Enteral Feeds: absorption of fosphenytoin possibly reduced by ENTERAL FEEDS.

- Folic Acid: plasma concentration of fosphenytoin possibly reduced by FOLATES.

- Fosaprepitant: plasma concentration of fosphenytoin possibly reduced by FUSPREPANT.
Fosphenytoin (continued)

- Hormone Antagonists: fosphenytoin possibly reduces plasma concentration of ABRABERONE—manufacturer of abiraterone advises avoid concomitant use; fosphenytoin possibly accelerates metabolism of TORMIFENE
- 5HT1 receptor Antagonists: fosphenytoin accelerates metabolism of ONDANSETRON (reduced effect)
- Vaccines: fosphenytoin possibly reduces plasma concentration of VACCFACTOR—manufacturer of vaccifactor advises avoid concomitant use
- Leflunomide: plasma concentration of fosphenytoin possibly increased by LEFLUNOMIDE
- Lipid-regulating Drugs: absorption of fosphenytoin possibly reduced by COLESEVELAM; combination of fosphenytoin with FLUVASTATIN may increase plasma concentration of either drug (or both)
- Lithium: neurotoxicity may occur when fosphenytoin given with LITHIUM without increased plasma concentration of lithium
- Macitentan: avoidance of fosphenytoin advised by manufacturer of MACITENTAN
- Modafinil: plasma concentration of fosphenytoin possibly increased by MODAFINIL
- Muscle Relaxants: long-term use of fosphenytoin reduces effects of NON-DEPOLARISING MUSCLE RELAXANTS (but acute use of fosphenytoin might increase effects of non-depolarising muscle relaxants)
- Oestrogens: fosphenytoin accelerates metabolism of OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNFC)
- Orilistat: possible increased risk of convulsions when antiepileptics given with ORLISTAT
- Progestogens: fosphenytoin accelerates metabolism of PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNFC)
- Roflumilast: fosphenytoin possibly inhibits effects of ROFLUMILAST (manufacturer of roflumilast advises avoid concomitant use)
- Sulfinpyrazone: plasma concentration of fosphenytoin increased by SULFINPYRAZONE
- Sympathomimetics: plasma concentration of fosphenytoin increased by METHYLPHENIDATE
- Tacrolimus: fosphenytoin reduces plasma concentration of TACROLIMUS, also plasma concentration of fosphenytoin possibly increased
- Theophylline: plasma concentration of both drugs reduced when fosphenytoin given with THEOPHYLLINE
- Thyroid Hormones: fosphenytoin accelerates metabolism of THYROID HORMONES (may increase requirements in hypothyroidism), also plasma concentration of fosphenytoin possibly increased
- Tizanidine: fosphenytoin possibly reduces plasma concentration of TIZANIDINE
- Ulcer-healing Drugs: metabolism of fosphenytoin inhibited by CIMETIDINE (increased plasma concentration); effects of fosphenytoin enhanced by ESOMEPRAZOLE; effects of fosphenytoin possibly enhanced by OMEPRAZOLE; absorption of fosphenytoin reduced by SUCRALFATE
- Ulipristal: avoidance of fosphenytoin advised by manufacturer of ULIPRISTAL (contraceptive effect of ulipristal possibly reduced)
- Vaccines: effects of fosphenytoin enhanced by INFLUENZA VACCINE
- Vitamins: fosphenytoin possibly increases requirements for ALFACALCIDOL, CALCITRIOL, COLECALCIFEROL, DIHYDROSTACHYSTEROL, ERGOCALCIFEROL, PARICALCITOL or VITAMIN D
- Frovatriptan see SHT-receptor Agonists (under HT)
- Furosemide see Diuretics

Fusidic Acid
- Antivirals: plasma concentration of both drugs increased when fusidic acid given with RITONAVIR—avoid concomitant use; plasma concentration of both drugs may increase when fusidic acid given with SAQUINAVIR
- Lipid-Regulating Drugs: risk of myopathy and rhabdomyolysis when fusidic acid given with STATINS—avoid concomitant use and for 7 days after last fusidic acid dose
- Sugammadex: fusidic acid possibly reduces response to SUGammadex
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see Under Typhoid Vaccine in BNFC

Gabapentin
- Analgesics: bioavailability of gabapentin increased by MORPHINE
- Antacids: absorption of gabapentin reduced by ANTACIDS
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIS and TRICYCLICS (convulsive threshold lowered)
- Antimalarial: anticonvulsant effect of antiepileptics antagonised by MEFLOQUINE
- Anticonvulsants: anticonvulsant effect of antiepileptics antagonised by ANTIPSYCHOTICS (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ORLISTAT

Galantamine see Parasympathomimetics

Ganciclovir
- NOTE Increased risk of myelosuppression with other myelosuppressive drugs—consult product literature
- Antivirals: increased risk of convulsions when ganciclovir given with IMPENEM WITH CILASTATIN
- Antivirals: ganciclovir possibly increases plasma concentration of DIDANOSINE; profound myelosuppression when ganciclovir given with ZIDOVUDINE (if possible avoid concomitant administration, particularly during initial ganciclovir therapy)
- Mycophenolate: plasma concentration of ganciclovir possibly increased by MYCOPHENOLEATE, also plasma concentration of inactive metabolite of mycophenolate possibly increased
- Tacrolimus: possible increased risk of nephrotoxicity when ganciclovir given with TACROLIMUS

Gefitinib
- Antibacterials: plasma concentration of gefitinib reduced by RIFAMPICIN—avoid concomitant use
- Anticoagulants: gefitinib possibly enhances anticoagulant effect of WARFARIN
- Antidepressants: manufacturer of gefitinib advises avoid concomitant use with ST JOHN’S WORT
- Antiepileptics: manufacturer of gefitinib advises avoid concomitant use with CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antifungals: plasma concentration of gefitinib increased by ITRACONAZOLE
- Anti-epileptic: avoidance of gefitinib advised by manufacturer of BOCEPREVIR
- Ulcer-healing Drugs: plasma concentration of gefitinib reduced by RANITIDINE

Gemcitabine
- Anticoagulants: gemcitabine possibly enhances anticoagulant effect of WARFARIN
- Antiepileptics: avoid concomitant use of cytotoxics with GEMCITABINE (increased risk of agranulocytosis)
- Antivirals: avoidance of gefitinib advised by manufacturer of BOCHEPREVIR

Gemfibrozil see Fibrate

Gentamicin see Aminoglycosides

Gestodene see Progestogens

Glibenclamide see Antidiabetics

Gliclazide see Antidiabetics

Glimepiride see Antidiabetics

Glipizide see Antidiabetics
Glyceryl Trinitrate
Ivabradine:
▶ Guanfacine: Cytotoxics: Corticosteroids: Colchicine:
▶ Calcium-channel Blockers: Avanafil:
▶ Antipsychotics: Anxiolytics and Hypnotics:
▶ Antivirals:
Antipsychotics:
▶ Antimalarials:
Antihistamines:
▶ Anticoagulants:
Glucosamine
Golimumab
▶ Abatacept: avoid concomitant use of golimumab with ABATACEPT
▶ Anakinra: avoid concomitant use of golimumab with ANAKINRA
▶ Antipsychotics: avoid concomitant use of cytoxics with CLOzapine (increased risk of agranulocytosis)
▶ Vaccines: risk of generalised infections when monoclonal antibodies given with VACCINES—avoid concomitant use

Grapefruit Juice
▶ Alsikiren: grapefruit juice reduces plasma concentration of Alsiksiken—avoid concomitant use
▶ Antihelmintics: grapefruit juice increases plasma concentration of active metabolite of AlBENDAZOLE; grapefruit juice increases plasma concentration of PRaziquANTEL
▶ Anti-arhythmic: grapefruit juice increases plasma concentration of AMiodARONe; grapefruit juice increases plasma concentration of DRONEDarone—avoid concomitant use
▶ Antidepressants: grapefruit juice possibly increases plasma concentration of SERtrALINE
▶ Antihistamines: grapefruit juice reduces plasma concentration of BilasteRINE
▶ Antimalaria: grapefruit juice possibly increases plasma concentration of ARtemether with LumeFArine; avoidance of grapefruit juice advised by manufacturer of ARtemeNOL with PiperAQuINE
▶ Antipsychotics: avoidance of grapefruit juice advised by manufacturer of LURASIDone and PimidoZee; grapefruit juice possibly increases plasma concentration of Quetiapine—manufacturer of quetiapine advises avoid concomitant use
▶ Antibiotics: grapefruit juice possibly increases plasma concentration of EFavirenZ
▶ Anxiolytics and Hypnotics: grapefruit juice possibly increases plasma concentration of Oral MIzalom; grapefruit juice increases plasma concentration of BuSPRone
▶ Avanafil: grapefruit juice possibly increases plasma concentration of AvanaFIL — manufacturer of avanafil advises avoid grapefruit juice for 24 hours before avanafil
▶ Calcium-channel blockers: grapefruit juice possibly increases plasma concentration of AMLODipine; grapefruit juice increases plasma concentration of FeLOdipine, IrsADipine, LaCidipine, Lercanidipine, Nicaidipine, Nifedipine, Nimodipine and Verapatil
▶ Ciclosporin: grapefruit juice increases plasma concentration of CicloSPORIN (increased risk of toxicity)
▶ Colchicine: grapefruit juice possibly increases risk of ColchicInE toxicity
▶ Corticosteroids: grapefruit juice increases plasma concentration of oral BudesoNide—avoid concurrent use or separate administration by as much as possible and consider reducing oral budesonide dose
▶ Cytotoxics: grapefruit juice possibly increases plasma concentration of AxitinIn, CabozantIN and PonatinIn; grapefruit juice possibly increases the plasma concentration of Bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; grapefruit juice possibly increases plasma concentration of crizotinib and vinflunine—manufacturer of crizotinib and vinflunine advises avoid concomitant use; avoidance of grapefruit juice advised by manufacturer of Dasatinib (plasma concentration of dasatinib possibly increased); avoidance of grapefruit juice advised by manufacturer of Everolimus, Ibrutinib, Lapatinib, Nilotinib and Pazopanib
▶ Guanfacine: avoidance of grapefruit juice advised by manufacturer of Guanfacine
▶ Ivabradine: grapefruit juice increases plasma concentration of IvABArdine

Grapefruit Juice (continued)
▶ Ivafactor: grapefruit juice possibly increases plasma concentration of IvaCaFOr—manufacturer of ivacaftor advises avoid concomitant use
▶ Lipid-regulating Drugs: grapefruit juice possibly increases plasma concentration of AtorvaStatin; grapefruit juice increases plasma concentration of Simvastatin—avoid concomitant use; avoidance of grapefruit juice advised by manufacturer of LomitaPide
▶ Pirfenidone: avoidance of grapefruit juice advised by manufacturer of PiRFenidone
▶ Ranolazine: grapefruit juice possibly increases plasma concentration of Ranolazine—manufacturer of ranolazine advises avoid concomitant use
▶ Sildenafil: grapefruit juice possibly increases plasma concentration of SilDEnAFIL
▶ Sirolimus: grapefruit juice increases plasma concentration of Sirolimus—avoid concomitant use
▶ Tacrolimus: grapefruit juice increases plasma concentration of Tacrolimus—avoid concomitant use
▶ Tadalafil: grapefruit juice possibly increases plasma concentration of TadalafIL
▶ TolVaptan: grapefruit juice increases plasma concentration of TolVaptan—avoid concomitant use
▶ Ulipristal: avoidance of grapefruit juice advised by manufacturer of low-dose Ulipristal
▶ Vardenafil: grapefruit juice possibly increases plasma concentration of Vardenafil—avoid concomitant use

Griseofulvin
▶ Alcohol: griseofulvin possibly enhances effects of Alcohol
▶ Anticoagulants: griseofulvin reduces anticoagulant effect of CouMArins
▶ Antiepileptics: absorption of griseofulvin reduced by PhenoBarbital and PRimidone (reduced effect)
▶ Ciclosporin: griseofulvin possibly reduces plasma concentration of CicloSPORIN
▶ Oestrogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with OestroGens
▶ Progestogens: anecdotal reports of contraceptive failure and menstrual irregularities when griseofulvin given with ProgestoGENs

Guadaceline see Adrenergic Neurone Blockers

Guanfacine
▶ Alcohol: sedative effects possibly increased when guanfacine given with AlCOHOL
▶ Antibacterials: plasma concentration of guanfacine possibly increased by ciprofloxACin, ERYthromycin and Telithromycin (halve dose of guanfacine); plasma concentration of guanfacine possibly reduced by RifabuTin—increase dose of guanfacine; plasma concentration of guanfacine reduced by Rifampin—increase dose of guanfacine; manufacturer of guanfacine advises halve dose when given with ChloroPHEnicol
▶ Antidepressants: plasma concentration of guanfacine possibly reduced by St John’s Wort—increase dose of guanfacine
▶ Antiepileptics: plasma concentration of guanfacine possibly reduced by CarbAMazepine, OCarBAzepine, PhenobarbiTAL, PhentoyIn and Primidone—increase dose of guanfacine; guanfacine increases plasma concentration of Sodium Valproate and ValPric Acid
▶ Antifungal: plasma concentration of guanfacine increased by ketoConAzoLe (halve dose of guanfacine); plasma concentration of guanfacine possibly increased by FluconaZole, ItraConAzoLe and PosaConAzoLe (halve dose of guanfacine)
▶ Antipsychotics: sedative effects possibly increased when guanfacine given with Antipsychotics
▶ Antivirals: plasma concentration of guanfacine possibly increased by AtenaNavir, BOCePrevir, FosamprenAvir, IndinAVir, RitonAvin, SaquInAVir and TelAprevir (halve dose of guanfacine); plasma concentration of guanfacine possibly reduced by efavirenZ, etrAVirine and Nevirapine—increase dose of guanfacine
▶ Anxiolytics and Hypnotics: sedative effects possibly increased when guanfacine given with Anxiolytics and Hypnotics
Guanfacine (continued)

Heparin see Heparins

Heparins

• ACE inhibitors: increased risk of hyperkalaemia when heparins given with ACE INHIBITORS

• Aspirin: increased risk of hyperkalaemia when heparins given with ASPIRIN

• Analgesics: possible increased risk of bleeding when heparins given with NSAIDs; increased risk of haemorrhage when antiocoagulants given with intravenous DILOFENAC (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when antiocoagulants given with KETOROLAC (avoid concomitant use, including low-dose heparins); anticoagulant effect of heparins enhanced by ASPIRIN

• Angiotensin II Receptor Antagonists: increased risk of hyperkalaemia when heparins given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS

• Anticoagulants: increased risk of haemorrhage when other anticoagulants given with APICABAN, DABIGATRAN, EDORABAN and RIVAROXABAN (avoid concomitant use except when maintaining catheter patency)

• Clopidogrel: increased risk of bleeding when heparins given with CLOPIDOGREL

• Dipyrindamole: anticoagulant effect of heparins enhanced by DIPYRIDAMOLE

• Iloprost: anticoagulant effect of heparins possibly enhanced by ILOPROST

• Nitrate: anticoagulant effect of heparins reduced by infusion of GLYCERYL TRINITRATE

Hepatitis Vaccines see Vaccines

Histamine

• Antidepressants: manufacturer of histamine advises avoid concomitant use with MAOIS; effects of histamine theoretically antagonised by TRICYCLICS — manufacturer of histamine advises avoid concomitant use

• Antihistamines: effects of histamine theoretically antagonised by ANTIHISTAMINES — manufacturer of histamine advises avoid concomitant use

• Antimalarials: manufacturer of histamine advises avoid concomitant use with ANTIMALARIALS

• Antipsychotics: effects of histamine theoretically antagonised by ANTIPSYCHOTICS — manufacturer of histamine advises avoid concomitant use

• Ato伐quone: manufacturer of histamine advises avoid concomitant use with ATOVAQUONE

• Clonidine: manufacturer of histamine advises avoid concomitant use with CLONIDINE

• Corticosteroids: manufacturer of histamine advises avoid concomitant use with CORTICOSTEROIDS

• Ulcer-healing Drugs: effects of histamine theoretically antagonised by HISTAMINE H2-ANTAGONISTS — manufacturer of histamine advises avoid concomitant use

Histamine H2-antagonists (continued)

• Analgesics: cimetidine inhibits metabolism of OPIOID ANALGESICS (increased plasma concentration)

• Anthelmintics: cimetidine possibly enhances effects of ALBENDAZOLE — cimetidine possibly inhibits metabolism of MEBENDAZOLE (increased plasma concentration); cimetidine increases plasma concentration of PRAZIQUANTEL

• Anti-arrhythmics: cimetidine increases plasma concentration of AMIODARONE and PROPafenone; cimetidine inhibits metabolism of FLECAINIDE (increased plasma concentration); cimetidine increases plasma concentration of LIDOCAINE (increased risk of toxicity)

• Antibacterials: cimetidine increases plasma concentration of ERITHROMYCIN (increased risk of toxicity, including deafness); cimetidine inhibits metabolism of trimethoprim (increased plasma concentration); metabolism of cimetidine accelerated by RIFAMPICIN (reduced plasma concentration)

• Anticoagulants: cimetidine inhibits metabolism of COUMARINS (enhanced anticoagulant effect)

• Antidepressants: cimetidine increases plasma concentration of CITALOPRAM, ESCITALOPRAM, MIRTAZAPINE and SERTRALINE; cimetidine inhibits metabolism of AMITRIPTYLINE, DOXEPIN, IMIPRAMINE and NORTRIPYLTE (increased plasma concentration); cimetidine increases plasma concentration of MOXIBEMIDE (half dose of moclubine); cimetidine possibly increases plasma concentration of TRICYCLICS

• Antidiabetics: cimetidine reduces excretion of METFORMIN (increased plasma concentration); cimetidine enhances hypoglycaemic effect of SULPHONYLUREAS

• Antiepileptics: cimetidine inhibits metabolism of CARBAMAZEPINE, FOSPHENTOIN, PHENYTOIN, SODIUM VALPROATE and VALPROIC ACID (increased plasma concentration)

• Antifungal: histamine H2-antagonists reduce absorption of ITRACONAZOLE and KETOCONAZOLE; cimetidine reduces plasma concentration of POSACONAZOLE — manufacturer of posaconazole suspension advises avoid concomitant use; famotidine, nizatidine and ranitidine possibly reduce plasma concentration of POSACONAZOLE — manufacturer of posaconazole suspension advises avoid concomitant use; cimetidine increases plasma concentration of TERBINAFINE

• Antihistamines: manufacturer of loratadine advises cimetidine possibly increases plasma concentration of LORATADINE; cimetidine increases plasma concentration of hydroxyazine

• Antimalarials: avoidance of cimetidine advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; cimetidine inhibits metabolism of CHLOROQUINE, HYDROXYCHLOROQUINE and QUININE (increased plasma concentration)

• Antipsychotics: cimetidine possibly enhances effects of ANTIPSYCHOTICS, Chlorpromazine and Clozapine

• Antivirals: famotidine and ranitidine reduce the plasma concentration of ATAZANAVIR (adjust doses of both drugs — consult atazanavir product literature); manufacturer of atazanavir advises adjust doses of both drugs when cimetidine and nizatidine given with ATAZANAVIR — consult atazanavir product literature; famotidine reduces plasma concentration of Ledipasvir; famotidine increases plasma concentration of Raltegravir; avoidance of histamine H2-antagonists for 12 hours before or 4 hours after RILPIVIRINE advised by manufacturer of rilpivirine — consult product literature; cimetidine possibly increases plasma concentration of SAQUINAVIR

• Anxiolytics and Hypnotics: cimetidine inhibits metabolism of BENZODIAZEPINES, CLOMETHIAZOLE and ZALEPLON (increased plasma concentration); cimetidine increases plasma concentration of MELATONIN

• Azathioprine: manufacturer of azathioprine advises possible increased risk of myelosuppression when cimetidine given with AZATHIOPRINE

• Beta-blockers: cimetidine increases plasma concentration of LABELETOL, METOPROLOL and PROPRANOL; cimetidine possibly increases plasma concentration of oral TIMOLOL

• Caffeine citrate: cimetidine increases plasma concentration of CAFFEINE CITRATE

• Calcium-channel Blockers: cimetidine possibly inhibits metabolism of CALCIUM-CHANNEL BLOCKERS (increased plasma concentration)
Histamine H₂-antagonists
Calcium-channel Blockers (continued) concentration); cimetidine increases plasma concentration of
ISRADIPINE (halve dose of isradipine)
- Ciclosporin: cimetidine possibly increases plasma concentration of
- Clopidogrel: cimetidine possibly reduces antplatelet effect of

Cytotoxics: cimetidine possibly enhances myelosuppressive effect of
CARmustine and LOMustine; cimetidine reduces plasma concentration of
DOXORUBICIN; cimetidine increases plasma concentration of • EPIRUBICIN; cimetidine inhibits metabolism of
CAPETITABLE, FLUOROURACIL and TEGAFUR (increased plasma concentration); famotidine possibly reduces plasma concentration of
GEPITINIB; histamine H₂-antagonists possibly reduce absorption of
LAPATINIB; histamine H₂-antagonists possibly reduce absorption of
PAZOPANIB—manufacturer of pazopanib advises at least 2 hours before or 10 hours after histamine H₂-antagonists
- Dopaminergics: cimetidine reduces excretion of PRAMIDEXOLE (increased plasma concentration)
- Ergot Alkaloids: increased risk of ergotism when cimetidine given with • ERGOTAMINE—avoid concomitant use
- Fampridine: reduced plasma concentration of cimetidine advised by manufacturer of
FAMPRIDINE
- Histamine: histamine H₂-antagonists theoretically antagonise effects of
HISTAMINE—manufacturer of histamine advises avoid concomitant use
- Hormone Antagonists: absorption of cimetidine possibly delayed by
OCTREOTIDE
- Sildenafil: cimetidine increases plasma concentration of
SILDENAFIL—consider reducing dose of sildenafil for erectile dysfunction
- Sympathomimetics: cimetidine possibly inhibits metabolism of
DOBUTAMINE
- Theophylline: cimetidine inhibits metabolism of • THEOPHYLLINE (increased plasma concentration)
- Thyroid Hormones: cimetidine reduces absorption of
LEVOTHYROXINE

Hormone Antagonists see Antimuscarinics
Hormone Antagonists see Abiraterone, Bicalutamide, Danazol, Dutasteride, Enzalutamide, Exemestane, Flutamide, Luteotide, Octreotide, Pasireotide, Tamoxifen, and Toremifene

SHT, receptor Agonists
- Antibacterials: plasma concentration of eletriptan increased by • CLARITHROMYCIN and • ERYTHROMYCIN (risk of toxicity)—avoid concomitant use; metabolism of zolmitriptan possibly inhibited by QUINOLONES (reduce dose of zolmitriptan)
- Antidepressants: increased risk of CNS toxicity when SHT, agonists given with • CITALOPRAM (manufacturer of citalopram advises avoid concomitant use); increased risk of CNS toxicity when sumatriptan given with • CITALOPRAM, • ESCITALOPRAM, • FLUOXETINE, • FLUOXAMINE or • PAROXETINE; metabolism of frovatriptan inhibited by FLUOXAMINE; metabolism of sumatriptan possibly inhibited by FLUOXAMINE (reduce dose of sumatriptan); CNS toxicity reported when sumatriptan given with SERTRALINE; possible increased serotoninergic effects when SHT, agonists given with • DOXETINE, • VENLAFAXINE or • VORITIKETINE; risk of CNS toxicity when rizatriptan or sumatriptan given with • MAOIs (avoid rizatriptan or sumatriptan for 2 weeks after MAOIs); risk of CNS toxicity when sumatriptan given with • MAOIs or

SHT, receptor Agonists
- Antidepressants (continued)
- MOLOBEMIDE (reduce dose of zolmitriptan); risk of CNS toxicity when rizatriptan or sumatriptan given with • MOLOBEMIDE (avoid rizatriptan or sumatriptan for 2 weeks after moclobemide); possible increased serotoninergic effects when sumatriptan given with • SSRIS; increased serotoninergic effects when SHT, agonists given with • ST JOHN’S WORT—avoid concomitant use
- Antifungals: plasma concentration of eletriptan increased by • ITRACONAZOLE and • KETOCONAZOLE (risk of toxicity)—avoid concomitant use; plasma concentration of almotriptan increased by • KETOCONAZOLE (increased risk of toxicity)
- Antivirals: plasma concentration of eletriptan increased by • INDINAVIR and • RITONAVIR (risk of toxicity)—avoid concomitant use
- Beta-blockers: plasma concentration of rizatriptan increased by • PROPRANOLOL (manufacturer of propranolol advises halve dose and avoid within 2 hours of propranolol)
- Dopamine: possible increased risk of serotoninergic effects when SHT, agonists given with • DAPoxetine (manufacturer of dapoxetine advises SHT, agonists should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping SHT, agonists)
- Dopaminergics: avoidance of SHT, agonists advised by manufacturer of • SELEGINILE
- Ergot Alkaloids: increased risk of vasospasm when eletriptan, frovatriptan or naratriptan given with • ERGOTAMINE (avoid ergotamine for 24 hours after eletriptan, frovatriptan or naratriptan, avoid eletriptan, frovatriptan or naratriptan for 24 hours after ergotamine); increased risk of vasospasm when almotriptan, rizatriptan, sumatriptan or zolmitriptan given with • ERGOTAMINE (avoid ergotamine for 6 hours after almotriptan, rizatriptan, sumatriptan or zolmitriptan, avoid almotriptan, rizatriptan, sumatriptan or zolmitriptan for 24 hours after ergotamine)
- Lithium: possible risk of toxicity when sumatriptan given with • LITHIUM
- Ulcer-healing Drugs: metabolism of zolmitriptan inhibited by • Cimetidine (reduce dose of zolmitriptan)

SHT,-receptor Antagonists
- Analgesics: ondansetron possibly antagonises effects of
TRAMADOL
- Antibacterials: metabolism of ondansetron accelerated by
RIFAMPICIN (reduced effect)
- Antidepressants: possible increased serotoninergic effects when SHT, agonists given with • SSRI-RELATED ANTIDEPRESSANTS or • SSRIS
- Antiepileptics: metabolism of ondansetron accelerated by • CARBAMAZEPINE, • PHENOBARBITAL and • PHENYTOIN (reduced effect)
- Cytotoxics: increased risk of ventricular arrhythmias when ondansetron given with • VANDETANIB—avoid concomitant use
- Dopaminergics: possible increased hypotensive effect when ondansetron given with • APOMORPHINE—avoid concomitant use

Human papillomavirus Vaccine see Vaccines
Hydralazine see Vasodilator Antihypertensives
Hydrochlorothiazide see Diuretics
Hydrocortisone see Corticosteroids
Hydroflumethiazide see Diuretics
Hydromorphone see Opioid Analgesics
Hydrotalcite see Antacids
Hydroxocobalamin
- Antibacterials: response to hydroxocobalamin reduced by • CHLORAMPHENICOL

Hydroxyaromadine
- Antipsychotics: avoid concomitant use of cytoxotics with •clozapine (increased risk of agranulocytosis)
- Antivirals: increased risk of toxicity when hydroxyaromadine given with • DITOSINE and • STAVUDINE—avoid concomitant use
- Vaccines: risk of generalised infections when hydroxyaromadine given with live • VACCINES—avoid concomitant use

Hydroxychloroquine
- Adsorbents: absorption of hydroxychloroquine reduced by • KAOLIN
IBRUTINIB

- Anti-arrhythmics: increased risk of ventricular arrhythmias when hydroxychloroquine given with a AMIODARONE—avoid concomitant use
- Anticiphosphatase: increased risk of ventricular arrhythmias when hydroxychloroquine given with a MOXIFLOXACIN—avoid concomitant use
- Antimalarials: avoidance of antimalarials advised by manufacturer of a ARTEMETHER WITH LUMEFANTRINE; increased risk of convulsions when hydroxychloroquine given with a MELOQUIN
- Cardiac Glycosides: hydroxychloroquine possibly increases plasma concentration of a DIGOXIN
- Ciclosporin: hydroxychloroquine increases plasma concentration of a CICLOSPORIN (increased risk of toxicity)
- Cytotoxics: possible increased risk of ventricular arrhythmias when hydroxychloroquine given with a BOSUTINIB
- Histamine: avoidance of antihistaminals advised by manufacturer of a HISTAMINE
- Lanthanum: absorption of hydroxychloroquine possibly reduced by a LANTHANUM (given at least 2 hours apart)
- Laronidase: hydroxychloroquine possibly inhibits effects of a LARONIDASE (manufacturer of laronidase advises avoid concomitant use)
- Parasympathomimetics: hydroxychloroquine has potential to increase symptoms of myasthenia gravis and thus diminish effect of a NEOSTIGMINE and PYRIDOSTIGMINE
- Penicillamine: increased risk of haematological toxicity when antimalarials given with a PENICILLAMINE—manufacturer of penicillamine advises avoid concomitant use
- Ulcer-healing Drugs: metabolism of hydroxychloroquine inhibited by a CIMETIDINE (increased plasma concentration)
- Vaccines: antimalarials inactivate a ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNFC

HYDROXYCHLOROQUINE

- Antimuscarinics
- Hyoscine see Antimuscarinics

IBANDRONIC ACID see Bisphosphonates

IBRUTINIB

- Anti-arrhythmics: plasma concentration of ibrutinib possibly increased by a AMIODARONE and a BOSUTINIB—reduce dose of ibrutinib (see under Ibrutinib, in BNF)
- Antibacterials: plasma concentration of ibrutinib possibly increased by a CIPROFLOXACIN, a CLARITHROMYCIN, a ERYTHROMYCIN and a TELITHROMYCIN—reduce dose of ibrutinib (see under Ibrutinib, in BNF); plasma concentration of ibrutinib reduced by a RIFAMPICIN—avoid concomitant use
- Anticoagulants: manufacturer of ibrutinib advises avoid concomitant use with a COUMARINS and PHENINDIONE
- Antidepressants: plasma concentration of ibrutinib possibly reduced by a CARBAMAZEPINE, a FOSPHENYTOIN and a PHENYTOIN—manufacturer of ibrutinib advises avoid concomitant use
- Antiepileptics: plasma concentration of ibrutinib possibly reduced by a CARBAMAZEPINE, a FOSPHENYTOIN and a PHENYTOIN—manufacturer of ibrutinib advises avoid concomitant use
- Antifungals: plasma concentration of ibrutinib possibly increased by a KETOCONAZOLE
- Antipsychotics: avoid concomitant use of cytotoxics with a CLOzapine (increased risk of agranulocytosis); manufacturer of CLOzapine advises avoid concomitant use with a PIMozIDE and a QUETIAPINE
- Antioxidants and Hypnotics: manufacturer of ibrutinib advises avoid concomitant use of oral a MALDIAZOLAM
- Ergot Alkaloids: manufacturer of ibrutinib advises avoid concomitant use with a ERGOTAMINE
- Cytotoxics: concentration of ibrutinib possibly reduced by a SIMVASTATIN
- Sildenafil: manufacturer of ibrutinib advises avoid concomitant use with a SILDENAFIL for pulmonary arterial hypertension
- Sympathomimetics, Beta: manufacturer of ibrutinib advises avoid concomitant use with a Salmeterol

IFOSFAMIDE

- Anti-arrhythmics: increased risk of bleeding when iroprost given with a NSAIDS or a ASPIRIN
- Anticholinergics: metabolism of ifosfamide inhibited by a KETOCONAZOLE
- Antipsychotics: avoid concomitant use of cytotoxics with a CLOzapine (increased risk of agranulocytosis)
- Cytotoxics: increased risk of toxicity when ifosfamide given with a CISPLATIN

IBUprofen see NSAIDs

IDARUBICIN

- Anti-arrhythmics: manufacturer of idelalisib advises avoid concomitant use with a ALFuzOSIN
- Antiarrhythmics: manufacturer of idelalisib advises avoid concomitant use with a AMIODARONE
- Antibacterials: plasma concentration of idelalisib reduced by a RIFAMPICIN—avoid concomitant use
- Antidepressants: plasma concentration of idelalisib possibly reduced by a ST JON’S WORT—manufacturer of idelalisib advises avoid concomitant use
- Antiepileptics: plasma concentration of idelalisib possibly reduced by a CARBAMAZEPINE, a FOSPHENYTOIN and a PHENYTOIN—manufacturer of idelalisib advises avoid concomitant use
- Antifungals: plasma concentration of idelalisib increased by a KETOCONAZOLE
- Antipsychotics: avoid concomitant use of cytotoxics with a CLOzapine (increased risk of agranulocytosis); manufacturer of CLOzapine advises avoid concomitant use with a PIMozIDE and a QUETIAPINE
- Antioxidants and Hypnotics: manufacturer of idelalisib advises avoid concomitant use of oral a MALDIAZOLAM
- Ergot Alkaloids: manufacturer of idelalisib advises avoid concomitant use with a ERGOTAMINE
- Cytotoxics: concentration of idelalisib possibly reduced by a SIMVASTATIN
- Sildenafil: manufacturer of idelalisib advises avoid concomitant use with a SILDENAFIL for pulmonary arterial hypertension
- Sympathomimetics, Beta: manufacturer of idelalisib advises avoid concomitant use with a Salmeterol

ILPROST

- Analgesics: increased risk of bleeding when iroprost given with a NSAIDS or a ASPIRIN
Iloprost (continued)

- Anticoagulants: iloprost possibly enhances anticoagulant effect of CLOXAPINE and RIVASTIGMINE; increased risk of bleeding when iloprost given with LURASIDONE or MARAVIROC
- Clopidogrel: increased risk of bleeding when iloprost given with CLOPIDOGREL or ETIONAMIDE
- Diltiazem: increased risk of bleeding when iloprost given with DILTIAZEM or MESALazine
- Ephedrine: increased risk of bleeding when iloprost given with EPHTHETRIN or CAMPHOR
- Tirofiban: increased risk of bleeding when iloprost given with TIRAFIBAN or PILOXONE

Imatinib

- Analgesics: manufacturer of imatinib advises caution with PARACETAMOL
- Antibacterials: plasma concentration of imatinib reduced by CIPROFLOXACIN and CEFOTAXIME; increased by AMINOGLYCOSIDES and RIFABUTIN
- Anticonvulsants: plasma concentration of imatinib reduced by ETOPOSIDE
- Antidepressants: plasma concentration of imatinib reduced by SARALMIDINE
- ST JOHN’S WORT—avoid concomitant use
- Antiepileptics: plasma concentration of imatinib reduced by METHOTREXATE (increased risk of ventricular arrhythmias; avoid concomitant use)
- Antifungals: plasma concentration of imatinib increased by KETOCONAZOLE
- Antihistamines: manufacturer of imatinib advises caution with TELFEDINE
- Anti-inflammatory: manufacturer of imatinib advises caution with CORTICOSTEROIDS
- Antineoplastics: manufacturer of imatinib advises caution with AZACITIDINE
- Antiplatelets: manufacturer of imatinib advises caution with TICILOXOLE
- Antipsychotics: increased risk of bleeding when iloprost given with TIOCCITRAMIDE
- Anticancer: iloprost possibly enhances anticoagulant effect of LETRUSTINE
- Anticoagulants: plasma concentration of imatinib increased by HEPARINS and AMINOCAPROIC ACID; plasma concentration of imatinib reduced by WARFARIN
- Antituberculosis: manufacturer of imatinib advises caution with RIFAMPICIN
- Antivirals: increased risk of bleeding when iloprost given with RIPAVIRIN
- Antivirals: increased risk of bleeding when iloprost given with TENOVIK or EFAVIRENZ

Immunoglobulins

- Vaccines (continued)
  - oral POLIOMYELITIS VACCINE—give oral poliomyelitis vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to POLIOVaccine; give rotavirus vaccine at least 3 weeks before or 5 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to VARICELLA-ZOSTER VACCINE; give smallpox vaccine at least 3 weeks before or 5 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to YELLOV FEVER VACCINE
  - ORAL TYPHOID VACCINE: give oral typhoid vaccine at least 3 weeks before or 3 months after anti-d immunoglobulins and normal immunoglobulin; anti-d immunoglobulins and normal immunoglobulin might impair immune response to ORAL TYPHOID VACCINE

Indigatenol see Sympathomimetics, Beta;
Indapamide see Diuretics
Indinavir

- Aldesleukin: plasma concentration of indinavir possibly increased by ALDESELEUKIN
- Anti-arrhythmics: indinavir possibly increases plasma concentration of AMIODARONE; avoid concomitant use; indinavir possibly increases plasma concentration of FLECAINIDE (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antibacterials: indinavir increases plasma concentration of Rifabutin, also plasma concentration of carbamazepine, fosphenytoin and phenytoin possibly increased; plasma concentration of indinavir possibly reduced by PHENINDIONE
- Anticoagulants: plasma concentration of indinavir possibly increased by RIFABUTIN, also plasma concentration of carbamazepine, fosphenytoin and phenytoin possibly increased; plasma concentration of indinavir possibly reduced by PHENINDIONE
- Antidepressants: plasma concentration of indinavir possibly increased by AMOXICILLIN and APILIVERB
- Antiplatelets: indinavir possibly increases plasma concentration of CARBAMAZEPINE and SIMVASTATIN
- Antineoplastic: manufacturer of indinavir advises caution with APILIVERB
- Antivirals: indinavir possibly increases plasma concentration of FOSPHENYTOIN, CARBAMAZEPINE and OXCARBAZEPINE
- Anticoagulants: plasma concentration of indinavir possibly increased by PRIMIDONE
- Anticonvulsants: plasma concentration of indinavir possibly increased by PRIMIDONE
- Antidiabetes: increased risk of ventricular arrhythmias—indinavir possibly increases plasma concentration of VENTRICULAR ARHYTHMIAS; avoid concomitant use)
- Antimalarials: caution with indinavir advised by manufacturer of ARTEMETHIN with LUMEFANTRINE; indinavir possibly increases plasma concentration of QUININE (increased risk of toxicity)
- Antimuscarinics: avoidance of indinavir advised by manufacturer of GALBUTIN, also plasma concentration of carbamazepine and phenytoin; plasma concentration of indinavir possibly reduced by PHENINDIONE
- Antineoplastic: manufacturer of indinavir advises caution with APILIVERB
- Antineoplastic: manufacturer of indinavir advises caution with APILIVERB
- Antivirals: indinavir possibly increases plasma concentration of PALNOSTATIN, also plasma concentration of lamivudine and zidovudine; plasma concentration of indinavir possibly reduced by RIFABUTIN
- Antineoplastic: manufacturer of indinavir advises caution with APILIVERB
- Antineoplastic: manufacturer of indinavir advises caution with APILIVERB
- Antineoplastic: manufacturer of indinavir advises caution with APILIVERB
- Antineoplastic: manufacturer of indinavir advises caution with APILIVERB
Indinavir

- Antivirals (continued)
  - Indinavir: avoid concomitant use of indinavir with ANAKINRA
  - Antipsychotics: avoid concomitant use of cytoxics with CLOZAPINE (increased risk of agranulocytosis)
  - Vaccines: risk of generalised infections when monoclonal antibodies given with VACCINES—avoid concomitant use

Vaccines see Vaccines

Insulin see Antidiabetics

Interferon Alfa see Interferons

Interferon Gamma see Interferons

- Aminophylline: interferon alfa and peginterferon alfa inhibit metabolism of AMINOPHYLLINE (consider reducing dose of aminophylline)
  - Antivirals: caution with peginterferon alfa advised by manufacturer of ADEFOVIR; increased risk of peripheral neuropathy when interferon alfa and peginterferon alfa given with TELBIVUDINE

- Theophylline: interferon alfa and peginterferon alfa inhibit metabolism of THEOPHYLLINE (consider reducing dose of theophylline)
  - Vaccines: manufacturer of interferon gamma advises avoid concomitant use with VACCINES

Ipratropium see Antimuscarinics

Irbesartan see Angiotensin-II Receptor Antagonists

Irinotecan

- Antidepressants: metabolism of irinotecan accelerated by ST JOHN‘S WORT (reduced plasma concentration—avoid concomitant use)
  - Antiepileptics: plasma concentration of irinotecan and its active metabolite reduced by CARBAMAZEPINE, FOSFOPHENITOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE

Antifungals: plasma concentration of irinotecan reduced by KETOCONAZOLE (but concentration of active metabolite of irinotecan increased)—avoid concomitant use; increased risk of toxicity when irinotecan given with IRON SALTS—avoid concomitant use

- Antipsychotics: avoid concomitant use of cytoxics with CLOZAPINE (increased risk of agranulocytosis)
  - Antivirals: metabolism of irinotecan possibly inhibited by ATAZANAVIR (increased risk of toxicity)

Cytotoxics: avoidance of irinotecan advised by manufacturer of PANTITUMUMAB; plasma concentration of active metabolite of irinotecan increased by LAPATINIB—consider reducing dose of irinotecan; plasma concentration of irinotecan increased by REGRAFENIB; plasma concentration of irinotecan possibly increased by SORAFENIB

Iron Salts

- Antacids: absorption of oral iron salts reduced by ORAL MAGNESIUM SALTS (as magnesium trisilicate)
  - Antibacterials: oral iron salts reduce absorption of CIPROFLOXACIN (give at least 2 hours before or 4 hours after ciprofloxacin); oral iron salts reduce absorption of LEVOFLOXACIN, NORFLOXACIN and OFLOXACIN (give at least 2 hours apart); oral iron salts reduce absorption of MOXIFLOXACIN (give at least 6 hours apart); effects of iron salts possibly inhibited by CHLORAMPHENICOL; oral iron salts reduce absorption of tetracyclines, also absorption of oral iron salts reduced by TETRACYCLINES (give at least 2 to 5 hours apart)

Antivirals: oral iron salts reduce absorption of DOLUTEGRAVIR—manufacturer of dolutegravir advises give at least 2 hours before or 6 hours after oral iron salts

Bisphosphonates: oral iron salts reduce absorption of BISPHOSPHONATES

Calcium Salts: absorption of oral iron salts reduced by CALCIUM SALTS

Dopaminergics: oral iron salts possibly reduce absorption of CO-BENELDOPA, CO-CARELDOPA and LEVODOPA; oral iron salts reduce absorption of ENTACAPONE

</table>
Lactulose

- Anticoagulants: lactulose possibly enhances anticoagulant effect of COUMARINS

Lamivudine

- Antidepressants: plasma concentration of lamivudine increased by TRIMETHOPRIM (as co-trimoxazole)—avoid concomitant use of high-dose co-trimoxazole
- Antivirals: avoidance of lamivudine advised by manufacturer of EMTRICITABINE
- Cytotoxics: manufacturer of lamivudine advises avoid concomitant use with LORABIDINE
- Olistat: absorption of lamivudine possibly reduced by ORLISTAT

Lamotrigine

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIIS and TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: plasma concentration of lamotrigine often reduced by CARBAMAZEPINE, also plasma concentration of an active metabolite of carbamazepine sometimes raised (but evidence is conflicting); plasma concentration of lamotrigine reduced by FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE; plasma concentration of lamotrigine increased by SODIUM VALPROATE and VALPROIC ACID (increased risk of toxicity—reduce lamotrigine dose)
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by MELFOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ANTIIPSCHYTICS (convulsive threshold lowered)
- Antivirals: plasma concentration of lamotrigine possibly reduced by RITONAVIR
- Oestrogens: plasma concentration of lamotrigine reduced by OESTROGENS—consider increasing dose of lamotrigine when antiepileptics given with OLISTAT
- Progestogens: plasma concentration of lamotrigine possibly increased by DESOGESTREL

Lanreotide

- Antidiabetics: lanreotide possibly reduces requirements for ANTIDIABETICS
- Ciclosporin: lanreotide reduces plasma concentration of CICLOSPORIN

Lansoprazole see Proton Pump Inhibitors

Lanthanum

- Antibacterials: lanthanum possibly reduces absorption of QUINOLONES (give at least 2 hours before or 4 hours after lanthanum)
- Antifungals: lanthanum possibly reduces absorption of KETOCONAZOLE (give at least 2 hours apart)
- Antimalarials: lanthanum possibly reduces absorption of CHLOOROQUINE and HYDROXYCHLOOROQUINE (give at least 2 hours apart)
- Thyroid Hormones: lanthanum reduces absorption of LEVOTHYROXINE (give at least 2 hours apart)

Lapatinib (continued)

- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis); manufacturer of lapatinib advises avoid concomitant use with pimozide
- Antivirals: avoidance of lapatinib advised by manufacturer of boceprevir; manufacturer of lapatinib advises avoid concomitant use with ritonavir and saquinavir
- Cytotoxics: lapatinib increases plasma concentration of pazopanib; possible increased risk of neutropenia when lapatinib given with docetaxel; increased risk of neutropenia when lapatinib given with paclitaxel; lapatinib increases plasma concentration of active metabolite of irinotecan—consider reducing dose of irinotecan
- Grapefruit Juice: manufacturer of lapatinib advises avoid concomitant use with grapefruit juice
- Lipid-regulating Drugs: avoidance of lapatinib by 12 hours advised by manufacturer of lovastatin
- Ulcer-healing Drugs: absorption of lapatinib possibly reduced by histamine H2 ANTAGONISTS and PROTON PUMP INHIBITORS

Laronidase

- Antimalarials: effects of laronidase possibly inhibited by CHLOOROQUINE and HYDROXYCHLOOROQUINE (manufacturer of laronidase advises avoid concomitant use)

Ledipasvir

- Antacids: manufacturer of ledipasvir advises separating administration from ANTACIDS by 4 hours
- Antiarrhythmics: possible increased risk of bradycardia when ledipasvir (with sofosbuvir) given with amiodarone—see under Amiodarone, in BNF
- Antibacterials: manufacturer of ledipasvir advises avoid concomitant use with rifabutin and rifampicin
- Antidepressants: manufacturer of ledipasvir advises avoid concomitant use with ST JOHN'S WORT
- Antiepileptics: manufacturer of ledipasvir advises avoid concomitant use with carbamazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin and primidone
- Antivirals: plasma concentration of both drugs increased when ledipasvir given with simprevir—manufacturer of ledipasvir advises avoid concomitant use
- Calcium Salts: manufacturer of ledipasvir advises separating administration from CALCIUM SALTS by 4 hours
- Lipid-regulating Drugs: possible increased risk of myopathy when ledipasvir given with atorvastatin, fluvastatin and simvastatin—manufacturer of ledipasvir advises consider reducing dose of atorvastatin, fluvastatin and simvastatin; manufacturer of ledipasvir advises avoid concomitant use with rosuvastatin
- Ulcer-healing Drugs: plasma concentration of ledipasvir reduced by famotidine and omeprazole; manufacturer of ledipasvir advises do not take PROTON PUMP INHIBITORS before ledipasvir

Leflunomide

- NOTE: Increased risk of toxicity with other haematotoxic and hepatotoxic drugs
- Anticoagulants: plasma concentration of active metabolite of leflunomide possibly increased by rifampicin
- Antidiabetics: leflunomide possibly enhances anticoagulant effect of warfarin
- Antiepileptics: leflunomide possibly enhances hypoglycaemic effect of tolbutamide
- Cytotoxics: risk of toxicity when leflunomide given with methotrexate
- Lipid-regulating Drugs: the effect of leflunomide is significantly decreased by colestyramine (enhanced elimination)—avoid unless drug elimination desired
- Vaccines: risk of generalised infections when leflunomide given with live vaccines—avoid concomitant use

Lenalidomide

- Anticoagulants: plasma concentration of lenalidomide possibly increased by clarithromycin (increased risk of toxicity)
- Antifungals: plasma concentration of lenalidomide possibly increased by itraconazole and ketoconazole (increased risk of toxicity)
Lenalidomide (continued)

- Calcium-channel Blockers: plasma concentration of lenalidomide possibly increased by
  - **VERAPAMIL** (increased risk of toxicity)
- Cardiac Glycosides: lenalidomide possibly increases plasma concentration of **DIGOXIN**
- Ciclosporin: plasma concentration of lenalidomide possibly increased by
  - **CICLOSPORIN** (increased risk of toxicity)

Lercanidipine see Calcium-channel Blockers

Lokketriene Receptor Antagonists

- Aminophylline: zafirlukast possibly increases plasma concentration of **AMINOPHYLLINE**, also plasma concentration of zafirlukast reduced
- Analgesics: plasma concentration of zafirlukast increased by
  - **ASPEN**
- Anticancer: plasma concentration of zafirlukast reduced by **ERYTHROMYCIN**
- Anticoagulants: zafirlukast enhances anticoagulant effect of
  - **WARFARIN**
- Antiepileptics: plasma concentration of montelukast reduced by
  - **PHENOBARBITAL** and **PRIMIDONE**
- Antifungals: plasma concentration of zafirlukast increased by
  - **FLUCONAZOLE**
- Lipid-regulating Drugs: plasma concentration of montelukast increased by
  - **GEMFIBROZIL**
- Theophylline: zafirlukast possibly increases plasma concentration of **THEOPHYLLINE**, also plasma concentration of zafirlukast reduced

Levamisole

- Alcohol: possibility of disulfiram-like reaction when levamisole given with **ALCOHOL**
- Anthelmintics: plasma concentration of both drugs possibly reduced when levamisole given with **ALBENDAZOLE**, levamisole possibly increases plasma concentration of **VERMECTIN**
- Anticoagulants: levamisole possibly enhances anticoagulant effect of
  - **WARFARIN**
- Antiepileptics: levamisole possibly increases plasma concentration of **PHENYTOIN** and **PHENOTTOIN**

Levetiracetam

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by **MAOIS** and
  - **TRICYCLIC-RELATED ANTI DEPRESSANTS** (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by
  - **SSRIS** and
  - **TRICYCLICS** (convulsive threshold lowered)
- Antiepileptics: levetiracetam possibly increases risk of **CARBAMAZEPINE** toxicity
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by **METHOTREXATE**
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by
  - **ANTIPSYCHOTICS** (convulsive threshold lowered)
- Cytotoxics: levetiracetam possibly increases plasma concentration of
  - **METHOTREXATE**
- Orlistat: possible increased risk of convulsions when antiepileptics given with
  - **ORLISTAT**

Levodabnol see Beta-blockers

Levobupivacaine

- Anti-arrhythmics: increased myocardial depression when levobupivacaine given with **ANTI-ARRHYTHMICS**

Levocarnitine

- Anticoagulants: levocarnitine possibly enhances anticoagulant effect of
  - **COUMARINS**

Levocetirizine see Antihistamines

Levodopa

- ACE Inhibitors: enhanced hypotensive effect when levodopa given with **ACE INHIBITORS**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when levodopa given with **ADRENERGIC NEURONE BLOCKERS**
- Alpha-blockers: enhanced hypotensive effect when levodopa given with **ALPHA-BLOCKERS**
- Anaesthetics: increased risk of arrhythmias when
  - **LEVODOPA**
  - **LIDOCAINE**
- Angiotensin II Receptor Antagonists: enhanced hypotensive effect when levodopa given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**

Levodopa (continued)

- Antibacterials: effects of levodopa possibly reduced by
  - **ISONIAZID**
- Antidepressants: risk of hypertensive crisis when levodopa given with
  - **MAOIS**, avoid levodopa for at least 2 weeks after stopping MAOIs; increased risk of side-effects when levodopa given with
  - **MOCloBEMIDE**
- Antiepileptics: effects of levodopa possibly reduced by
  - **FOSPHENYTOIN** and **PHENOTTOIN**
- Antimuscarnics: absorption of levodopa possibly reduced by
  - **ANTIMUSCARINICS**
- Antipsychotics: effects of levodopa antagonised by
  - **ANTIPSYCHOTICS**; avoidance of levodopa advised by manufacturer of **ANISULPIDE** (antagonism of effect)
- Antithrombics and Heparins: effects of levodopa possibly antagonised by **BENZODIAZEPINES**
- Beta-blockers: enhanced hypotensive effect when levodopa given with **BETA-BLOCKERS**
- Bupropion: increased risk of side-effects when levodopa given with **BUPROPION**
- Calcium-channel Blockers: enhanced hypotensive effect when levodopa given with calcium-channel **BLOCKERS**
- Clonidine: enhanced hypotensive effect when levodopa given with **CLONIDINE**
- Diazoxide: enhanced hypotensive effect when levodopa given with **DIAZoxide**
- Diuretics: enhanced hypotensive effect when levodopa given with **DIURETICS**
- Dopaminergics: enhanced effects and increased toxicity of levodopa when given with **SELEGILINE** (reduce dose of levodopa)
- Iron Salts: absorption of levodopa possibly reduced by **oral IRON SALTS**
- Memantine: effects of dopaminergics possibly enhanced by **MEMANTINE**
- MethylDopa: enhanced hypotensive effect when levodopa given with **METHYLDOPA**; antiParkinsonian effect of dopaminergics antagonised by **METHYLDOPA**
- Moxonidine: enhanced hypotensive effect when levodopa given with **MOXONIDINE**
- Muscle Relaxants: possible agitation, confusion and hallucinations when levodopa given with **SACLOFEN**
- Nitrates: enhanced hypotensive effect when levodopa given with **NITRATES**
- Vasodilator Antihypertensives: enhanced hypotensive effect when levodopa given with **HYDRAZININE**, **MINOXIDIL** or **SODIUM NITROPRUSIDE**
- Vitamins: effects of levodopa reduced by **PYRIDOXINE** when given without **dopex-metabolism inhibitor**

Levoloxifene see Quinolones

Levolufolinic Acid see Folates

Levomepromazine see Antipsychotics

Levonorgestrel see Progestagens

Levosimendan

- Nitrates: possible severe postural hypotension when levosimendan given with
  - **ISOSORBIDE MONONITRATE**

Levotheroxine see Thyroid Hormones

Lidocaine

NOTE Interactions less likely when lidocaine used topically

- Anaesthetics, Local: increased myocardial depression when anti-arrhythmics given with **BUPIVACAINE**, **LEVOBUPIVACAINE**, **PRIOCAINE** or **ROPIVACAINE**
- Anti-arrhythmics: increased myocardial depression when anti-arrhythmics given with other **ANTIARRHYTHMICS**
- Antipsychotics: increased risk of ventricular arrhythmias when anti-arrhythmics that prolong the QT interval given with
  - **ANTIPSYCHOTICS** that prolong the QT interval
- Atrials: plasma concentration of lidocaine possibly increased by
  - **ATAZANAVIR** and **LONAPNAVIR**; plasma concentration of lidocaine possibly increased by **DARUNAVIR** and **fosamprenavir**—avoid concomitant use; increased risk of ventricular arrhythmias when lidocaine given with
  - **SAQUINAVIR**—avoid concomitant use; caution with **intravenous lidocaine** advised by manufacturer of **TELAPREVIR**
- Beta-blockers: increased myocardial depression when anti-arrhythmics given with **BETA-BLOCKERS**; possible increased
Lidoxydine — Lomitapide

**Lidocaine**
- Beta-blockers (continued)
  - risk of lidocaine toxicity when given with **NAPODOL**; increased risk of lidocaine toxicity when given with **PROPANOLOL**
  - Diuretics: action of lidocaine antagonised by hypokalaemia caused by **ACETAZOLAMIDE**
  - Loop Diuretics or **THIAZIDES AND RELATED DIURETICS**
  - Muscle relaxants: neuromuscular blockade enhanced and prolonged when lidocaine given with **SUXAMETHONIUM**
  - Ulcer-healing Drugs: plasma concentration of lidocaine increased by **CIMETIDINE** (increased risk of toxicity)

**Linagliptin** see Antidiabetes

**Linoxydine** see MAOIs

**Liothyronine** see Thyroid Hormones

**Lipogefilgrastim**
- Cytotoxics: neutropaenia possibly exacerbated when lipogefilgrastim given with **CAPECITABINE, FLUOROURACIL** or **TEGAFUR**

**Lipid-regulating Drugs** see Colesevelam, Colestipol, Colestynamine, Ezetimibe, Fibrates, Lomitapide, Nicotinic Acid, and Statins

**Liraglutide** see Antidiabetics

**Lidexamfetamine** see Sympathomimetics

**Lisinopril** see ACE Inhibitors

**Lithium**
- **ACE ACE inhibitors**: excretion of lithium reduced by **ACE INHIBITORS** (increased plasma concentration)
  - Aminophylline: excretion of lithium increased by **AMINO-PHYLLINE** (reduced plasma concentration)
  - Analgesics: excretion of lithium reduced by **NSAIDS** (increased risk of toxicity); excretion of lithium reduced by **RETOROLAC** (increased risk of toxicity)—avoid concomitant use
  - Angiotensin-II Receptor Antagonists: excretion of lithium reduced by **ANGIOTENSIN-II RECEPTOR ANTAGONISTS** (increased plasma concentration)
  - Antacids: excretion of lithium increased by **SODIUM BICARBONATE** (reduced plasma concentration)
  - Anti-arrhythmics: avoidance of lithium advised by manufacturer of **AMIODARONE** (risk of ventricular arrhythmias)
  - Antibacterials: increased risk of lithium toxicity when given with **METRONIDAZOLE**
  - Antidepressants: possible increased serotonergic effects when lithium given with **VENLAFAXINE**; increased risk of CNS effects when lithium given with **SSRIS** (lithium toxicity reported); risk of toxicity when lithium given with **TRICYCLICS**
  - Antiepileptics: neurotoxicity may occur when lithium given with **CARBAMAZEPINE, FOSPHENTOIN or PHENYTOIN** without increased plasma concentration of lithium; plasma concentration of lithium possibly affected by **TOPRA-MATE**
  - Antipsychotics: increased risk of extrapyramidal side-effects—possibility of neurotoxicity when lithium given with **CLOZAPINE, FLUPENTIXOL, HALOPERIDOL, PHENOTHIAZINES, RISPERIDONE or ZUCLOPEN-TILOX**, possible risk of toxicity when lithium given with **OLANZAPINE**; lithium possibly increases extrapyramidal side-effects of **QUETIAPINE**; increased risk of extrapyramidal side-effects when lithium given with **SULPPIRE**
  - Anti-convulsants and Hypnotics: increased risk of neurotoxicity when lithium given with **CLONAZEPAM**
  - Calcium-channel Blockers: neurotoxicity may occur when lithium given with **DILTIAZEM or VERAPAMIL** without increased plasma concentration of lithium
  - Cytotoxics: increased risk of ventricular arrhythmias when lithium given with **ARSENIC TROMETHAMINES**
  - Dapoxetine: possible increased risk of serotoninergic effects when lithium given with **DAPoxetine** (manufacturer of dapoxetine advises lithium should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping lithium)
  - Diuretics: excretion of lithium increased by **ACETAZOLAMIDE**; excretion of lithium reduced by **LOOP DIURETICS** and **THIAZIDES AND RELATED DIURETICS** (increased plasma concentration and risk of toxicity)—loop diuretics safer than thiazides; excretion of lithium reduced by

**Lithium**
- **Diuretics** (continued)
  - **POTASSIUM-SPARING DIURETICS AND ALDOSTERONE ANTAGONISTS** (increased plasma concentration and risk of toxicity)
  - SERT-3 receptor Agonists; possible risk of toxicity when lithium given with **SUMATRIPTAN**
  - Methyldopa: neurotoxicity may occur when lithium given with **METHYLDOPA** without increased plasma concentration of lithium
  - Muscle relaxants: lithium enhances effects of **MUSCLE RELAXANTS**; hyperkinesia caused by lithium possibly aggravated by **BACLOFEN**
  - Parasympathomimetics: lithium antagonises effects of **NEOSTIGMINE**
  - Theophylline: excretion of lithium increased by **THEOPHYLLINE** (reduced plasma concentration)

**Lixisenatide** see Antidiabetics

**Lofepramine** see Antidepressants, Tricyclic

**Lofexidine**
- **Alcohol**: increased sedative effect when lofepramine given with **ALCOHOL**
  - Antidepressants and Hypnotics: increased sedative effect when lofepramine given with **ANXIOLYTICS AND HYPNOTICS**

**Lomitapide**
- **Alcoho**: manufacturer of lomitapide advises avoid concomitant use with **ALCOHOL**
  - Anti-arrhythmics: manufacturer of lomitapide advises separating administration from **AMIODARONE** by 12 hours; manufacturer of lomitapide advises avoid concomitant use with **DROSERARONE** (plasma concentration of lomitapide possibly increased)
  - Antibacterials: manufacturer of lomitapide advises separating administration from **AZITHROMYCIN and SOTALOL** by 12 hours; manufacturer of lomitapide advise avoid concomitant use with **CLARITHROMYCIN, ERYTHROMYCIN and TELITHROMYCIN** (plasma concentration of lomitapide possibly increased)
  - Anticoagulants: lomitapide possibly enhances anticoagulant effect of **WARFARIN**
  - Antidepressants: manufacturer of lomitapide advises separating administration from **FLUOXETINE and FLUVOXAMINE** by 12 hours
  - Antidiabetics: manufacturer of lomitapide advises separating administration from **LIGINAPTIN** by 12 hours
  - Antifungals: plasma concentration of lomitapide increased by **KETOCONAZOLE**—avoid concomitant use; manufacturer of lomitapide advises avoid concomitant use with **TIAZOLE** (plasma concentration of lomitapide possibly increased)
  - Antivirals: manufacturer of lomitapide advise avoid concomitant use with **DARUNAVIR, FOSAMPRENAVIR, INDINAVIR, LOPINAVIR, RITONAVIR, SAQUINAVIR, TELAPREVIR and TIPRANAVIR** (plasma concentration of lomitapide possibly increased)
  - Antiepileptics and Hypnotics: manufacturer of lomitapide advises separating administration from **ALPRAZOLAM** by 12 hours
  - Calcium-channel Blockers: manufacturer of lomitapide advises separating administration from **AMLODIPINE and LACIDIPINE** by 12 hours; manufacturer of lomitapide advise avoid concomitant use with **DILTIAZEM and VERAPAMIL** (plasma concentration of lomitapide possibly increased)
  - Ciclosporin: manufacturer of lomitapide advises separating administration from **CICLOSPORIN** by 12 hours
  - Clobazol: manufacturer of lomitapide advises separating administration from **LAPATINIB, NILOTINIB and PAZOPANIB** by 12 hours
  - Fosaprepitant: manufacturer of lomitapide adviser separating administration from **FOSAPREPTANT** by 12 hours
  - Grapefruit Juice: manufacturer of lomitapide advise avoid concomitant use with **GRAPEFRUIT JUICE**
  - Hormone Antagonists: manufacturer of lomitapide advises separating administration from **BICALUTAMIDE** by 12 hours
  - Ivacafar: manufacturer of lomitapide advises separating administration from **IVACAFAR** by 12 hours
  - **Lipid-regulating Drugs**: lomitapide increases plasma concentration of **ATORVASTATIN**—manufacturer of lomitapide
Lomustine
- **Antipsychotics:** avoid concomitant use of cytoxotics with
- **Ulcer-healing Drugs:** myelosuppressive effects of lomustine possibly enhanced by Cimetidine

Loperamide
- Desmopressin: loperamide increases plasma concentration of oral DESMOPRESSIN

Lopinavir
- **In combination with ritonavir as Kaletra®** (ritonavir is present to inhibit lopinavir metabolism and increase plasma-lopinavir concentration)—see also Ritonavir
- **Anti-arrhythmics:** lopinavir possibly increases plasma concentration of Flecainide (increased risk of ventricular arrhythmias)—avoid concomitant use; lopinavir possibly increases plasma concentration of Lidocaine
- **Antibacterials:** plasma concentration of lopinavir reduced by rifampicin—avoid concomitant use; lopinavir increases plasma concentration of Phenytoin, Primidone; avoidance of concomitant lopinavir in severe renal and hepatic impairment advised by manufacturer of Felithromycin
- **Anticoagulants:** avoidance of lopinavir advised by manufacturer of Apixaban; manufacturers advise avoid concomitant use of lopinavir with Rivaroxaban
- **Antidepressants:** plasma concentration of lopinavir reduced by St John's Wort—avoid concomitant use
- **Antiepileptics:** plasma concentration of lopinavir possibly reduced by Carbamazepine, fosphenytoin, Phenytoin, Phenobarbital, Phenytin and Primidone
- **Antihistamines:** lopinavir possibly increases plasma concentration of Chlorphenamine
- **Antimalarials:** caution with lopinavir advised by manufacturer of Arthemether with Lumefantrine
- **Antimycotics:** avoidance of lopinavir advised by manufacturer of Darifenacin and Tolterodine
- **Antipsychotics:** lopinavir possibly increases plasma concentration of Aripiprazole (reduce dose of aripiprazole—consult aripiprazole product literature); lopinavir possibly increases plasma concentration of Quetiapine—manufacturer of quetiapine advises avoid concomitant use
- **Antivirals:** manufacturers advise avoid concomitant use of lopinavir with Boceprevir and Telaprevir; lopinavir reduces plasma concentration of Darunavir—avoid concomitant use; plasma concentration of lopinavir reduced by Efavirenz—consider increasing dose of lopinavir; lopinavir boosted with ritonavir increases plasma concentration of Elvitegravir (reduce dose of elvitegravir); lopinavir possibly increases plasma concentration of Fosamprenavir, effect on lopinavir plasma concentration not predictable—avoid concomitant use; lopinavir increases plasma concentration of Maraviroc (consider reducing dose of maraviroc); plasma concentration of lopinavir possibly reduced by Nevirapine—consider increasing dose of lopinavir; lopinavir increases plasma concentration of Paritaprevir—manufacturer of paritaprevir advises avoid concomitant use; increased risk of ventricular arrhythmias when lopinavir given with Saquinavir—avoid concomitant use; lopinavir increases plasma concentration of Tenofvir; plasma concentration of lopinavir reduced by ritonavir
- **Bozotan:** lopinavir increases plasma concentration of Bosantan (consider reducing dose of bosantan)
- **Corticosteroids:** plasma concentration of lopinavir possibly reduced by Dexamethasone
- **Cytoxotics:** manufacturer of ruxolitinib advises dose reduction when lopinavir given with Ruxolitinib—consult ruxolitinib product literature
- **Eltrombopag:** lopinavir possibly reduces plasma concentration of Eltrombopag
- **Lipid-regulating Drugs:** possible increased risk of myopathy when lopinavir given with Aторвастатин; lopinavir increases plasma concentration of Rosuvastatin—adjust dose of rosuvastatin (consult product literature); possible increased risk of myopathy when lopinavir given with Simvastatin—avoid concomitant use; avoidance of lopinavir advised by manufacturer of Lomitapide (plasma concentration of lomitapide possibly increased)
- **Orlistat:** absorption of lopinavir possibly reduced by Orlistat
- **Ranolazine:** lopinavir possibly increases plasma concentration of Ranolazine—manufacturer of ranolazine advises avoid concomitant use
- **Sirolimus:** lopinavir possibly increases plasma concentration of Sirolimus
- **Symptomametics, Beta:** manufacturer of lopinavir advises avoid concomitant use with Salmeterol

Loprazolam see Anxiolytics and Hypnotics

Loratadine see Antihistaamines

Lorazepam see Anxiolytics and Hypnotics

Lormetazepam see Anxiolytics and Hypnotics

Losartan see Angiotensin-II Receptor Antagonists

Lurasidone see Antipsychotics

Lymecycline see Tetracyclines

Macitentan
- **Antibacterials:** plasma concentration of macitentan reduced by rifampicin—avoid concomitant use
- **Antidepressants:** manufacturer of macitentan advises avoid concomitant use with St John's Wort
- **Antiepileptics:** manufacturer of macitentan advises avoid concomitant use with Carbamazepine, fosphenytoin and Phenytoin
- **Antifungals:** plasma concentration of macitentan increased by Ketoconazole

Macrogols
- **Note** Some manufacturers suggest taking other oral medication 1 hour before or 1 hour after macrogols to reduce possible interference with absorption

Macrolides
- **Note** See also Telithromycin
- **Note** Interactions do not apply to small amounts of erythromycin used topically
- **Aminophylline:** clarithromycin possibly increases plasma concentration of Aminophylline; erythromycin increases plasma concentration of Aminophylline (also aminophylline may reduce absorption of oral erythromycin)
- **Analgesics:** erythromycin increases plasma concentration of Alfentanil; clarithromycin possibly increases plasma concentration of Fentanyl
- **Antacid:** absorption of azithromycin reduced by Antacids (give at least 2 hours before or 1 hour after antacids)
- **Anti-arrhythmics:** increased risk of ventricular arrhythmias when parenteral erythromycin given with Ampicillin—avoid concomitant use; erythromycin increases plasma concentration of Disopyramide (increased risk of toxicity); clarithromycin possibly increases plasma concentration of Disopyramide (increased risk of ventricular arrhythmias); azithromycin possibly increases plasma concentration of Disopyramide (increased risk of toxicity); avoidance of clarithromycin advised by manufacturer of Renedarone (risk of ventricular arrhythmias); erythromycin increases
Macrolides

- Anti-arrhythmics (continued)
  plasma concentration of ▶ DRONERADONE (increased risk of ventricular arrhythmias—avoid concomitant use)
- Antibacterials; increased risk of ventricular arrhythmias when parenteral erythromycin given with ▶ MOXIFLOXACIN—avoid concomitant use; increased risk of side-effects including neutropenia when azithromycin given with ▶ RIFABUTIN; clarithromycin increases plasma concentration of ▶ RIFABUTIN (increased risk of toxicity—reduce rifabutin dose); erythromycin possibly increases plasma concentration of ▶ RIFABUTIN (increased risk of toxicity—reduce rifabutin dose); clarithromycin and erythromycin possibly increase plasma concentration of ▶ SEDAQUILINE—avoid concomitant use if clarithromycin and erythromycin given for more than 14 days; possible increased risk of ventricular arrhythmias when clarithromycin and erythromycin given with ▶ DELAMANID; avoidance of clarithromycin and erythromycin advised by manufacturer of ▶ FLIXOMYCIN; plasma concentration of clarithromycin reduced by ▶ RIFABUTIN;
- Anticoagulants: avoidance of clarithromycin advised by manufacturer of ▶ APIXABAN; clarithromycin and erythromycin enhance anticoagulant effect of ▶ COUMARINS; azithromycin possibly enhances anticoagulant effect of ▶ COUMARINS; possible increased risk of bleeding when clarithromycin given with ▶ DABIGATRAN; erythromycin increases plasma concentration of ▶ EDOXABAN (reduce dose of edoxaban—see under Edoxaban, in BNF);
- Antidepressants: avoidance of macrolides advised by manufacturer of ▶ REBOXETEINE; avoidance of intravenous erythromycin advised by manufacturer of ▶ CITOFLOXAM and ▶ ESCITALOFLAM (risk of ventricular arrhythmias); avoidance of erythromycin advised by manufacturer of ▶ VENLAFAXINE (risk of ventricular arrhythmias); clarithromycin possibly increases plasma concentration of ▶ TRADAFRON;
- Anti-infectives: clarithromycin enhances effects of ▶ REPAGLINIDE;
- Antiepileptics: erythromycin increases plasma concentration of ▶ CARBAMAZEPINE; clarithromycin increases plasma concentration of ▶ CARBAMAZEPINE (consider reducing dose of carbamazepine); clarithromycin inhibits metabolism of ▶ FOSPHENTYOIN and ▶ PHENTOYIN (increased plasma concentration); erythromycin possibly inhibits metabolism of ▶ SODIUM VALPROATE and ▶ VALPROIC ACID (increased plasma concentration);
- Antiinflammatories; avoidance of concomitant clarithromycin in severe renal impairment advised by manufacturer of ▶ KETOCONAZOLE; avoidance of erythromycin advised by manufacturer of ▶ FLUCONAZOLE; clarithromycin increases plasma concentration of ▶ ITROCONAZOLE;
- Antihistamines: manufacturer of loratadine advises erythromycin possibly increases plasma concentration of ▶ LORATADINE; macrolides possibly inhibit metabolism of ▶ MIZOLASTINE (avoid concomitant use); erythromycin inhibits metabolism of ▶ MIZOLASTINE—avoid concomitant use;
- Antimalarias: avoidance of macrolides advised by manufacturer of ▶ ARTEMETHER with LUMEFANTRINE; avoidance of macrolides advised by manufacturer of ▶ ARTEMINE WITH LUMEFANTRINE;
- Antifungals: avoidance of concomitant use of clarithromycin in severe renal impairment advised by manufacturer of ▶ KETOCONAZOLE; avoidance of erythromycin advised by manufacturer of ▶ FLUCONAZOLE; clarithromycin increases plasma concentration of ▶ ITROCONAZOLE;
- Anti-infectives: clarithromycin possibly increases plasma concentration of ▶ DARIFENACIN; manufacturer of fosfomycin advises dose reduction when clarithromycin given with ▶ FESOTERODINE—consult fosfomycin product literature; avoidance of clarithromycin and erythromycin advised by manufacturer of ▶ TOLTERODINE;
- Antipsychotics: avoidance of macrolides advised by manufacturer of ▶ DROPERIDOL (risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when parenteral erythromycin given with ▶ AMILOPENTHIXID—avoid concomitant use; increased risk of ventricular arrhythmias when erythromycin given with ▶ AMISULPRIDE—avoid concomitant use; erythromycin possibly increases plasma concentration of ▶ CLOzapine (possible increased risk of convulsions); clarithromycin possibly increases plasma concentration of ▶ LURASIDONE—avoid concomitant use; erythromycin possibly increases plasma concentration of ▶ LURASIDONE (see under Lurasidone, in BNF); increased risk of ventricular arrhythmias when clarithromycin given with ▶ PIMOZIDE—avoid concomitant use; possible increased risk of ventricular arrhythmias when erythromycin given with ▶ PIMOZIDE—avoid concomitant use; clarithromycin possibly increases plasma concentration of ▶ QUIETAPINE—manufacturer of quetiapine advises avoid concomitant use; erythromycin increases plasma concentration of ▶ QUIETAPINE—manufacturer of quetiapine advises avoid concomitant use; increased risk of ventricular arrhythmias when parenteral erythromycin given with ▶ SULPIRIDE; avoidance of clarithromycin and erythromycin advised by manufacturer of ▶ FLIXOMYCIN; plasma concentration of clarithromycin reduced by ▶ EFAVIREN; also plasma concentration of active metabolite of clarithromycin increased; plasma concentration of clarithromycin reduced by ▶ ETRAVIRINE and ▶ NEVIRAPINE (but concentration of an active metabolite increased), also plasma concentration of etravirine and nevirapine increased; clarithromycin possibly increases plasma concentration of ▶ MARAVIROC (consider reducing dose of maraviroc); avoidance of clarithromycin and erythromycin advised by manufacturer of ▶ RILPIRIVIRINE (plasma concentration of rilpivirine possibly increased); plasma concentration of clarithromycin increased by ▶ RITONAVIR (reduce dose of clarithromycin in renal impairment); plasma concentration of azithromycin and erythromycin possibly increased by ▶ RITONAVIR; increased risk of ventricular arrhythmias when erythromycin given with ▶ SAQUINAVIR—avoid concomitant use; plasma concentration of both drugs possibly increased when clarithromycin given with ▶ SAQUINAVIR and ▶ TELAPRERVIR (increased risk of ventricular arrhythmias); plasma concentration of both drugs increased when erythromycin given with ▶ TELAPREVR (reduce dose of clarithromycin in renal impairment); plasma concentration of clarithromycin increased by ▶ TELAPREVR (reduce dose of clarithromycin in renal impairment), also clarithromycin increases plasma concentration of tipranavir; clarithromycin tablets reduce absorption of ▶ ZIDOVUDINE (give at least 2 hours apart);
- Anti-inflammatory and Hypnotics: clarithromycin and erythromycin inhibit metabolism of ▶ MIDAZOLAM (increased plasma concentration with increased sedation); erythromycin increases plasma concentration of ▶ BUSPIRONE (reduce dose of buspirone); erythromycin inhibits the metabolism of ▶ ZOPICLONE;
- Aprepitant: clarithromycin possibly increases plasma concentration of ▶ APREPIVAN;
- Atomoxetine: increased risk of ventricular arrhythmias when parenteral erythromycin given with ▶ ATOMOXETINE;
- Avanafl: clarithromycin possibly increases plasma concentration of ▶ AVANAFIL—manufacturer of avanafl advises avoid concomitant use; erythromycin increases plasma concentration of ▶ AVANAFIL—see under Avanafl, in BNF;
- Calcium-channel blockers: clarithromycin and erythromycin possibly inhibit metabolism of ▶ ALCALCUM-CHANNEL BLOCKERS (increased risk of side-effects); avoidance of erythromycin advised by manufacturer of ▶ LERFINDINE;
- Cardiac Glycosides: macrolides increase plasma concentration of ▶ DIGOXIN (increased risk of toxicity); clarithromycin possibly increases plasma concentration of ▶ MARAVIROC (possible increased risk of toxicity); azithromycin increases plasma concentration of ▶ CICLOSPORIN; clarithromycin and erythromycin inhibit metabolism of ▶ CICLOSPORIN (increased risk of plasma concentration); colistin: clarithromycin possibly increases plasma concentration of ▶ CILOSTAZOL (see under Cilostazol, in BNF);
Macrolides
- Cilostazol (continued)
  - erythromycin increases plasma concentration of cilostazol (see under Cilostazol, in BNFC).
- Clopidogrel: erythromycin possibly reduces antiplatelet effect of clopidogrel.
- Colchicine: azithromycin, clarithromycin and erythromycin possibly increase risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment).
  - Corticosteroids: erythromycin possibly inhibits metabolism of corticosteroids; erythromycin inhibits the metabolism of methylprednisolone; clarithromycin possibly increases plasma concentration of methylprednisolone.
  - Cytotoxics: erythromycin possibly increases the plasma concentration of afatinib—manufacturer of afatinib advises separating administration of erythromycin by 6 to 12 hours; clarithromycin and erythromycin possibly increase plasma concentration of axitinib (reduce dose of axitinib—consult axitinib product literature); clarithromycin and erythromycin possibly increase the plasma concentration of bosutinib—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; clarithromycin and erythromycin possibly increase plasma concentration of cabozantinib; clarithromycin and erythromycin possibly reduce the plasma concentration of crizotinib and everolimus—manufacturer of crizotinib and everolimus advises avoid concomitant use; avoidance of clarithromycin and erythromycin advised by manufacturer of dasatinib (plasma concentration of dasatinib possibly increased); erythromycin increases plasma concentration of everolimus (consider reducing the dose of everolimus—consult everolimus product literature); clarithromycin and erythromycin possibly increase the plasma concentration of ibrutinib—reduce dose of ibrutinib (see under Ibrutinib, in BNFC); avoidance of clarithromycin and erythromycin advised by manufacturer of nilotinib and olarabine; clarithromycin possibly increases plasma concentration of pazopanib (reduce dose of pazopanib); clarithromycin possibly increases plasma concentration of ponatinib—consider reducing initial dose of ponatinib (see under Ponatinib, in BNFC); manufacturer of ruxolitinib advises dose reduction when clarithromycin given with ruxolitinib—consult ruxolitinib product literature; possible increased risk of ventricular arrhythmias when parenteral erythromycin given with vantinib—avoid concomitant use; clarithromycin possibly increases the plasma concentration of cabazitaxel—manufacturer of cabazitaxel advises avoid or consider reducing dose of cabazitaxel; clarithromycin possibly increases plasma concentration of docetaxel—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose; increased risk of ventricular arrhythmias when erythromycin given with arsenic trioxide; erythromycin increases toxicity of vinblastine—avoid concomitant use; possible increased risk of neutropenia when clarithromycin given with vinorelbine.
  - Dapoxetine: manufacturer of dapoxetine advises dose reduction when clarithromycin and erythromycin given with dapoxetine (see under Dapoxetine, in BNFC).
- Diuretics: clarithromycin increases plasma concentration of eplerenone—avoid concomitant use; erythromycin increases plasma concentration of eplerenone (reduce dose of eplerenone).
  - Domperidone: possible increased risk of ventricular arrhythmias when clarithromycin and erythromycin given with domperidone—avoid concomitant use; erythromycin increases plasma concentration of domperidone (increased risk of ventricular arrhythmias—avoid concomitant use).
  - Dopaminergics: macrolides possibly increase plasma concentration of bromocriptine and cabergoline (increased risk of toxicity); erythromycin increases plasma concentration of bromocriptine and cabergoline (increased risk of toxicity).
- Ergot Alkaloids: increased risk of ergotism when clarithromycin or erythromycin given with ergot alkaloids—avoid concomitant use.
- Fosaprepitant: clarithromycin possibly increases plasma concentration of fosaprepitant.

Macrolides (continued)
- Guanfacine: clarithromycin and erythromycin possibly increase the plasma concentration of guanfacine (halve dose of guanfacine).
- MR, receptor Agonists: clarithromycin and erythromycin increase plasma concentration of elapenotan (risk of toxicity)—avoid concomitant use.
- Ibrutinib: clarithromycin possibly increase plasma concentration of ibrutinib (increased risk of toxicity). Leukotriene Receptor Agonists: clarithromycin reduces plasma concentration of zafirlukast.
- Lipid-regulating Drugs: possible increased risk of myopathy when azithromycin or erythromycin given with atorvastatin; clarithromycin increases plasma concentration of atorvastatin and pravastatin; erythromycin increases plasma concentration of pravastatin; erythromycin reduces plasma concentration of rosuvastatin; possible increased risk of myopathy when azithromycin given with simvastatin; increased risk of myopathy when clarithromycin or erythromycin given with simvastatin (avoid concomitant use); avoidance of clarithromycin and erythromycin advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased); separating administration from azithromycin by 12 hours advised by manufacturer of lomitapide.
  - Mirabegron: when given with clarithromycin avoid or reduce dose of mirabegron in hepatic or renal impairment—see Mirabegron, in BNFC.
- Netupitant: plasma concentration of erythromycin increased by netupitant.
  - Oestrogens: erythromycin increases plasma concentration of estradiol.
- Parasympathomimetics: erythromycin increases plasma concentration of galantamine.
  - Pentamidine isetionate: increased risk of ventricular arrhythmias when parenteral erythromycin given with pentamidine isetionate.
  - Progestogens: erythromycin increases plasma concentration of dienogest.
  - Ranolazine: clarithromycin possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use.
  - Sildenafil: clarithromycin increases the plasma concentration of sildenafil—consider reducing initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to once daily for pulmonary hypertension; erythromycin increases plasma concentration of sildenafil—reduce initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to twice daily for pulmonary hypertension.
  - Sirolimus: clarithromycin increases plasma concentration of sirolimus—avoid concomitant use; plasma concentration of both drugs increased when erythromycin given with sirolimus.
  - Tacrolimus: clarithromycin and erythromycin increase plasma concentration of tacrolimus.
  - Tadalafil: clarithromycin and erythromycin possibly increase plasma concentration of tadalafil.
  - Theophylline: clarithromycin possibly increases plasma concentration of theophylline; erythromycin increases plasma concentration of theophylline (when theophylline may reduce absorption of oral erythromycin).
- Ticagrelor: clarithromycin possibly increases plasma concentration of ticagrelor—manufacturer of ticagrelor advises avoid concomitant use; erythromycin possibly increases plasma concentration of ticagrelor.
  - Ulcer-healing Drugs: plasma concentration of erythromycin increased by cimetidine (increased risk of toxicity, including deafness); plasma concentration of both drugs increased when clarithromycin given with omeprazole.
Macrolides (continued)  
- Ulipristal: avoidance of clarithromycin advised by manufacturer of low-dose ULPRIPLAT; erythromycin increases plasma concentration of low-dose ULPRIPLAT—manufacturer of low-dose ulipristal advises avoid concomitant use.  
- Vaccines: antibacterials inactivate OLFALYPIHOD VACCINE—see under Typhoid Vaccine in BNFC.  
- Vardenafil: clarithromycin possibly increases plasma concentration of VARDENAFIL (consider reducing initial dose of vardenafil); erythromycin increases plasma concentration of VARDENAFIL (reduce dose of vardenafil).  

Magnesium (parenteral)  
- Calcium-channel Blockers: profound hypotension reported with concomitant use of parenteral magnesium and NIFEDIPINE in pheochromocytoma.  
- Muscle Relaxants: parenteral magnesium enhances effects of NON-DEPOLARISING MUSCLE RELAXANTS and SUXAMETHONIUM.  

Magnesium Salts (oral) see Antacids.  

Mannitol.  
- Antibacterials: avoidance of mannitol advised by manufacturer of TROMBAMYCIN.  
- Ciclosporin: increased risk of nephrotoxicity when mannitol given with CICLOSPORIN.  

NOTE For interactions of reversible MAO-A inhibitors (RIMAs) see Moclobemide, and for interactions of MAO-B inhibitors see Rasagiline and Selegiline.  

NOTE Lineozolid is a reversible, non-selective MAO inhibitor and an antimalarial.  

NOTE ACE inhibitors: MAOIs possibly enhance hypotensive effect of ACE INHIBITORS.  

- Adrenergic Neurone Blockers: enhanced hypotensive effect when MAOIs given with ADRENERGIC NEURONE BLOCKERS.  
- Alcohol: MAOIs interact with tyramine found in some beverages containing ALCOHOL and some dealcoholised beverages (hypertensive crisis)—if no tyramine, enhanced hypotensive effect.  
- Alpha-adrenoceptor Stimulants: avoidance of MAOIs advised by manufacturer of APRACLONIDINE and BUPIRONIDINE.  
- Alpha-blockers: avoidance of MAOIs advised by manufacturer of INDORAMIN; enhanced hypotensive effect when MAOIs given with ALPHA-BLOCKERS.  
- Antidepressants: increased risk of serotoninergic effects when MAOIs given with FENTANYL; CNS excitation or depression (hypertension or hypotension) when MAOIs given with PETHIDINE—avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotoninergic effects and increased risk of convulsions when MAOIs given with TRAMADOL—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; avoidance of MAOIs advised by manufacturer of NEFOPAM; possible CNS excitation or depression (hypertension or hypotension) when MAOIs given with OPIOID ANALGESICS—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs.  
- Angiotensin-II Receptor Antagonists: MAOIs possibly enhance hypotensive effect of ANGIOTENSIN-II RECEPTOR ANTAGONISTS.  
- Antibacterials: plasma concentration of linezolid reduced by RIFAMPICIN (possible therapeutic failure of linezolid).  
- Antidepressants: increased risk of hypertensive and CNS excitation when MAOIs given with BUPERIDINE (MAOIs should not be started until 1 week after stopping bupropion), avoid reboxetine for 2 weeks after stopping MAOIs; after stopping MAOIs do not start CITALOPRAM, ECTOSALOPRAM, FLUOXAMINE, PAROXETINE or SERTRALINE for 2 weeks, also MAOIs should not be started until at least 1 week after stopping citalopram, escitalopram, fluvoxamine, paroxetine or sertraline; after stopping MAOIs do not start FLUOXETINE for 2 weeks, also MAOIs should not be started until at least 5 weeks after stopping fluoxetine; after stopping MAOIs do not start DULOXETINE for 2 weeks, also MAOIs should not be started until at least 5 days after stopping duloxetine; enhanced CNS effects and toxicity when MAOIs given with VENLAFAXINE (venlafaxine should not be started until at least 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); increased risk of hypertensive and MAOIs.  
- Antidepressants (continued)  
- CNS excitation when MAOIs given with other MAOIs (avoid for at least 2 weeks after stopping previous MAOIs and then start at a reduced dose); after stopping MAOIs do not start NIFEDIPINE; for at least 1 week, MAOIs increase CNS effects of SSRIS (risk of serious toxicity); after stopping MAOIs do not start MIRTAZAPINE for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping MAOIs do not start TRICYCLIC-RELATED ANTIDEPRESSANTS for 2 weeks, also MAOIs should not be started until at least 1–2 weeks after stopping tricyclic-related antidepressants; increased risk of hypertension and CNS excitation when MAOIs given with TRICYCLICs, tricycles should not be started until 2 weeks after stopping MAOIs (3 weeks if starting clomipramine or imipramine), also MAOIs should not be started for at least 1–2 weeks after stopping tricyclics (3 weeks in the case of clomipramine or imipramine); increased risk of hypertension and CNS excitation when MAOIs given with VORTIOXETINE (vortioxetine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 2 weeks after stopping vortioxetine); avoidance of lineozolid advised by manufacturer of VORTIOXETINE.  

Antidiabetics: MAOIs possibly enhance hypoglycaemic effect of ANTIDIABETICS; MAOIs enhance hypoglycaemic effect of INSULIN, METFORMIN and SULFONYLUREAS.  

Antiepileptics: MAOIs possibly antagonise anticonvulsant effect of ANTEIEPILEPTICS (convulsive threshold lowered); avoidance for 2 weeks after stopping MAOIs advised by manufacturer of CARBAMAZEPINE, also antagonism of anticonvulsant effect.  

Antihistamines: avoidance of MAOIs advised by manufacturer of HYDROXYZINE; avoidance of promethazine for 2 weeks after stopping MAOIs advised by manufacturer of PROMETHAZINE; increased antimuscarinic and sedative effects when MAOIs given with ANTIHISTAMINES.  

Antimarial: avoidance of antimarial advised by manufacturer of ARTEMETHER with LUMEFANTRINE and ARTEMIVIL with PIPERAQUINE.  

Antimuscarinics: increased risk of antimuscarinic side-effects when MAOIs given with ANTIMUSCARINICS.  

Antipsychotics: CNS effects of MAOIs possibly increased by CLOzapine.  

Anxiolytics and Hypnotics: manufacturer of tranylcypromine advises avoid BUPPRIONE for 14 days after stopping tranylcypromine; avoidance of MAOIs advised by manufacturer of BUPPRIONE.  

Atomoxetine: after stopping MAOIs do not start ATOMOXETINE for 2 weeks, also MAOIs should not be started until at least 2 weeks after stopping atomoxetine; possible increased risk of convulsions when antidepressants given with ATOMOXETINE.  

Beta-blockers: enhanced hypotensive effect when MAOIs given with BETA-BLOCKERS.  

Bupropion: avoidance of bupropion for 2 weeks after stopping MAOIs advised by manufacturer of BUPPRIONE.  

Calcium-channel Blockers: enhanced hypotensive effect when MAOIs given with CALCIUM-CHANNEL BLOCKERS.  

Clonidine: enhanced hypotensive effect when MAOIs given with CLONIDINE.  

Dapoxetine: increased risk of serotoninergic effects when MAOIs given with DAPAXETINE (MAOIs should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping MAOIs).  

Diazoxide: enhanced hypotensive effect when MAOIs given with DIAZOXIDE.  

Diuretics: enhanced hypotensive effect when MAOIs given with DIURETICS.  

Dopaminergics: risk of hypertensive crisis when MAOIs given with CO-BENEDOLPA, CO-CAREDLopa or LEVODOLPA, avoid co-beneldopa, co-careldopa or levodopa for at least 2 weeks after stopping MAOIs; avoid concomitant use of non-selective MAOIs with ENTACAPONE; risk of hypertensive crisis when MAOIs given with RASAGILINE, avoid MAOIs for at least 2 weeks after stopping rasagiline; enhanced hypotensive effect when MAOIs given with SELEGILINE—manufacturer of}

Maraviroc reduced by reducing dose of maraviroc; plasma concentration of maraviroc possibly reduced by:

Ketoconazole

Plasma concentration of maraviroc possibly reduced by:

Lopinavir

Plasma concentration of maraviroc increased by:

Ketoconazole

Plasma concentration of maraviroc inhibited by:

Fosamprenavir

Memantine

Mefloquine

Anti-arrhythmics: increased risk of ventricular arrhythmias when mefloquine given with:

Amiodarone—avoid concomitant use

Antibacterials: increased risk of ventricular arrhythmias when mefloquine given with:

Moxifloxacin—avoid concomitant use; plasma concentration of mefloquine reduced by:

Rifampicin—avoid concomitant use

Antidepressants: possible increased risk of convulsions when mefloquine given with:

Vortioxetine

Antiepileptics: mefloquine antagonises anticonvulsant effect of:

Antipileptics

Antifungals: plasma concentration of mefloquine increased by:

Ketoconazole

Antimalarials: avoidance of antimalarials advised by manufacturer of:

Artemether with lumefantrine; increased risk of convulsions when mefloquine given with:

Chloroquine or Hydroxychloroquine; increased risk of convulsions when mefloquine given with:

Risperidone

Antivirals: mefloquine possibly reduces plasma concentration of:

Ritonavir

Atomoxetine: increased risk of ventricular arrhythmias when mefloquine given with:

Haloperidol—avoid concomitant use; avoidance of mefloquine advised by manufacturer of Amisulpride; increased risk of ventricular arrhythmias when mefloquine given with:

Pimozone—avoid concomitant use; manufacturer of risperidone advises possible risk of ventricular arrhythmias when mefloquine given with:

Risperidone

Cytotoxics: possible increased risk of bradycardia when mefloquine given with:

Cisplatin

Cytotoxics: increased risk of melphalan toxicity when given with:

Calcium-channel Blockers

Cardiac Glycosides: possible increased risk of bradycardia when mefloquine given with:

Calcium-channel Blockers

Cytotoxics: possible increased risk of ventricular arrhythmias when mefloquine given with:

Antipsychotics: possible increased risk of ventricular arrhythmias when mefloquine given with:

Haloperidol—avoid concomitant use; avoidance of mefloquine advised by manufacturer of Amisulpride; increased risk of ventricular arrhythmias when mefloquine given with:

Pimozone—avoid concomitant use; manufacturer of risperidone advises possible risk of ventricular arrhythmias when mefloquine given with:

Risperidone

Antivirals: mefloquine possibly reduces plasma concentration of:

Ritonavir

Risperidone

Antivirals: mefloquine possibly reduces plasma concentration of:

Ritonavir

Atomoxetine: increased risk of ventricular arrhythmias when mefloquine given with:

Atomoxetine
Methotrexate

- **Antibacterials** (continued) methotrexate given with • TRIMETHOPRIM (also with co-trimoxazole)
- *Antiepileptics*: antiepileptic effect of methotrexate increased by FOSPHENYTOIN and PHENYTOIN; plasma concentration of methotrexate possibly increased by • LEVETIRACETAM
- **Antimalarials**: antifolate effect of methotrexate increased by • PRIMETHAMINE
- **Antipsychotics**: avoid concomitant use of cytoxics with • CLOZAPINE (increased risk of agranulocytosis)
- **Cardiac Glycosides**: methotrexate possibly reduces absorption of DIGOXIN tablets
- **Cytotoxics**: increased pulmonary toxicity when methotrexate given with • CISPALTIN
- **Diuretics**: excretion of methotrexate increased by alkaline urine due to ACETAZOLAMIDE
- **Leflunomide**: risk of toxicity when methotrexate given with • LEFLOXAFINE
- **Nitroimidazoles**: plasma concentration of methotrexate increased by • ACITRETIN (also increased risk of hepatotoxicity) • ACITRETIN (also increased risk of hepatotoxicity) — avoid concomitant use
- **Theophylline**: plasma concentration of THEOPHYLLINE possibly increased by methotrexate possibly reduced by PROTON PUMP INHIBITORS (increased risk of toxicity)

**Methyldopa**

- **ACE inhibitors**: enhanced hypotensive effect when methyldopa given with **ACE INHIBITORS**
- **Adrenergic Neurone Blockers**: enhanced hypotensive effect when methyldopa given with ADRENERGIC NEURONE BLOCKERS
- **Alcohol**: enhanced hypotensive effect when methyldopa given with **ALCOHOL**
- **Aldesleukin**: enhanced hypotensive effect when methyldopa given with **ALDESLEUKIN**
- **Alpha-blockers**: enhanced hypotensive effect when methyldopa given with **ALPHA-BLOCKERS**
- **Anasthetics, General**: enhanced hypotensive effect when methyldopa given with **GENERAL ANAESTHETICS**
- **Analgesics**: hypotensive effect of methyldopa antagonised by • NSAIDS
- **Angiotensin II Receptor Antagonists**: enhanced hypotensive effect when methyldopa given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
- **Antidepressants**: manufacturer of methyldopa advises avoid concomitant use with • MAOIS
- **Antiepileptics**: enhanced hypotensive effect when methyldopa given with **ANTIEPILEPTICS** (also increased risk of extrapyramidal effects)
- **Anxiolytics and Hypnotics**: enhanced hypotensive effect when methyldopa given with **ANXIOLYTICS AND HYPNOTICS**
- **Beta-blockers**: enhanced hypotensive effect when methyldopa given with **BETA-BLOCKERS**
- **Calcium-channel Blockers**: enhanced hypotensive effect when methyldopa given with **CALCIUM-CHANNEL BLOCKERS**
- **Clonidine**: enhanced hypotensive effect when methyldopa given with **CLONIDINE**
- **Corticosteroids**: hypotensive effect of methyldopa antagonised by **CORTICOSTEROIDS**
- **Diazoxide**: enhanced hypotensive effect when methyldopa given with **DIAZOXIDE**
- **Diuretics**: enhanced hypotensive effect when methyldopa given with **DIURETICS**
- **Dopaminergics**: methyldopa antagonises antiparkinsonian effect of **DOPAMINERGICS**; increased risk of extrapyramidal side-effects when methyldopa given with **AMANTADINE** • enhanced hypotensive effect when methyldopa given with **CISPLATIN**; increased risk of extrapyramidal side-effects when methyldopa given with **COBENDELDA, CO-CAREDLIDA or LEVDOPA**; effects of methyldopa possibly enhanced by ENTACAPONE
- **Iron Salts**: hypotensive effect of methyldopa antagonised by • IRON SALTS
- **Lithium**: neurotoxicity may occur when methyldopa given with • LITHIUM without increased plasma concentration of lithium
Methyldopa (continued)

- Moxisylyte: enhanced hypotensive effect when methyldopa given with MOXISYLYTE
- Moxonidine: enhanced hypotensive effect when methyldopa given with MOXONIDINE
- Muscle Relaxants: enhanced hypotensive effect when methyldopa given with BACLOFEN or TIZANIDINE
- Nitrates: enhanced hypotensive effect when methyldopa given with NITRATES
- Oestrogens: hypotensive effect of methyldopa antagonised by OESTROGENS
- Prostaglandins: enhanced hypotensive effect when methyldopa given with infusion of SALBUTAMOL
- Vasodilator Antihypertensives: enhanced hypotensive effect when methyldopa given with HYDRAZINE, MINOXIDIL or SODIUM NITROPRISIDE

Metiphenytoin

Metiphenytoin: see Corticosteroids

Methyldopa

- Antidepressants: risk of CNS toxicity when methyldopa given with SSRI-RELATED ANTIDEPRESSANTS, SSRIs and COMBINATION—avoid concomitant use (if avoidance not possible, use lowest possible dose of methyldopa and observe patient for up to 4 hours after administration); possible risk of CNS toxicity when methyldopa given with → BUPROPION—avoid concomitant use (if avoidance not possible, use lowest possible dose of methyldopa and observe patient for up to 4 hours after administration)
- Anxiolytics and Hypnotics: possible risk of CNS toxicity when methyldopa given with → BUPROPION—avoid concomitant use (if avoidance not possible, use lowest possible dose of methyldopa and observe patient for up to 4 hours after administration)
- Bupropion: possible risk of CNS toxicity when methyldopa given with → BUPROPION—avoid concomitant use (if avoidance not possible, use lowest possible dose of methyldopa and observe patient for up to 4 hours after administration)

Metclopramide

- Alcohol: metclopramide possibly increases absorption of ALCOHOL
- Anaesthetics: general: metclopramide enhances effects of THIOPENTAL
- Analgesics: metclopramide increases rate of absorption of ASPIRIN (enhanced effect); effects of metclopramide on gastro-intestinal activity antagonised by OPIOID ANALGESICS; metclopramide increases rate of absorption of PARACETAMOL
- Antibacterials: metclopramide reduces plasma concentration of FOSFOMYCIN
- Antidepressants: CNS toxicity reported when metclopramide given with SSRIS
- Antimucinaries: effects of metclopramide on gastro-intestinal activity antagonised by ANTIMUCINARICS
- Antipsychotics: increased risk of extrapyramidal side-effects when metclopramide given with ANTIPSYCHOTICS
- Atovaquone: metclopramide reduces plasma concentration of ATOVAQUONE—avoid concomitant use
- Ciclosporin: metclopramide increases plasma concentration of → CICLOSPORIN
- Dopamineergics: metclopramide antagonises hypoprolactinaemic effects of BROMOCRIPTINE and CABERGOLINE; metclopramide antagonises antiparkinsonian effect of PERGOLIDE; avoidance of metclopramide advised by manufacturer of ROPINIROL and ROTTIGATIN (antagonism of effect)
- Muscle Relaxants: metclopramide enhances effects of SUXAMETHONIUM
- Tetrabenazine: increased risk of extrapyramidal side-effects when metclopramide given with TETRABENAZINE

Metronidazole

Metronidazole: see Diuretics

Metoprolol

Metoprolol: see Beta-blockers

Methyldopa — Mirtazapine

Methyldopa — Mirtazapine

Metoprolol

Metoprolol: see Diuretics

Metronidazole

Metronidazole: see Diuretics

- Alcohol: disulfram-like reaction when metronidazole given with ALCOHOL
- Anticoagulants: metronidazole enhances anticoagulant effect of COUMARINS
- Antiepileptics: metronidazole possibly inhibits metabolism of FOSPHENYTOIN and PHENYTOIN (increased plasma concentration); metabolism of metronidazole accelerated by PHENOBARBITAL and PRIMIDONE (reduced effect)
- Cytotoxics: metronidazole increases plasma concentration of BUSULFAN (increased risk of toxicity); metronidazole inhibits metabolism of CAPECITABINE, FLUOROURACIL and TEGAFUR (increased toxicity)
- Disulfiram: psychic reaction reported when metronidazole given with DISULFIRAM
- Lithium: metronidazole increases risk of LITHIUM toxicity
- Mycophenolate: metronidazole possibly reduces bioavailability of MYCOPHENOLATE
- Ulcer Healing Drugs: metabolism of metronidazole inhibited by Cimetidine (increased plasma concentration)
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNFC

Mianserin

Mianserin: see Antidepressants, Tricyclic (related)

Micafungin

Micafungin: Anti-fungals: micafungin possibly increases plasma concentration of AMPHOTERICIN; micafungin increases plasma concentration of ITRACONAZOLE (consider reducing dose of itraconazole)
- Calcium-channel Blockers: micafungin increases plasma concentration of NIFEDIPINE
- Ciclosporin: micafungin possibly increases plasma concentration of CICLOSPORIN
- Sirolimus: micafungin increases plasma concentration of SIROLIMUS

Micronazole

Micronazole: see Anti-fungals, Imidazole

Midazolam

Midazolam: see Anxiolytics and Hypnotics

Midodrine

Midodrine: see Sympathomimetics

Mifamurtide

Mifamurtide: Analgesics: manufacturer of mifamurtide advises avoid concomitant use with high doses of NSAIDS
- Ciclosporin: manufacturer of mifamurtide advises avoid concomitant use with CICLOSPORIN
- Corticosteroids: manufacturer of mifamurtide advises avoid concomitant use with CORTICOSTEROIDS
- Tacrolimus: manufacturer of mifamurtide advises avoid concomitant use with TACROLIMUS

Mifepristone

Mifepristone: Corticosteroids: mifepristone may reduce effect of CORTICOSTEROIDS (including inhaled corticosteroids) for 3–4 days

Mimironine

Mimironine: see Phosphodiesterase Inhibitors

Minocycline

Minocycline: see Tetracyclines

Minoxidil

Minoxidil: see Vasodilator Anti-hypertensives

Mirabegron

Mirabegron: Antibacterials: avoid or reduce dose of mirabegron in hepatic or renal impairment when given with CLARITHROMYCIN—see Mirabegron, in BNF
- Antifungals: avoid or reduce dose of mirabegron in hepatic or renal impairment when given with STRAUCONAZOLE and KETOCONAZOLE—see Mirabegron, in BNF
- Antivirals: avoid or reduce dose of mirabegron in hepatic or renal impairment when given with ritonavir—see Mirabegron, in BNF
- Beta-blockers: mirabegron increases plasma concentration of METOPROLOL
- Cardiac Glycosides: mirabegron increases plasma concentration of DIGOXIN—reduce initial dose of digoxin

Mirtazapine

Mirtazapine: Alcohol: increased sedative effect when mirtazapine given with ALCOHOL
- Analgesics: possible increased serotoninergic effects when mirtazapine given with TRAMADOL
- Anticoagulants: mirtazapine enhances anticoagulant effect of WARFARIN
- Antidepressants: possible increased serotoninergic effects when mirtazapine given with FLUOXETINE, FLUOXAMINE or FLUOXAMINE
Mirtazapine

- Antidepressants (continued)

VENLAFAXINE; mirtazapine should not be started until 2 weeks after stopping MAOIs, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping mirtazapine do not start MOXONIDINE for at least 1 week.
- Antiepileptics: plasma concentration of mirtazapine reduced by CARBAMAZEPINE, FOSPHENYTOIN and PHENYTOIN.
- Antifungals: plasma concentration of mirtazapine increased by KETOCONAZOLE.
- Antimalarials: avoidance of antidepressants advised by manufacturer of ARTENIMOL WITH PIPERAQUINE.
- Antihistamines: increased sedative effect when mirtazapine given with ANTIHISTAMINES.
- Atropine: possible increased risk of convulsions when antidepressants given with ATROPINE.
- Clonidine: mirtazapine possibly antagonises hypotensive effect of CLONIDINE.
- Methylthionium: possible risk of CNS toxicity when mirtazapine given with METHYLTHIONIUM—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration).
- Ulcer-healing Drugs: plasma concentration of mirtazapine increased by CIMETIDINE.

Moxonidine

▶ Adrenergic Neurone Blockers: enhanced hypotensive effect when moxonidine given with ADRENERGIC NEURONE BLOCKERS.
▶ Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxonidine given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS.
▶ BETA-BLOCKERS: possible severe postural hypotension when moxonidine given with BETA-BLOCKERS.
▶ Calcium-channel Blockers: enhanced hypotensive effect when moxonidine given with CALCIUM-CHANNEL BLOCKERS.
▶ Diazoxide: enhanced hypotensive effect when moxonidine given with DIAZOXIDE.
▶ Diuretics: enhanced hypotensive effect when moxonidine given with DIURETICS.
▶ Methyl dopa: enhanced hypotensive effect when moxonidine given with METHYLDOPA.
▶ Nitrate: enhanced hypotensive effect when moxonidine given with NITRATES.
▶ Sodium nitroprusside: enhanced hypotensive effect when moxonidine given with SODIUM NITROPRUSSIDE.

Mirtazapine – Moxonidine

Mirtazapine

- Antidepressants

VENLAFAXINE; mirtazapine should not be started until 2 weeks after stopping MAOIs, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping mirtazapine do not start MOXONIDINE for at least 1 week.
- Antiepileptics: plasma concentration of mirtazapine reduced by CARBAMAZEPINE, FOSPHENYTOIN and PHENYTOIN.
- Antifungals: plasma concentration of mirtazapine increased by KETOCONAZOLE.
- Antimalarials: avoidance of antidepressants advised by manufacturer of ARTENIMOL WITH PIPERAQUINE.
- Antihistamines: increased sedative effect when mirtazapine given with ANTIHISTAMINES.
- Atropine: possible increased risk of convulsions when antidepressants given with ATROPINE.
- Clonidine: mirtazapine possibly antagonises hypotensive effect of CLONIDINE.
- Methylthionium: possible risk of CNS toxicity when mirtazapine given with METHYLTHIONIUM—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration).
- Ulcer-healing Drugs: plasma concentration of mirtazapine increased by CIMETIDINE.

Moxonidine

▶ Adrenergic Neurone Blockers: enhanced hypotensive effect when moxonidine given with ADRENERGIC NEURONE BLOCKERS.
▶ Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxonidine given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS.
▶ BETA-BLOCKERS: possible severe postural hypotension when moxonidine given with BETA-BLOCKERS.
▶ Calcium-channel Blockers: enhanced hypotensive effect when moxonidine given with CALCIUM-CHANNEL BLOCKERS.
▶ Diazoxide: enhanced hypotensive effect when moxonidine given with DIAZOXIDE.
▶ Diuretics: enhanced hypotensive effect when moxonidine given with DIURETICS.
▶ Methyl dopa: enhanced hypotensive effect when moxonidine given with METHYLDOPA.
▶ Nitrate: enhanced hypotensive effect when moxonidine given with NITRATES.
▶ Sodium nitroprusside: enhanced hypotensive effect when moxonidine given with SODIUM NITROPRUSSIDE.

Mirtazapine – Moxonidine

Mirtazapine

- Antidepressants (continued)

VENLAFAXINE; mirtazapine should not be started until 2 weeks after stopping MAOIs, also MAOIs should not be started until at least 2 weeks after stopping mirtazapine; after stopping mirtazapine do not start MOXONIDINE for at least 1 week.
- Antiepileptics: plasma concentration of mirtazapine reduced by CARBAMAZEPINE, FOSPHENYTOIN and PHENYTOIN.
- Antifungals: plasma concentration of mirtazapine increased by KETOCONAZOLE.
- Antimalarials: avoidance of antidepressants advised by manufacturer of ARTENIMOL WITH PIPERAQUINE.
- Antihistamines: increased sedative effect when mirtazapine given with ANTIHISTAMINES.
- Atropine: possible increased risk of convulsions when antidepressants given with ATROPINE.
- Clonidine: mirtazapine possibly antagonises hypotensive effect of CLONIDINE.
- Methylthionium: possible risk of CNS toxicity when mirtazapine given with METHYLTHIONIUM—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthionium and observe patient for up to 4 hours after administration).
- Ulcer-healing Drugs: plasma concentration of mirtazapine increased by CIMETIDINE.

Moxonidine

▶ Adrenergic Neurone Blockers: enhanced hypotensive effect when moxonidine given with ADRENERGIC NEURONE BLOCKERS.
▶ Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxonidine given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS.
▶ BETA-BLOCKERS: possible severe postural hypotension when moxonidine given with BETA-BLOCKERS.
▶ Calcium-channel Blockers: enhanced hypotensive effect when moxonidine given with CALCIUM-CHANNEL BLOCKERS.
▶ Diazoxide: enhanced hypotensive effect when moxonidine given with DIAZOXIDE.
▶ Diuretics: enhanced hypotensive effect when moxonidine given with DIURETICS.
▶ Methyl dopa: enhanced hypotensive effect when moxonidine given with METHYLDOPA.
▶ Nitrate: enhanced hypotensive effect when moxonidine given with NITRATES.
▶ Sodium nitroprusside: enhanced hypotensive effect when moxonidine given with SODIUM NITROPRUSSIDE.
**Moxonidine** (continued)
- Alcohol: enhanced hypotensive effect when moxonidine given with **ALCOHOL**
- Aldesleukin: enhanced hypotensive effect when moxonidine given with **ALDESLEUKIN**
- Alpha-blockers: enhanced hypotensive effect when moxonidine given with **ALPHA-BLOCKERS**
- Anaesthetics, General: enhanced hypotensive effect when moxonidine given with **GENERAL ANAESTHETICS**
- Antidepressants: enhanced hypotensive effect when moxonidine antagonised by **NSAIDS**
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when moxonidine given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
- Antidepressants: enhanced hypotensive effect when moxonidine given with **MAOIS**; hypotensive effect of moxonidine possibly antagonised by **TRICYCLICS** (manufacturer of moxonidine advises avoid concomitant use)
- Antipsychotics: enhanced hypotensive effect when moxonidine given with **PHENOTHIAZINES**
- Anxiolytics and Hypnotics: enhanced hypotensive effect when moxonidine given with **ANXIOLYTICS AND HYPNOTICS**; sedative effects possibly increased when moxonidine given with **BENZODIAZEPINES**
- Beta-blockers: enhanced hypotensive effect when moxonidine given with **BETA-BLOCKERS**
- Calcium-channel Blockers: enhanced hypotensive effect when moxonidine given with **CALCIUM-CHANNEL BLOCKERS**
- Clonidine: enhanced hypotensive effect when moxonidine given with **CLONIDINE**
- Corticosteroids: hypotensive effect of moxonidine antagonised by **CORTICOSTEROIDS**
- Diazoxide: enhanced hypotensive effect when moxonidine given with **DIAZOXIDE**
- Diuretics: enhanced hypotensive effect when moxonidine given with **DIURETICS**
- Dopaminergics: enhanced hypotensive effect when moxonidine given with **DOPAMINERGICS**
- Methyldopa: enhanced hypotensive effect when moxonidine given with **METHYLDOPA**
- Moxisylyte: enhanced hypotensive effect when moxonidine given with **MOXISLYTE**
- Muscle Relaxants: enhanced hypotensive effect when moxonidine given with **MUSCLE RELAXANTS**
- Nitrates: enhanced hypotensive effect when moxonidine given with **NITRATES**
- Oestrogens: hypotensive effect of moxonidine antagonised by **OESTROGENS**
- Prostaglandins: enhanced hypotensive effect when moxonidine given with **PROSTAGLANDINS**
- Vasodilator Antihypertensives: enhanced hypotensive effect when moxonidine given with **HYDRALAZINE, MINOXIDIL OR SODIUM NITROPRUSSIDE**

**Muscle Relaxants**
- ACE Inhibitors: enhanced hypotensive effect when baclofen or tizanidine given with **ACE INHIBITORS**
- Adrenergic Neurone Blockers: enhanced hypotensive effect when baclofen or tizanidine given with **ADRENERGIC NEURONE BLOCKERS**
- Alcohol: increased sedative effect when baclofen, methocarbamol or tizanidine given with **ALCOHOL**
- Alpha-blockers: enhanced hypotensive effect when baclofen or tizanidine given with **ALPHA-BLOCKERS**
  - Anaesthetics, General: effects of atracurium enhanced by **KETAMINE**; increased risk of myocardial depression and bradycardia when suxamethonium given with **KETAMINE**; effects of non-depolarising muscle relaxants and suxamethonium enhanced by **VOLATILE LIQUID GENERAL ANAESTHETICS**
  - Analgesics: excitation of baclofen possibly reduced by **NSAIDS**; increased risk of toxicity; excitation of baclofen reduced by **IBUPROFEN** (increased risk of toxicity); increased sedative effect when baclofen given with **FENTANYL OR MORPHINE**
  - Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when baclofen or tizanidine given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**

**Muscle Relaxants (continued)**
- Anti-arrhythmia: enhanced hypotensive effect when baclofen or tizanidine given with **ANTIARRHYTHMICS**
  - Beta-blockers: enhanced hypotensive effect when baclofen given with **BETA-BLOCKERS**; possible increased risk of bradycardia when baclofen given with **VERAPAMIL**
  - Calcium-channel Blockers: enhanced hypotensive effect when baclofen or tizanidine given with **CALCIUM-CHANNEL BLOCKERS**; effects of non-depolarising muscle relaxants possibly enhanced by **CALCIUM-CHANNEL BLOCKERS**; possible increased risk of ventricular arrhythmias when **INTRAVENTRICULAR DRUGS** given with **DILTIAZEM**—manufacturer of diltiazem advises avoid concomitant use; effects of non-depolarising muscle relaxants and suxamethonium enhanced by **VERAPAMIL**; avoidance of **INTRAVENTRICULAR DRUGS** given with **DILTIAZEM**—manufacturer of diltiazem advises avoid concomitant use; effects of non-depolarising muscle relaxants and suxamethonium enhanced by **VERAPAMIL**
  - Cardiac Glycosides: increased hypotensive effect when baclofen or tizanidine given with **CARDIAC GLYCOSIDES**; risk of ventricular arrhythmias when suxamethonium given with **CARDIAC GLYCOSIDES**
  - Clonidine: enhanced hypotensive effect when baclofen or tizanidine given with **CLONIDINE**
  - Corticosteroids: effects of pancuronium and vecuronium possibly antagonised by **CORTICOSTEROIDS**
  - Cytotoxics: effects of suxamethonium enhanced by **CYCLOPHOSPHAMIDE AND THIOTEPA**
  - Deferasirox: antagonism of tizanidine advised by manufacturer of **DEFERASIROX**
  - Diazoxide: enhanced hypotensive effect when baclofen or tizanidine given with **DIAZOXIDE**
  - Diuretics: enhanced hypotensive effect when baclofen or tizanidine given with **DIURETICS**
  - Dopaminergics: possible agitation, confusion and hallucinations when baclofen given with **CO-BENELDOPA, CO-CARELDOPA OR LEVODOPA**
  - Lithium: effects of muscle relaxants enhanced by **LITHIUM**; baclofen possibly aggravates hypokinesia caused by **LITHIUM**
  - Magnesium (parenteral): effects of non-depolarising muscle relaxants and suxamethonium enhanced by **PARENTERAL MAGNESIUM**
  - Memantine: effects of baclofen and dantrolene possibly modified by **MEMANTINE**
Muscle Relaxants

Muscle Relaxants (continued)

- Methyldopa: enhanced hypertensive effect when baclofen or tizanidine given with METHYLDOPA
- Metoclopramide: effects of suxamethonium enhanced by METOCLOPRAMIDE
- Moxonidine: enhanced hypertensive effect when baclofen or tizanidine given with MOXONIDINE
- Nitrates: enhanced hypertensive effect when baclofen or tizanidine given with NITRATES
- Oestrogens: plasma concentration of tizanidine possibly increased by OESTROGENS (increased risk of toxicity)
- Parasympathomimetics: effects of non-depolarising muscle relaxants possibly antagonised by DONEPEZIL; effects of suxamethonium possibly enhanced by DONEPEZIL; effects of suxamethonium enhanced by GALANTAMINE, NEOSTIGMINE, PYRIDOSTIGMINE and RIVASTIGMINE; effects of non-depolarising muscle relaxants antagonised by NEOSTIGMINE, PYRIDOSTIGMINE and RIVASTIGMINE
- Progestogens: plasma concentration of tizanidine possibly increased by PROGESTOGENS (increased risk of toxicity)
- Sympathomimetics, Beta2: effects of suxamethonium enhanced by BAMBUTEROL
- Vasodilator Antihypertensives: enhanced hypertensive effect when baclofen or tizanidine given with HYDRAZIN; enhanced hypertensive effect when baclofen or tizanidine given with MINOXIDIL; enhanced hypertensive effect when baclofen or tizanidine given with SODIUM NITROPRUSSIDE

Muscle Relaxants, depolarising

See Muscle Relaxants

Myкопенолат

- Antacids: absorption of mycopenolate reduced by ANTACIDS
- Antibacterials: bioavailability of mycopenolate possibly reduced by METRONIDAZOLE and NONFLOXACIN; plasma concentration of mycopenolate possibly reduced by CO-AMOXICLAV; plasma concentration of active metabolite of mycopenolate reduced by Rifampicin
- Antivirals: mycopenolate increases plasma concentration of AICLOVIR and VALACLOVIR, also plasma concentration of inactive metabolite of mycopenolate increased; mycopenolate possibly increases plasma concentration of GANCLOVIR and VALGANCLOVIR, also plasma concentration of inactive metabolite of mycopenolate possibly increased
- Iron Salts: absorption of mycopenolate reduced by oral IRON SALTS
- Lipid-regulating Drugs: absorption of mycopenolate reduced by COLESTYRAMINE
- Sevelamer: plasma concentration of mycopenolate possibly reduced by SEVELAMER

Nabumetone see NSAIDs

Nadolol see Beta-blockers

Nalidixic Acid see Quinolones

Nalmefene

- Analgesics: manufacturer of nalmefene advises avoid concomitant use with OPIOID ANALGESICS

Nandrolone see Anabolic Steroids

Naproxen see NSAIDs

Naratriptan see SHT-receptor Agonists (under HT)

Nitazoxanide

- Antiparasitics: avoid concomitant use of cytotoxic drugs with CLOzapine (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live VACCINES - avoid concomitant use

Nateglinide see Anti-diabetics

Nebivolol see Beta-blockers

Nefopam

- Antidepressants: manufacturer of nefopam advises avoid concomitant use with MAOIS; side-effects possibly increased when nefopam given with TRICYCLES
- Antimuscarinics: increased risk of antimuscarinic side-effects when nefopam given with ANTimuscarinics

Neomycin see Aminoglycosides

Neostigmine see Parasympathomimetics

Netupitant

- Analgesics: manufacturer of netupitant advises caution with MORPHINE

Netupitant (continued)

- Antibacterials: netupitant increases plasma concentration of ERYTHROMYCIN; plasma concentration of netupitant reduced by Rifampicin - avoid concomitant use
- Anticoagulants: manufacturer of netupitant advises caution with DABIGATRAN
- Antiepileptics: manufacturer of netupitant advises caution with VALPROIC ACID
- Antifungals: plasma concentration of netupitant possibly increased by KETOCONAZOLE
- Antivirals: manufacturer of netupitant advises caution with ZIDOVUDINE
- Anxiolytics and Hypnotics: netupitant increases plasma concentration of MIDAZOLAM
- Colchicine: manufacturer of netupitant advises caution with COLCHICINE
- Corticosteroids: netupitant increases plasma concentration of DEXAMETHASONE (halve dose of dexamethasone)
- Cytostatics: netupitant increases plasma concentration of DOCETAXEL and ETOPOSIDE

Nevirapine

- Analgesics: nevirapine possibly reduces plasma concentration of METHADONE
- Antibacterials: nevirapine reduces plasma concentration of CLARITHROMYCIN (but concentration of an active metabolite increased), also plasma concentration of nevirapine increased; nevirapine possibly increases plasma concentration of Rifampicin; plasma concentration of nevirapine reduced by Rifampicin - avoid concomitant use
- Anticoagulants: nevirapine may enhance or reduce anticoagulant effect of Warfarin
- Antidepressants: plasma concentration of nevirapine reduced by St John’s WORT - avoid concomitant use
- Antiepileptics: plasma concentration of nevirapine reduced by CARBAMAZEPINE
- Antifungals: nevirapine reduces plasma concentration of KETOCONAZOLE - avoid concomitant use; plasma concentration of nevirapine increased by Fluconazole; nevirapine possibly reduces plasma concentration of CASPOFUNGIN and ITRACONAZOLE - consider increasing dose of caspofungin and itraconazole
- Antipsychotics: nevirapine possibly reduces plasma concentration of Aripiprazole (avoid concomitant use or consider increasing the dose of aripiprazole - consult aripiprazole product literature)
- Antivirals: nevirapine possibly reduces plasma concentration of ATAZANAVIR and ETRAVIRINE - avoid concomitant use; manufacturer of nevirapine advises avoid concomitant use with BOCEPREVIR and RILPVIRINE; avoidance of nevirapine advised by manufacturer of DACLATASVIR (plasma concentration of daclatasvir possibly reduced); avoidance of nevirapine advised by manufacturer of DASABUVIR, ETVIREGAVIR, OMITATUVIR and PARITAPREVIR; nevirapine possibly reduces the plasma concentration of DOLUTEGRAVIR (see under Dolutegravir, p. 387); nevirapine reduces plasma concentration of Efavirenz - avoid concomitant use; nevirapine possibly reduces plasma concentration of FOSAMPRNAVIR - avoid unboosted fosamprenavir; nevirapine reduces plasma concentration of INDINAVIR; nevirapine possibly reduces plasma concentration of LOPINAVIR and TELAPREVIR - consider increasing dose of lopinavir and telaprevir; nevirapine possibly reduces plasma concentration of SIMEPREVIR; manufacturer of simeprevir advises avoid concomitant use; increased risk of granulocytopenia when nevirapine given with ZIDOVUDINE
- Cobicistat: manufacturer of nevirapine advises avoid concomitant use with Cobicistat
- Cytotoxic: avoidance of nevirapine advised by manufacturer of OLAPARIB
- Guanfacine: nevirapine possibly reduces plasma concentration of Guanfacine - increase dose of guanfacine
- Oestrogens: nevirapine accelerates metabolism of OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings - see Contraceptive Interactions in BNFC)
Nevirapine (continued)

- Oritavat: absorption of nevirapine possibly reduced by ORLISAT.
- Progestogens: nevirapine accelerates metabolism of progestogens (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNFC).

Nicardipine see Calcium-channel Blockers

Nifedipine

- Hypotensive effect of nifedipine possibly enhanced by ALCOHOL.
- Analgesics: increased risk of gastro-intestinal bleeding and ulceration when nifedipine given with NSAIDS or ASPIRIN.
- Antidepressants: enhanced hypotensive effect when nifedipine given with MAOIS; hypotensive effect of nifedipine possibly enhanced by TRICYCLICS.
- Avanafil: hypotensive effect of nifedipine significantly enhanced by AVANAFIL (avoid concomitant use).
- Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when nifedipine given with CORTICOSTEROIDS.
- Riociguat: possible increased hypotensive effect when nifedipine given with RIOCIGUAT—avoid concomitant use.
- Sildefaf: hypotensive effect of nifedipine significantly enhanced by SILDENAFIL (avoid concomitant use).
- Tadalafil: hypotensive effect of nifedipine significantly enhanced by TADALAFIL. (avoid concomitant use).
- Vardenafil: possible increased hypotensive effect when nifedipine given with VARDENAFIL—avoid concomitant use.
- Vasodilators: possible enhanced hypotensive effect when nifedipine given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE.

Nicotine

- Anti-arrhythmics: nicotine possibly enhances effects of ADENOSINE.

Nicotinic Acid

- Lipid-regulating Drugs: increased risk of myopathy when nicotinic acid given with STATINS (applies to lipid regulating doses of nicotinic acid).

Nifedipine see Calcium-channel Blockers

Nilotinib

- Antibacterials: manufacturer of nilotinib advises avoid concomitant use with CLARITHROMYCIN and CLINDAMYCIN; plasma concentration of nilotinib reduced by RIFAMPICIN—avoid concomitant use.
- Antiulcer: plasma concentration of nilotinib increased by RIFAMPICIN—avoid concomitant use; manufacturer of nilotinib advises avoid concomitant use with TRICYCLIC-RELATED ANTIDEPRESSANTS.
- Antipsychotics: avoid concomitant use of cytoxotics with CLOzapine (increased risk of agranulocytosis).
- Antivirals: avoidance of nilotinib advised by manufacturer of BOCEPREVIR; plasma concentration of nilotinib possibly increased by RITONAVIR—manufacturer of nilotinib advises avoid concomitant use.
- Anxiolytics and Hypnotics: nilotinib increases plasma concentration of MIDAZOLAM.
- Grapefruit Juice: manufacturer of nilotinib advises avoid concomitant use with GRAPEFRUIT JUICE.
- Lipid-regulating Drugs: separating administration from nilotinib by 12 hours advised by manufacturer of LOMITAPIDE.

Nimodipine see Calcium-channel Blockers

Nindetanib

- Antibacterials: plasma concentration of nindetanib reduced by RIFAMPICIN—avoid concomitant use.
- Antifungals: plasma concentration of nindetanib increased by RIFAMPICIN.
- Antipsychotics: avoid concomitant use of cytoxotics with CLOzapine (increased risk of agranulocytosis).

Nitrates

- ACE Inhibitors: enhanced hypotensive effect when nitrates given with ACE INHIBITORS.
- Adrenergic Neurone Blockers: enhanced hypotensive effect when nitrates given with ADRENERGIC NEURONE BLOCKERS.

Nitrates (continued)

- Alcohol: enhanced hypotensive effect when nitrates given with ALCOHOL.
- Aldesleukin: enhanced hypotensive effect when nitrates given with ALDESLEUKIN.
- Alpha-blockers: enhanced hypotensive effect when nitrates given with ALPHA-BLOCKERS.
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when nitrates given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS.
- Anti-arrhythmics: effects of sublingual tablets of nitrates reduced by DISOPRamine (failure to dissolve under tongue owing to dry mouth).
- Anticoagulants: infusion of glyceryl trinitrate reduces anticoagulant effect of HEPARINS.
- Antidepressants: enhanced hypotensive effect when nitrates given with MAOIS; effects of sublingual tablets of nitrates possibly reduced by TRICYCLIC-RELATED ANTIDEPRESSANTS.
- Beta-blockers: enhanced hypotensive effect when nitrates given with BETA-BLOCKERS.
- Calcium-channel Blockers: enhanced hypotensive effect when nitrates given with CALCIUM-CHANNEL BLOCKERS.
- Clonidine: enhanced hypotensive effect when nitrates given with CLONIDINE.
- Corticosteroids: hypotensive effect of nitrates significantly enhanced by AVANAFIL (avoid concomitant use).
- Diazoxide: enhanced hypotensive effect when nitrates given with DIAZoxide.
- Diuretics: enhanced hypotensive effect when nitrates given with DIURETICS.
- Dopaminergics: enhanced hypotensive effect when nitrates given with CO-BENELDOPA, CO-CARELDOPA or LEVODOPA.
- Levosimendan: possible severe postural hypotension when isosorbide mononitrate given with LEVOSIMENDAN.
- Methyldopa: enhanced hypotensive effect when nitrates given with METHYLDOPA.
- Moxisylyte: enhanced hypotensive effect when nitrates given with MOXISLYTE.
- Moxonidine: enhanced hypotensive effect when nitrates given with MOXONIDINE.
- Muscle Relaxants: enhanced hypotensive effect when nitrates given with BACLOFEN or TIZANIDINE.
- Oestrogens: hypotensive effect of nitrates antagonised by OESTROGENS.
- Prostaglandins: enhanced hypotensive effect when nitrates given with ALPROSTADIL.
- Riociguat: possible enhanced hypotensive effect when nitrates given with RIOCIGUAT—avoid concomitant use.
- Sildefaf: hypotensive effect of nitrates significantly enhanced by SILDENAFIL (avoid concomitant use).
- Tadalafil: hypotensive effect of nitrates significantly enhanced by TADALAFIL (avoid concomitant use).
- Vardenafil: possible increased hypotensive effect when nitrates given with VARDENAFIL—avoid concomitant use.
- Vasodilators: enhanced hypotensive effect when nitrates given with HYDRALAZINE, MINOXIDIL or SODIUM NITROPRUSSIDE.

Nitratrepam see Anxiolytics and Hypnotics

Nitrofurantoin

- Antacids: absorption of nitrofurantoin reduced by ORAL MAGNESIUM SALTS (as magnesium trisilicate).
Nitrofurantoin – NSAIDs

Interactions

Nitrofurantoin (continued)

> Antibacterials: nitrofurantoin possibly antagonises effects of NASIDAXIC ACID
> Sulfinpyrazone: excretion of nitrofurantoin reduced by NASIDAXIC ACID (increased risk of toxicity)
> Vaccines: antibacterials inactive ORAL TYPHOID VACCINE — see when Typhoid Vaccine in BNFC

Nitroimidazoles see Metronidazole and Tinidazole

Nitrofurantoin (norrenepinephrine) see Sympathomimetics

Noradrenaline (norepinephrine) see Sympathomimetics

Norclorina see Progestogens

Norfloxacin see Quinolones

Norprost see Progestogens

Northeristone see Progestogens

Norepinephrine see Sympathomimetics

Nomegestrol see Progestogens

Norcortrine see Progestogens

Norepinephrine

NOTE Norepinephrine interactions as for noradrenaline, see under sympathomimetics

Norprost see Progestogens

Norfloxacin see Quinolones

Norprost see Progestogens

Normal Immunoglobulin see Immunoglobulins

Nortriptyline see Antidepressants, Tricyclic

NSAIDs

NOTE See also Aspirin. Interactions do not generally apply to topical NSAIDs

> ACE inhibitors: increased risk of renal impairment when NSAIDs given with ACE INHIBITORS, also hypotensive effect antagonised
> Adrenergic Neurone Blockers: NSAIDs antagonise hypotensive effect of ADRENERGIC NEURONE BLOCKERS
> Aksipren: NSAIDs possibly antagonise hypotensive effect of ALISKIREN
> Alpha-blockers: NSAIDs antagonise hypotensive effect of ALPHA-BLOCKERS
> Analgesics: avoid concomitant use of NSAIDs with NSAIDs or NSAIDs or NSAIDs with NSAIDs with KETOROLAC (increased side-effects and haemorrhage); ibuprofen possibly reduces antiplatelet effect of ASPRIN
> Angiotensin-II Receptor Antagonists: increased risk of renal impairment when NSAIDs given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS, also hypotensive effect antagonised
> Antacids: absorption of acetaminophen possibly reduced by ANTACIDS
> Antibacterials: indometacin possibly increases plasma concentration of AMIKIN and GENITACIN in neonates; plasma concentration of cefalexin, diclofenac and etoricoxib reduced by RIFAPNIC; possible increased risk of convulsions when NSAIDs given with QUINOLONES
> Anticoagulants: increased risk of haemorrhage when intravenous diclofenac given with ANTICOAGULANTS (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when ketorolac given with ANTICOAGULANTS (avoid concomitant use, including low-dose heparins); NSAIDs possibly enhance anticoagulant effect of QUINARINS and PHENINDIONE; possible increased risk of bleeding when NSAIDs given with DABIGATRAN or HEPARINS; increased risk of bleeding when NSAIDs given with EDOXABAN (manufacturer of edoxaban advises avoid long-term NSAIDs)
> Antidepressants: increased risk of bleeding when NSAIDs given with SSRIS or VENLAFAXINE
> Antidiabetics: NSAIDs possibly enhance effects of SULFINPYRAZONE
> Antiepileptics: acetaminophen possibly reduces excretion of FOSPHENYTHION and PHENYTOIN (increased risk of toxicity)
> Antifungals: plasma concentration of paxiloxin increased by FLUCONAZOLE (reduce dose of paxiloxin); plasma concentration of cefalexin increased by FLUCONAZOLE (halve dose of cefalexin); plasma concentration of flurbiprofen and ibuprofen increased by FLUCONAZOLE; plasma concentration of diclofenac and ibuprofen increased by VORICONAZOLE
> Antipsychotics: possible severe drowsiness when acetaminophen or indometacin given with HALOPERIDOL
> Antivirals: plasma concentration of NSAIDs possibly increased by RITONAVIR; plasma concentration of piroxicam increased by RITONAVIR (risk of toxicity)—avoid concomitant use; NSAIDs

> Antivirals (continued)
> increased risk of haematological toxicity when NSAIDs given with ZIDOVUDINE
> Azathioprine: manufacturer of azathioprine advises possible increased risk of myelosuppression when indometacin given with AZATHIOPRINE
> Beta-blockers: NSAIDs antagonise hypotensive effect of BETABLOCKERS
> Calcium-channel Blockers: NSAIDs antagonise hypotensive effect of CALCIUM-CHANNEL BLOCKERS
> Cardiac Glycosides: NSAIDs possibly increase plasma concentration of CARDIAC GLYCOSIDES, also possible exacerbation of heart failure and reduction of renal function
> Ciclosporin: increased risk of nephrotoxicity when NSAIDs given with CICLOSPORIN; plasma concentration of diclofenac increased by CICLOSPORIN (halve dose of diclofenac)
> Clopidogrel: increased risk of bleeding when NSAIDs given with CLOPIDOGREL
> Corticosteroids: increased risk of gastro-intestinal bleeding and ulceration when NSAIDs given with CORTICOSTEROIDS
> Cytotoxics: NSAIDs probably reduce excretion of METHOTREXATE (increased risk of toxicity); diclofenac, ibuprofen, indometacin, ketoprofen, meloxicam and naproxen reduce excretion of METHOTREXATE (increased risk of toxicity); NSAIDs possibly reduce renal excretion of Pemetrexed—consult product literature; increased risk of bleeding when NSAIDs given with Pemetrexed; avoidance of mephenamic acid advised by manufacturer of REGORAFENIB
> Desmopressin: indometacin enhances effects of DESMOPRESSIN
> Diazoxide: NSAIDs antagonise hypotensive effect of DIAZOXIDE
> Dimethyl sulfoxide: avoid concomitant use of sulindac with DIMETHYL-SULFOXIDE
> Diuretics: risk of nephrotoxicity of NSAIDs increased by DIURETICS, also antagonism of diuretic effect; indometacin and ketorolac antagonise effects of DIURETICS; excretion of acetaminophen possibly increased by FLUCONAZOLE; NSAIDs possibly antagonise diuretic effect of POTASSIUM CANRENOATE; occasional reports of reduced renal function when indometacin given with TRIAMTERENE—avoid concomitant use; increased risk of hyperkalaemia when indometacin given with POTASSIUM-SPARING DIURETICS and ALDOSTERONE ANTAGONISTS; possible increased risk of hyperkalaemia when NSAIDs given with POTASSIUM-SPARING DIURETICS and ALDOSTERONE ANTAGONISTS
> Epoprostenol: increased risk of bleeding when NSAIDs given with ELOPROST
> Lipid-regulating Drugs: excretion of meloxicam increased by COLESTYRAMINE
> Lithium: NSAIDs reduce excretion of LITHIUM (increased risk of toxicity); ketorolac reduces excretion of LITHIUM (increased risk of toxicity)—avoid concomitant use
> Methyldopa: NSAIDs antagonise hypotensive effect of METHYLDOPA
> Mifamurtide: avoidance of high doses of NSAIDs advised by manufacturer of MIFAMURTIDE
> Moxonidine: NSAIDs antagonise hypotensive effect of MOXONIDINE
> Muscle Relaxants: ibuprofen reduces excretion of BACLOFEN (increased risk of toxicity); NSAIDs possibly reduce excretion of BACLOFEN (increased risk of toxicity)
> Nicorandil: increased risk of gastro-intestinal bleeding and ulceration when NSAIDs given with NICORANDIL
> Nitrates: NSAIDs antagonise hypotensive effect of NITRATES
> Oestrogens: etoricoxib increases plasma concentration of ETHINYLESTRADIOL
> Penicillamine: possible increased risk of nephrotoxicity when NSAIDs given with PENICILLAMINE
> Penkoxifylline: possible increased risk of bleeding when NSAIDs given with PENKOKSIFYLLINE; increased risk of bleeding when ketorolac given with PENKOKSIFYLLINE (avoid concomitant use)
> Prasugrel: possible increased risk of bleeding when NSAIDs given with PRASUGREL
NSAIDs — Ofatumumab

**Oestrogens**
- Antivirals (continued) manufacturer of telaprevir advises additional contraceptive precautions
- Anxiolytics and Hypnotics: oestrogens possibly increase plasma concentration of CHLOROAZEPoxide, DIAzepam and NITRAZepam; oestrogens possibly reduce plasma concentration of LORazepam, DIAzepam and TEMAZepam; oestrogens increase plasma concentration of MELATONIN
- Aprapitant: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with APRAPITANT (alternative contraception recommended)
- Beta-blockers: oestrogens antagonise hypotensive effect of BETA-BLOCKERS
- Bosentan: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with BOSENTAN (alternative contraception recommended)
- Calcium-channel Blockers: oestrogens antagonise hypotensive effect of CALCIUM-CHANNEL BLOCKERS
- Ciclosporin: oestrogens possibly increase plasma concentration of CICLOSPORIN
- Clonidine: oestrogens antagonise hypotensive effect of CLONIDINE
- Cobicistat: metabolism of oestrogens accelerated by COBICISTAT (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNFC)
- Corticosteroids: oral contraceptives containing oestrogens increase plasma concentration of CORTICOSTEROIDS
- Cytoxotics: possible reduction in contraceptive effect of oestrogens advised by manufacturer of CRIZOTINIB and VEMURAFENIB; possible reduced contraceptive effect of hormonal contraceptives containing oestrogens advised by manufacturer of DABrafenIb (alternative contraception recommended)
- Diuretics: oestrogens antagonise diuretic effect of DIURETICS
- Dopaminergics: oestrogens increase plasma concentration of ROPINIOLE; oestrogens increase plasma concentration of SELENLIGINE—manufacturer of selengeLine advises avoid concomitant use
- Fosaprepitant: possible contraceptive failure of hormonal contraceptives containing oestrogens when given with FOSAPREPIrANT (alternative contraception recommended)
- Lipid-regulating Drugs: absorption of ethinylestradiol reduced by COLESEVELAM; plasma concentration of ethinylestradiol increased by ATORVASTATIN and ROSUVASTATIN; separating administration from oestrogens by 12 hours advised by manufacturer of LOmitAPiDE
- Methyldopa: oestrogens antagonise hypotensive effect of METHYLDOPA
- Modafinil: metabolism of oestrogens accelerated by MODAFINIL (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNFC)
- Moxonidine: oestrogens antagonise hypotensive effect of MOXONIDINE
- Muscle Relaxants: oestrogens possibly increase plasma concentration of TIZANIDINE (increased risk of toxicity)
- Nitrates: oestrogens antagonise hypotensive effect of NITRATES
- Somatropin: oestrogens (when used as oral replacement therapy) may increase dose requirements of SOMATROPIN
- Tacrolimus: ethinylestradiol possibly increases plasma concentration of TACROLiMUS
- Teriflunomide: plasma concentration of ethinylestradiol increased by TERIFLUNOMIDE
- Theophylline: oestrogens increase plasma concentration of THEOPHYLLINE (consider reducing dose of theophylline) Thyroid Hormones: oestrogens may increase requirements for THYROID HORMONES in hypothyroidism
- Vasodilator Antihypertensives: oestrogens antagonise hypotensive effect of HYDRAZINE, MINOXiDIL and SODiUM NITROPRUSSiDE

**Oestrogens, conjugated** see Oestrogens

**Ofatumumab**
- Antipsychotics: avoid concomitant use of cytotoxics with CLOZAPINE (increased risk of agranulocytosis)
Interactions

Opioid Analgesics

- **Antibacterials** (continued)
  - accelerated by *rifampicin* (reduced effect); metabolism of oxycodone possibly accelerated by *rifampicin*; increased risk of ventricular arrhythmias when methadone given with *delamanid*; manufacturer of pethidine advises avoid concomitant use with *isoniazid*; metabolism of oxycodone inhibited by *telithromycin*; possible increased risk of ventricular arrhythmias when methadone given with *telithromycin*.

- **Anticoagulants**; tramadol enhances anticoagulant effect of *coumarins*.

- **Antidepressants**: plasma concentration of methadone possibly increased by *fluoxetine, fluvoxamine, paroxetine* and *sertraline*; possible increased serotonergic effects when tramadol given with *mirzapine, venlafaxine* or *vortioxetine*; possible increased serotonergic effects and increased risk of convulsions when tramadol given with *maois*—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; CNS excitation or depression (hypertension or hypotension) when pethidine given with *maois*—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotonergic effects when tramadol given with *mirzapine, venlafaxine* or *vortioxetine*; possible increased serotonergic effects and increased risk of convulsions when tramadol given with *maois*—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; CNS excitation or depression (hypertension or hypotension) when methadone given with *maois*—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs; possible increased serotonergic effects and increased risk of convulsions when tramadol given with *maois*—some manufacturers advise avoid concomitant use and for 2 weeks after stopping MAOIs.

- **Antiepileptics**: metabolism of fentanyl possibly increased by *allopREPivir, alpivir, indinavir*, *nevirapine* and *saquinavir* and *telaprevir*.

- **Antihistamines**: metabolism of fentanyl possibly increased by *allopREPivir, alpivir, indinavir*, *nevirapine* and *saquinavir* and *telaprevir*.

- **Antivirals**: plasma concentration of methadone possibly increased by *allopREPivir, alpivir, indinavir*, *nevirapine* and *saquinavir* and *telaprevir*.
Opioid Analgesics

- **Antipsychotics (continued)**
  - Risk of ventricular arrhythmias when methadone given with • **ANTIPSYCHOTICS** that prolong the QT interval; increased risk of convulsions when tramadol given with **ANTIPSYCHOTICS**; increased risk of ventricular arrhythmias when methadone given with • **AMISULPRIDE**—avoid concomitant use

- **Antivirals**: Plasma concentration of methadone possibly reduced by • **ABACAVIR**, **NEVIRAPINE** and **RILPIVIRINE**; plasma concentration of buprenorphine increased by • **ATAZANAVIR**; plasma concentration of methadone possibly affected by • **BOCEPREvir**; possible increased risk of prolonged sedation and respiratory depression when buprenorphine given with • **BOCEPREvir**; methadone possibly reduces plasma concentration of **DIDANOxIN**; plasma concentration of methadone reduced by • **EFAVIRENz**, **FOSAMPRENAVIR** and **RITONAVIR**; plasma concentration of alfentanil and fentanyl increased by • **RITONAVIR**; plasma concentration of pethidine reduced by • **RITONAVIR**, but plasma concentration of toxic metabolite possibly increased; plasma concentration of morphine possibly reduced by • **RITONAVIR**; plasma concentration of dextropropoxyphene increased by • **RITONAVIR** (risk of toxicity)—avoid concomitant use; plasma concentration of buprenorphine possibly increased by • **RITONAVIR**; increased risk of ventricular arrhythmias when alfentanil, fentanyl or methadone given with • **SAQUINAVIR**—avoid concomitant use; caution with methadone advised by manufacturer of • **TELAPREvir** (risk of ventricular arrhythmias); buprenorphine possibly reduces plasma concentration of • **TIPRANAVIR**; methadone possibly increases plasma concentration of • **ZIDOVUDINE**

- **Anxiolytics and Hypnotics**: Increased sedative effect when opioid analgesics given with • **ANXIOLYTICS** and **HYPNOTICS**; fentanyl possibly inhibits metabolism of • **MIDOZalam**

- **Atomoxetine**: Increased risk of ventricular arrhythmias when methadone given with • **ATOMOXETINE**; possible increased risk of convulsions when tramadol given with • **ATOMOXETINE**

- **Beta-blockers**: Morphine possibly increases plasma concentration of • **ESMOLOL**

- **Calcium-channel blockers**: Metabolism of alfentanil inhibited by • **DILTIAZEM** (risk of prolonged or delayed respiratory depression)

- **Cytotoxics**: Possible increased risk of ventricular arrhythmias when methadone given with • **CYTOTOXICS**; increased risk of ventricular arrhythmias when methadone given with • **CRIZOTINIB**; possible increased risk of ventricular arrhythmias when methadone given with • **VANDETANIB**—avoid concomitant use

- **Dapoxetine**: Possible increased risk of serotoninergic effects when tramadol given with • **DAPoxetine** (manufacturer of dapoxetine advises tramadol should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping tramadol)

- **Dopaminergic**: Opioid analgesics antagonise effects of • **DOPERIDONE** on gastro-intestinal activity

- **Dopaminergics**: Avoid concomitant use of dextromethorphan with • **RASAGILINE**; risk of CNS toxicity when pethidine given with • **RASAGILINE** (avoid pethidine for 2 weeks after rasagiline); avoidance of opioid analgesics advised by manufacturer of • **SELEGILINE**; hypopressxia and CNS toxicity reported when pethidine given with • **SELEGILINE** (avoid concomitant use)

- **Hormone Antagonists**: Plasma concentration of • **Dexamethorphan** increased by • **SELEGILINE**; hyperpyrexia and CNS toxicity reported when pethidine given with • **SELEGILINE** (avoid concomitant use)

- **SH1-receptor Antagonists**: Effects of tramadol possibly antagonised by • **ONDANSETRON**

- **Memantine**: Increased risk of CNS toxicity when dextromethorphan given with • **MEMANTINE** (manufacturer of memantine advises avoid concomitant use)

- **Meclopramide**: Opioid analgesics antagonise effects of • **METOCLOPRAMIDE** on gastro-intestinal activity

- **Muscle Relaxants**: Increased sedative effect when fentanyl or morphine given with • **BACLOFEN**

- **Nalene**: Avoidance of opioid analgesics advised by manufacturer of • **NALMEFENE**
### Oxcarbazolepine

- Guanfacine: oxcarbazolepine possibly reduces plasma concentration of guanfacine.
- Oestrogens: oxcarbazolepine accelerates metabolism of.
- Oestrogens: reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNFC.
- Oral: possible increased risk of convalusions when antiepileptics given with.
- Prostaglandins: oxcarbazolepine accelerates metabolism of.
- Prostaglandins: reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNFC.

#### Oxybutynin
- Antimuscarinics.

#### Oxycodeone
- Opioid Analgesics.

#### Oxetaclycine
- Tetracyclines.

#### Oxytocin
- Anaesthetics, General: oxytocin effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when oxytocin given with volatile liquid general anaesthetics.
- Prostaglandins: uterine effect of oxytocin potentiated by prostaglandins.
- Sympathomimetics: risk of hypertension when oxytocin given with vasocostructor sympathomimetics (due to enhanced vasopressor effect).

#### Paclitaxel
- Antipsychotics: avoid concomitant use of cytoxics with.
- Clozapine (increased risk of agranulocytosis).
- Antivirals: plasma concentration of paclitaxel increased by ritonavir.
- Cytoxins: increased risk of neutropenia when paclitaxel given with lapatinib.

#### Paliperidone
- Antipsychotics.

#### Palonosetron
- 5HT3-receptor Antagonists (under HT).

#### Pancreatin
- Lipid-regulating Drugs: absorption of pancreatin reduced by colestyramine.
- Metoclopramide: rate of absorption of pancreatin increased by metoclopramide.

#### Paraldehyde
- Alcohol: increased sedative effect when paraldehyde given with alcohol.
- Disulfiram: risk of toxicity when paraldehyde given with disulfiram.

#### Parasympathomimetics
- Anti-arrhythmics: effects of neostigmine and pyridostigmine possibly antagonised by propanolol.
- Antibacterials: plasma concentration of galantamine increased by erythromycin; effects of neostigmine and pyridostigmine antagonised by clindamycin; effects of neostigmine and pyridostigmine antagonised by polymyxins.
- Antidepressants: plasma concentration of galantamine increased by paroxetine.
- Antifungals: plasma concentration of galantamine increased by ketoconazole.
- Antimalarials: effects of neostigmine and pyridostigmine may be diminished because of potential for chloroquine to increase symptoms of myasthenia gravis; effects of neostigmine and pyridostigmine may be diminished because of potential for hydroxychloroquine to increase symptoms of myasthenia gravis.
- Antimuscarinics: effects of parasympathomimetics antagonised by antimuscarinics.
- Beta-blockers: increased risk of arrhythmias when paclitaxel given with beta-blockers; effects of neostigmine and pyridostigmine antagonised by propranolol.

#### Paracetamol
- Acarbose.

#### Panitumumab
- Beta-blockers.
- Cytotoxics.
- Antiepileptics.
- Cytotoxic.
- Cardiac Glycosides.

#### Paracetamol—Paritaprevir
- interactions.

#### Paracetamol—Paritaprevir
- Antivirals: plasma concentration of paritaprevir possibly reduced by rifampin—avoid concomitant use.
- Antidepressants: plasma concentration of paritaprevir possibly reduced by st john's wort—manufacturer of paritaprevir advises avoid concomitant use.
- Antiepileptics: plasma concentration of paritaprevir reduced by carbamazepine—avoid concomitant use; plasma concentration of paritaprevir possibly reduced by fosphenytoin, phenobarbital, phenytoin and primidone—avoid concomitant use.
- Antifungals: plasma concentration of both drugs increased when paritaprevir given with ketoconazole—avoid concomitant use; plasma concentration of both drugs possibly increased when paritaprevir given with itraconazole and posaconazole—avoid concomitant use.
- Antivirals: plasma concentration of paritaprevir increased by atazanavir; plasma concentration of paritaprevir increased by darunavir and plasma concentration of darunavir decreased; manufacturer of paritaprevir advises avoid concomitant use with ritonavir, etravirine, indinavir, nevirapine, saquinavir and tipranavir; plasma concentration of paritaprevir increased by lopinavir—manufacturer of paritaprevir advises avoid concomitant use.
- Cardiac Glycosides: paritaprevir possibly increases plasma concentration of digoxin; manufacturer of paritaprevir advises avoid concomitant use with digitoxin and other glycosides.
- Cobicistat: manufacturer of paritaprevir advises avoid concomitant use with cobicistat.
- Cytoxins: manufacturer of paritaprevir advises avoid concomitant use with mitotane.
- Diuretics: paritaprevir increases plasma concentration of furosemide (reduce dose of furosemide).
- Hormone Antagonists: manufacturer of paritaprevir advises avoid concomitant use with enzalutamide.

#### Interactions

- Appendix 1
- BNF 2016–2017
- Oxybutynin see Antimuscarinics
- Oxycodeone see Opioid Analgesics
- Oxetaclycine see Tetracyclines
- Oxetaclycine see Tetracyclines
- Oxynon see Beta-blockers
- Oxytocin
  - Anaesthetics, General: oxytocin effect possibly reduced, also enhanced hypotensive effect and risk of arrhythmias when oxytocin given with volatile liquid general anaesthetics
  - Prostaglandins: uterine effect of oxytocin potentiated by prostaglandins
  - Sympathomimetics: risk of hypertension when oxytocin given with vasocostructor sympathomimetics (due to enhanced vasopressor effect)
- Paclitaxel
  - Antipsychotics: avoid concomitant use of cytoxics with
  - Clozapine (increased risk of agranulocytosis)
  - Antivirals: plasma concentration of paclitaxel increased by ritonavir
  - Cytoxins: increased risk of neutropenia when paclitaxel given with lapatinib
- Paliperidone see Antipsychotics
- Palonosetron see 5HT3-receptor Antagonists (under HT)
- Pamidronate Disodium see Bisphosphonates
- Pancreatin
  - Anti-diabetics: pancreatin antagonises hypoglycaemic effect of acarbose
  - Pancuronium see Muscle Relaxants
- Panitumumab
  - Antipsychotics: avoid concomitant use of cytoxics with
  - Clozapine (increased risk of agranulocytosis)
  - Cytoxins: manufacturer of panitumumab advises avoid concomitant use with bevacizumab, fluorouracil, irinotecan and oxaliplatn
  - Folate: manufacturer of panitumumab advises avoid concomitant use with folic acid
  - Vaccines: risk of generalised infections when monoclonal antibodies given with live vaccines—avoid concomitant use
- Pantoprazole see Proton Pump Inhibitors
- Papaveretum see Opioid Analgesics
- Paracetamol
  - Anti-inflammatory: prolonged regular use of paracetamol possibly enhances anticoagulant effect of coumarins
  - Anti-diabetics: absorption of paracetamol possibly reduced when given 1 to 4 hours after liniseotide
  - Antiepileptics: metabolism of paracetamol possibly accelerated by carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone (also isolated reports of hepatotoxicity)
  - Antifungals: avoidance of paracetamol advised by manufacturer of ketoconazole
  - Cytoxins: paracetamol possibly inhibits metabolism of intravenous busulfan (manufacturer of intravenous busulfan advises caution within 72 hours of paracetamol); caution with paracetamol advised by manufacturer of metformin
  - Lipid regulating Drugs: absorption of paracetamol reduced by colestyramine
  - Metoclopramide: rate of absorption of paracetamol increased by metoclopramide
- Paraldehyde
  - Alcohol: increased sedative effect when paraldehyde given with alcohol.
  - Disulfiram: risk of toxicity when paraldehyde given with disulfiram.
- Parasympathomimetics
  - Anti-arrhythmics: effects of neostigmine and pyridostigmine possibly antagonised by propanolol.
  - Antibacterials: plasma concentration of galantamine increased by erythromycin; effects of neostigmine and pyridostigmine antagonised by clindamycin; effects of neostigmine and pyridostigmine antagonised by polymyxins.
  - Antidepressants: plasma concentration of galantamine increased by paroxetine.
  - Antifungals: plasma concentration of galantamine increased by ketoconazole.
  - Antimalarials: effects of neostigmine and pyridostigmine may be diminished because of potential for chloroquine to increase symptoms of myasthenia gravis; effects of neostigmine and pyridostigmine may be diminished because of potential for hydroxychloroquine to increase symptoms of myasthenia gravis.
  - Antimuscarinics: effects of parasympathomimetics antagonised by antimuscarinics.
  - Beta-blockers: increased risk of arrhythmias when paclitaxel given with beta-blockers; effects of neostigmine and pyridostigmine antagonised by propranolol.

Paritaprevir (continued)

- Lipid-regulating Drugs: plasma concentration of paritaprevir increased by GEMFIBrozil — manufacturer of paritaprevir advises avoid concomitant use; manufacturer of paritaprevir avoids concomitant use with CYP 3A4 inhibitors.
- FLUVASTATIN and SIMVASTATIN; paritaprevir increases plasma concentration of PRAVASTATIN (reduce dose of pravastatin).
- paritaprevir increases plasma concentration of ROSUVASTATIN (reduce dose of rosuvastatin — see under Rosuvastatin, in BNF).
- Cypreebrel: manufacturer of paritaprevir avoids concomitant use of ETHINYLESTRADIOL—use alternative form of contraception.

Pentamidine Isetionate

- Antimalarials: the possibility of increased risk of bradycardia when pentamidine isetionate given with ATOMOXETINE; increased risk of ventricular arrhythmias when pentamidine isetionate given with AMIODARONE (possible risk of ventricular arrhythmias; increased risk of ventricular arrhythmias when pentamidine isetionate given with TRICYCLICS.
- Antifungals: possible increased risk of nephrotoxicity when paritaprevir is used with TELITHROMYCIN.
- Antidepressants: avoiding the possibility of increased risk of bradycardia when paritaprevir is given with DESIPRAMINE; increased risk of ventricular arrhythmias when paritaprevir given with INIBITION-4.
- Antiepileptics: increased risk of haematological toxicity when paritaprevir is given with any antiepileptic.
- Antipsychotics: increased risk of haematological toxicity when paritaprevir is given with ANTIPSYCHOTICS — manufacturer of paritaprevir advises avoid concomitant use.
- Antihistamines: increased risk of ventricular arrhythmias when paritaprevir is given with any antihistamine.
- Antidiabetics: increased risk of hypoglycaemia when paritaprevir is given with any antidiabetic.
- Analgesics: increased risk of nephrotoxicity when paritaprevir is given with AMPEXIR;
- Analgesics: increased risk of nephrotoxicity when paritaprevir is given with any analgesic.
- Antineoplastic: increased risk of haematological toxicity when paritaprevir is given with any anticancer agent.
- Antivirals: increased risk of nephrotoxicity when paritaprevir is given with any antiviral.
- Vaccines: increased risk of nephrotoxicity when paritaprevir is given with any vaccine.

Paroxetine see Antidepressants, SSRI

Peginterferon Alfa see Interferons

Pembrolizumab

- Antipsychotics: avoid concomitant use of pembrolizumab with OXYBUTYNIN.
- Antidepressants: increased risk of bradycardia when pembrolizumab is given with DESIPRAMINE.
- Analgesics: increased risk of nephrotoxicity when pembrolizumab is given with any analgesic.
- Antineoplastic: increased risk of haematological toxicity when pembrolizumab is given with any anticancer agent.
- Antivirals: increased risk of nephrotoxicity when pembrolizumab is given with any antiviral.
- Vaccines: increased risk of nephrotoxicity when pembrolizumab is given with any vaccine.

Penicillamine

- Analgesics: possible increased risk of nephrotoxicity when penicillamine is given with NSAIDS.
- Antacids: absorption of penicillamine reduced by ANTACIDS.
- Antimalarials: increased risk of haematological toxicity when penicillamine is given with ANTIMALARIALS — manufacturer of penicillamine advises avoid concomitant use.
- Antipsychotics: increased risk of haematological toxicity when penicillamine is given with any antipsychotic.
- Antidiabetics: increased risk of hyperglycaemia when penicillamine is given with any antidiabetic.
- Antivirals: increased risk of nephrotoxicity when penicillamine is given with any antiviral.
- Analgesics: increased risk of nephrotoxicity when penicillamine is given with any analgesic.
- Antineoplastic: increased risk of haematological toxicity when penicillamine is given with any anticancer agent.
- Antivirals: increased risk of nephrotoxicity when penicillamine is given with any antiviral.
- Vaccines: increased risk of nephrotoxicity when penicillamine is given with any vaccine.

Pentamidine Isetionate

- Antimalarials: the possibility of increased risk of bradycardia when pentamidine isetionate given with ATOMOXETINE; increased risk of ventricular arrhythmias when pentamidine isetionate given with AMIODARONE (possible risk of ventricular arrhythmias; increased risk of ventricular arrhythmias when pentamidine isetionate given with TRICYCLICS.
- Antifungals: possible increased risk of nephrotoxicity when paritaprevir is used with TELITHROMYCIN.
- Antidepressants: avoiding the possibility of increased risk of bradycardia when paritaprevir is given with DESIPRAMINE; increased risk of ventricular arrhythmias when paritaprevir given with INIBITION-4.
- Antiepileptics: increased risk of haematological toxicity when paritaprevir is given with any antiepileptic.
- Antipsychotics: increased risk of haematological toxicity when paritaprevir is given with ANTIPSYCHOTICS — manufacturer of paritaprevir advises avoid concomitant use.
- Antihistamines: increased risk of ventricular arrhythmias when paritaprevir is given with any antihistamine.
- Antidiabetics: increased risk of hypoglycaemia when paritaprevir is given with any antidiabetic.
- Analgesics: increased risk of nephrotoxicity when paritaprevir is given with any analgesic.
- Antineoplastic: increased risk of haematological toxicity when paritaprevir is given with any anticancer agent.
- Antivirals: increased risk of nephrotoxicity when paritaprevir is given with any antiviral.
- Vaccines: increased risk of nephrotoxicity when paritaprevir is given with any vaccine.
Pentamidine Isletamine – Phenobarbital

Phenindione (continued)
- and in alcohol consumption may also affect anticoagulant control
- Alcohol: anticoagulant control with phenindione may be affected by major changes in consumption of ALCOHOL
- Anticoagulants: anticoagulant effect of phenindione is enhanced by ANABOLIC STEROIDS
- Analgesics: anticoagulant effect of phenindione possibly enhanced by NSAIDS; increased risk of haemorrhage when anticoagulants given with intravenous DICLOFENAC; (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with KETOROLAC (avoid concomitant use, including low-dose heparins); increased risk of bleeding when phenindione given with ASPIRIN (due to antiplatelet effect)
- Anti-arrhythmics: metabolism of phenindione inhibited by AMIODARONE (enhanced anticoagulant effect); anticoagulant effect of phenindione possibly enhanced by DRONEDARONE
- Antituberculars: experience in anticoagulant clinics suggests that INR possibly altered when phenindione is given with NEOMYCIN (given for local action on gut); anticoagulant effect of phenindione enhanced by LEVOFLOXACIN and TETRACYCLINES; an interaction between phenindione and broad-spectrum PENICILLINS has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered; metabolism of phenindione possibly inhibited by SULFONAMIDES
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with APIXABAN, DAIGABRAN, EDOXABAN and RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antivirals: anticoagulant effect of phenindione possibly enhanced by RITONAVIR

Pentazocine see Opioid Analgesics

Pentostatin
- Antipsychotics: avoid concomitant use of cytoxotics with CLOzapine, (increased risk of agranulocytosis)
- Cytoxotics: increased toxicity when pentostatin given with high-dose CYCLOPHOSPHAMIDE — avoid concomitant use; increased pulmonary toxicity when pentostatin given with FLUDARABINE (unacceptably high incidence of fatalities)
- Aminophylline: pentoxifylline increases plasma concentration of AMINOPHYLLINE
- Analgesics: possible increased risk of bleeding when pentoxifylline given with NSAIDS; increased risk of bleeding when pentoxifylline given with KETONOLAC (avoid concomitant use)
- Theophylline: pentoxifylline increases plasma concentration of THEOPHYLLINE

Perampanel
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIS and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIS and TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: plasma concentration of perampanel reduced by CARBAMAZEPINE, FOSPHENITOIN and PHENITOIN (see under Perampanel, p. 195); plasma concentration of perampanel reduced by OSCARBAZEPINE, also plasma concentration of oscarbazepine increased (see under Perampanel, p. 193); plasma concentration of perampanel reduced by TOPRAZATE
- Antifungals: plasma concentration of perampanel increased by KETOKONAZOLE
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by MEfloquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ANTIEPSEPTICS (convulsive threshold lowered)

Pentobarbital
- Analgesics: metabolism of phenindione inhibited by AMIODARONE (enhanced anticoagulant effect); anticoagulant effect of phenindione possibly enhanced by DRONEDARONE
- Anticoagulants: anticoagulant effect of phenindione possibly enhanced by NSAIDS; increased risk of haemorrhage when anticoagulants given with intravenous DICLOFENAC; (avoid concomitant use, including low-dose heparins); increased risk of haemorrhage when anticoagulants given with KETOROLAC (avoid concomitant use, including low-dose heparins); increased risk of bleeding when phenindione given with ASPIRIN (due to antiplatelet effect)
- Anti-arrhythmics: metabolism of phenindione inhibited by AMIODARONE (enhanced anticoagulant effect); anticoagulant effect of phenindione possibly enhanced by DRONEDARONE
- Antituberculars: experience in anticoagulant clinics suggests that INR possibly altered when phenindione is given with NEOMYCIN (given for local action on gut); anticoagulant effect of phenindione enhanced by LEVOFLOXACIN and TETRACYCLINES; an interaction between phenindione and broad-spectrum PENICILLINS has not been demonstrated in studies, but common experience in anticoagulant clinics is that INR can be altered; metabolism of phenindione possibly inhibited by SULFONAMIDES
- Anticoagulants: increased risk of haemorrhage when other anticoagulants given with APIXABAN, DAIGABRAN, EDOXABAN and RIVAROXABAN (avoid concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency)
- Antivirals: anticoagulant effect of phenindione possibly enhanced by RITONAVIR

Peroxide
- Antipsychotics: effects of peroxide antagonised by ANTIPSYCHOTICS
- Memantine: effects of dopaminergics possibly enhanced by MEMANTINE
- Methylpapa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA
- Metoclopramide: antiparkinsonian effect of pergolide antagonised by METOCLOPRAMIDE

Pericyazine see Antipsychotics

Perindopril see ACE Inhibitors

Perphenazine see Antipsychotics

Pertuzumab
- Antipsychotics: avoid concomitant use of cytoxotics with CLOzapine, (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live VACCINES — avoid concomitant use

Pethidine see Opioid Analgesics

Phenelzine see MAOIs

Phenindione
- Note: Change in patient’s clinical condition particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. Major changes in diet (especially involving salads and vegetables)
- Alcohol: increased sedative effect when phenobarbital given with ALCOHOL
- Aminophylline: phenobarbital accelerates metabolism of AMINOPHYLLINE (reduced effect)
- Analgesics: phenobarbital reduces plasma concentration of METHADONE; phenobarbital possibly accelerates metabolism of PARACETAMOL (also isolated reports of hepatotoxicity)
- Antihelmintics: phenobarbital reduces plasma concentration of ALBENDAZOLE and PRAZIQUNATE — consider increasing...
Phenobarbital

- Antihelmintics (continued)
  - albendazole and praziquantel dose when given for systemic infections
  - Antiarhythmics: phenobarbital accelerates metabolism of disopyramide (reduced plasma concentration); phenobarbital possibly reduces plasma concentration of 
    - Disopyramide — avoid concomitant use; phenobarbital possibly accelerates metabolism of 
    - Propafenone

- Antibacterials: phenobarbital accelerates metabolism of 
  - Metronidazole (reduced effect); phenobarbital possibly reduces plasma concentration of 
    - Rifampicin; phenobarbital accelerates metabolism of 
      - Doxycycline (reduced plasma concentration); phenobarbital possibly accelerates metabolism of 
        - PROPSOMIDE

- Antiallergics: phenobarbital accelerates metabolism of 
  - Cimetidine (reduced plasma concentration)

- Anticoagulants: phenobarbital reduces plasma concentration of 
  - Rivaroxaban advises monitor for signs of thrombosis

- Antidepressants: phenobarbital possibly reduces plasma concentration of 
  - Reboxetine; phenobarbital reduces plasma concentration of 
    - Paroxetine; phenobarbital accelerates metabolism of 
      - Mianserin (reduced plasma concentration); phenobarbital possibly antagonises effect of antiepileptics antagonised by 
        - Carbamazepine; phenobarbital reduces plasma concentration of 
          - Ethosuximide and Topiramate; plasma concentration of phenobarbital often increased by 
            - Fosphenytoin and Phenytoin, plasma concentration of fosphenytoin and phenytoin often reduced but may be increased; phenobarbital reduces plasma concentration of 
              - Lamotrigine, Tiagabine and Zonisamide; plasma concentration of phenobarbital increased by 
                - Oxcarbazepine, also plasma concentration of an active metabolite of oxcarbazepine reduced; plasma concentration of phenobarbital increased by 
                  - Sodium Valproate and Valproic Acid (also plasma concentration of sodium valproate and valproic acid reduced); plasma concentration of phenobarbital increased by 
                    - Stiripentol

- Antifungals: phenobarbital possibly reduces plasma concentration of 
  - Itraconazole and Posaconazole; phenobarbital possibly reduces plasma concentration of 
    - Voriconazole — avoid concomitant use; phenobarbital reduces absorption of 
      - Griseofulvin (reduced effect)

- Antimalarials: avoid concomitant use
  - Arsenic products
  - Chloroquine, hydroxychloroquine, and proguanil
  - Mefloquine — also plasma concentration of 
  - Niflumic acid
  - Quinacrine

- Antipsychotics: 
  - Aripiprazole manufacturer advises possible increased risk 
    - Metabolism of aripiprazole
  - Chlorpromazine — also plasma concentration of 
  - Fluphenazine
  - Haloperidol
  - Lurasidone — also plasma concentration of 
  - Paliperidone
  - Quetiapine
  - Sulpiride

- Antivirals: phenobarbital possibly reduces plasma concentration of 
  - Abacavir, Darunavir, Fosamprenavir, and
  - Phenobarbital (continued)
    - Indinavir, Lopinavir and Saquinavir; avoidance of phenobarbital advised by manufacturer of 
      - Boceprevir and
    - Rifapentine (plasma concentration of boceprevir and rilpivirine possibly reduced); phenobarbital possibly reduces plasma concentration of 
      - Dalatavir and Simprevir — manufacturer of dalatavir and simprevir advises avoid concomitant use; phenobarbital possibly reduces plasma concentration of 
      - Dasabuvir
      - Paritaprevir — avoid concomitant use; phenobarbital possibly reduces the plasma concentration of 
        - Dolasetavir (see under Dolasetavir, p. 887); avoidance of phenobarbital advised by manufacturer of 
          - Elvitegravir, Etravirine, Ledipasvir, Sofosbuvir and Telaprevir

- Anticoagulants: phenobarbital reduces plasma concentration of 
  - Clonazepam

- Anticoagulants: phenobarbital possibly reduces plasma concentration of 
  - Apremilast — avoid concomitant use

- Anticoagulants: phenobarbital possibly reduces plasma concentration of 
  - Aprepitant

- Anticoagulants: phenobarbital possibly reduces plasma concentration of 
  - Avasulfan — manufacturer of avasulfan advises avoid concomitant use

- Beta-blockers: phenobarbital possibly reduces plasma concentration of 
  - Propranolol

- Biologics: 
  - Bivalirudin

- Caffeine: Caffeine citrate: effects of phenobarbital possibly antagonised by 
  - Caffeine Citrate

- Calcium channel blockers: 
  - Rifampicin; phenobarbital reduces plasma concentration of 
    - Calcium channel blockers; avoidance of phenobarbital advised by manufacturer of 
      - Isradipine; avoidance of phenobarbital advised by manufacturer of 
        - Nimodipine (plasma concentration of nimodipine reduced)

- Cannabis Extract: phenobarbital possibly reduces plasma concentration of 
  - Cannabinoids; avoidance of cannabis extract avoids concomitant use

- Ciclosporin: phenobarbital accelerates metabolism of 
  - Ciclosporin (reduced plasma concentration)

- Cobasistat: phenobarbital possibly reduces plasma concentration of 
  - Cobasistat — manufacturer of cobasistat advises avoid concomitant use

- Corticosteroids: phenobarbital accelerates metabolism of 
  - Corticosteroids (reduced effect)

- Cytostatics: 
  - Carboplatin and Cisplatin is also plasma concentration of 
    - Etoposide; phenobarbital possibly reduces plasma concentration of 
      - Bortezomib, Bosutinib, Crizotinib and Ponatinib — manufacturer of bortezomib, bosutinib, crizotinib and ponatinib advises avoid concomitant use; phenobarbital possibly reduces plasma concentration of 
        - Cabozantinib — avoid concomitant use; avoidance of phenobarbital advised by manufacturer of 
          - Cabazitaxel, Dabrafinib, Gefitinib and Olaparib; avoidance of phenobarbital advised by manufacturer of 
            - Dasatinib and Vandetanib (plasma concentration of dasatinib and Vandetanib possibly reduced); phenobarbital possibly reduces plasma concentration of 
              - Etoperoside; phenobarbital reduces plasma concentration of 
                - Irinotecan and its active metabolite; manufacturer of procarbazine advises possible increased risk of 
                  - Hypersensitivity reactions when phenobarbital given with 
                    - Procarbazine

- Diuretics: phenobarbital reduces plasma concentration of 
  - Sildenafil — avoid concomitant use; increased risk of 
    - Osteomalacia when phenobarbital given with 
      - Carbonic Anhydrase Inhibitors

- Folic acid: plasma concentration of phenobarbital possibly reduced by 
  - Folates

- Fosaprepitant: phenobarbital possibly reduces plasma concentration of 
  - Fosaprepitant

- Guanfacine: phenobarbital possibly reduces plasma concentration of 
  - Guanfacine — increase dose of guanfacine

- Guanfacine: phenobarbital possibly reduces plasma concentration of 
  - Guanfacine
Phenobarbital (continued)
- Hormone Antagonists: phenobarbital possibly reduces plasma concentration of o ABIRATRONE — manufacturer of abiraterone advises avoid concomitant use; phenobarbital accelerates metabolism of o TOREMIFENINE (reduced plasma concentration)
- Iacofar: phenobarbital possibly reduces plasma concentration of o IACOFAR — manufacturer of iacofar advises avoid concomitant use
- Leukotriene Receptor Antagonists: phenobarbital reduces plasma concentration of MONODOL (continued)
- Oestrogens: phenobarbital accelerates metabolism of o OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings — see Contraceptive Interactions in BNFC)
- Orlistat: possible increased risk of convulsions when anti-epileptics given with o ORLISTAT
- Progestogens: phenobarbital accelerates metabolism of o PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception — see Contraceptive Interactions in BNFC)
- Roflumilast: phenobarbital possibly inhibits effects of o ROFLUMILAST (manufacturer of roflumilast advises avoid concomitant use)
- Sodium Oxybate: avoidance of phenobarbital advised by manufacturer of o SODIUM OXYBATE
- Sympathomimetics: plasma concentration of phenobarbital possibly increased by METHYLPHENIDATE
- Tacrolimus: phenobarbital reduces plasma concentration of o TACROLIMUS
- Theophylline: phenobarbital accelerates metabolism of o THEOPHYLLINE (reduced effect)
- Thyroid hormones: phenobarbital accelerates metabolism of o THYROID HORMONES (may increase requirements for thyroid hormones in hypothyroidism)
- Ticagrelor: phenobarbital possibly reduces plasma concentration of o TICAGRELOR
- Ulipristal: avoidance of phenobarbital advised by manufacturer of o ULIPRISTAL (contraceptive effect of ulipristal possibly reduced)
- Vitamins: phenobarbital possibly increases requirements for o ACERALBETHOXYSTEROL, ERGOCALCIFEROL, PARICALCITOL or VITAMIN D

Phenothiazines see Antipsychotics
Phenoxycbenzamine see Alpha-blockers
Phenoxymethylpenicillin see Penicillins
Phenotamine see Alpha-Blockers
Phenylephrine see Sympathomimetics
Phenytoin
- Alcohol: plasma concentration of phenytoin possibly reduced by chronic heavy consumption of o ALCOHOL
- Aminophylline: plasma concentration of both drugs reduced when phenytoin given with o AMINOPHYLLINE
- Analgesics: excretion of phenytoin possibly reduced by o ACEMETACIN (increased risk of toxicity); phenytoin possibly accelerates metabolism of oFENTANYL (reduced effect); phenytoin accelerates metabolism of o METHADONE (reduced effect and risk of withdrawal effects); phenytoin possibly increases risk of o PETHIDINE toxicity; effects of phenytoin enhanced by o ASPRIN; phenytoin possibly accelerates metabolism of o PARACETAMOL (also isolated reports of hepatotoxicity)
- Antacids: absorption of phenytoin reduced by o ANTACIDS
- Anthelmintics: phenytoin reduces plasma concentration of o ALBENDAZOLE and o PRAZIQUANTEL — consider increasing albenzole and praziquantel dose when given for systemic infections; plasma concentration of phenytoin possibly increased by o LEVAMISOLE
- Anti-arhythmic: metabolism of phenytoin inhibited by o AMIODARONE (increased plasma concentration); phenytoin reduces plasma concentration of o ESICARBAPAPINE; phenytoin possibly reduces plasma concentration of o DRONEDARONE — avoid concomitant use

Phenotoin (continued)
- Antibacterials: metabolism of phenytoin inhibited by o CLARITHROMYCIN (increased plasma concentration); metabolism of phenytoin possibly inhibited by o METRONIDAZOLE (increased plasma concentration); plasma concentration of phenytoin increased or decreased by o CIPROFLOXACIN; phenytoin accelerates metabolism of o DOXYCYCLINE (reduced plasma concentration); phenytoin possibly reduces plasma concentration of o BEDAQUILINE — manufacturer of bedaquiline advises avoid concomitant use; plasma concentration of phenytoin increased by o CHLORAMPHENICOL (increased risk of toxicity); metabolism of phenytoin possibly inhibited by o ISONIAZID (increased risk of toxicity); metabolism of phenytoin accelerated by o RIFAMPICINS (reduced plasma concentration); plasma concentration of phenytoin possibly increased by o SULFONAMIDES; phenytoin reduces plasma concentration of o TELITHROMYCIN (avoid during and for 2 weeks after phenytoin); plasma concentration of phenytoin increased by o TRIMETHOPRIM (also increased antifolate effect)
- Anticoagulants: phenytoin possibly reduces plasma concentration of o APIXABAN and o EDOXABAN; phenytoin accelerates metabolism of o COUMARINS (possibility of reduced anticoagulant effect, but enhancement also reported); phenytoin possibly reduces plasma concentration of o DABIGATRON — manufacturer of dabigatran advises avoid concomitant use; phenytoin possibly reduces plasma concentration of o RIVAROXABAN — manufacturer of rivaroxaban advises monitor for signs of thrombosis
- Antidepressants: plasma concentration of phenytoin increased by o FLUOXETINE and o FLUVOXAMINE; phenytoin reduces plasma concentration of o MIAESERIN, MIRTAZAPINE and o PAROXETINE; plasma concentration of phenytoin possibly increased by o SERTRALINE, also plasma concentration of sertraline possibly reduced; anticonvulsant effect of antiepileptics possibly antagonised by o MAOIS and o TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by o SSRIS and o TRICYCLICS (convulsive threshold lowered); plasma concentration of phenytoin possibly reduced by o ST JOHN’S WORT — avoid concomitant use; phenytoin possibly reduces plasma concentration of o TRICYCLICS; phenytoin possibly reduces plasma concentration of o VORTICOTINE — consider increasing dose of vortioxetine
- Antidiabetics: plasma concentration of phenytoin transiently increased by o TOLBUTAMIDE (possibility of toxicity)
- Antiepileptics: plasma concentration of both drugs often reduced when phenytoin given with o CARBAMAZEPINE, also plasma concentration of phenytoin may be increased; phenytoin reduces plasma concentration of o ESICARBAPAPINE, also plasma concentration of phenytoin increased; plasma concentration of phenytoin possibly increased by o ETHOSUXIMIDE, also plasma concentration of ethosuximide possibly reduced; phenytoin reduces plasma concentration of o LAMOTRIGINE, also plasma concentration of ethosuximide possibly reduced; plasma concentration of phenytoin increased by o VIGABATRIN
- Antibiotics: plasma concentration of phenytoin possibly increased by o SULFONAMIDES; phenytoin reduces plasma concentration of o OXCARBAPAPINE, also plasma concentration of an active metabolite of oxcarbapapine reduced; phenytoin reduces plasma concentration of o PARMAPAN (see under Perampanel, p. 192); phenytoin often increases plasma concentration of o LEVETIRACETAM and o PRIMAQUIVAM, also plasma concentration of phenytoin possibly increased; plasma concentration of phenytoin increased or possibly reduced when given with o SODIUM VALPROATE and o VALPROIC ACID, also plasma concentration of sodium valproate and valproic acid reduced; plasma concentration of phenytoin increased by o STIRIPENTOL; plasma concentration of phenytoin increased by o TOPIRAMATE (also plasma concentration of topiramate reduced); plasma concentration of phenytoin reduced by o VIGABATRIN
- Antifungals: phenytoin reduces plasma concentration of o KETOCONAZOLE and o POSACONAZOLE; anticonvulsant effect of phenytoin enhanced by o MICONAZOLE (plasma concentration
Phenytoin

- Antianginals (continued)
  of phenytoin increased; plasma concentration of phenytoin increased by • FLUCONAZOLE (consider reducing dose of phenytoin); phenytoin reduces plasma concentration of • IFRAZONAZOLE – avoid concomitant use; plasma concentration of phenytoin increased by • VORICONAZOLE, also phenytoin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for phenytoin toxicity); phenytoin possibly reduces plasma concentration of CAFEP التערה جوني – consider increasing dose of fosphenytoin
- Antimalarials: avoidance of phenytoin advised by manufacturer of ARTENIMOL WITH PIPERASINE; anticonvulsant effect of antiepileptics antagonised by • MELOQUINE; anticonvulsant effect of phenytoin antagonised by • PYRIMETHAMINE, also increased antifolate effect
- Antimuscarinics: phenytoin possibly reduces plasma concentration of active metabolite of • FESOTERODINE – manufacturer of fesoterodine advises avoid concomitant use
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by • ANTIPSYCHOTICS
- Anxiolytics and Hypnotics: phenytoin possibly reduces plasma concentration of • LURASIDONE – avoid concomitant use
- Antivirals: phenytoin possibly reduces plasma concentration of • ABACAVIR, DARUNAVIR, LOPINAVIR and SQUALINAVIR; avoidance of phenytoin advised by manufacturer of • BOCEPREVIR and • RILPILUPIR (plasma concentration of boceprevir and rilpivirine possibly reduced); phenytoin possibly reduces plasma concentration of • DACEPTASIR and • SIMPEPREVIR – manufacturer of daclatasvir and simprevir advises avoid concomitant use; phenytoin possibly reduces plasma concentration of • DASABUVR and • MBTASFAR and • PARITAPREVR – avoid concomitant use; phenytoin possibly reduces the plasma concentration of • DOLTEGAVIR (see under Dolasetravir, p. 387); avoidance of phenytoin advised by manufacturer of • ELVITEGRAVIR, ETRAVIRINE, LEDIPSARVIR, SOFOSBUVIR and • TELAPREIR – phenytoin possibly reduces plasma concentration of • INDINAVIR, also plasma concentration of phenytoin possibly increased; phenytoin possibly reduces plasma concentration of RITONAVIR, also plasma concentration of phenytoin possibly affected; plasma concentration of phenytoin increased or decreased by • ZIDOVUDINE
  - Anxiolytics and Hypnotics: phenytoin often reduces plasma concentration of • CLONAZEPAM, plasma concentration of phenytoin increased or decreased by • DIAZEPAM, plasma concentration of phenytoin possibly increased or decreased by • BENZODIAZEPINES
  - Aprepitant: phenytoin possibly reduces plasma concentration of • APREMLIST – avoid concomitant use
  - Aprepitant: phenytoin possibly reduces plasma concentration of • APREMLIST
  - Bupropion: phenytoin reduces plasma concentration of • BUPROPION
  - Caffeine citrate: phenytoin reduces plasma concentration of • CAFFEINE CITRATE
  - Calcium-channel Blockers: phenytoin reduces effects of • FELODIPINE and VERAPAMIL; avoidance of phenytoin advised by manufacturer of ISRADIPINE; avoidance of phenytoin advised by manufacturer of NIMODIPINE (plasma concentration of nimodipine possibly reduced); plasma concentration of phenytoin increased by • DILTIAZEM but also effect of diltiazem reduced
  - Cannabis Extract: phenytoin possibly reduces plasma concentration of • CANNABIS EXTRACT – manufacturer of cannabis extract advises avoid concomitant use
  - Cardiac Glycosides: phenytoin possibly reduces plasma concentration of • DIGOXIN

Phenytoin (continued)

- Ciclosporin: phenytoin accelerates metabolism of • CICLOSPORIN (reduced plasma concentration)
- Cobecistat: phenytoin possibly reduces plasma concentration of • COBICISTAT – manufacturer of cobecistat advises avoid concomitant use
- Corticosteroids: phenytoin accelerates metabolism of • CORTICOSTEROIDS (reduced effect)
- Cytotoxics: phenytoin possibly reduces plasma concentration of • BUSULFAN, ERIBULIN and ETOPOSIDE; metabolism of phenytoin possibly inhibited by • CAPECITABINE, FLUOROURACIL and • TEGAFIR (increased risk of toxicity); phenytoin increases antifolate effect of • METHOTREXATE; plasma concentration of phenytoin possibly reduced by • ISPLATIN; phenytoin possibly decreases plasma concentration of • AXITINIB (increase dose of axitinib – consult axitinib product literature); phenytoin possibly reduces plasma concentration of • BORTEZOMIB, • BOSUTINIB, CRIZOTINIB, • IBRUTINIB, • IDEALISIB and • PONATITIN – manufacturer of bortezomib, bosutinib, crizotinib,ibrutinib, idealisib and ponatinib advises avoid concomitant use; phenytoin possibly reduces plasma concentration of • CABOZANTINIB – avoid concomitant use; avoidance of phenytoin advised by manufacturer of • CABAZITAXEL, DABRAFENIB, GEFITINIB, • LAPATINIB, • OLABAPRIB and • VEMURAFENIB; avoidance of phenytoin advised by manufacturer of • DASATIVITIN and • VISMODEGIB (plasma concentration of dasatinib and vismodegib possibly reduced); phenytoin reduces plasma concentration of • IMATINIB – avoid concomitant use; phenytoin reduces plasma concentration of • IRINOTECAN and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when phenytoin given with • PROCARBZINE
- Desmazoxide: absorption of phenytoin possibly reduced by • DESMAZOXANE
- Diazoxide: plasma concentration of phenytoin reduced by • DIAZOXIDE, also effect of diazoxide may be reduced
- Divalproex: metabolism of phenytoin inhibited by • DISULFIRAM (increased risk of toxicity)
- Diuretics: plasma concentration of phenytoin possibly increased by • ACETAZOLAMIDE; phenytoin antagonises effects of • FUROSEMIDE; phenytoin reduces plasma concentration of • SPIRENONE – avoid concomitant use; increased risk of osteomalacia when phenytoin given with • CARBONIC ANHYDRASE INHIBITORS
- Dopaminergics: phenytoin possibly reduces effects of • COBENELLOPA, CO-CARELDOPA and • LEVODOOPA
- Enteral Feeds: absorption of phenytoin possibly reduced by • ENTERAL FEEDS
- Folates: plasma concentration of phenytoin possibly reduced by • FOLATES
- Fosapirant: phenytoin possibly reduces plasma concentration of • FOSAPIRENT
- Guanaficine: phenytoin possibly reduces plasma concentration of • GUANAFICINE – increase dose of guanaficine
- Hormone Antagonists: phenytoin possibly reduces plasma concentration of • ABIRATERONE – manufacturer of abiraterone advises avoid concomitant use; phenytoin possibly accelerates metabolism of • TOREMIFENE
- HTR4 receptor Antagonists: phenytoin accelerates metabolism of • ONDANSTRON (reduced effect)
- Ivaclair: phenytoin possibly reduces plasma concentration of • IVACLOR – manufacturer of ivaclor advises avoid concomitant use
- Leflunomide: plasma concentration of phenytoin possibly increased by • LEFLUNOMIDE
- Lipid-regulating Drugs: absorption of phenytoin possibly reduced by • COLESEVELAM; combination of phenytoin with • FLUVASTATIN may increase plasma concentration of either drug (or both)
- Lithium: neurotoxicity may occur when phenytoin given with • LITHIUM without increased plasma concentration of lithium
- Macitentan: avoidance of phenytoin advised by manufacturer of • MACITENTAN
- Modafinil: plasma concentration of phenytoin possibly increased by • MODAFINIL
Phenytoin — Ponatinib

**Phenytoin** (continued)

- Muscle Relaxants: long-term use of phenytoin reduces effects of
  - NON-DEPOLARISING MUSCLE RELAXANTS (but acute use of phenytoin might increase effects of non-depolarising muscle relaxants)
- Oestrogens: phenytoin accelerates metabolism of
  - OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNF)
- Orostat: possible increased risk of convulsions when anti-epileptics given with
  - ORLISTAT
- Progesterone: phenytoin accelerates metabolism of
  - PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, estrogen-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNF)
- Roxulmest: phenytoin possibly inhibits effects of
  - ROFLUMILAST (manufacturer of roxulmest advises avoid concomitant use)
- Sulfipyrazole: plasma concentration of phenytoin increased by
  - SULFOPYRAZOLE
- Sympathomimetics: plasma concentration of phenytoin increased by
  - METHYLPHENIDATE
- Tacrolimus: phenytoin reduces plasma concentration of
  - TACROLIMUS, also plasma concentration of phenytoin possibly increased
- Theophylline: plasma concentration of both drugs reduced when phenytoin given with
  - THEOPHYLLINE
- Thyroid hormones: phenytoin accelerates metabolism of
  - THYROID HORMONES (may increase requirements in hypothyroidism), also plasma concentration of phenytoin possibly increased
- Ticlopidine: phenytoin accelerates metabolism of
  - TICLOPIDINE
- Ticagrelor: phenytoin possibly reduces plasma concentration of
  - TICAGRELOR
- Uler-healing Drugs: metabolism of phenytoin inhibited by
  - CIMETIDINE (increased plasma concentration); effects of phenytoin enhanced by
  - OMEPRAZOLE; absorption of phenytoin reduced by
  - SUCRALFATE
- Ulipristal: avoidance of phenytoin advised by manufacturer of
  - ULIPRISTAL (concomitant use of ulipristal possibly reduced)
- Vitamins: effects of phenytoin enhanced by
  - INFLUENZA VACCINE
- Vitamins: phenytoin possibly increases requirements for
  - ALFACALCIDOL, CALCIOTRIL, COLECALCIFEROL, DIHYDROTACHysterol, ERGOCALCIFEROL, PARICALCITOL or
  - VITAMIN D
- Phocodine
  - Antidepressants: manufacturer of phocodine advises avoid for 2 weeks after stopping MADIS

**Phosphodiesterase Type-3 inhibitors**

- Amanrelide: avoidance of enoximone and milrinone advised by manufacturer of
  - ANAGRELIDE

**Pilocarpine** see Parasympathomimetics

**Pimozide** see Antipsychotics

**Pindolol** see Beta-blockers

**Pipetazilone** see Antidiabetics

**Piperacillin** see Penicillins

**Piperazine** see Artemisin with Piperazine

**Pirfenidone**

- Antibacterials: plasma concentration of pirfenidone increased by
  - CIPROFLOXACIN—see under Pirfenidone, in BNF
- Antibacterials: plasma concentration of pirfenidone increased by
  - FLUOXAMINE—manufacturer of pirfenidone advises avoid concomitant use
- Grapefruit Juice: manufacturer of pirfenidone advises avoid concomitant use with
  - GRAPEFRUIT JUICE

**Piroxicam** see NSAIDs

**Pivmecillinam** see Penicillins

**Pixantrone**

- Antipsychotics: avoid concomitant use of cytotoxics with
  - FLUOXAMINE (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when cytotoxic antibiotics given with live
  - VACCINES—avoid concomitant use

**Pizotifen**

- Adrenergic Neurone Blockers: pizotifen antagonises hypotensive effect of
  - ADRENERGIC NEURONE BLOCKERS

**Platinum Compounds**

- Aldesleukin: avoidance of cisplatin advised by manufacturer of
  - ALDESLUKIN
- Antibacterials: increased risk of nephrotoxicity and possibly of otoxicity when platinum compounds given with
  - AMINOGLYCOSIDES or
  - POLYMIXINS; increased risk of nephrotoxicity and otoxicity when platinum compounds given with
  - CAPREOMYCIN; increased risk of nephrotoxicity and possibly of otoxicity when cisplatin given with
  - VANCOMYCIN
- Anti-epileptics: cisplatin possibly reduces plasma concentration of
  - FOSPHENYTOIN and
  - PHENYTOIN
- Antipsychotics: avoid concomitant use of cytotoxics with
  - CLOZAPINE (increased risk of agranulocytosis)
- Cytotoxics: increased risk of otoxicity when cisplatin given with
  - IFOSFAMIDE; increased pulmonary toxicity when cisplatin given with
  - BLEOMYCIN and
  - METHOTREXATE; avoidance of oxaliplatin advised by manufacturer of
  - PANITUMUMAB
- Diuretics: increased risk of nephrotoxicity and otoxicity when platinum compounds given with
  - DIURETICS

**Pneumococcal Vaccine** see Vaccines

**Polimyelitis Vaccine** see Vaccines

**Polymyxins**

- Antibacterials: increased risk of nephrotoxicity when colistimethate sodium or polymyxins given with
  - AMINOGLYCOSIDES; increased risk of nephrotoxicity when colistimethate sodium or polymyxins given with
  - CAPREOMYCIN; increased risk of nephrotoxicity when polymyxins given with
  - VANCOMYCIN; increased risk of nephrotoxicity and otoxicity when colistimethate sodium given with
  - VANCOMYCIN
- Antifungals: increased risk of nephrotoxicity when polymyxins given with
  - AMPHOTHERICIN
- Ciclopamine: increased risk of nephrotoxicity when polymyxins given with
  - CICLOSPORIN
- Cytotoxics: increased risk of nephrotoxicity and possibly of otoxicity when polymyxins given with
  - PLATINUM COMPOUNDS
- Diuretics: increased risk of otoxicity when polymyxins given with
  - LOOP DIURETICS
- Muscle Relaxants: polymyxins enhance effects of
  - NON-DEPOLARISING MUSCLE RELAXANTS and
  - SUXAMETHONIUM
- Parasympathomimetics: polymyxins antagonise effect of
  - NEOSTIGMINE and
  - PYRIDOSTIGMINE
- Vaccines: antibacterials inactivate
  - ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNF

**Polysaccharide—iron Complex** see Iron salts

**Poliostereate Sulfonate Resins**

- Antacids: risk of intestinal obstruction when polystereate sulfonate resins given with
  - ALUMINIUM HYDROXIDE; risk of metabolic alkalosis when polystereate sulfonate resins given with
  - ORAL MAGNESIUM SALTS
- Thyroid Hormones: polystereate sulfonate resins reduce absorption of
  - LEVOTHYROXINE

**Pomalidomide**

- Antidepressants: plasma concentration of pomalidomide increased by
  - FLUOXAMINE

**Ponatinib**

- Antibacterials: plasma concentration of ponatinib possibly increased by
  - CLARITHROMYCIN and
  - TELITHROMYCIN—consider reducing initial dose of ponatinib (see under Ponatinib, in BNF); plasma concentration of ponatinib possibly reduced by
  - RIFABUTIN—manufacturer of ponatinib advises avoid concomitant use; plasma concentration of ponatinib reduced by
  - RIFAMPICIN—manufacturer of ponatinib advises avoid concomitant use
- Antidepressants: plasma concentration of ponatinib possibly reduced by
  - ST JOHN’S WORT—manufacturer of ponatinib advises avoid concomitant use
- Antiepileptics: plasma concentration of ponatinib possibly reduced by
  - CARBAMAZEPINE, FOSPHENYTOIN, PHENOBARBITAL, PHENYTOIN and
  - PRIMIDONE—manufacturer of ponatinib advises avoid concomitant use
Ponatinib – Primidone

Ponatinib (continued)

- Antifungals: plasma concentration of ponatinib increased by ketoconazole; plasma concentration of ponatinib possibly increased by tacrolimus; and voriconazole—consider reducing initial dose of ponatinib (see under Ponatinib, in BNFC).
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis).
- Antiarrhythmics: plasma concentration of ponatinib possibly increased by propafenone and procainamide—consider reducing initial dose of ponatinib (see under Ponatinib, in BNFC).
- Grapefruit juice: plasma concentration of ponatinib possibly increased by grapefruit juice.

Prazosin see Alpha-blockers

Prednisolone see Corticosteroids

Prednisone see Corticosteroids

Pregabalin see Antiepileptics

Praziquantel (continued)

- Ulcer-healing Drugs: plasma concentration of praziquantel increased by cimetidine.

Prazosin see Alpha-blockers

Prednisolone see Corticosteroids

Prednisone see Corticosteroids

Pregabalin see Antiepileptics

Praziquantel

- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by paroxetine and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by sertraline and tricyclics (convulsive threshold lowered).
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by mefloquine.
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered).
- Orlistat: possible increased risk of convulsions when antiepileptics given with orlistat.

Prolamine

- Anti-arrhythmics: increased myocardial depression when prilocaine given with anti-arrhythmics.
- Antibacterials: increased risk of methaemoglobinemia when prilocaine given with sulfonamides.

Primadone

- Alcohol: increased sedative effect when primidone given with alcohol.
- Aminophylline: primidone accelerates metabolism of aminophylline (reduced effect).
- Analgesics: primidone reduces plasma concentration of methadone; primidone possibly accelerates metabolism of paracetamol (also isolated reports of hepatotoxicity).
- Antihelminths: primidone reduces plasma concentration of albendazole and praziquantel—consider increasing albendazole and praziquantel dose when given for systemic infections.
- Anti-arrhythmics: primidone accelerates metabolism of disopyramide (reduced plasma concentration); primidone possibly reduces plasma concentration of dronedarone—avoid concomitant use; primidone possibly accelerates metabolism of chloramphenicol (reduced plasma concentration).
- Anticancer: primidone accelerates metabolism of metronidazole (reduced effect); primidone possibly reduces plasma concentration of rifampicin; primidone accelerates metabolism of doxycycline (reduced plasma concentration); primidone possibly accelerates metabolism of chloramphenicol (reduced plasma concentration).
- Anticonvulsant effect of antiepileptics—consider increasing plasma concentration of primidone possibly reduces plasma concentration of telithromycin (avoid during and for 2 weeks after primidone).
- Anticoagulants: primidone possibly reduces plasma concentration of apixaban and edoxaban; primidone accelerates metabolism of coumarins (reduced anticoagulant effect); primidone possibly reduces plasma concentration of rivaroxaban—manufacturer of rivaroxaban advises monitor for signs of thrombosis.
- Antidepressants: primidone possibly reduces plasma concentration of reboxetine; primidone reduces plasma concentration of paroxetine; primidone accelerates metabolism of mianserin (reduced plasma concentration);
- Anticonvulsant effect of antiepileptics possibly antagonised by maois and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ssris and tricyclics (convulsive threshold lowered); plasma concentration of
**Primidone**
- Antidepressants (continued)
  - Primidone possibly reduced by: [ST JOHN'S WORT]—avoid concomitant use; primidone possibly accelerates metabolism of [TRICYCLES (reduced plasma concentration)].
- Antiepileptics: plasma concentration of primidone possibly increased by [CARBAMAZEPINE]; primidone possibly reduces plasma concentration of [ETHOSUXIMIDE, RUFINAMIDE and TOPiramate]; plasma concentration of primidone often increased by [FOSPHENITIN and PHENITOIN]; plasma concentration of fosphenityn and phenytoin often reduced but may be increased; primidone reduces plasma concentration of [LAMOTRIGINE, TIAGABINE and ZONISAMIDE]; plasma concentration of primidone increased by [SODIUM VALPROATE and VALPROIC ACID] (also plasma concentration of sodium valproate and valproic acid reduced); plasma concentration of primidone increased by: [STRIPEPTIL].
- Antifungals: primidone possibly reduces plasma concentration of [ITRACONAZOLE and POSACONAZOLE]; primidone possibly reduces plasma concentration of [VORICONAZOLE]—avoid concomitant use; primidone reduces absorption of [GRISOFULVIN] (reduced effect).
- Antimalarials: avoidance of primidone advised by manufacturer of [ARTENIMOL WITH PIPERAQUINE]; anticonvulsant effect of antiepileptics antagonised by: [MELOQUINE].
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by: [ANTIPSYCHOTICS (convulsive threshold lowered)]; primidone accelerates metabolism of [HALOPERIDOL] (reduced plasma concentration); plasma concentration of both drugs reduced when primidone given with [CHLORPROMAZINE]; primidone possibly reduces plasma concentration of [ARIPIPRAZOLE] (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); primidone possibly reduces plasma concentration of [CLOZAPINE]; primidone possibly reduces plasma concentration of [LURASIDONE]—avoid concomitant use.
- Antivirals: primidone possibly reduces plasma concentration of [ABACAVIR, DARUNAVIR, FOSAMPRENARVIR, INDINAVIR, LOPINAVIR and SAQUINAVIR]; avoidance of primidone advised by manufacturer of [BOCEPREVIR and RILPIVIRINE] (plasma concentration of boceprevir and rilpivirine possibly reduced); primidone possibly reduces plasma concentration of [DACLATASVIR and SIMPELVIR]—manufacturer of daclatasvir and simprevir advises avoid concomitant use; primidone possibly reduces plasma concentration of [DASABUVIR, OMBITASVIR and PARITASVIR]—avoid concomitant use; primidone possibly reduces the plasma concentration of [DOLUTEGRAVIR] (see under Dolutegravir, p. 387); avoidance of primidone advised by manufacturer of [ELVITEGRAVIR, ETRAVIRINE, LIDIPASVIR, SOFOSBUVIR and TELAPREVir].
- Anxiolytics and Hypnotics: increased sedative effect when primidone given with [ANXIOLYTICS AND HYPNOTICS]; primidone often reduces plasma concentration of [CLOZAPINE]—primidone possibly reduces plasma concentration of [APREPENDANT]—avoid concomitant use.
- Anavafin: primidone possibly reduces plasma concentration of [ANAVAFIN]—manufacturer of anavafin advises avoid concomitant use.
- Beta-blockers: primidone possibly reduces plasma concentration of [INDAPAMID].
- Caffeine citrate: effects of primidone possibly antagonised by [CAFFEINE CITRATE].
- Calcium-channel Blockers: primidone probably reduces effects of [CALCIUM-CHANNEL BLOCKERS]; avoidance of primidone advised by manufacturer of [NIFEDIPINE]; avoidance of primidone advised by manufacturer of [CYPHOSPerl].
- Cannabis Extract: primidone possibly reduces plasma concentration of [CANNABIS EXTRACT]—manufacturer of cannabis extract advises avoid concomitant use.
- Ciclosporin: primidone accelerates metabolism of [CICLOSPORIN] (reduced plasma concentration).

**Primidone** (continued)
- Ciclosporin: primidone possibly reduces plasma concentration of [CICLOSPORIN]—manufacturer of ciclosporin advises avoid concomitant use.
- Corticosteroids: primidone accelerates metabolism of [CORTICOSTEROIDS] (reduced effect).
- Cytoxics: primidone possibly decreases plasma concentration of [AXITINIB] (increase dose of axitinib—consult axitinib product literature); primidone possibly reduces plasma concentration of [BORTezOMIB, BOSUTINIB, CAbAZITAXEL and CABOZANTINIB]—manufacturer of bortezomib, bosutinib, cabazitaxel and cabozantinib advises avoid concomitant use; primidone possibly reduces plasma concentration of [CABOZANTINIB]—avoid concomitant use; avoidance of primidone advised by manufacturer of [CABAZITAXEL, DARAFENIB and GERCINIB]; avoidance of primidone advised by manufacturer of [DASATINIB and VANDETANIB] (plasma concentration of dasatinib and vandetanib possibly reduced); primidone possibly reduces plasma concentration of [ETOPOSIDE]; primidone reduces plasma concentration of [INTERFERON] and its active metabolite; manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when primidone given with [PROCARBAZINE].
- Diuretics: primidone reduces plasma concentration of [FOLARES]—avoid concomitant use; increased risk of osteomalacia when primidone given with [CARBONIC ANHYDRASE INHIBITORS].
- Folate: plasma concentration of primidone possibly reduced by [FOLATES].
- Fosaprepitant: primidone possibly reduces plasma concentration of [FOSAPRENTANT].
- Guanfacine: primidone possibly reduces plasma concentration of [GUANFACINE]—increase dose of guanfacine.
- Hormone Antagonists: primidone possibly reduces plasma concentration of [ABIRATERONE]—manufacturer of abiraterone advises avoid concomitant use; primidone accelerates metabolism of [Toremifene] (reduced plasma concentration).
- Ivacafar: primidone possibly reduces plasma concentration of [ICAVACAFAR]—manufacturer of ivacafar advises avoid concomitant use.
- Leukotriene Receptor Antagonists: primidone reduces plasma concentration of [MONTelukAST].
- Oestrogens: primidone accelerates metabolism of [OESTROGENS] (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNFC).
- Oral: possible increased risk of convulsions when antiepileptics given with [ORLUSTAT].
- Progestogens: primidone accelerates metabolism of [PROGESTOGENS] (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, eutogonstral-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNFC).
- Roflumilast: primidone possibly inhibits effects of [ROFLUMILAST] (manufacturer of roflumilast advises avoid concomitant use).
- Sodium Oxybate: avoidance of primidone advised by manufacturer of [SODIUM OXYBATE].
- Symptomhemitics: plasma concentration of primidone possibly increased by [METHYLPHENIDATE].
- Tacrolimus: primidone reduces plasma concentration of [TACROLIMUS].
- Theophylline: primidone accelerates metabolism of [THEOPHYLLINE] (reduced effect).
- Thyroid Hormones: primidone accelerates metabolism of [THYROID HORMONES] (may increase requirements for thyroid hormones in hypothyroidism).
- Ticagrelor: primidone possibly reduces plasma concentration of [TIGACRELOR].
- Ulipristal: avoidance of primidone advised by manufacturer of [ULIPRISTAL] (contraceptive effect of ulipristal possibly reduced).
- Vitamins: primidone possibly increases requirements for [ALFALCALCIDIOL, CALCITRIOL, COLECALCIFEROL, DHYDROXYCHYLSTEROL, ERGOCALCIFEROL, PARICALCITOL or VITAMIN D].
Procarbazine
- Alcohol: disulfiram-like reaction when procarbazine given with.
- Antiepileptics: manufacturer of procarbazine advises possible increased risk of hypersensitivity reactions when given with carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone.
- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis).
- Cardiac Glycosides: procarbazine possibly reduces absorption of digitoxin tablets.

Prochlorperazine see Antipsychotics.

Procyclidine see Antihistaminics.

Progesterone see Progestogens.

Progestogens
- Antifungal: plasma concentration of dienogest increased by erythromycin; metabolism of progestogens accelerated by rifampicins (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNFC).
- Anticoagulants: progestogens may enhance or reduce anticoagulant effect of coumarins; progestogens antagonise anticoagulant effect of phenindione.
- Antidepressants: contraceptive effect of progestogens reduced by ST JOHN'S WORT (avoid concomitant use).
- Antiadrenergics: progestogens antagonise hypoglycaemic effect of antidiabetics.
- Antiepileptics: metabolism of progestogens accelerated by carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rifinamide and topiramate (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNFC).
- Desogestrel possibly increases plasma concentration of lamotrigine.
- Antivirals: plasma concentration of drospirenone increased by ketocapazole; progestogens possibly increase plasma concentration of voriconazole; anecdotal reports of contraceptive failure and menstrual irregularities when progestogens given with orisefolin; occasional reports of breakthrough bleeding when progestogens (used for contraception) given with terbutaline.
- Antivirals: plasma concentration of norethisterone increased by propafenone (increased risk of myocardial depression when anti-arrhythmic given with propafenone); desogestrel possibly increases plasma concentration of lamotrigine.
- Antifungal: plasma concentration of drospirenone increased by ketoconazole; progestogens possibly increase plasma concentration of voriconazole; anecdotal reports of contraceptive failure and menstrual irregularities when progestogens given with orisefolin; occasional reports of breakthrough bleeding when progestogens (used for contraception) given with terbutaline.
- Antivirals: plasma concentration of norethisterone increased by propafenone (increased risk of myocardial depression when anti-arrhythmic given with propafenone); desogestrel possibly increases plasma concentration of lamotrigine.

Progesterone
- Antifungal: plasma concentration of drospirenone increased by ketoconazole; progestogens possibly increase plasma concentration of voriconazole; anecdotal reports of contraceptive failure and menstrual irregularities when progestogens given with orisefolin; occasional reports of breakthrough bleeding when progestogens (used for contraception) given with terbutaline.

Antivirals: plasma concentration of norethisterone increased by propafenone (increased risk of myocardial depression when anti-arrhythmic given with propafenone); desogestrel possibly increases plasma concentration of lamotrigine.

Progestogens
- Antifungal: plasma concentration of dienogest increased by erythromycin; metabolism of progestogens accelerated by rifampicins (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNFC).
- Anticoagulants: progestogens may enhance or reduce anticoagulant effect of coumarins; progestogens antagonise anticoagulant effect of phenindione.
- Antidepressants: contraceptive effect of progestogens reduced by ST JOHN'S WORT (avoid concomitant use).
- Antiadrenergics: progestogens antagonise hypoglycaemic effect of antidiabetics.
- Antiepileptics: metabolism of progestogens accelerated by carbamazepine, eslicarbazepine, fosphenytoin, oxcarbazepine, perampanel, phenobarbital, phenytoin, primidone, rifinamide and topiramate (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNFC).
- Desogestrel possibly increases plasma concentration of lamotrigine.
- Antivirals: plasma concentration of drospirenone increased by ketocapazole; progestogens possibly increase plasma concentration of voriconazole; anecdotal reports of contraceptive failure and menstrual irregularities when progestogens given with orisefolin; occasional reports of breakthrough bleeding when progestogens (used for contraception) given with terbutaline.
- Antivirals: plasma concentration of norethisterone increased by propafenone (increased risk of myocardial depression when anti-arrhythmic given with propafenone); desogestrel possibly increases plasma concentration of lamotrigine.

Antifungal: plasma concentration of drospirenone increased by ketoconazole; progestogens possibly increase plasma concentration of voriconazole; anecdotal reports of contraceptive failure and menstrual irregularities when progestogens given with orisefolin; occasional reports of breakthrough bleeding when progestogens (used for contraception) given with terbutaline.

Antivirals: plasma concentration of norethisterone increased by propafenone (increased risk of myocardial depression when anti-arrhythmic given with propafenone); desogestrel possibly increases plasma concentration of lamotrigine.

Antivirals: plasma concentration of norethisterone increased by propafenone (increased risk of myocardial depression when anti-arrhythmic given with propafenone); desogestrel possibly increases plasma concentration of lamotrigine.
Propafenone

- Antiarrhythmics (continued)
  - Propafenone advised by manufacturer of Telaprevir (risk of ventricular arrhythmias)
  - Beta-blockers: increased myocardial depression when antiarrhythmics given with Beta-blockers; propafenone increases plasma concentration of Metoprolol and Propranolol
  - Cardiac Glycosides: propafenone increases plasma concentration of Digoxin
  - Ciclosporin: propafenone possibly increases plasma concentration of Theophylline
  - Ulcer-healing Drugs: plasma concentration of propafenone increased by Cimetidine

Propantheline see Antimuscarinics
Propiverine see Antimuscarinics
Propofol see Anaesthetics, General
Propranolol see Beta-blockers
Prostaglandins
  - ACE inhibitors: enhanced hypotensive effect when alprostadil given with ACE inhibitors
  - Adrenergic Neurone Blockers: enhanced hypotensive effect when alprostadil given with Adrenergic Neurone Blockers
  - Alpha-blockers: enhanced hypotensive effect when alprostadil given with Alpha-blockers
  - Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when alprostadil given with Angiotensin-II Receptor Antagonists
  - Beta-blockers: enhanced hypotensive effect when alprostadil given with Beta-blockers
  - Calcium-channel Blockers: enhanced hypotensive effect when alprostadil given with Calcium-channel Blockers
  - Clonidine: enhanced hypotensive effect when alprostadil given with Clonidine
  - Diuretics: enhanced hypotensive effect when alprostadil given with Diuretics
  - Methyl-dopa: enhanced hypotensive effect when alprostadil given with Methyl-dopa
  - Moxonidine: enhanced hypotensive effect when alprostadil given with Moxonidine
  - Nitrates: enhanced hypotensive effect when alprostadil given with Nitrates
  - Oxytocin: prostaglandins potentiate uterotonic effect of Oxytocin
  - Vasodilator Antihypertensives: enhanced hypotensive effect when alprostadil given with Hydralazine, Minoxidil or Sodium Nitroprusside

Protein Kinase Inhibitors see individual drugs

Proton Pump Inhibitors
  - Antacids: absorption of lansoprazole possibly reduced by Antacids
  - Antibacterials: plasma concentration of both drugs increased when omeprazole given with Clarithromycin
  - Anticoagulants: pantoprazole might enhance the anticoagulant effect of Coumarins; esomeprazole and omeprazole possibly enhance anticoagulant effect of Coumarins
  - Antidepressants: omeprazole increases plasma concentration of Escitalopram; plasma concentration of lansoprazole possibly increased by Fluvoxamine; plasma concentration of omeprazole possibly reduced by St John’s Wort
  - Antiepileptics: esomeprazole enhances effects of Fosphenytoin and Phenytoin; omeprazole possibly enhances effects of Fosphenytoin and Phenytoin
  - Antifungals: proton pump inhibitors reduce absorption of Itraconazole and Ketoconazole; esomeprazole reduces plasma concentration of Posaconazole — manufacturer of posaconazole suspension advises avoid concomitant use; lansoprazole, omeprazole, pantoprazole and rabeprazole possibly reduce plasma concentration of Posaconazole — manufacturer of posaconazole suspension advises avoid concomitant use; pantoprazole and rabeprazole possibly increase plasma concentration of Posaconazole — manufacturer of posaconazole suspension advises avoid concomitant use; pantoprazole and rabeprazole possibly reduce plasma concentration of Voriconazole; plasma concentration of omeprazole increased by Voriconazole (consider reducing dose of omeprazole)
  - Antipsychotics: omeprazole possibly reduces plasma concentration of Clozapine
  - Antivirals: proton pump inhibitors reduce plasma concentration of Azacitidine (avoid or adjust dose of omeprazole)

SAQUINAVIR
  - Omeprazole reduces plasma concentration of Saquinavir with manufacturer of Saquinavir

THEOPHYLLINE
  - Propafenone possibly antagonises concentration of Theophylline
  - Propafenone possibly increases plasma concentration of Theophylline

Ulcer-healing Drugs: plasma concentration of propafenone increased by Cimetidine

Antifungals

- Antimycotics: voriconazole
  - Antiretroviral: saquinavir

Antibacterials

- Beta-lactam antibiotics
  - Inhibitors before Cilastrol: advice by manufacturer of Cilastrol
  - Omeprazole increases plasma concentration of Cilastrol

Cytotoxics

- Erlotinib: manufacturer of Erlotinib advises avoid concomitant use; plasma concentration of Erlotinib increases when omeprazole given with Erlotinib

Hormone Antagonists

- CYP3A4: manufacturer of Tadalafil advises avoid concomitant use; increased plasma concentration of Tadalafil when given with Omeprazole

Moxonidine

- Tolterodine: increased plasma concentration of Tolterodine when given with Omeprazole

Other

- Propafenone — manufacturer of Propafenone advises avoid concomitant use; increased plasma concentration of Propafenone when given with Propafenone

Sacubitril/valsartan

- Olepropazole: advice by manufacturer of Sacubitril/valsartan

Interactions

- Pseudoephedrine see Sympathomimetics

Pyrazinamide

- Antidepressants: pyrazinamide increases plasma concentration of Sulfonamides

Vaccines: antibacterials inactivate Oral Typhoid Vaccine — see under Typhoid Vaccine in BNFC

Pyridostigmine see Parasympathomimetics

Pyridoxine see Vitamins

Prismethamine

- Anticholinergics: increased anticholinergic effect when pyrimethamine given with Anticholinergics

Antiepileptics: pyrimethamine antagonises anticonvulsant effect of Antiepileptics; pyrimethamine, also increased anticonvulsant effect

Antimalarials: avoidance of antimalarials advised by manufacturer of Antimalarials

Antivirals: increased antiviral effect when pyrimethamine given with Antivirals
**Quinapril** see ACE Inhibitors

**Quinine**
- Anti-arrhythmics: increased risk of ventricular arrhythmias when quinidine given with moxifloxacin; avoided concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when quinidine given with tetracyclines (possible risk of ventricular arrhythmias); should not prevent the use of quinidine given with tetracyclines
- Anticonvulsants: plasma concentration of phenytoin possibly reduced by quinidine
- Antimalarials: increased risk of ventricular arrhythmias when quinidine given with mefloquine; avoidance of antimalarials advised by manufacturer
- Antipsychotics: increased risk of ventricular arrhythmias when quinidine given with clozapine, quetiapine, ziprasidone; possible increased risk of ventricular arrhythmias when quinidine given with risperidone, ziprasidone
- Antiretrovirals: increased risk of ventricular arrhythmias when quinidine given with lamivudine, stavudine, tenofovir, emtricitabine; should not prevent the use of lamivudine, stavudine, tenofovir, emtricitabine
- Antithyroid PUFA: absorption of ciprofloxacin possibly reduced by quinidine

**Quinolones** (continued)
- Increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with aminosalicylate
- Anti-arrhythmics: increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with disopyramide; avoided concomitant use
- Antibacterials: increased risk of ventricular arrhythmias when moxifloxacin given with parental erythromycin; avoided concomitant use; avoidance of moxifloxacin advised by manufacturer of bedaquiline; ciprofloxacin possibly increases plasma concentration of bedaquiline; avoided concomitant use if ciprofloxacin given for more than 14 days; increased risk of ventricular arrhythmias when moxifloxacin given with delamanid; effects of nalidixic acid possibly antagonised by nitrofurantoin; norfloxacin, ofloxacin, moxifloxacin increased risk of convulsions when ciprofloxacin advised by manufacturer of delamanid; possible increased risk of convulsions when moxifloxacin given with telithromycin
- Anticoagulants: ciprofloxacin and levofloxacin possibly enhance anticoagulant effect of coumarins; nalidixic acid, norfloxacin and ofloxacin enhance anticoagulant effect of coumarins
- Antidopaminergics: increased risk of ventricular arrhythmias when moxifloxacin given with memantine; levodopa possibly enhances anticoagulant effect of phenindione
- Antidepressants: avoidance of moxifloxacin advised by manufacturer of citalopram, escitalopram and venlafaxine (risk of ventricular arrhythmias); ciprofloxacin inhibits metabolism of duloxetine—avoided concomitant use; avoidance of ciprofloxacin advised by manufacturer of agomelatine; increased risk of ventricular arrhythmias when moxifloxacin given with tricyclics; avoided concomitant use
- Anti-diabetics: norfloxacin possibly enhances effects of glimepiride
- Antiepileptics: ciprofloxacin increases or decreases plasma concentration of fosphenytoin and phenytoin
- Antihistamines: increased risk of ventricular arrhythmias when moxifloxacin given with mizolastine; avoided concomitant use
- Antimalarials: avoidance of quinolones advised by manufacturer of artemether with lumefantrine; avoidance of moxifloxacin advised by manufacturer of artemisinin with piperazine (possible risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when moxifloxacin given with chloroquine, hydroxychloroquine, melflufen or quinine; avoided concomitant use
- Antipsychotics: increased risk of ventricular arrhythmias when moxifloxacin given with aripiprazole, ziprasidone; effects of nalidixic acid possibly antagonised by rifampicin
- Antiretrovirals: increased risk of ventricular arrhythmias when moxifloxacin given with didanosine, zidovudine, stavudine, tenofovir, emtricitabine; increased risk of ventricular arrhythmias when moxifloxacin given with cobicistat; increased risk of ventricular arrhythmias when moxifloxacin given with atazanavir, fosamprenavir, indinavir and tipranavir; increased risk of toxicity; plasma concentration of quinidine increased by ritonavir (increased risk of toxicity); increased risk of ventricular arrhythmias when quinidine given with saquinavir; avoided concomitant use
- Antiretroviral nucleoside analogs: increased risk of ventricular arrhythmias when moxifloxacin given with didanosine, zidovudine, stavudine, tenofovir, emtricitabine; increased risk of ventricular arrhythmias when moxifloxacin given with atazanavir, fosamprenavir, indinavir and tipranavir; increased risk of toxicity; plasma concentration of quinidine increased by ritonavir (increased risk of toxicity); increased risk of ventricular arrhythmias when quinidine given with saquinavir; avoided concomitant use
- Antithyroid PUFA: absorption of ciprofloxacin possibly reduced by quinidine
- Anti-inflammatory agents: increased risk of nephrotoxicity when quinolones given for more than 14 days; increased risk of ventricular arrhythmias when moxifloxacin given with delamanid; effects of nalidixic acid possibly antagonised by nitrofurantoin; norfloxacin, ofloxacin, moxifloxacin increased risk of convulsions when ciprofloxacin advised by manufacturer of delamanid; possible increased risk of convulsions when moxifloxacin given with telithromycin
- Anticoagulants: ciprofloxacin and levofloxacin possibly enhance anticoagulant effect of coumarins; nalidixic acid, norfloxacin and ofloxacin enhance anticoagulant effect of coumarins
- Antidopaminergics: increased risk of ventricular arrhythmias when moxifloxacin given with memantine; levodopa possibly enhances anticoagulant effect of phenindione
- Antidepressants: avoidance of moxifloxacin advised by manufacturer of citalopram, escitalopram and venlafaxine (risk of ventricular arrhythmias); ciprofloxacin inhibits metabolism of duloxetine—avoided concomitant use; avoidance of ciprofloxacin advised by manufacturer of agomelatine; increased risk of ventricular arrhythmias when moxifloxacin given with tricyclics; avoided concomitant use
- Anti-diabetics: norfloxacin possibly enhances effects of glimepiride
- Antiepileptics: ciprofloxacin increases or decreases plasma concentration of fosphenytoin and phenytoin
- Antihistamines: increased risk of ventricular arrhythmias when moxifloxacin given with mizolastine—avoided concomitant use
- Antimalarials: avoidance of quinolones advised by manufacturer of artemether with lumefantrine; avoidance of moxifloxacin advised by manufacturer of artemisinin with piperazine (possible risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when moxifloxacin given with chloroquine, hydroxychloroquine, melflufen or quinine; avoided concomitant use
- Antipsychotics: increased risk of ventricular arrhythmias when moxifloxacin given with aripiprazole, ziprasidone; effects of nalidixic acid possibly antagonised by rifampicin
- Antiretrovirals: increased risk of ventricular arrhythmias when moxifloxacin given with didanosine, zidovudine, stavudine, tenofovir, emtricitabine; increased risk of ventricular arrhythmias when moxifloxacin given with cobicistat; increased risk of ventricular arrhythmias when moxifloxacin given with atazanavir, fosamprenavir, indinavir and tipranavir; increased risk of toxicity; plasma concentration of quinidine increased by ritonavir (increased risk of toxicity); increased risk of ventricular arrhythmias when quinidine given with saquinavir; avoided concomitant use
- Antithyroid PUFA: absorption of ciprofloxacin possibly reduced by quinidine
Quinolones

- Cytoxics (continued)
  - ventricular arrhythmias when moxifloxacin given with:
    - ❮BOSUTINIB❯; ciprofloxacin possibly increases the plasma concentration of ❮BOSUTINIB❯—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; ciprofloxacin increases plasma concentration of ❮ERLOTINIB❯; ciprofloxacin possibly increases the plasma concentration of ❮IBRUTINIB❯—reduce dose of ibrutinib (see under ibritunib, in BNFC) due to increased risk of ventricular arrhythmias when moxifloxacin given with ❮VANDETANIB❯—avoid concomitant use; increased risk of ventricular arrhythmias when levofloxacin or moxifloxacin given with.
- Lipid-regulating Drugs:
  - Sevelamer: ciprofloxacin possibly inhibits metabolism of ❮ZOLMITRIPTAN❯ (reduce dose of zolmitryptan)
- Iron Salts:
  - absorption of moxifloxacin reduced by ❮IRON FLAVOSUM❯ (give at least 6 hours apart); absorption of ciprofloxacin reduced by ❮IRON FLAVOSUM❯ (give at least 2 hours before or 4 hours after ciprofloxacin absorption of levofloxacin, norfloxacin and ofloxacin reduced by ❮IRON ORAL❯ (give at least 2 hours apart)
- lanternum: absorption of quinolones possibly reduced by ❮LANTHANUM❯ (give at least 2 hours before or 4 hours after lanthanum)
- Muscle Relaxants: ciprofloxacin increases plasma concentration of ❮TIZANIDINE❯ (increased risk of toxicity)—avoid concomitant use; norfloxacin possibly increases plasma concentration of ❮TIZANIDINE❯ (increased risk of toxicity)
- Mycophenolate: norfloxacin possibly reduces bioavailability of ❮MYCOPHENOLATE❯
- Pentamidine Isetionate: increased risk of ventricular arrhythmias when moxifloxacin given with ❮PENTAMIDINE ISETIONATE❯
- Pipemidone: ciprofloxacin increases plasma concentration of ❮PIPERIDINE❯—see under Pipemidone, in BNFC
- Sevelamer: absorption of ciprofloxacin reduced by ❮SEVELAMER❯ (give at least 2 hours before or 4 hours after ciprofloxacin absorption of levofloxacin)
- Strontium Ranelate: absorption of quinolones reduced by ❮STRONTIUM RANELATE❯ (manufacturer of strontium ranelate advises avoid concomitant use)
- Theophylline: possible increased risk of convulsions when quinolones given with ❮THEOPHYLLINE❯; ciprofloxacin and norfloxacin increase plasma concentration of ❮THEOPHYLLINE❯
- Ulcer-healing Drugs: absorption of moxifloxacin reduced by ❮SUCRALFATE❯ (give at least 6 hours apart); absorption of levofloxacin, norfloxacin and ofloxacin reduced by ❮SUCRALFATE❯ (give at least 2 hours after ciprofloxacin)
- Vaccines: antibacterials inactivate ❮ORAL TYPHOID VACCINE❯—see under Typhoid Vaccine in BNFC
- Zink: absorption of moxifloxacin reduced by ❮ZINC❯ (give at least 6 hours apart); absorption of ciprofloxacin, levofloxacin, norfloxacin and ofloxacin reduced by ❮ZINC❯ (give at least 2 hours apart)

Rabeprazole see Proton Pump Inhibitors

Rabies Vaccine see Vaccines

Ranolazine

- Antidepressants: manufacturer of ranolazine advises avoid concomitant use with ❮DISOPYRAMIDE❯
- Antibacterials: plasma concentration of ranolazine possibly increased by ❮CLARITHROMYCIN❯ and ❮TELITHROMYCIN❯—manufacturer of ranolazine advises avoid concomitant use; plasma concentration of ranolazine reduced by ❮rifampicin❯—manufacturer of ranolazine advises avoid concomitant use
- Antidepressants: plasma concentration of ranolazine increased by ❮FLUOXETINE❯
- Antiarrhythmics: plasma concentration of ranolazine possibly increased by ❮ATAZANAVIR, DARUNAVIR, FOSAMPAVIR, INDINAVIR, LOPINAVIR, Ritonavir, saquinavir and tipranavir❯—manufacturer of ranolazine advises avoid concomitant use
- Beta-blockers: manufacturer of ranolazine advises avoid concomitant use with ❮SOTALOL❯
- Calcium-channel Blockers: plasma concentration of ranolazine increased by ❮DILTIAZEM AND VERAPAMIL❯ (consider reducing dose of ranolazine)
- Cardiac Glycosides: ranolazine increases plasma concentration of ❮DIGOXIN❯
- Cilopram: plasma concentration of both drugs may increase when ranolazine given with ❮CLOZAPINE❯
- Grapefruit Juice: plasma concentration of ranolazine possibly increased by ❮GRAPEFRUIT JUICE❯—manufacturer of ranolazine advises avoid concomitant use
- Lipid-regulating Drugs: ranolazine increases plasma concentration of ❮SIMVASTATIN❯ (see under Simvastatin, in BNFC); separating administration from ranolazine by 12 hours advised by manufacturer of ❮Lomitapide❯
- Tacrolimus: ranolazine increases plasma concentration of ❮TACROLIMUS❯

Rasagiline

- Antidepressants: increased risk of rash when rasagiline given with ❮FLUOXETINE❯; avoidance of rasagiline advised by manufacturer of ❮FLUOXETINE❯
- Orlistat: absorption of rasagiline possibly reduced by ❮ORLISTAT❯
- Ulcer-healing Drugs: plasma concentration of rasagiline increased by ❮FAMOTIDINE AND OMEPRAZOLE❯

Raltegravir (continued)

- Antivirals: increased risk of rash when raltegravir given with ❮DARUNAVIR❯; avoidance of raltegravir advised by manufacturer of ❮DARUNAVIR❯
- Orlistat: absorption of raltegravir possibly reduced by ❮ORLISTAT❯
- Antiarrhythmics: plasma concentration of raltegravir possibly reduced by ❮VANDETANIB❯—consider increasing dose of raltegravir

Rasagiline

- Antidepressants: increasing risk of rash when rasagiline given with ❮FLUOXETINE❯; avoidance of rasagiline advised by manufacturer of ❮FLUOXETINE❯
- Orlistat: absorption of rasagiline possibly reduced by ❮ORLISTAT❯
- Ulcer-healing Drugs: plasma concentration of rasaggravir increased by ❮FAMOTIDINE AND OMEPRAZOLE❯

Raltitrexed

- Anticancer drugs: avoid concomitant use of cytotoxic agents with ❮CLOZAPINE❯ (increased risk of agranulocytosis)
- Folate: manufacturer of raltitrexed advises avoid concomitant use with ❮FOLATES❯

drug interactions
Rasagiline (continued)  
» Dopaminergics: plasma concentration of rasagiline possibly reduced by ENTACAPONE  
» Memantine: effects of dopaminergics possibly enhanced by RIFABUTIN  
» Methyldopa: antiparkinsonian effect of dopaminergics antagonised by METHYLDOPA  
• Sympathomimetics: avoid concomitant use of rasagiline with  

Reboxetine  
• Antibacterials: manufacturer of reboxetine advises avoid concomitant use with  
  • MACROLIDES  
• Antidepressants: manufacturer of reboxetine advises avoid concomitant use with  
  • FLUOXETINE; increased risk of hypertension and CNS excitation when reboxetine given with  
  • MAOIs (MAOIs should not be started until 1 week after stopping reboxetine, avoid reboxetine for 2 weeks after stopping MAOIs)  
• Antiepileptics: plasma concentration of reboxetine possibly reduced by  
  • CARBAMAZEPINE, PHENOBARBITAL AND PRIMIDONE  
• Antifungals: manufacturer of reboxetine advises avoid concomitant use with  
  • IMIDAZOLES AND TRIAZOLES  
• Antimalarials: avoidance of antiparasitic advise by manufacturer of  
  • ARTEMETHER WITH LUMESNAFIRINE AND  
  • ARTEMINOL WITH PIPERAQUINE  
• Analgesics: possible increased risk of convulsions when antiparasitic given with  
• Antihypertensives: possible increased risk of hypokalaemia when reboxetine given with  
• Antipsychotics: possible antagonised by antiepileptics  
• Antitubercular: avoid concomitant use of antitubercular with  
• Antidepressants: possible increased risk of convulsions when given with  
• Duloxetine: — avoid concomitant use; increased risk of toxicity with duloxetine given with  
• ERADICAN; — avoid concomitant use  

Rifampicin see Rifamycins  
Rifabutin see Rifamycins  

Rifamycins  
• Note Interactions do not apply to rifaximin  
• ACE Inhibitors: rifampicin reduces plasma concentration of active metabolite of IMIDAPIR (reduced antihypertensive effect)  
• Aliskiren: rifampicin reduces plasma concentration of ALISKIREN  
• Ambisentan: rifampicin possibly increases plasma concentration of AMBISONTAN  
• Aminophylline: rifampicin accelerates metabolism of AMINOPHYLLINE (reduced plasma concentration)  
• Analgesics: rifampicin reduces plasma concentration of CELECOXIB, DICLOFENAC AND ETORICOXIB; rifampicin accelerates metabolism of ALFENTANIL, CODEINE, FENTANYL, METHADONE AND MORPHINE (reduced effect); rifampicin possibly accelerates metabolism of DOXYCYCLINE  
• Angiotensin II Receptor Antagonists: rifampicin reduces plasma concentration of LOSARTAN and its active metabolite  
• Antacids: absorption of rifampicin reduced by ANTACIDS  
• Antidepressants: rifampicin reduces plasma concentration of  
  • PRAZOSINTEL — avoid concomitant use  
• Anti-arrrhythmics: rifampicin accelerate metabolism of  
  • DISOPRAMIDE (reduced plasma concentration); rifampicin reduces plasma concentration of  
  • DRONEDARONE — avoid concomitant use; rifampicin accelerates metabolism of  
  • PROPafenONE (reduced effect)  
• Antibacterials: increased risk of side-effects including neutropenia when rifabutin given with  
  • AZITHROMYCIN; rifampicin reduces plasma concentration of  
• Antiepileptics: plasma concentration of rifampicin possibly reduced by  
  • CARBAMAZEPINE, FOSFENYTROXIN AND PHENOTYNOXIN  
• Antimalarials: antiepileptics antagonised by rifampicin  
• Antipsychotics: antiepileptics antagonised by  
• Antiparkinsonians:  
• Antitubercular: rifampicin reduces plasma concentration of  
  • BEDAQUILINE — manufacturer of bedaquiline advises avoid concomitant use; rifabutin possibly reduces plasma concentration of  
  • BEDAQUILINE — manufacturer of bedaquiline advises avoid concomitant use; rifampicin reduces plasma concentration of  
• Antivirals: increased risk of hepatotoxicity when rifampicin given with  
• Azathioprine: rifampicin possibly accelerates metabolism of  
  • AZATHIOPRINE (reduced anticoagulant effect); rifampicin reduces plasma concentration of
**Rifamycins**

- **Anticoagulants (continued)**
  - **DABIGATRAN**—manufacturer of dabigatran advises avoid concomitant use; rifampicin reduces plasma concentration of **EDOXABAN**; rifampicin reduces plasma concentration of **RIVAROXABAN**—manufacturer of rivaroxaban advises monitor for signs of thrombosis
- **Antidepressants**: rifampicin reduces plasma concentration of **LINOZOLID** (possible therapeutic failure of linezolid); rifampicin reduces plasma concentration of **VORTIOXETINE**—consider increasing dose of vortioxetine
- **Antidiabetics**: rifampicins accelerate metabolism of **TOLBUTAMIDE** (reduced effect);
  - **Aprepitant**: rifampicin reduces plasma concentration of **CANNABIS EXTRACT**
  - **Avanafil**: rifampicin reduces plasma concentration of **DACTASVIR**
  - **Daclatasvir**: rifampicin reduces plasma concentration of **NLAVIRIAVIR**
  - **FLUCONAZOLE**: rifampicin possibly reduces plasma concentration of **SAQUINAVIR**
  - **Maraviroc**: rifampicin possibly reduces plasma concentration of **TAFINITRIN**
  - **Omibitasvir**: rifampicin reduces plasma concentration of **TIPRANAVIR**
  - **Posaconazole**: rifampicin reduces plasma concentration of **PRIMIDONE**
  - **Ritonavir**: rifampicin reduces plasma concentration of **SIMPREVIR**
  - **SOFOSBUVIR**: rifampicin reduces plasma concentration of **SOFOSBUVIR**
  - **Tebipirone**: rifampicin reduces plasma concentration of **TIPRANAVIR**
  - **Telaprevir**: rifampicin reduces plasma concentration of **VORICONAZOLE**—manufacturer of **SULFONYLUREAS** (reduced effect)
- **Antiinfectives**
  - **Antimalarials**: rifampicins accelerate metabolism of **CLOZAPINE**
  - **Antihistamines**: rifampicin possibly reduces plasma concentration of **FLUCONAZOLE** (increased risk of uveitis—reduce rifabutin dose); rifampicin possibly reduces plasma concentration of **FOSPHENYTOIN** and **PHENYTOIN** (reduced plasma concentration); rifampicin reduces plasma concentration of **LAMOTRIGINE**; plasma concentration of rilpivirine possibly reduced by **PHENOBARBITAL** and **PRIMIDONE**
- **Antiepileptics**: rifampicin reduces plasma concentration of **CARRABAZEPINE**, rifampicins accelerate metabolism of **FOSFENYTIOIN** and **PHENYTOIN** (reduced plasma concentration); rifampicin reduces plasma concentration of **LAMOTRIGINE**; plasma concentration of rilpivirine possibly reduced by **PHENOBARBITAL** and **PRIMIDONE**
  - **Antirheumatics**: rifampicin reduces plasma concentration of **FLUCONAZOLE** (reduced effect), also plasma concentration of rifampicin may be reduced by ketoconazole; plasma concentration of rifabutin increased by **FLUCONAZOLE** (increased risk of uveitis—reduce rifabutin dose); rifampicin reduces plasma concentration of **FLUCONAZOLE** (reduced plasma concentration); rifabutin and rifampicin reduce plasma concentration of **ITRACONAZOLE**—manufacturer of itraconazole advises avoid concomitant use; plasma concentration of rifabutin increased by **POSACONAZOLE** (also plasma concentration of posaconazole reduced); rifampicin reduces plasma concentration of **ITRACONAZOLE**—manufacturer of itraconazole advises avoid concomitant use; plasma concentration of rifabutin increased by **POSACONAZOLE** and **TERBINAFINE**; plasma concentration of rifabutin increased by **VORICONAZOLE**, also rifabutin reduces plasma concentration of voriconazole (increase dose of voriconazole and also monitor for rifabutin toxicity); rifampicin reduces plasma concentration of **VORICONAZOLE**—avoid concomitant use; rifampicin initially increases and then reduces plasma concentration of **CASPOFUNGIN** (consider increasing dose of caspofungin); plasma concentration of rifabutin possibly increased by **ERITREAZOLE** (increased risk of uveitis—reduce rifabutin dose)
- **Antiinfectives**
  - **Antimalarials**: avoidance of rifampicin advised by manufacturer of artemether—lumefantrine; rifampicin reduces plasma concentration of **MEFLOQUINE**—avoid concomitant use; rifampicin reduces plasma concentration of **QUININE**
  - **Antimycotics**: rifampicin reduces plasma concentration of active metabolite of **FESOTERODIUM**—avoid concomitant use
  - **Antipsychotics**: rifampicin accelerates metabolism of **HALOPERIDOL** (reduced plasma concentration); rifabutin and rifampicin possibly reduce plasma concentration of **ARIPIPRAZOLE** (avoid concomitant use or consider increasing the dose of aripiprazole—consult aripiprazole product literature); rifampicin possibly reduces plasma concentration of **CLOZAPINE**; rifampicin reduces plasma concentration of **LURASIDE**—avoid concomitant use
  - **Antiinfectives**
  - **Antivirals**: rifampicin possibly reduces plasma concentration of **ABACAVIR**; rifampicin reduces plasma concentration of **ATAZANAVIR, DACLATASVIR, LOPINAVIR, NEVIRAPINE and RILPIVIRINE**—avoid concomitant use; plasma concentration of rifabutin increased by **ATAZANAVIR, DARUNAVIR, FOSAMPRENAVIR and TIPRANAVIR**—reduce dose of rifabutin; avoidance of rifampicin advised by manufacturer of **BOCEPREVIR** (plasma concentration of boceprevir possibly reduced); rifabutin possibly reduces plasma concentration of **DACLATASVIR**—manufacturer of dactasvir and simprevir advises avoid concomitant use; rifampicin significantly reduces plasma concentration of **DARUNAVIR, FOSAMPRENAVIR and TIPRANAVIR**—avoid concomitant use; rifampicin possibly reduces plasma concentration of **DACLATASVIR** and **SIMPREVIR**—manufacturer of dactasvir and simprevir advises avoid concomitant use; rifampicin significantly reduces plasma concentration of **DEMOCTRIBINE** and **NEMORACINE** and **VERAPAMIL** ( plasma concentration significantly reduced)
  - **Cannabis Extract**: rifampicin reduces plasma concentration of **CANNABIS EXTRACT**—manufacturer of cannabis extract advises avoid concomitant use
  - **Cardiac Glycosides**: rifampicin possibly reduces plasma concentration of **DIGOXIN**
Rifamycins (continued)

- Ciprofloxacin: rifampicin accelerates metabolism of CIPROFLOXACIN (reduced plasma concentration)
- Cobicistat: rifabutin reduces plasma concentration of COBICISTAT (reduced dose—lower product literature); rifampicin possibly reduces plasma concentration of COBICISTAT—manufacturer of cobicistat advises avoid concomitant use
- Corticosteroids: rifampicin accelerates metabolism of Corticosteroids (reduced effect)
- Cytotoxics: rifampicin possibly reduces effects of Cytotoxic (reduced effect)
- Deferasirox: rifampicin possibly reduces plasma concentration of DEFERASIROX (reduced plasma concentration)
- EPLERENONE: rifampicin reduces plasma concentration of EPLERENONE (reduced plasma concentration)
- Erythromycin: rifampicin reduces plasma concentration of ERYTHROMYCIN (reduced plasma concentration)
- Fludarabine: rifampicin reduces plasma concentration of FLUDARABINE (reduced plasma concentration)
- Fluvastatin: rifampicin reduces plasma concentration of FLUVASTATIN (reduced plasma concentration)
- Fosaprepitant: rifampicin reduces plasma concentration of FOSAPREPITANT (reduced plasma concentration)
- Guanfacine: rifabutin possibly reduces plasma concentration of GUANFACINE—increase dose of guanfacine; rifampicin reduces plasma concentration of GUANFACINE—increase dose of guanfacine
- Hormone Antagonists: rifampicin reduces plasma concentration of ABRATRONER—manufacturer of abiraterone advises avoid concomitant use; rifabutin possibly reduces plasma concentration of ABRATRONER—manufacturer of abiraterone advises avoid concomitant use; rifampicin possibly reduces plasma concentration of ABRATRONER—manufacturer of abiraterone advises avoid concomitant use; rifampicin accelerates metabolism of TAMOXIFEN (reduced plasma concentration)
- Ipratropium: rifampicin accelerates metabolism of IPRATROPium (reduced effect)
- Ivecac: rifabutin possibly reduces plasma concentration of IVACAR—manufacturer of ivacaftor advises avoid concomitant use; rifampicin reduces plasma concentration of IVACAR—manufacturer of ivacaftor advises avoid concomitant use
- Leflunomide: rifampicin possibly increases plasma concentration of Leflunomide (reduced plasma concentration of active metabolite of Leflunomide)
- Lipid-regulating Drugs: rifampicin possibly reduces plasma concentration of LIPID-REGULATING DRUGS (reduced effect)
- Macitentan: rifampicin reduces plasma concentration of MACITENTAN—avoid concomitant use
- Muscle Relaxants: rifampicin possibly reduces plasma concentration of Muscle Relaxants (reduced plasma concentration)
- Mycophenolate: rifampicin reduces plasma concentration of MYCOPHENOLATE (reduced plasma concentration)
- Netupitant: rifampicin reduces plasma concentration of NETUPITANT—avoid concomitant use
- Oestrogens: rifampicin accelerates metabolism of OESTROGENS (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNFC)
- Progestogens: rifampicin accelerates metabolism of PROGESTOGENS (reduced contraceptive effect with combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, etonogestrel-releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNFC)
- Ranolazine: rifampicin reduces plasma concentration of RANOLAZINE—manufacturer of ranolazine advises avoid concomitant use
- Rifampicin: rifampicin reduces plasma concentration of RIFAMPICIN—avoid concomitant use
- Roflumilast: rifampicin inhibits effects of ROFLUMILAST (manufacturer of roflumilast advises avoid concomitant use)
- Sirolimus: rifabutin and rifampicin reduce plasma concentration of SIROLIMUS—avoid concomitant use
- Tacrolimus: rifampicin reduces plasma concentration of TACROLIMUS; rifampicin reduces plasma concentration of TACROLIMUS
- Taladafil: rifampicin reduces plasma concentration of Tadalafil—manufacturer of tadalafil advises avoid concomitant use
- Teriflunomide: rifampicin reduces plasma concentration of TERIFLUNOMIDE
- Theophylline: rifampicin accelerates metabolism of THEOPHYLLINE (reduced plasma concentration)
- Thyroid Hormones: rifampicin accelerates metabolism of LEVOThyroxINE (may increase requirements for levothyroxine in hypothyroidism)
- Tobilone: rifampicin accelerates metabolism of TIBOLONE (reduced plasma concentration)
- Ticagrelor: rifampicin reduces plasma concentration of TICAGRELOR
- Tolvaptan: rifampicin reduces plasma concentration of TOLVAPTAN
- Ulcer-healing Drugs: rifampicin accelerates metabolism of CIMETIDINE (reduced plasma concentration)
- Ulipristal: avoidance of rifampicin advised by manufacturer of Ulipristal (contraceptive effect of ulipristal possibly reduced)
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNFC

Rifampicin

NOTE

Rifampicins interactions do not apply to rifampicin
- Anticoagulants: rifampicin possibly reduces anticoagulant effect of WARFARIN
- Cicleson: rifampicin plasma concentration of rifampicin increased by Cicleson (reduced plasma concentration)
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNFC

Rilpivirine

Analgesics: rilpivirine possibly reduces plasma concentration of METHADONE
- Antacids: manufacturer of rilpivirine advises give ANTACIDS 2 hours before or 4 hours after rilpivirine
- Antibacterials: manufacturer of rilpivirine advises avoid concomitant use with ANTIBACTERIALS; rifampicin increases plasma concentration of ERYTHROMYCIN (plasma concentration of rifampicin possibly increased); plasma concentration of rilpivirine decreased by Rifabutin (increase dose of rilpivirine—consult rilpivirine product literature); plasma concentration of rilpivirine reduced by Rifampicin—avoid concomitant use
- Anticoagulants: rilpivirine possibly increases plasma concentration of DABIGATRAN
Rilpivirine

Antidepressants: manufacturer of rilpivirine advises avoid concomitant use with
- ST JOHN’S WORT (plasma concentration of rilpivirine possibly reduced)
- Antiepileptics: manufacturer of rilpivirine advises avoid concomitant use with
  - CARBAMAZEPINE, FOSPHENYTION,
  - OXCARBAZEPINE, PHENOBARBITAL, PHENYTOIN and
  - PRIMIDONE (plasma concentration of rilpivirine possibly reduced)
- Antihistamines: manufacturer of rilpivirine advises give DIDANOSONE 2 hours before or 4 hours after rilpivirine; avoidance of rilpivirine by manufacturer of NEVIRAPINE
- Calcium Salts: manufacturer of rilpivirine advises give CALCIUM SALTS 2 hours before or 4 hours after rilpivirine
- Corticosteroids: manufacturer of rilpivirine advises avoid concomitant use with DEXAMETHASONE (except when given as a single dose)
- Orlistat: absorption of rilpivirine possibly reduced by
- Ulcer-healing Drugs: manufacturer of rilpivirine advises avoid concomitant use with ESOMEPRAZOLE, Lansoprazole, Pantoprazole and Rabeprazole (plasma concentration of rilpivirine possibly reduced); plasma concentration of rilpivirine reduced by OMEPRAZOLE; plasma concentration of either drug (or both) reduced by manufacturer of rilpivirine advises avoid HISTAMINE H2-ANTAGONISTS for 12 hours before or 4 hours after rilpivirine—consult product literature

Riociguat

- Antacids: absorption of riociguat reduced by ANTACIDS (give at least 2 hours before or 1 hour after riociguat)
- Antifungals: manufacturer of riociguat advises avoid concomitant use with ITRACONAZOLE, KETOCONAZOLE and VORICONAZOLE
- Antihypertensives: manufacturer of riociguat advises avoid concomitant use with RITONAVIR
  - AVANAFIL: possible enhanced hypotensive effect when riociguat given with AVANAFIL—avoid concomitant use
  - Bosentan: plasma concentration of riociguat reduced by BOSENTAN
  - Nicardipine: possible enhanced hypotensive effect when riociguat given with NICARDIPINE—avoid concomitant use
  - Nitrates: possible enhanced hypotensive effect when riociguat given with NITRATES—avoid concomitant use
  - Sildenafil: enhanced hypotensive effect when riociguat given with SILDENIFIL—avoid concomitant use
  - Tadalafil: possible enhanced hypotensive effect when riociguat given with TADALAFIL—avoid concomitant use
  - Vardenafil: possible enhanced hypotensive effect when riociguat given with VARDENAFIL—avoid concomitant use

Risedronate Sodium see Bisphosphonates

Risperidone see Antipsychotics

Ritonavir

- Anti-arrhythmics (continued)
  - plasma concentration of FLECAINIDE (increased risk of ventricular arrhythmias—avoid concomitant use)
  - Antibacterials: ritonavir possibly increases plasma concentration of AZITHROMYCIN and ERYTHROMYCIN; ritonavir increases plasma concentration of CLARITHROMYCIN (reduce dose of clarithromycin in renal impairment); ritonavir increases plasma concentration of Rifabutin (increased risk of toxicity—reduce rifabutin dose); plasma concentration of ritonavir reduced by RIFAMPICIN; ritonavir possibly increases plasma concentration of BEDAQUILINE—manufacturer of ritonavir advises avoid concomitant use; ritonavir increases plasma concentration of DELAMANID; plasma concentration of both drugs increased when ritonavir given with RUSUSIDIC ACID—avoid concomitant use; avoidance of concomitant ritonavir in severe renal and hepatic impairment advised by manufacturer of TELITHROMYCIN
  - Anticoagulants: ritonavir may enhance or reduce anticoagulant effect of WARFARIN; avoidance of ritonavir advised by manufacturer of ARIXIBAN; ritonavir possibly enhances anticoagulant effect of CUMARINS and PHENINDIONE; ritonavir increases plasma concentration of RIVAROXABAN—avoid concomitant use
  - Antidepressants: ritonavir possibly reduces plasma concentration of PAROXETINE; ritonavir increases plasma concentration of Trazodone (increased risk of toxicity); ritonavir possibly increases plasma concentration of SSB3S and TRICYCLES; plasma concentration of ritonavir reduced by ST JOHN’S WORT—avoid concomitant use
  - Antiepileptics: ritonavir possibly increases plasma concentration of TOLBUTAMIDE
  - Antiepileptics: ritonavir possibly increases plasma concentration of CARBAMAZEPINE; plasma concentration of ritonavir possibly reduced by FOSPHENYTION and PHENYTOIN, also plasma concentration of fosphenytogen and phenytoin possibly affected; ritonavir possibly reduces plasma concentration of LAMOTRIGINE, SODIUM VALPROATE and VALPROIC ACID
  - Antifungals: ritonavir increases plasma concentration of KETOCONAZOLE (reduce dose of ketoconazole); plasma concentration of ritonavir increased by FLUCONAZOLE; combination of ritonavir with ITRACONAZOLE may increase plasma concentration of either drug (or both); ritonavir reduces plasma concentration of VORICONAZOLE—avoid concomitant use
  - Antihistamines: ritonavir possibly increases plasma concentration of NON-SEDATING ANTIHISTAMINES
  - Antimalarials: caution with ritonavir advised by manufacturer of ARTEMETHER WITH LUMEFANTRINE; plasma concentration of ritonavir possibly reduced by MEFLOQUINE; ritonavir increases plasma concentration of QUININE (increased risk of toxicity)
  - Antimuscarinics: avoidance of ritonavir advised by manufacturer of DARIFENACIN and TOLERODINE; manufacturer of fosoterodine advises dose reduction when ritonavir given with FESOTERODINE—consult fosoterodine product literature; ritonavir possibly increases plasma concentration of SOLIFENACIN—see under Solifenacin, in BNF
  - Antipsychotics: ritonavir possibly increases plasma concentration of ANTIPSYCHOTICS; ritonavir possibly increases plasma concentration of ARIPIPRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); manufacturer of ritonavir advises avoid concomitant use with ARIPIPRAZOLE; ritonavir possibly increases plasma concentration of Lurasidone—avoid concomitant use; ritonavir reduces plasma concentration of OLANZAPINE—consider increasing dose of olanzapine; ritonavir increases plasma concentration of MOXIDIZIDE (increased risk of ventricular arrhythmias—avoid concomitant use); ritonavir possibly increases plasma concentration of QUETAPINE—manufacturer of quetiapine advises avoid concomitant use
  - Antibiotics: plasma concentration of both drugs reduced when ritonavir given with ROCEPREVIR; manufacturer of ritonavir advises ritonavir and DIDANOSONE should be taken 2.5 hours apart; ritonavir increases the toxicity of EFAVIRENZ, monitor
Ritonavir

- Antivirals (continued)

  Liver function tests — manufacturer of Atripla® advises avoid concomitant use with high-dose ritonavir; ritonavir increases plasma concentration of indinavir, maraviroc and simvastatin. Ritonavir increases plasma concentration of SIMPREVIR — manufacturer of simprevir advises avoid concomitant use; ritonavir possibly reduces plasma concentration of telaprevir.

Cytotoxics:

- Cobicistat:
- Ciclosporin:

Cardiac Glycosides:

- Calcium-channel blockers: ritonavir possibly increases plasma concentration of calcium-channel blockers; ritonavir increases plasma concentration of amloidipine (reduce dose of amloidipine); avoidance of ritonavir advised by manufacturer of Lercanidipine.

Cardiac Glycosides: ritonavir possibly increases plasma concentration of digoxin.

- Ciclosporin: ritonavir possibly increases plasma concentration of ciclosporin.

- Citrulline: ritonavir possibly increases plasma concentration of citrulline.

- Corticosteroids: ritonavir possibly increases plasma concentration of corticosteroids — increased risk of adrenal suppression; ritonavir possibly increases plasma concentration of budesonide (including inhaled, intranasal, and rectal budesonide) — increased risk of adrenal suppression; ritonavir increases plasma concentration of inhaled and intranasal fluticasone — increased risk of adrenal suppression; ritonavir increases plasma concentration of inhaled and intranasal flunisolide injection — increased risk of adrenal suppression.

- Cytotoxic: ritonavir increases the plasma concentration of afatinib — manufacturer of afatinib advises separating administration of ritonavir by 6 to 12 hours; ritonavir possibly increases plasma concentration of axitinib (reduce dose of axitinib — consult axitinib product literature); ritonavir possibly increases the plasma concentration of bosutinib and cabazitaxel; ritonavir possibly increases plasma concentration of cabozantinib and vinblastine; ritonavir possibly increases plasma concentration of crizotinib.

- Everolimus, nilotinib and vinelflunine — manufacturer of crizotinib, everolimus, nilotinib and vinelflunine advises avoid or consider reducing dose of bosutinib and cabazitaxel; ritonavir possibly increases plasma concentration of dasatinib (plasma concentration of dasatinib possibly increased); ritonavir possibly increases plasma concentration of crizotinib.

- Eperarotinib: ritonavir possibly increases plasma concentration of brutinib — reduce dose of brutinib (see under brutinib, in BNF); avoidance of ritonavir advised by manufacturer of lapatinib; ritonavir possibly increases plasma concentration of pazopanib (reduce dose of pazopanib); ritonavir possibly increases plasma concentration of ponatinib — consider reducing initial dose of ponatinib (see under Ponatinib, in BNF); manufacturer of ruxolitinib advises dose reduction when ritonavir given with ruxolitinib — consult ruxolitinib product literature; ritonavir possibly increases plasma concentration of docetaxel — manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose; ritonavir increases plasma concentration of paclitaxel.

- Dapotexine: avoidance of ritonavir advised by manufacturer of datotexine (increased risk of toxicity).

- Eplerenone: avoid concomitant use.

- Domperidone: possible increased risk of ventricular arrhythmias when ritonavir given with domperidone — avoid concomitant use.

- Ergot Alkaloids: increased risk of ergotism when ritonavir given with ergot alkaloids — avoid concomitant use.

- Fosaprepitant: ritonavir possibly increases plasma concentration of fosaprepitant.

- Guanfacine: ritonavir possibly increases plasma concentration of guanfacine.

- Hormones: (including ultrasound and transabdominal) may be significantly increased when given with ritonavir; halve dose of guanfacine.

- HRT-receptor Agonists: ritonavir increases plasma concentration of elagrisitin (risk of toxicity) — avoid concomitant use.

- Ibrutinib: possible increased risk of myeloproliferative disorder when ritonavir given with ibrutinib — avoid concomitant use.

- Ivermectin: possibly increased risk of myeloproliferative disorders when ritonavir given with ivermectin — avoid concomitant use.

- Ivabradine: ritonavir possibly increases plasma concentration of ivabradine — avoid concomitant use.

- Lipid-regulating Drugs: ritonavir possibly increases plasma concentration of atorvastatin; possible increased risk of myopathy when ritonavir given with rosuvastatin — manufacturer of rosuvastatin advises avoid concomitant use; increased risk of myopathy when ritonavir given with simvastatin (avoid concomitant use); avoidance of ritonavir advised by manufacturer of lixitapide (plasma concentration of lixitapide possibly increased).

- Mirabegron: when given with ritonavir avoid or reduce dose of mirabegron in hypertensive or renal impairment — see Mirabegron, in BNF.

- Oestrogens: ritonavir accelerates metabolism of oestrogens (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings — see Contraceptive Interactions in BNFC).

- Orlistat: absorption of ritonavir possibly reduced by orlistat.

- Ranolazine: ritonavir possibly increases plasma concentration of ranolazine — manufacturer of ranolazine advises avoid concomitant use.

- Rosuvastatin/ledipasivir: avoidance of ritonavir advised by manufacturer of rosiglitazone.

- Sildenafil: ritonavir significantly increases plasma concentration of sildenafil — avoid concomitant use with sildenafil for erectile dysfunction (consult sildenafil product literature).

- Simvastatin/lovastatin: ritonavir possibly increases plasma concentration of simvastatin/lovastatin — avoid concomitant use with simvastatin/lovastatin for pulmonary arterial hypertension.

- Theophylline: ritonavir accelerates metabolism of theophylline.

- Ticagrelor: ritonavir possibly increases plasma concentration of ticagrelor — manufacturer of ticagrelor advises avoid concomitant use.

- Ulipristal: avoidance of ritonavir advised by manufacturer of ulipristal (contraceptive effect of ulipristal possibly reduced).

- Vardenafil: ritonavir increases plasma concentration of vardenafil — avoid concomitant use.

Rituximab

- Antipsychotics: avoid concomitant use of cytoxotics with clozapine (increased risk of agranulocytosis).

- Contraceptive Interactions in BNFC (continued)
### Anticoagulants

- **Anticoagulants given with Anticoagulants or using heparin to maintain catheter concomitant use except when switching with other anticoagulants or using heparin to maintain catheter patency**;
- Increased risk of haemorrhage when anticoagulants given with **Ketorolac** (avoid concomitant use, including low-dose heparins);
- Increased risk of haemorrhage when anticoagulants given with **Ketorolac** (avoid concomitant use, including low-dose heparins);
- Antithrombotics: manufacturer of rivaroxaban advises avoid concomitant use with **Dronedarone**

#### Antidepressants

- Antidepressants: manufacturer of rivaroxaban advises monitor for signs of thrombosis

#### Antibacterials

- Antibacterials: manufacturer of rivaroxaban advises monitor for signs of thrombosis

#### Anticoagulants

- Anticoagulants: manufacturer of rivaroxaban advises monitor for signs of thrombosis

#### Antifungals

- Antifungals: manufacturer of rivaroxaban advises monitor for signs of thrombosis

#### Analgesics

- Analgesics: manufacturer of rivaroxaban advises monitor for signs of thrombosis

#### Roflumilast

- Roflumilast: manufacturer of roxolitinib advises avoid concomitant use of **Antipsychotics (agonist of effect)**

#### Rituximab

- Rituximab: manufacturer of rituximab advises avoid concomitant use of **Antipsychotics (agonist of effect)**

#### Ropinirole

- Ropinirole: manufacturer of ropinirole advises avoid concomitant use of **Antipsychotics (agonist of effect)**

#### Ruxolitinib

- Ruxolitinib: manufacturer of ruxolitinib advises dose reduction when ruxolitinib given with **Atorvastatin**

#### Sacubitril

- Sacubitril: manufacturer of sacubitril advises avoid **ACE inhibitors** for 36 hours before or after sacubitril

#### St John’s Wort

- St John’s Wort: manufacturer of St John’s Wort possibly reduces plasma concentration of **Aminophylline**
St John’s Wort (continued)

• Anti-arrhythmics: St John’s wort possibly reduces plasma concentration of:
  ▶ DRONEDARONE—avoid concomitant use

• Antibacterials: St John’s wort possibly reduces plasma concentration of:
  ▶ BEDAOUIIL—manufacturer of bedaquiline advises avoid concomitant use; St John’s wort reduces plasma concentration of:
  ▶ TELITHROMYCIN (avoid during and for 2 weeks after St John’s wort)

• Anticoagulants: St John’s wort possibly reduces plasma concentration of:
  ▶ DAPSOXETINE—manufacturer of dapoxetine advises avoid concomitant use; St John’s wort reduces plasma concentration of:
  ▶ RIVAROXABAN—manufacturer of rivaroxaban advises monitor for signs of concomitant use

• Antidepressants: possible increased serotonin effects when St John’s wort given with:
  ▶ DULOXETINE, VENLAFAXINE or VORTIOXETINE; St John’s wort reduces plasma concentration of:
  ▶ AMITRIPTYLINE; increased serotonin effects when St John’s wort given with:
  ▶ SOX—avoid concomitant use

• Antiemetics: St John’s wort possibly reduces plasma concentration of:
  ▶ CARBAMAZEPINE; St John’s wort possibly reduces plasma concentration of:
  ▶ FOSPHENYTIOIN, PHENOBARBITAL, PHENTYOIN and PRIMIDONE—avoid concomitant use

• Antifungals: St John’s wort reduces plasma concentration of:
  ▶ VIRCONAZOLE—avoid concomitant use

• Antimalarials: avoidance of antimalarials advised by:
  ▶ RAPIDMALAR WITH LUMESANTRINE and ARTEMINOL WITH PIPERAQUE

• Antimuscarinics: St John’s wort possibly reduces plasma concentration of active metabolite of:
  ▶ FESOTERODINE—manufacturer of fesoterodine advises avoid concomitant use

• Antiplatelets: St John’s wort possibly reduces plasma concentration of:
  ▶ APIXABAN; St John’s wort possibly reduces plasma concentration of:
  ▶ AMIODARONE—avoid concomitant use or consider increasing the dose of amiodarone—consult aripiprazole product literature); St John’s wort possibly reduces plasma concentration of:
  ▶ LURASIDONE—avoid concomitant use

• Antivirals: St John’s wort reduces plasma concentration of:
  ▶ ATAZANAVIR, DARUNAVIR, Efavirenz, FOSAMPRAGAVIR, INDINAVIR, LOPINAVIR, NEVIRAPINE, RITONAVIR and SAQUINAVIR—avoid concomitant use; St John’s wort possibly reduces plasma concentration of:
  ▶ DACLATASVIR, DASABUVIR, OMBITASVIR, PARITAPREVIR and SIMPREEVIR—manufacturer of daclatasvir, dasabuvir, ombitasvir, paritaprevir and simprevir advises avoid concomitant use; St John’s wort possibly reduces the plasma concentration of:
  ▶ DULLUTEGRAVIR (see under Dolutegravir, p. 387); avoidance of St John’s wort advised by manufacturer of:
  ▶ ELTVEGRAVIR, ETAVRIRINE, LEDIPASVIR, SOFOBUVIR and TELAPREVIR; St John’s wort possibly reduces plasma concentration of:
  ▶ MARAVIROC and TIPRANAVIR—avoid concomitant use; avoidance of St John’s wort advised by manufacturer of:
  ▶ RILPIVERSINE (plasma concentration of rilpivirine possibly reduced)

• Anxiolytics and Hypnotics: St John’s wort possibly reduces plasma concentration of:
  ▶ ORAL MIDAZOLAM

• Apremilast: St John’s wort possibly reduces plasma concentration of:
  ▶ APREMILAST—avoid concomitant use

• Aprepitant: avoidance of St John’s wort advised by manufacturer of:
  ▶ APREPITANT

• Atomoxetine: possible increased risk of convulsions when:
  ▶ Antidepressants given with atomoxetine

• Calcium-channel blockers: St John’s wort possibly reduces plasma concentration of:
  ▶ AMLODIPINE and FELODIPINE; St John’s wort reduces plasma concentration of:
  ▶ NFEDIPINE; St John’s wort significantly reduces plasma concentration of:
  ▶ VERAPAMIL

• Cannabis Extract: St John’s wort possibly reduces plasma concentration of:
  ▶ CANNABIS EXTRACT—manufacturer of cannabis extract advises avoid concomitant use

St John’s Wort (continued)

• Cardiac Glycosides: St John’s wort reduces plasma concentration of:
  ▶ DIGOXIN—avoid concomitant use

• Ciclosporin: St John’s wort reduces plasma concentration of:
  ▶ CICLOSPORIN—avoid concomitant use

• Cobicitstat: St John’s wort possibly reduces plasma concentration of:
  ▶ COBICISTAT—manufacturer of cobicitstat advises avoid concomitant use

• Cytotoxics: St John’s wort possibly reduces plasma concentration of:
  ▶ AXITINIB—consider increasing dose of axitinib; St John’s wort possibly reduces plasma concentration of:
  ▶ BORTEZOMIB, BOSONUTIN, CAPAZANTINIB, CRIZOTINIB, EVEROLIMUS, IBRUTINIB, IDELISLISH, PONATINIB and VINFLUNINE—manufacturer of bortezomib, bosnutin, capazantine, crizotinib, everolimus, ibrutinib, idelislish, ponatinib and vinflunine advises avoid concomitant use; avoidance of St John’s wort advised by manufacturer of:
  ▶ CABAZITAXEL, DABRAPHENIN, GEFITINIB, LAPATINIB, OLAPARIB and VEMURAFINIB; St John’s wort reduces plasma concentration of:
  ▶ MATNIB—avoid concomitant use; avoidance of St John’s wort advised by manufacturer of:
  ▶ VANDENABIN and VISMODEGIB (plasma concentration of vandetanib and vismodegib possibly reduced); St John’s wort possibly reduces plasma concentration of:
  ▶ ERIBULIN; St John’s wort accelerates metabolism of:
  ▶ RIVAROXABAN (reduced plasma concentration—avoid concomitant use)

• Dapoxetine: possible increased risk of serotonin effects when St John’s wort given with:
  ▶ DAPOXETINE (manufacturer of dapoxetine advises St John’s wort should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping St John’s wort)

• Diuretics: St John’s wort reduces plasma concentration of:
  ▶ EPLERENONE—avoid concomitant use

• Fingolimod: St John’s wort possibly reduces plasma concentration of:
  ▶ FINGLIMOD—manufacturer of fingolimod advises avoid concomitant use

• Fosapreptant: avoidance of St John’s wort advised by manufacturer of:
  ▶ FOSAPREPTANT

• Guanfacine: St John’s wort possibly reduces plasma concentration of:
  ▶ GUANFACINE—increase dose of guanfacine

• Hormone Antagonists: St John’s wort possibly reduces plasma concentration of:
  ▶ ABIRATERONE—manufacturer of abiraterone advises avoid concomitant use

• SHT receptor Agonists: increased serotonin effects when St John’s wort given with:
  ▶ SHT, AGONISTS—avoid concomitant use

• Ivabradine: St John’s wort reduces plasma concentration of:
  ▶ IVABRADINE—avoid concomitant use

• Ivacaftor: St John’s wort possibly reduces plasma concentration of:
  ▶ IVACAFTOR—manufacturer of ivacaftor advises avoid concomitant use

• Lipid-regulating Drugs: St John’s wort reduces plasma concentration of:
  ▶ SIMVASTATIN

• Macitentan: avoidance of St John’s wort advised by manufacturer of:
  ▶ MACITENTAN

• Oestrogens: St John’s wort reduces contraceptive effect of:
  ▶ OESTROGENS (avoid concomitant use)

• Progestogens: St John’s wort reduces contraceptive effect of:
  ▶ PROGESTOGENs (avoid concomitant use)

• Tacrolimus: St John’s wort reduces plasma concentration of:
  ▶ TACROLIMUS—avoid concomitant use

• Theophylline: St John’s wort possibly reduces plasma concentration of:
  ▶ THEOPHYLLINE

• Ulcer-healing Drugs: St John’s wort possibly reduces plasma concentration of:
  ▶ OMEPRAZOLE

• Ulipristal: avoidance of St John’s wort advised by manufacturer of:
  ▶ ULIPRISTAL (contraceptive effect of ulipristal possibly reduced)

Salbutamol see Sympathomimetics, Beta2
Salmeterol see Sympathomimetics, Beta2
Saquinavir
• Analgesics: increased risk of ventricular arrhythmias when saquinavir given with:
  ▶ ALFENTANIL, FENTANYL or METHADONE—avoid concomitant use

• Anti-arrhythmics: increased risk of ventricular arrhythmias when saquinavir given with:
  ▶ AMIODARONE, DISOPYRAMIDE,
Squainavir

- **Anti-arrhythmics** (continued)

  - **DRONEDARONE**, **FLECAINIDE**, **LIDOCAINE** or **PROPafenONE**—avoid concomitant use
  - **Antibacterials**: plasma concentration of both drugs possibly increased when saquinavir given with **CLARITHROMYCIN** (increased risk of ventricular arrhythmias); increased risk of ventricular arrhythmias when saquinavir given with **DAPSONE**, **ERYTHROMYCIN** or **MOXIFLOXACIN**—avoid concomitant use; saquinavir increases plasma concentration of **RIFABUTIN** (also plasma concentration of saquinavir reduced)—reduce rifabutin dose; plasma concentration of saquinavir significantly reduced by **RIFAMPICIN**, also risk of hepatotoxicity—avoid concomitant use; increased risk of ventricular arrhythmias when **RANOLAZINE** given with **SOTALOL**—avoid concomitant use
  - **Anticoagulants**: plasma concentration of both drugs may increase when saquinavir given with **FUSIDIC ACID**; avoidance of saquinavir advised by manufacturer of **TELITHROMYCIN** (risk of ventricular arrhythmias)
  - **Antidepressants**: plasma concentration of saquinavir possibly enhanced anticoagulant effect of **WARFARIN**; avoidance of saquinavir advised by manufacturer of **APIXABAN** and **RIVAROXABAN**
  - **Antihistamines**: increased risk of ventricular arrhythmias when saquinavir given with **TRAZODONE** or **TRICYCLICS**—avoid concomitant use; plasma concentration of saquinavir reduced by **ST JOHN’S WORT**—avoid concomitant use
  - **Antiepileptics**: plasma concentration of saquinavir possibly reduced by **CARBAMAZEPINE**, **FOSFENITOIN**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE**
  - **Antifungals**: increased risk of ventricular arrhythmias when saquinavir given with **MICONAZOLE**—avoid concomitant use
  - **Antimalarials**: caution with saquinavir advised by manufacturer of **ARTEMETHER WITH LUMEFANTRINE**; avoidance of saquinavir advised by manufacturer of **ARTEMIMOL WITH PIPERAQUINE** (possible risk of ventricular arrhythmias when saquinavir given with **LOMITAPIDE**—avoid concomitant use
  - **Antimalarials**: interaction of saquinavir with **MIZOLASTINE**—avoid concomitant use
  - **Antimycotics**: avoidance of saquinavir advised by manufacturer of **ARTEMETHER WITH LUMEFANTRINE**; avoidance of saquinavir advised by manufacturer of **ARTENIMOL WITH PIPERAQUINE** (possible risk of ventricular arrhythmias when saquinavir given with **CICLOSPORIN**—consult ciclosporin product literature)
  - **Antipsychotics**: increased risk of ventricular arrhythmias when saquinavir given with **CLOZAPINE**, **HALOPERIDOL** or **PHENOTHIAZINES**—avoid concomitant use; saquinavir possibly increases plasma concentration of **ARIPIPRAZOLE** (risk of increased risk of ventricular arrhythmias; avoid concomitant use); saquinavir possibly increases plasma concentration of **LURASIDONE**—avoid concomitant use; saquinavir possibly increases plasma concentration of **QUETIAPINE**—manufacturer of quetiapine advises avoid concomitant use
  - **Antivirals**: increased risk of ventricular arrhythmias when saquinavir given with **ATAZANAVIR** or **LOPINAVIR**—avoid concomitant use; saquinavir reduces plasma concentration of **DARUNAVIR**—avoid concomitant use; plasma concentration of saquinavir significantly reduced by **EFAVIRENZ** and **ETRAVIRINE**; plasma concentration of saquinavir increased by **INDINAVIR** and **RITONAVIR**; saquinavir increases plasma concentration of **MARAVIROC** (consider reducing dose of maraviroc); avoidance of saquinavir advised by manufacturer of **PARTAPREVIR**; plasma concentration of saquinavir reduced by **TIPRANAVIR**
  - **Anxiolytics and Hypnotics**: saquinavir increases plasma concentration of **MIDAZOLAM** (risk of prolonged sedation—avoid concomitant use of **oral midazolam**)
  - **Avasartin**: saquinavir possibly increases plasma concentration of **AVANAFIL**—manufacturer of avanafil advises avoid concomitant use
  - **Beta-blockers**: increased risk of ventricular arrhythmias when saquinavir given with **SOTALOL**—avoid concomitant use

Squainavir (continued)

- **Ciclosporin**: plasma concentration of both drugs increased when saquinavir given with **CICLOSPORIN**
  - **Corticosteroids**: plasma concentration of saquinavir possibly reduced by **DEXAMETHASONE**
  - **Cytoxotics**: saquinavir possibly increases the plasma concentration of **AFATIBIN**—manufacturer of afatinib advises separating administration of saquinavir by 6 to 12 hours; saquinavir possibly increases plasma concentration of **AXITINIB** (reduce dose of axitinib—consult axitinib product literature); saquinavir possibly increases the plasma concentration of **BOSUTINIB** and **CAZABITAXEL**—manufacturer of bosutinib and cabazitaxel advises avoid or consider reducing dose of bosutinib and cabazitaxel; saquinavir possibly decreases the plasma concentration of **CRIZOTINIB** and **EVEROLIMUS**—manufacturer of crizotinib and everolimus advises avoid concomitant use; saquinavir possibly increases the plasma concentration of **IBRUTINIB**—reduce dose of ibritinib (see under ibritinib, in BNF); avoidance of saquinavir advised by manufacturer of **LAPatinib** and **OLAPARIB**; increased risk of ventricular arrhythmias when saquinavir given with **RAKALITINIB**—consult ruxolitinib product literature; saquinavir possibly increases plasma concentration of **DOCETAXEL**—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose
  - **Dapoxetine**: avoidance of saquinavir advised by manufacturer of **DAPOXETINE** (increased risk of toxicity)
  - **Diuretics**: saquinavir increases plasma concentration of **FEXATONE** (reduce dose of fexatone)
  - **Ergot Alkaloids**: increased risk of ergotism when saquinavir given with **ERGOTAMINE**—avoid concomitant use
  - **Guanfacine**: saquinavir possibly increases plasma concentration of **GUANFACINE** (halve dose of guanfacine)
  - **Hepatic Regulating Drugs**: possible increased risk of myopathy when saquinavir given with **ATORVASTATIN**; possible increased risk of myopathy when saquinavir given with **ROSVASTATIN**—manufacturer of rosvastatin advises avoid concomitant use; increased risk of myopathy when saquinavir given with **SIMVASTATIN** (avoid concomitant use); avoidance of saquinavir advised by manufacturer of **Lomitapide** (plasma concentration of lomitapide possibly increased)
  - **Olistat**: absorption of saquinavir possibly reduced by **ORLISTAT**
  - **Pentamidine isetionate**: increased risk of ventricular arrhythmias when saquinavir given with **PENTAMIDINE**
  - **Pantoprazole**—avoid concomitant use
  - **Ranolazine**: saquinavir possibly increases plasma concentration of **RANOLAZINE**—manufacturer of ranolazine advises avoid concomitant use
  - **Sildeanafil**: increased risk of ventricular arrhythmias when saquinavir given with **SILDENAFIL**—avoid concomitant use
  - **Tadalafil**: increased risk of ventricular arrhythmias when saquinavir given with **TADALAFIL**—avoid concomitant use
  - **Tacrolimus**: saquinavir increases plasma concentration of **TACROLIMUS** (consider reducing dose of tacrolimus)
  - **Telithromycin**: increased risk of ventricular arrhythmias when saquinavir given with **TELITHROMYCIN**—avoid concomitant use
  - **Uleter-Healing Drugs**: plasma concentration of saquinavir possibly increased by **CIMETIDINE**; plasma concentration of saquinavir possibly increased by **ESOMEPRAZOLE**, **LANSOPRAZOLE**, **LORATIDINE** and **RANITIDINE**—manufacturer of saquinavir advises avoid concomitant use; plasma concentration of saquinavir increased by **OMEPRAZOLE**—manufacturer of saquinavir advises avoid concomitant use
  - **Vardenafil**: increased risk of ventricular arrhythmias when saquinavir given with **VARDENAFIL**—avoid concomitant use

Saxaglptin see Antidiabetics
Secukinumab

- Antipsychotics: avoid concomitant use of cytotoxics with
  - CLOzapine (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live ▶ VACCINES—avoid concomitant use

Seleline

**NOTE** Selegiline is a MAO-B inhibitor

- Analgesics: hyperpyrexia and CNS toxicity reported when selegiline given with ▶ Pethidine (avoid concomitant use); manufacturer of selegiline advises avoid concomitant use with OPIOID ANALGESICS
- Antidepressants: manufacturer of selegiline advises avoid concomitant use with CITALOPRAM and Escitalopram; increased risk of hypertension and CNS excitation when selegiline given with ▶ fluoxetine (selegiline should not be started until 5 weeks after stopping fluoxetine, avoid fluoxetine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when selegiline given with ▶ fluvoxamine, ▶ sertraline or ▶ venlafaxine (selegiline should not be started until 1 week after stopping fluvoxamine, sertraline or venlafaxine, avoid fluvoxamine, sertraline or venlafaxine for 2 weeks after stopping selegiline); increased risk of hypertension and CNS excitation when selegiline given with ▶ Paroxetine (selegiline should not be started until 2 weeks after stopping paroxetine, avoid paroxetine for 2 weeks after stopping selegiline); enhanced hypotensive effect when selegiline given with ▶ MAOI — manufacturer of selegiline advises avoid concomitant use; avoid concomitant use of selegiline with ▶ moclobemide; CNS toxicity reported when selegiline given with ▶ tetracyclines; risk of CNS excitation and hypertension when selegiline given with ▶ vortioxetine
- Dopaminergics: selegiline enhances effects and increases toxicity of ▶ CO-beneldopa, ▶ Co-careldopa or ▶ levodopa (reduce dose of co-beneldopa, co-careldopa or levodopa); max. dose of 10 mg selegiline advised by manufacturer of Entacapone if used concomitantly
- SHT-receptor Agonists: manufacturer of selegiline advises avoid concomitant use with SHT agonists
- Memantine: effects of dopaminergics and selegiline possibly enhanced by memantine
- Methyldopa: antiparkinsonian effect of dopaminergics antagonised by methyldopa
- Oestrogens: plasma concentration of selegiline increased by ▶ oestrogens — manufacturer of selegiline advises avoid concomitant use
- Progestogens: plasma concentration of selegiline increased by ▶ progestogens — manufacturer of selegiline advises avoid concomitant use
- Sympathomimetics: manufacturer of selegiline advises avoid concomitant use with sympathomimetics; risk of hypertensive crisis when selegiline given with ▶ dopamine

Selenium

- Etorphobap: selenium possibly reduces absorption of ▶ etorophobap (give at least 4 hours apart)
- Vitamins: absorption of selenium possibly reduced by ▶ ascorbic acid (give at least 4 hours apart)

Sertraline see Antidepressants, SSRI

Sevelamer

- Antibacterials: sevelamer reduces absorption of ▶ Ciprofloxacin (give at least 2 hours before or 4 hours after ciprofloxacin)
- Ciclosporin: sevelamer possibly reduces plasma concentration of ▶ Ciclosporin
- Mycophenolate: sevelamer possibly reduces plasma concentration of ▶ Mycophenolate
- Tacrolimus: sevelamer possibly reduces plasma concentration of ▶ tacrolimus
- Thyroid Hormones: sevelamer possibly reduces absorption of ▶ Levothyroxine
- Vitamins: sevelamer reduces absorption of ▶ calcitriol (give at least 1 hour before or 3 hours after sevelamer)

Sefofluarane see Anaesthetics, General

Sildenafil (continued)

- Anti-arrhythmics: avoidance of sildenafil advised by manufacturer of ▶ Disopyramide (risk of ventricular arrhythmias)
- Antibacterials: plasma concentration of sildenafil increased by ▶ clarithromycin — consider reducing initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to once daily for pulmonary hypertension; plasma concentration of sildenafil increased by ▶ erythromycin — reduce initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to twice daily for pulmonary hypertension; plasma concentration of sildenafil possibly increased by ▶ telithromycin — consider reducing initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to once daily for pulmonary hypertension; plasma concentration of sildenafil increased by ▶ ketoconazole — reduce initial dose of sildenafil for erectile dysfunction and avoid concomitant use of sildenafil for pulmonary hypertension; plasma concentration of sildenafil increased by ▶ fluoxetine, ▶ sertraline or ▶ venlafaxine — reduce initial dose of sildenafil
- Antifungals: plasma concentration of sildenafil increased by ▶ itraconazole
- Antivirals: plasma concentration of sildenafil reduced by ▶ efavirenz, ▶ nevirapine; plasma concentration of sildenafil possibly reduced by ▶ fosamprenavir; plasma concentration of sildenafil increased by ▶ indinavir — reduce initial dose of sildenafil; plasma concentration of sildenafil significantly increased by ▶ ritonavir — avoid concomitant use of sildenafil for pulmonary arterial hypertension or reduce dose of sildenafil for erectile dysfunction (consult sildenafil product literature); increased risk of ventricular arrhythmias when sildenafil given with ▶ saquinavir — avoid concomitant use; avoidance of sildenafil advised by manufacturer of ▶ telaprevir; avoidance of sildenafil for pulmonary arterial hypertension advised by manufacturer of ▶ Tipranavir
- Bosentan: plasma concentration of sildenafil reduced by ▶ bosentan, also plasma concentration of bosentan increased calcium-channel blockers: enhanced hypotensive effect when sildenafil given with ▶ amiodipine
- Cobicistat: plasma concentration of sildenafil possibly increased by ▶ cobicistat — manufacturer of cobicistat advises avoid concomitant use of sildenafil for pulmonary arterial hypertension or reduce dose of sildenafil for erectile dysfunction — consult cobicistat product literature
- Cytotoxics: avoidance of sildenafil for pulmonary arterial hypertension advised by manufacturer of ▶ delgocitin
- Dapoxetine: avoidance of sildenafil advised by manufacturer of ▶ dapoxetine
- Grapefruit Juice: plasma concentration of sildenafil possibly increased by ▶ grapefruit Juice
- Nicorandil: sildenafil significantly enhances hypotensive effect of ▶ nicorandil (avoid concomitant use)
- Nitrates: sildenafil significantly enhances hypotensive effect of ▶ nitrates (avoid concomitant use)
- Riociguat: enhanced hypotensive effect when sildenafil given with ▶ riociguat — avoid concomitant use
- Ulcer-healing Drugs: plasma concentration of sildenafil increased by ▶ cinetidine — consider reducing dose of sildenafil for erectile dysfunction

Silpatimab

- Antipsychotics: avoidance of concomitant use of cytotoxics with ▶ clozapine (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live ▶ vaccines — avoid concomitant use

Simeprevir

- Anti-arrhythmics: possible increased risk of bradycardia when simeprevir (with sofosbuvir) given with ▶ amiodarone — see under amiodarone, in BNF
- Antibacterials: plasma concentration of simeprevir possibly increased by ▶ clarithromycin and ▶ telithromycin — manufacturer of simeprevir advises avoid concomitant use; plasma concentration of both drugs increased when simeprevir given with ▶ erythromycin — manufacturer of simeprevir advises avoid concomitant use; plasma concentration of simeprevir possibly reduced by ▶ rifabutin — manufacturer of simeprevir advises avoid concomitant use; plasma concentration of simeprevir reduced by ▶ rifampicin — manufacturer of simeprevir advises avoid concomitant use
Simeprevir — Sodium Valproate

**Simeprevir** (continued)

- **Antidepressants**: plasma concentration of simeprevir possibly reduced by sodium valproate; sodium valproate sometimes reduces plasma concentration of simeprevir given with **ST JOHN’S WORT**—manufacturer of simeprevir advises avoid concomitant use.
- **Antiepileptics**: plasma concentration of simeprevir possibly reduced by carbamazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin and primidone—manufacturer of simeprevir advises avoid concomitant use.
- **Antifungals**: manufacturer of simeprevir advises avoid concomitant use with ketoconazole, posaconazole and voriconazole—manufacturer of simeprevir advises avoid concomitant use; plasma concentration of simeprevir possibly increased by darunavir—manufacturer of simeprevir advises avoid concomitant use; plasma concentration of simeprevir possibly reduced by nevirapine—manufacturer of simeprevir advises avoid concomitant use; plasma concentration of simeprevir increased by ritonavir—manufacturer of simeprevir advises avoid concomitant use.
- **Cardiac glycosides**: simeprevir increases plasma concentration of digoxin.
- **Corticosteroids**: plasma concentration of simeprevir possibly increased by dexamethasone—manufacturer of simeprevir advises avoid concomitant use; plasma concentration of simeprevir increased by dexamethasone—manufacturer of simeprevir advises avoid concomitant use.
- **Lipid-regulating Drugs**: simeprevir increases plasma concentration of atorvastatin, rosuvastatin and simvastatin (consider reducing dose of atorvastatin, rosuvastatin and simvastatin).

**Simvastatin** see Statins

**Sirolimus**

- **Anti-arrhythmics**: caution with sirolimus advised by manufacturer of dronedarone.
- **Antibacterials**: plasma concentration of sirolimus increased by clarithromycin and telithromycin—avoid concomitant use; plasma concentration of both drugs increased when sirolimus given with erythromycin; plasma concentration of sirolimus reduced by rifabutin and rifampicin—avoid concomitant use.
- **Antifungals**: plasma concentration of sirolimus increased by fluconazole and voriconazole—avoid concomitant use; plasma concentration of sirolimus increased by micafungin and miconazole; plasma concentration of sirolimus possibly increased by fluconazole and posaconazole.
- **Antivirals**: plasma concentration of sirolimus possibly increased by atazanavir and lopinavir; plasma concentration of sirolimus increased by boceprevir (increased risk of toxicity—reduce sirolimus dose); plasma concentration of both drugs increased when sirolimus given with telaprevir (reduce dose of sirolimus).
- **Calcium-channel Blockers**: plasma concentration of sirolimus possibly increased by nicardipine; plasma concentration of sirolimus increased by cilosporin.
- **Cytotoxics**: caution with sirolimus advised by manufacturer of crizotinib.
- **Grapefruit Juice**: plasma concentration of sirolimus increased by grapefruit juice—avoid concomitant use.

**Sitaglipin** see Antidiabetics

**Smallpox Vaccine** see Vaccines

**Sodium Aurothiomalate**

- **ACE Inhibitors**: flushing and hypotension reported when sodium aurothiomalate given with ACE inhibitors.
- **Penicillamine**: increased risk of haematological toxicity when sodium aurothiomalate given with penicillamine—see under penicillamine, in BNF.

**Sodium Benzolate**

- **Antiepileptics**: effects of sodium benzolate possibly reduced by sodium valproate and valproic acid.
- **Antipsychotics**: effects of sodium benzolate possibly reduced by haloperidol.
- **Corticosteroids**: effects of sodium benzolate possibly reduced by corticosteroids.

**Sodium Bicarbonate** see Antacids

**Sodium Citrate**

- **Antibacterials**: avoid concomitant use of sodium citrate with methenamine.
- **Ulcер-healing Drugs**: avoidance of sodium citrate advised by manufacturer of sucralfate.

**Sodium Clofibrate** see Bisphosphonates

**Sodium Feredate** see Iron salts

**Sodium Nitroprusside** see Vasodilator Antihypertensives

**Sodium Oxybate**

- **Analgesics**: effects of sodium oxybate enhanced by opioid analgesics (avoid concomitant use).
- **Antidepressants**: increased risk of side-effects when sodium oxybate given with tricyclics.
- **Antiepileptics**: manufacturer of sodium oxybate advises avoid concomitant use with phenobarbital and primidone; plasma concentration of sodium oxybate increased by sodium valproate and valproic acid (see under Sodium Oxybate, in BNF).
- **Antipsychotics**: effects of sodium oxybate possibly reduced by haloperidol.
- **Corticosteroids**: effects of sodium oxybate possibly reduced by corticosteroids.

**Sodium Phenytoximate**

- **Antiepileptics**: effects of sodium phenytoximate possibly reduced by sodium valproate and valproic acid.
- **Antipsychotics**: effects of sodium phenytoximate possibly reduced by haloperidol.
- **Corticosteroids**: effects of sodium phenytoximate possibly reduced by corticosteroids.

**Sodium Stibogluconate**

- **Antifungals**: possible increased risk of arhythmias when sodium stibogluconate given before carbamazepine; sodium stibogluconate given before active metabolite of carbamazepine increased; sodium stibogluconate increases plasma concentration of ethosuximide; sodium stibogluconate increases plasma concentration of fosphenytoin and phenytoin, also plasma concentration of sodium valproate reduced; sodium valproate increases plasma concentration of lamotrigine (increased risk of toxicity—reduce lamotrigine dose); sodium valproate sometimes reduces plasma concentration of an active metabolite of oxcarbazepine; sodium valproate increases plasma concentration of phenobarbital and primidone (also plasma concentration of sodium valproate reduced); sodium valproate possibly
Sodium Valproate

- Antiepileptics (continued)
  - increases plasma concentration of rifampicin (reduce dose of rifampicin); hyperammonaemia and CNS toxicity reported when sodium valproate given with topiramate
  - Antimalarials: anticonvulsant effect of antiepileptics antagonised by mefloquine
  - Antipsychotics: anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered); sodium valproate possibly increases or decreases plasma concentration of clozapine; increased risk of side-effects including neutropenia when sodium valproate given with olanzapine
  - Antivirals: plasma concentration of sodium valproate possibly reduced by ritonavir; sodium valproate possibly increases plasma concentration of zidovudine (increased risk of toxicity)
  - Anxiolytics and Hypnotics: plasma concentration of sodium valproate possibly increased by clozapine; increased risk of side-effects when sodium valproate given with clonazepam; sodium valproate possibly increases plasma concentration of diazepam and lorazepam
  - Bupropion: sodium valproate inhibits the metabolism of bupropion
  - Cytotoxics: sodium valproate increases plasma concentration of temozolomide
  - Guanfacine: plasma concentration of sodium valproate increased by guanfacine
  - Lipid-regulating Drugs: absorption of sodium valproate possibly reduced by colestyramine
  - Oestrogens: plasma concentration of sodium valproate possibly reduced by ethynylestradiol
  - Sulfonamides: possible increased risk of convulsions when antiepileptics given with orlistat
  - Sodium Benzoate: sodium valproate possibly reduces effects of sodium benzoate
  - Sodium Oxamate: sodium valproate increases the plasma concentration of sodium oxamate (see under Sodium Oxamate, in BNF)
  - Sodium Phenylbutyrate: sodium valproate possibly reduces effects of sodium phenylbutyrate
  - Ulcer-healing Drugs: metabolism of sodium valproate inhibited by a cinclidine (increased plasma concentration)

Sofosbuvir

- Anti-arrhythmics: possible increased risk of bradycardia when sofosbuvir given with amiodarone; see under Amiodarone, in BNF
- Antibacterials: manufacturer of sofosbuvir advises avoid concomitant use with rifabutin and rifampicin
- Antidepressants: manufacturer of sofosbuvir advises avoid concomitant use with st john’s wort
- Antiepileptics: manufacturer of sofosbuvir advises avoid concomitant use with carbamazepine, fosphenytoin, oxcarbazepine, phenobarbital, phenytoin and primidone

Sotalol see Beta-blockers

Spirinolactone see Diuretics

Statins

- Antacids: absorption of rosuvastatin reduced by antacids
- Anti-arrhythmics: increased risk of myopathy when simvastatin given with amiodarone (see under Simvastatin, p. 125); plasma concentration of rosuvastatin increased by dronedarone—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when simvastatin given with dronedarone; plasma concentration of atorvastatin possibly increased by dronedarone
- Antibacterials: possible increased risk of myopathy when atorvastin or simvastatin given with azithromycin; plasma concentration of atorvastatin and pravastatin increased by clarithromycin; increased risk of myopathy when simvastatin given with clarithromycin, erythromycin or telithromycin (avoid concomitant use); plasma concentration of rosuvastatin reduced by erthyromycin; plasma concentration of atorvastatin and simvastatin increased by clarithromycin and rifampicin; metabolism of fluvastatin accelerated by rifampicin (reduced effect); increased risk of myopathy when statins given with dapotomycin (preferably avoid concomitant use); risk of myopathy and rhabdomyolysis when statins given with fusidic acid—avoid concomitant use and for 7 days after last fusidic acid dose; possible increased risk of myopathy when pravastatin given with telithromycin; increased risk of myopathy when atorvastatin given with telithromycin (avoid concomitant use)
- Anticoagulants: atorvastatin may transiently reduce anticoagulant effect of warfarin; rosuvastatin possibly enhances anticoagulant effect of coumarins and phenindione; simvastatin can enhance the anticoagulant effect of coumarins; fluvastatin enhances anticoagulant effect of coumarins
- Antidepressants: plasma concentration of simvastatin reduced by st john’s wort
- Antidiabetics: fluvastatin possibly increases plasma concentration of glimepiride
- Antiepileptics: plasma concentration of simvastatin reduced by carbamazepine and eslicarbazepine—consider increasing dose of simvastatin; plasma concentration of rosuvastatin reduced by eslicarbazepine; combination of fluvastatin with fosphenytoin or phenytoin may increase plasma concentration of either drug (or both)
- Antifungals: possible increased risk of myopathy when atorvastatin given with atazanavir, lopinavir and tipranavir—adjust dose of rosuvastatin (consult product literature); increased risk of myopathy when atorvastatin given with itraconazole, posaconazole or voriconazole; increased risk of myopathy when simvastatin given with voriconazole
- Antivirals: increased risk of myopathy when simvastatin given with atazanavir, indinavir, ritonavir or saquinavir (avoid concomitant use); possible increased risk of myopathy when atorvastin or pravastatin given with atazanavir; plasma concentration of rosvustatin increased by atazanavir, darunavir, lopinavir and tipranavir—adjust dose of rosuvastatin (consult product literature); plasma concentration of pravastatin increased by boceprevir; plasma concentration of atorvastatin increased by boceprevir (reduce dose of atorvastatin); manufacturers advise avoid concomitant use of simvastatin with boceprevir and telaprevir; plasma concentration of rosuvastatin increased by daclatasvir; plasma concentration of pravastatin possibly increased by darunavir (use lowest possible dose of pravastatin); possible increased risk of myopathy when atorvastatin given with darunavir, fosamprenavir,
**Statins**

- **Antivirals** (continued)
  - INDAVIR, LOPINAVIR or SAQUINAVIR; plasma concentration of rosvastatin increased by ASABUVIR and PARITAPREVIR (reduce dose of rosvastatin—see under Rosuvastatin, in BNF); avoidance of atorvastatin and simvastatin advised by manufacturer of ASABUVIR; plasma concentration of atorvastatin, pravastatin and simvastatin reduced by EFAVIRENZ; plasma concentration of atorvastatin possibly reduced by ETAVIRENZ; possible increased risk of myopathy when rosvastatin given with FOSAMPRENAVIR, INDAVIR, RITONAVIR and SAQUINAVIR—manufacturer of rosvastatin advises avoid concomitant use; possible increased risk of myopathy when simvastatin given with FOSAMPRENAVIR, INDAVIR, RITONAVIR and SAQUINAVIR.

- **Calcium-channel Blockers**:
  - Colchicine: possible increased risk of myopathy when simvastatin given with DANAZOL—avoid concomitant use.
  - Lipid-regulating Drugs: possible increased risk of myopathy when simvastatin given with BEZAFIBRATE (see under Simvastatin, in BNF); possible increased risk of myopathy when simvastatin given with CIPROFIBRATE (see under Simvastatin, in BNF); when given with statins reduce maximum dose of FIBRATE—see under Fenofibrate, p. 122; increased risk of myopathy when atorvastatin, fluvastatin or pravastatin given with GEMFIBROZIL (preferably avoid concomitant use); increased risk of myopathy when simvastatin given with GEMFIBROZIL (avoid concomitant use); plasma concentration of rosvastatin increased by EZETIMIBE—adjust dose of rosvastatin (consult product literature); increased risk of myopathy when statins given with GEMFIBROZIL.

- **Statins** (continued)
  - Antiepileptics: stiripentol increases plasma concentration of rosvastatin (see under Stavudine, in BNF)
  - Antidepressants: anticonvulsant effect of antiepileptics antagonised by PRIMIDONE, PHENOBARBITAL, PHENYTOIN, PRIMIDONE and MEFLOQUINE (convulsive threshold lowered).

- **Stiripentol**
  - Antidepressants: anticonvulsant effect of antiepileptics antagonised by PRIMIDONE, PHENOBARBITAL, PHENYTOIN, PRIMIDONE and MEFLOQUINE (convulsive threshold lowered).

- **ORLISTAT**
  - Antidepressants: anticonvulsant effect of antiepileptics antagonised by PRIMIDONE, PHENOBARBITAL, PHENYTOIN, PRIMIDONE and MEFLOQUINE (convulsive threshold lowered).

- **Streptomycin**
  - See Antimicrobial Agents

- **Bosentan**: plasma concentration of simvastatin reduced by Bosentan.

- **Calcium-channel Blockers**: possible increased risk of myopathy when simvastatin given with AMLODIPINE and DILTIAZEM (see under Simvastatin, p. 125); plasma concentration of atorvastatin increased by DILTIAZEM—possible increased risk of myopathy; atorvastatin increases plasma concentration of VERAPAMIL, also possible increased risk of myopathy (consider reducing dose of atorvastatin); increased risk of myopathy when simvastatin given with VERAPAMIL (see under Simvastatin, p. 125).

- **Cardiac Glycosides**: atorvastatin possibly increases plasma concentration of DIGOXIN.

- **Ciclosporin**: increased risk of myopathy when simvastatin given with CICLOSPORIN (avoid concomitant use); increased risk of myopathy when atorvastatin given with CICLOSPORIN.

- **Clodigrogl développe**: plasma concentration of rosuvastatin increased by CLOPIDOGREL—adjust dose of rosuvastatin (consult product literature).

- **Cobicistat**: plasma concentration of atorvastatin possibly increased by COBICISTAT—manufacturer of cobicistat advises reduce dose of atorvastatin; avoidance of simvastatin advised by manufacturer of COBICISTAT.

- **Colchicine**: possible increased risk of myopathy when statins given with COLCHICINE.

- **Cytoxics**: plasma concentration of simvastatin possibly increased by DASATINIB; avoidance of simvastatin advised by manufacturer of IDEALISIB; plasma concentration of simvastatin increased by IMATINIB.

- **Elotropographe**: plasma concentration of rosuvastatin increased by ELTROMBOPAG—adjust dose of rosuvastatin (consult product literature).

- **Grapefruit Juice**: plasma concentration of atorvastatin possibly increased by GRAPEFRUIT JUICE; plasma concentration of simvastatin increased by GRAPEFRUIT JUICE—avoid concomitant use.
Strontium Ranelate – Sympathomimetics

Strontium Ranelate

- Antibacterials: strontium ranelate reduces absorption of quinolones and tetracyclines (manufacturer of strontium ranelate advises avoid concomitant use)

Sucralfate

- Aminophylline: sucralfate possibly reduces absorption of aminophylline (give at least 2 hours apart)
- Antibacterials: sucralfate reduces absorption of ciprofloxacin (give at least 2 hours before or 4 hours after ciprofloxacin); sucralfate reduces absorption of levofloxacin, norfloxacin and ofloxacin (give at least 2 hours apart); sucralfate reduces absorption of moxifloxacin (give at least 6 hours apart); sucralfate reduces absorption of tetracyclines
- Anticoagulants: sucralfate possibly reduces absorption of warfarin and anticoagulant effect
- Antiepileptics: sucralfate reduces absorption of fosphenytoin and phenytoin
- Antifungals: sucralfate reduces absorption of ketoconazole
- Antipsychotics: sucralfate reduces absorption of sulphuride
- Cardiac Glycosides: sucralfate possibly reduces absorption of cardiac glycosides
- Potassium Salts: manufacturer of sucralfate advises avoid concomitant use with potassium citrate; sucralfate reduces plasma concentration of progestogens—manufacturer of sucralfate advises additional contraceptive precautions

Sulfadiazine see Sulfonamides

Sulfadoxine see Sulfonamides

Sulfamethoxazole see Sulfonamides

Sulfasalazine

- Cardiac Glycosides: sulfasalazine possibly reduces absorption of digoxin
- Folic Acid: sulfasalazine possibly reduces absorption of folic acid

Sulfipyrazone

- Aminophylline: sulfipyrazone reduces plasma concentration of aminophylline
- Analgesics: effects of sulfipyrazone antagonised by aspirin
- Antibacterials: sulfipyrazone reduces excretion of nitrofurantoin (increased risk of toxicity); sulfipyrazone reduces excretion of pencicillin; effects of sulfipyrazone antagonised by pyrazinamide
- Anticoagulants: increased risk of bleeding when sulfipyrazone given with apixaban; sulfipyrazone enhances anticoagulant effect of coumarins; possible increased risk of bleeding when sulfipyrazone given with dabigatran
- Antidiabetics: sulfipyrazone enhances effects of sulfonylureas
- Antiepileptics: sulfipyrazone increases plasma concentration of fosphenytoin and phenytoin
- Calcium-channel Blockers: sulfipyrazone reduces plasma concentration of verapamil
- Ciclosporin: sulfipyrazone reduces plasma concentration of ciclosporin
- Theophylline: sulfipyrazone reduces plasma concentration of theophylline

Sulfamethoxazole

- Anaesthetics, General: sulfamethoxazole enhance effects of thiopental
- Anaesthetics, Local: effects of sulfamethoxazole possibly inhibited by chloroprocaine (manufacturer of chloroprocaine advises avoid concomitant use); increased risk of methaemoglobinemia when sulfamethoxazole given with prilocaine

Sulfonamides (continued)

- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when sulfamethoxazole (as co-trimoxazole) given with amiodarone—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole
- Antibacterials: increased risk of crystalluria when sulfonamides given with methenamine
- Anticoagulants: sulfonamides enhance anticoagulant effect of coumarins; sulfonamides possibly inhibit metabolism of phenindione
- Antidiabetics: sulfonamides rarely enhance the effects of sulfonylureas
- Antiepileptics: sulfonamides possibly increase plasma concentration of fosphenytoin and phenytoin
- Antimalarials: increased antifolate effect when sulfonamides given with pyrimethamine
- Antipsychotics: avoid concomitant use of sulfonamides with clozapine (increased risk of agranulocytosis)
- Azathioprine: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with azathioprine
- Ciclosporin: increased risk of nephrotoxicity when sulfonamides given with ciclosporin; sulfadiazine possibly reduces plasma concentration of ciclosporin
- Cytoxotics: increased risk of haematological toxicity when sulfamethoxazole (as co-trimoxazole) given with mercaptopurine; sulfonamides increase risk of methotrexate toxicity; increased risk of severe bone marrow depression (fatalities reported) and other haematological toxicities when sulfamethoxazole (as co-trimoxazole) given with methotrexate
- Potassium Aminobenzoate: effects of sulfonamides inhibited by potassium aminobenzoate
- Tacrolimus: possible increased risk of nephrotoxicity when sulfamethoxazole given with tacrolimus
- Vaccines: antibacterials inactivate oral typhoid vaccine—see under Typhoid Vaccine in BNFC

Sulfonylureas see Antidiabetics

Sulindac see NSAIDs

Sulpiride see Antipsychotics

Sumatriptan see SHT1-receptor Agonists (under HT)

Sunitinib

- Antibacterials: metabolism of sunitinib accelerated by digoxin
- Antifungals: metabolism of sunitinib inhibited by ketoconazole (increased plasma concentration)
- Antipsychotics: avoid concomitant use of cytoxotics with sunitinib
- Antivirals: avoid sunitinib advised by manufacturer of boceprevir

Suxamethonium see Muscle Relaxants

Sympathomimetics

- Adrenergic Neurone Blockers: ephedrine, isometheptene, metaraminol, methylphenidate, noradrenaline (norepinephrine), oxymetazoline, phenylephrine, pseudoephedrine and xylometazoline antagonise hypotensive effect of adrenergic neurone blockers; manufacturer of midodrine advises avoid concomitant use with guanethidine; dexametazime and lidexametazime antagonise hypotensive effect of guanethidine; increased risk of hypertension when adrenaline (epinephrine) given with guanethidine
- Alcohol: effects of methylphenidate possibly enhanced by alcohol
- Alpha-adrenoceptor Stimulants: avoidance of sympathomimetic advised by manufacturer of apraclonidine
- Alpha-blockers: effects of midodrine possibly antagonised by alpha-blockers; avoid concomitant use of adrenalin (epinephrine) or dopamine with tolazoline
- Aminophylline: avoidance of ephedrine in children advised by manufacturer of aminophylline
- Anaesthetics, General: avoidance of sympathomimetics advised by manufacturer of aminophylline
- Anaesthetics, General: avoidance of sympathomimetics advised by manufacturer of amiodarone
Sympathomimetics

Ergot Alkaloids:
▶ Beta-blockers:
▶ Antidepressants:
▶ Antipsychotics:
▶ Antiepileptics:
▶ Analgesics:
▶ Diuretics:
▶ Cytotoxics:
▶ Muscle Relaxants:
▶ Ulcer-healing Drugs:
▶ Anti-arrhythmics:
▶ Anticoagulants:
▶ Antibacterials:
▶ Antifungals:
▶ Antiarrhythmics:
▶ Anti-arrhythmics (beta2):
▶ Antidepressants:
▶ Anticoagulants:
▶ Antibacterials:
▶ Anti-inflammatory Agents:
Tacrolimus

- Antiepileptics (continued): concentration of tacrolimus reduced by phenobarbital and primidone.
- Antifungals: plasma concentration of tacrolimus increased by itraconazole, ketoconazole, posaconazole and voriconazole (consider reducing dose of tacrolimus); plasma concentration of tacrolimus possibly increased by miconazole oral gel; increased risk of nephrotoxicity when tacrolimus given with amphibetin; plasma concentration of tacrolimus reduced by caspofungin.
- Antipyschotics: avoidance of tacrolimus advised by manufacturer of deropiridol (risk of ventricular arrhythmias).
- Antitussives: increased risk of nephrotoxicity when tacrolimus given with aciclovir, ganciclovir, valaciclovir or varicelzovir; plasma concentration of tacrolimus possibly increased by efavirenz; plasma concentration of tacrolimus increased by fosapremarin; plasma concentration of tacrolimus increased by saquinavir (consider reducing dose of tacrolimus); plasma concentration of both drugs increased when tacrolimus given with telaprevir (reduce dose of tacrolimus).
- Calcium-channel blockers: plasma concentration of tacrolimus possibly increased by felodipine and veramamipii; plasma concentration of tacrolimus increased by diltiazem, nicardipine and nifedipine.
- Ciclosporin: tacrolimus increases plasma concentration of ciclosporin (increased risk of nephrotoxicity)—avoid concomitant use.
- Cytotoxics: tacrolimus possibly increases the plasma concentration of afatinib—manufacturer of afatinib advises separating administration of tacrolimus by 6 to 12 hours; caution with tacrolimus advised by manufacturer of crizotinib; plasma concentration of tacrolimus increased by mafitinib.
- Dexamethasone: increased risk of immunosupression with tacrolimus advised by manufacturer of dexrazoxane.
- Diuretics: increased risk of hyperkalaemia when tacrolimus given with potassium-sparing diuretics and aldosterone antagonists.
- Grapefruit juice: plasma concentration of tacrolimus increased by grapefruit juice.
- Hormone Antagonists: plasma concentration of tacrolimus possibly increased by danazol.
- Lipid-regulating Drugs: separating administration from tacrolimus by 12 hours advised by manufacturer of lomitapide.
- Mifamurtide: avoidance of tacrolimus advised by manufacturer of mifamurtide.
- Osmogestine: plasma concentration of tacrolimus possibly increased by ethinylestradiol.
- Potassium Salts: increased risk of hyperkalaemia when tacrolimus given with potassium salts.
- Ranolazine: plasma concentration of tacrolimus increased by ranolazine.
- Sevelamer: plasma concentration of tacrolimus possibly reduced by sevelamer.
- Ulcer-healing Drugs: plasma concentration of tacrolimus possibly increased by omeprazole.

Telaprevir

- Alpha-blockers: enhanced hypotensive effect when tedalafil given with doxazosin—manufacturer of tedalafil advises avoid concomitant use; enhanced hypotensive effect when tedalafil given with alpha-blockers—when patient is stable on the alpha blocker initiate tedafalil at the lowest possible dose.
- Anti-arrhythmics: avoidance of tedalafil advised by manufacturer of disopyramide (risk of ventricular arrhythmias).
- Antibacterials: plasma concentration of tedalafil possibly increased by clarithromycin and erythromycin; plasma concentration of tedalafil reduced by rifampicin—manufacturer of tedalafil advises avoid concomitant use.

Tadalafil

- Antifungals: tadalafil concentration is increased by ketoconazole—avoid concomitant use of tadalafil for pulmonary hypertension; plasma concentration of tadalafil possibly increased by itraconazole.
- Antivirals: plasma concentration of tadalafil possibly increased by fosamprenavir and indinavir; plasma concentration of tadalafil increased by ritonavir—avoid concomitant use of tadalafil for pulmonary hypertension; increased risk of ventricular arrhythmias when tadalafil given with saquinavir—avoid concomitant use; avoidance of high doses of tadalafil advised by manufacturer of telaprevir—consult product literature.
- Bosentan: plasma concentration of tadalafil reduced by bosentan.
- Cobicistat: plasma concentration of tadalafil possibly increased by cobicistat—manufacturer of cobicistat advises reduce dose of tadalafil (consult cobicistat product literature).
- Dapoxetine: avoidance of tadalafil advised by manufacturer of dapoxetine.
- Grapefruit juice: plasma concentration of tadalafil possibly increased by grapefruit juice.
- Nicorandil: tadalafil significantly enhances hypotensive effect of nicorandil (avoid concomitant use).
- Nitrates: tadalafil significantly enhances hypotensive effect of nitrates (avoid concomitant use).
- Ricoguan: possible enhanced hypotensive effect when tadalafil given with ricoguan—avoid concomitant use.

Tamoxifen

- Antibacterials: metabolism of tamoxifen accelerated by rifampicin (reduced plasma concentration).
- Anticoagulants: tamoxifen enhances anticoagulant effect of coumarins.
- Antidepressants: metabolism of tamoxifen to active metabolite possibly inhibited by fluoxetine and paroxetine (avoid concomitant use).
- Antipsychotics: avoidance of tamoxifen advised by manufacturer of deropiridol (risk of ventricular arrhythmias).
- Bupropion: metabolism of tamoxifen to active metabolite possibly inhibited by bupropion (avoid concomitant use).
- Ciracalcet: metabolism of tamoxifen to active metabolite possibly inhibited by ciracalcet (avoid concomitant use).

Tamsulosin see Alpha-blockers.

Tapentadol see Opioid Analgesics.

Taxanes see Cabazitaxel, Docetaxel, and Paclitaxel.

Telaprevir

- Antibacterials: metabolism of telaprevir inhibited by metronidazole (increased toxicity).
- Anticoagulants: telaprevir enhances anticoagulant effect of coumarins.
- Antiepileptics: telaprevir possibly inhibits metabolism of fosphenytoin and phenytoin (increased risk of toxicity).
- Antipsychotics: avoid concomitant use of cytotoxics with clozapine (increased risk of agranulocytosis).
- Filgrastim: neutropenia possibly exacerbated when telaprevir given with filgrastim.
- Folares: toxicity of telaprevir increased by folic acid—avoid concomitant use.
- Lipeflugilgrastim: neutropenia possibly exacerbated when telaprevir given with lipugilgrastim.
- Pegfilgrastim: neutropenia possibly exacerbated when telaprevir given with pegphilgrastim.
- Ulcer-healing Drugs: metabolism of telaprevir inhibited by cimetidine (increased plasma concentration).

Teicoplanin

- Vaccines: antibacterials inactivate oral typhoid vaccine—see under Typhoid Vaccine in BNFC.
Telaprevir

- Anti-arrhythmics (continued) advises caution with *Flecainide* and *Propafenone* (risk of ventricular arrhythmias); manufacturer of telaprevir advises caution with intravenous *Lidocaine*.
- Antibacterials: plasma concentration of both drugs possibly increased when telaprevir given with *Clarithromycin*, *Erythromycin* and *Telithromycin* (increased risk of ventricular arrhythmias); manufacturer of telaprevir advises avoid concomitant use with * rifabutin*; plasma concentration of telaprevir significantly reduced by * Rifampicin*—avoid concomitant use.
- Anticoagulants: telaprevir possibly affects plasma concentration of *Warfarin*; avoidance of telaprevir advised across all warfarin users. Telaprevir possibly increases plasma concentration of *Dabigatran*.
- Antidepressants: telaprevir possibly increases plasma concentration of *Fosamprenavir*; manufacturer of telaprevir advises avoid concomitant use with *St John’s Wort*.
- Antipsychotics: manufacturer of telaprevir advises avoid concomitant use with *Carbamazepine*, *Fosphenytoin*, *Phenobarbital*, *Phenytoin* and * Primidone*.
- Antifungals: plasma concentration of both drugs possibly increased when telaprevir given with *Ketoconazole* (increased risk of ventricular arrhythmias)—reduce dose of ketoconazole; telaprevir possibly increases plasma concentration of *Flucytosine*; telaprevir possibly increases plasma concentration of *Posaconazole* (increased risk of ventricular arrhythmias); telaprevir possibly affects plasma concentration of *Voriconazole* (possible increased risk of ventricular arrhythmias).
- Antihypertensives: telaprevir possibly increases plasma concentration of *Lurasidone*—avoid concomitant use; manufacturer of telaprevir advises avoid concomitant use with *Pimozide*; telaprevir possibly increases plasma concentration of *Quetiapine*—manufacturer of quetiapine advises avoid concomitant use.
- Antivirals: plasma concentration of telaprevir possibly reduced by *Atazanavir*, also plasma concentration of atazanavir possibly increased; telaprevir increases the plasma concentration of *Daclatasvir*—reduce dose of daclatasvir (see under Daclatasvir, in BNF); avoid concomitant use of telaprevir with *Darunavir*; plasma concentration of telaprevir reduced by *Efavirenz*—increase dose of telaprevir; manufacturers advise avoid concomitant use of telaprevir with *Fosamprenavir* and *Lopinavir*; telaprevir increases plasma concentration of *Maraviroc* (consider reducing dose of maraviroc); plasma concentration of telaprevir possibly reduced by *Nevirapine*—consider increasing dose of telaprevir; plasma concentration of telaprevir possibly reduced by *Ritonavir*; telaprevir increases plasma concentration of *Tenofovir*; avoidance of telaprevir advised by manufacturer of *Tipranavir*.
- Anxiolytics and Hypnotics: telaprevir possibly increases plasma concentration of *Midazolam* (risk of prolonged sedation)—avoid concomitant use of *oral midazolam*.
- Beta-blockers: manufacturer of telaprevir advises avoid concomitant use with *Sotalol* (risk of ventricular arrhythmias).
- Bosentan: plasma concentration of telaprevir possibly reduced by *Bosentan*, also plasma concentration of bosentan possibly increased.
- Calcium-channel Blockers: telaprevir increases plasma concentration of *Amlodipine* (consider reducing dose of amlodipine); manufacturer of telaprevir advises caution with *Diltiazem*, *Felodipine*, *Nicardipine*, *Nifedipine* and *Verapamil*.
- Cardiac Glycosides: telaprevir increases plasma concentration of *Digoxin*.
- Ciclosporin: plasma concentration of both drugs increased when telaprevir given with *Ciclosporin* (reduce dose of ciclosporin)
- Clozapine: telaprevir possibly increases plasma concentration of *Cilostazol* (see under Cilostazol, in BNF).

Telaprevir (continued)

- Colchicine: telaprevir possibly increases risk of *Colchicine* toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment).
- Corticosteroids: telaprevir possibly increases plasma concentration of *Inhaled and intranasal Budesonide* and *Fluticasone*; plasma concentration of telaprevir possibly reduced by *Dexamethasone*.
- Cytoxotics: telaprevir possibly increases the plasma concentration of *Bosutinib*—manufacturer of bosutinib advises avoid or consider reducing dose of bosutinib; manufacturer of ruxolitinib advises dose reduction when telaprevir given with *Ruxolitinib*—consult ruxolitinib product literature; avoidance of telaprevir advised by manufacturer of *OLAPARIB*.
- Domperidone: possible increased risk of ventricular arrhythmias when telaprevir given with *Domperidone*—avoid concomitant use.
- Ergot Alkaloids: manufacturer of telaprevir advises avoid concomitant use with *Ergot Alkaloids*.
- Guanfacine: telaprevir possibly increases plasma concentration of *Guanfacine* (halve dose of guanfacine).
- Lipid-regulating Drugs: manufacturer of telaprevir advises avoid concomitant use with *Atorvastatin*; manufacturers advise avoid concomitant use of telaprevir with *Simvastatin*; avoidance of telaprevir advised by manufacturer of *Lomitapide* (plasma concentration of lomitapide possibly increased).
- Diuretics: telaprevir possibly reduces plasma concentration of *Ethinylestradiol*—manufacturer of telaprevir advises additional contraceptive precautions.
- Sildenafil: manufacturer of telaprevir advises avoid concomitant use with *Sildenafil*.
- Sirolimus: plasma concentration of both drugs increased when telaprevir given with *Sirolimus* (reduce dose of sirolimus).
- Symptomimetics, Beta2: manufacturer of telaprevir advises avoid concomitant use with *Salmeterol* (risk of ventricular arrhythmias).
- Tacrolimus: plasma concentration of both drugs increased when telaprevir given with *Tacrolimus* (reduce dose of tacrolimus).
- Tadalafil: manufacturer of telaprevir advises avoid concomitant use with high doses of *Tadalafil*—consult product literature.
- Vardenafil: manufacturer of telaprevir advises avoid concomitant use with *Vardenafil*.

Telavancin

- Vaccines: antibacterials inactivate *Oral Typhoid Vaccine*—see under Typhoid Vaccine in BNF.

Telbivudine

- Interferon: increased risk of peripheral neuropathy when telbivudine given with *Interferon Alfa* and *PEGinterferon Alfa*.

Telithromycin

- Analgesics: possible increased risk of ventricular arrhythmias when telithromycin given with *Methadone*; telithromycin inhibits the metabolism of *Oxycodeone*.
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when telithromycin given with *Amdoacidone* and *Disopyramide*; increased risk of ventricular arrhythmias when telithromycin given with *Dronedarone*—avoid concomitant use.
- Antibacterials: possible increased risk of ventricular arrhythmias when telithromycin given with *Moxifloxacin*; plasma concentration of telithromycin reduced by *Rifampicin* (avoid during and for 2 weeks after rifampicin).
- Anti-arrhythmics: avoidance of telithromycin advised by manufacturer of *Aripiprazole*.
- Antidepressants: possible increased risk of ventricular arrhythmias when telithromycin given with *Citalopram* and *Tricyclics*; plasma concentration of telithromycin reduced by *St John’s Wort* (avoid during and for 2 weeks after St John’s wort).
- Antiepileptics: plasma concentration of telithromycin reduced by *Carbamazepine*, *Fosphenytoin*, *Phenobarbital*, *Phenytoin* and *Primidone* (avoid during and for 2 weeks after primidone).
Teilithromycin

Antiepileptics (continued)

after carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone

Antifungals: plasma concentration of teilithromycin increased by ketoconazole—avoid in severe renal and hepatic impairment

Antimuscarinics: manufacturer of fosoterodine advises dose reduction when teilithromycin given with fosoterodine—avoid concomitant use

Antipsychotics: possible increased risk of ventricular arrhythmias when teilithromycin given with chlorpromazine; teilithromycin possibly increases plasma concentration of loratadine—avoid concomitant use; concentration of telithromycin possibly increases plasma concentration of ventricular arrhythmias when teilithromycin given with pimozide—avoid concomitant use; teilithromycin possibly increases plasma concentration of quetiapine

Antivirals: manufacturer of teilithromycin advises avoid concomitant use with atazanavir, fosamprenavir, indinavir, lopinavir, ritonavir and tipranavir in severe renal and hepatic impairment; teilithromycin possibly increases the plasma concentration of daclatasvir—reduce dose of daclatasvir (see under Daclatasvir, in BNF); avoidance of teilithromycin advised by manufacturer of dasabuvir and paritaprevir; teilithromycin possibly increases plasma concentration of maraviroc (consider reducing dose of maraviroc); manufacturer of teilithromycin advises avoid concomitant use with saquinavir (risk of ventricular arrhythmias); teilithromycin possibly increases plasma concentration of midazolam (increased plasma concentration with increased sedation)

Aprepitant: teilithromycin possibly increases plasma concentration of aprepitant

Avanafil: teilithromycin possibly increases plasma concentration of avanafil—manufacturer of avanafil advises avoid concomitant use

Calcium-channel blockers: teilithromycin possibly inhibits metabolism of calcium-channel blockers (increased risk of side-effects)

Cardiac Glycosides: teilithromycin possibly increases plasma concentration of digoxin

Ciclosporin: teilithromycin possibly increases plasma concentration of ciclosporin

Colchicine: teilithromycin possibly increases risk of colchicine toxicity—suspend or reduce dose of colchicine (avoid concomitant use in hepatic or renal impairment)

Cytotoxic: teilithromycin possibly increases plasma concentration of axitinib (reduce dose of axitinib—consult axitinib product literature); teilithromycin possibly increases the plasma concentration of atrasine (see under atrasine, in BNF); avoidance of teilithromycin advised by manufacturer of lapaatinib, nilotinib and olaparib—teilithromycin possibly increases plasma concentration of pazopanib (reduce dose of pazopanib); teilithromycin possibly increases plasma concentration of ponatinib—consider reducing initial dose of ponatinib (see under ponatinib, in BNF); manufacturer of ruxolitinib advises dose reduction when teilithromycin given with ruxolitinib—consult ruxolitinib product literature; teilithromycin possibly increases plasma concentration of docetaxel—manufacturer of docetaxel advises avoid concomitant use or consider reducing docetaxel dose

Teilithromycin (continued)

Dapoxetine: avoidance of teilithromycin advised by manufacturer of dapoxetine (increased risk of toxicity)

Diuretics: teilithromycin increases plasma concentration of eplerenone—avoid concomitant use

Dopemidine: possible increased risk of ventricular arrhythmias when teilithromycin given with dopemidine—avoid concomitant use

Ergot alkaloids: increased risk of ergotism when teilithromycin given with ergot alkaloids—avoid concomitant use

Fosaprepitant: teilithromycin possibly increases plasma concentration of fosaprepitant

Guanci: teilithromycin possibly increases plasma concentration of guanci (halve dose of guanci)

IbBARBINE: teilithromycin possibly increases plasma concentration of ibBARBINE—avoid concomitant use

Ivacator: teilithromycin possibly increases plasma concentration of icover (see under Ivacator, p. 175)

Lipid-regulating Drugs: increased risk of myopathy when teilithromycin given with atorvastatin or simvastatin (avoid concomitant use); plasma concentration of atorvastatin possibly increased when teilithromycin given with p rashivastatin; avoidance of teilithromycin advised by manufacturer of lomitapide (plasma concentration of lomitapide possibly increased)

Pentamidine tetrionate: possible increased risk of ventricular arrhythmias when teilithromycin given with parenteral pentamidine isetionate

Ranolazine: teilithromycin possibly increases plasma concentration of ranolazine—manufacturer of ranolazine advises avoid concomitant use

Sildenafil: teilithromycin possibly increases plasma concentration of sildenafil—consider reducing initial dose of sildenafil for erectile dysfunction or reduce sildenafil dose frequency to once daily for pulmonary hypertension

Sirolimus: teilithromycin increases plasma concentration of sirolimus—avoid concomitant use

Tacrolimus: teilithromycin possibly increases plasma concentration of tacrolimus

Ulipristal: avoidance of teilithromycin advised by manufacturer of low-dose ulipristal

Vaccines: antibiotics inactivate oral typhoid vaccine—see under Typhoid Vaccine in BNFC

Telmisartan see Angiotensin-II Receptor Antagonists

Temazepam see Antiepileptics

Temocillin see Penicillins

Temoporfin see Pyridopyrimidine Derivatives

Tenofovir

Cytotoxics: increased skin photosensitivity when tenofovir given with topical fluourouracil

Tenoxicam

Cytotoxics: increased skin photosensitivity when tenofovir given with topical fluourouracil

Tenoxicam see NSAIDs
Terazosin see Alpha-blockers

Terbutaline see Sympathomimetics, Beta,

Terazocin see See Corticosteroids

Tetracycline see Tetracyclines

Tetracyclines (continued)

- Calcium Salts: absorption of tetracyclines possibly reduced by CALCIUM SALTS (give at least 2 to 3 hours apart)
- Cytosplasts: doxycycline or tetracycline increase risk of METHOTREXATE toxicity
- Dairy Products: absorption of tetracyclines (except doxycycline and minocycline) reduced by DAIRY PRODUCTS
- Diuretics: manufacturer of tetracycline advises avoid concomitant use with DIURETICS
- Ergot Alkaloids: increased risk of ergotism when tetracyclines given with ERGOTAMINE
- Iron Salts: absorption of tetracyclines reduced by oral IRON SALTS, also absorption of oral iron salts reduced by tetracyclines (give at least 2 to 3 hours apart)
- Lipid-regulating Drugs: absorption of tetracycline possibly reduced by COLESTIPOL and COLESTRAMINE
- Retinoids: possible increased risk of benign intracranial hypertension when tetracyclines given with RETINOIDS (avoid concomitant use)
- Strontium Ranelate: absorption of tetracyclines reduced by STRONTIUM RANELATE (manufacturer of strontium ranelate advises avoid concomitant use)
- Ulcer-healing Drugs: absorption of tetracyclines reduced by SUERAFATE and TRISODIUM DICITRATOBISUMATE
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNFC
- Zinc: absorption of tetracyclines possibly reduced by ZINC (give at least 2 to 3 hours apart)

Theophylline

- Allopurinol: plasma concentration of theophylline possibly increased by ALLOPURINOL
- Anaesthetics, General: increased risk of convulsions when theophylline given with KETAMINE
- Anti-arrhythmics: theophylline antagonises anti-arrhythmic effect of ADENOSINE—manufacturer of adenosine advises avoid theophylline for 24 hours before adenosine; plasma concentration of theophylline increased by PROPafenONE
- Antibacterials: plasma concentration of theophylline possibly increased by CLARITHROMYCIN and ISONIAZID; plasma concentration of theophylline increased by ERYTHROMYCIN (also theophylline may reduce absorption of oral erythromycin); plasma concentration of theophylline increased by CIPROFLAXIN and NORFLOXACIN; metabolism of theophylline accelerated by RIFAMPICIN (reduced plasma concentration); possible increased risk of convulsions when theophylline given with QUINOLONES
- Antidepressants: plasma concentration of theophylline possibly increased by FLUVOXAMINE (concomitant use should usually be avoided, but where not possible halve theophylline dose and monitor plasma-theophylline concentration); plasma concentration of theophylline possibly reduced by ST JOHN'S WORT
- Antiepileptics: metabolism of theophylline accelerated by CARBAMAZEPINE, PHENOBARBITAL and PRIMIDONE (reduced effect); plasma concentration of both drugs reduced when theophylline given with PHENOBARBITAL and PHENYTOIN
- Antifungals: plasma concentration of theophylline possibly increased by FLUCONAZOLE and KETOCONAZOLE
- Antiplatelets: plasma concentration of theophylline possibly increased by ACICLOVIR and VALACICLOVIR; metabolism of theophylline accelerated by RITONAVIR (reduced plasma concentration)
- Antioxidants: theophylline reduces effects of BENZODIAZEPINES
- Antiplatelets: metabolism of theophylline accelerated by CAFFEINE CITRATE: avoidance of theophylline advised by manufacturer of CAFFEINE CITRATE
- Calcium-channel Blockers: plasma concentration of theophylline possibly increased by CALCIUM CHANNEL BLOCKERS (enhanced effect); plasma concentration of theophylline increased by DILTIAZEM; plasma concentration of theophylline increased by VERAPAMIL (enhanced effect)
- Corticosteroids: increased risk of hypokalaemia when theophylline given with CORTICOSTEROIDS
- Cytotoxic: plasma concentration of theophylline possibly increased by METHOTREXATE

Interactions | Appendix 1
**Theophylline** (continued)
- Deferasirox: plasma concentration of theophylline increased by DEFERASIROX (consider reducing dose of theophylline)
- Disulfiram: metabolism of theophylline inhibited by DISULFiram (increased risk of toxicity)
- Diuretics: increased risk of hypokalaemia when theophylline given with ACETAZOLAMIDE, LOOP DIURETICS or THIAZIDES and RELATED DIURETICS
- Doxapram: increased CNS stimulation when theophylline given with DOXAPRAM
- Interferons: metabolism of theophylline inhibited by INTERFERON ALFA and PEGINTERFERON ALFA (consider reducing dose of theophylline)
- Leukotriene Receptor Antagonists: plasma concentration of theophylline possibly increased by ZAFIRLUKAST, also plasma concentration of zafirlukast reduced
- Lithium: theophylline increases excretion of LITHIUM (reduced plasma concentration)
- Oestrogen: plasma concentration of theophylline increased by OESTROGENS (consider reducing dose of theophylline)
- Pentoxyfilline: plasma concentration of theophylline increased by PENTOXIFILLINE
- Rosflumilast: avoidance of theophylline advised by manufacturer of ROSFLUMILAST
- Sulfinpyrazone: plasma concentration of theophylline reduced by SULFINPYRAZONE
- Sympathomimetics: manufacturer of theophylline advises avoid concomitant use with sympathomimetics in children
- Sympathomimetics, Beta: increased risk of hypokalaemia when theophylline given with high doses of BETA-SYMPATHOMIMETICS
- Ulcer-healing Drugs: metabolism of theophylline inhibited by cimetidine (increased plasma concentration of theophylline); absorption of theophylline reduced by SUCRALFATE (give at least 2 hours apart)
- Vaccines: plasma concentration of theophylline possibly increased by INFLUENZA VACCINE

**Thiopepa** see Antibiotics, General

**Thiotepa**
- Antipsychotics: avoid concomitant use of cytotoxics with CLOzapine (increased risk of agranulocytosis)
- Muscle Relaxants: thiotepa enhances effects of SUxAMETHONIUM

**Thioxanthenes** see Antipsychotics

**Thyroid Hormones**
- Antacids: absorption of levothyroxine possibly reduced by ANTACIDS
- Antiarhythmic: serum concentrations of thyroid hormones can be affected by AMIODARONE—monitor thyroid function closely
- Antibacterials: metabolism of levothyroxine accelerated by rifampicin (may increase requirements for levothyroxine in hypothyroidism)
- Anticoagulants: thyroid hormones enhance anticoagulant effect of COUMARINS and PHENIDINe
- Antidepressants: thyroid hormones enhance effects of AMITRIPTYLINE and MIPRAMINE; thyroid hormones possibly enhance effects of TRICYCLES
- Antiepileptics: metabolism of thyroid hormones accelerated by CARBAMAZEPINE, PHENOBARBITAL and PRIMIDONE (may increase requirements for thyroid hormones in hypothyroidism); metabolism of thyroid hormones accelerated by FOSPHENYTIOIN and PHENYTOIN (may increase requirements in hypothyroidism), also plasma concentration of fosphenytoin and phenytoin possibly increased
- Beta-blockers: levothyroxine accelerates metabolism of DISULFiram
- Calcium Salts: absorption of levothyroxine reduced by CALCIUM SALTS
- Cytotoxics: plasma concentration of levothyroxine possibly reduced by IMATINIB
- Iron Salts: absorption of levothyroxine reduced by oral IRON SALTS (give at least 2 hours apart)
- Lanthanum: absorption of levothyroxine reduced by LANTHANUM (give at least 2 hours apart)

**Thyroid Hormones** (continued)
- Lipid-regulating Drugs: absorption of levothyroxine reduced by COLESEvelAM; absorption of thyroid hormones reduced by COLESTIPol and COLESTYRAMINE
- Oestrogens: requirements for thyroid hormones in hypothyroidism may be increased by OESTROGENs
- Orlistat: possible increased risk of hypothyroidism when levothyroxine given with ORLISTAT
- Polystyrene Sulfonate Resins: absorption of levothyroxine reduced by POLYSTYRENE SULFONATE RESINS
- Sevelamer: absorption of levothyroxine possibly reduced by SEVELAMER
- Sympathomimetics: avoidance of thyroid hormones advised by manufacturer of theophylline
- Ulcer-healing Drugs: absorption of levothyroxine reduced by cimetidine and SUcRALFATE

**Tiagabine**
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIS and TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: plasma concentration of tiagabine reduced by CARRABAMAZEPINE, FOSPHENYTIOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by MELOquine
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ANTIPSYCHOTICS (convulsive threshold lowered)
- Orlistat: possible increased risk of convulsions when antiepileptics given with ORLISTAT

**Tiaprofenic Acid** see NSAIDs

**Tilabone**
- Antibacterials: metabolism of tibolone accelerated by rifampicin (reduced plasma concentration)
- Antiepileptics: metabolism of tibolone accelerated by CARBAMAZEPINE (reduced plasma concentration); metabolism of tibolone accelerated by FOSPHENYTIOIN and PHENYTOIN

**Ticagrelor**
- Antibacterials: plasma concentration of ticagrelor possibly increased by clarithromycin—manufacturer of ticagrelor advises avoid concomitant use; plasma concentration of ticagrelor possibly increased by erythromycin; plasma concentration of ticagrelor reduced by rifampicin
- Anticoagulants: ticagrelor increases plasma concentration of dabigatran
- Antidepressants: possible increased risk of bleeding when ticagrelor given with CITALOPRAM, PAROKETINE or SERTRALINE
- Antiepileptics: plasma concentration of ticagrelor possibly reduced by CARBAMAZEPINE, FOSPHENYTIOIN, PHENOBARBITAL, PHENYTOIN and PRIMIDONE
- Antifungals: plasma concentration of ticagrelor increased by ketoconazolE—manufacturer of ticagrelor advises avoid concomitant use
- Antivirals: plasma concentration of ticagrelor possibly increased by AzaTANAVIR and Ritonavir—manufacturer of ticagrelor advises avoid concomitant use
- Calcium-channel Blockers: plasma concentration of ticagrelor increased by Diltiazem
- Cardiac Glycosides: ticagrelor increases plasma concentration of digoxin
- Ciclosporin: plasma concentration of ticagrelor increased by CiclosporIN
- Ergot Alkaloids: ticagrelor possibly increases plasma concentration of ergotalkaloIDs
- Lipid-regulating Drugs: ticagrelor increases plasma concentration of simvastatin (increased risk of toxicity); separating administration from ticagrelor by 12 hours advised by manufacturer of Lomitapide

**Ticarcillin** see Penicillins

**Tigecycline**
- Anticoagulants: tigecycline possibly enhances anticoagulant effect of COUMARINs

---

918 Theophylline – Tigecycline

BNFC 2016–2017
Timolol

Lipid-regulating Drugs:

▶ Beta-blockers:

Antivirals:

▶ Antifungals:

Antidepressants:

▶ Antibacterials:

Cytotoxics:

▶ Antipsychotics:

Vaccines:

▶ Alcohol:

(continued)

should be taken at least 2 hours apart; tipranavir reduces the plasma concentration of

Dolutegravir, p. 387); tipranavir reduces plasma concentration of

tipranavir given with

ATAZANAVIR

ZIDOVUDINE

ABACAVIR

tipranavir reduces plasma concentration of

QUETIAPINE

l

concentration of

avoidance of tipranavir advised by

manufacturer of tipranavir advises avoid concomitant use

with

BUSULFAN

CLOZAPINE

l

increased risk of toxicity

Antimuscarinics: avoidance of tipranavir advised by

manufacturer of Tipranavir

Antidepressants: plasma concentration of tipranavir possibly reduced by

BUPRENORPHINE

Antacids: absorption of tipranavir reduced by

ANTACIDS (give at least 2 hours apart)

Antibacterials: tipranavir increases plasma concentration of

■ CLARITHROMYCIN (reduce dose of clarithromycin in renal impairment), also plasma concentration of tipranavir increased by clarithromycin; tipranavir increases plasma concentration of

■ RIFABUTIN (reduce dose of rifabutin); plasma concentration of tipranavir possibly reduced by

■ RIFAXIMIN—avoid concomitant use; avoidance of concomitant tipranavir in severe renal and hepatic impairment advised by manufacturer of

■ TELITHROMYCIN

■ Anticoagulants: avoidance of tipranavir advised by manufacturer of

■ APIXABAN and RIVAROXABAN

Antidepressants: plasma concentration of tipranavir possibly reduced by

ST JOHN’S WORT—avoid concomitant use

Antiepileptics: plasma concentration of tipranavir possibly reduced by

CARBAMAZEPINE

Antifungals: plasma concentration of tipranavir increased by

FLUCONAZOLE

■ Antimalarials: caution with tipranavir advised by manufacturer of

■ ARTEMETHER WITH LUMEFANTRINE; tipranavir possibly increases plasma concentration of

■ QUININE (increased risk of toxicity)

Antimuscarinics: avoidance of tipranavir advised by

manufacturer of Darifenacin

Antipsychotics: tipranavir possibly increases plasma concentration of

■ ARIPIPRAZOLE (reduce dose of aripiprazole—consult aripiprazole product literature); tipranavir possibly increases plasma concentration of

■ QUETIAPINE—manufacturer of quetiapine advises avoid concomitant use

Antivirals: tipranavir reduces plasma concentration of

■ ABACAVIR, ■ DASONPIRAZOLE, ■ LOPINAVIR, ■ SQUVINAVIR and

■ ZIDOVUDINE; plasma concentration of tipranavir increased by

ATAZANAVIR (also plasma concentration of atazanavir reduced); manufacturer of tipranavir advises avoid concomitant use with

BOCEPREVIR and TELAPREVIR; tipranavir reduces plasma concentration of didanosine—manufacturer of tipranavir advises tipranavir and didanosine capsules should be taken at least 2 hours apart; tipranavir reduces the plasma concentration of

■ DOLUTEGRAVIR (see under Dolutegravir, p. 387); tipranavir reduces plasma concentration of

tipranavir increased (avoid concomitant use); avoidance of tipranavir advised by manufacturer of

■ PARITAPREVIR

■ Beta-blockers: manufacturer of tipranavir advises avoid concomitant use with

■ METOPROLOL, for heart failure

■ Bosentan: manufacturer of tipranavir advises avoid concomitant use with

■ Bosentan

■ Cobicistat: plasma concentration of both drugs reduced when tipranavir given with

■ Cobicistat (avoid concomitant use)

■ Lipid-regulating Drugs: increased risk of myopathy when tipranavir given with

■ ATORVASTATIN (see under Atorvastatin, p. 123); tipranavir increases plasma concentration of

■ ROSUVASTATIN—adjust dose of rosuvastatin (consult product

Tipranavir

● Lipid-regulating Drugs (continued)

literature); tipranavir possibly increases plasma concentration of

■ SIMVASTATIN—avoid concomitant use; avoidance of tipranavir advised by manufacturer of

■ LOMITAPIDE (plasma concentration of lomitapide possibly increased)

■ Orlistat: absorption of tipranavir possibly reduced by

■ ORLISTAT

■ Ranolazine: tipranavir possibly increases plasma concentration of

■ Ranolazine—manufacturer of ranolazine advises avoid concomitant use

■ Sildenafil: manufacturer of tipranavir advises avoid concomitant use of

■ SILDENAFIL for pulmonary arterial hypertension

■ Antipsychotics, Beta, manufacturer of tipranavir advises avoid concomitant use with

■ SILDENAFIL

● Vitamins: increased risk of bleeding when tipranavir given with high doses of

■ VITAMIN E

Tirofiban

● Iloprost: increased risk of bleeding when tirofiban given with

■ ILOPROST

Tizanidine see Muscle Relaxants

Tobramycin see Aminoglycosides

Toxicity

Antipsychotics: avoid concomitant use of cytotoxics with

■ clozapine (increased risk of agranulocytosis)

■ Vaccines: risk of generalised infections when monoclonal antibodies given with live

■ VACCINES—avoid concomitant use

Tolazoline see Alpha-blockers

Tolbutamide see Antidiabetics

Tolcapone

■ Antidepressants: avoid concomitant use of tolcapone with

■ MAOIs

■ Memantine: effects of dopaminergics possibly enhanced by

■ MEMANTINE

■ Methyldopa: antiparkinsonian effect of dopaminergics antagonised by

■ METHYLDOPA

Toltenamic Acid see NSAIDs

Tolterodine see Antimuscarinics

Tolvaptan

■ Antibacterials: plasma concentration of tolvaptan reduced by

■ RIFAMPICIN

■ Antifungals: plasma concentration of tolvaptan increased by

■ KETOCONAZOLE—manufacturer of ketoconazole advises avoid concomitant use

■ Cardiac Glycosides: tolvaptan increases plasma concentration of

■ DIGOXIN (increased risk of toxicity)

■ Grapefruit juice: plasma concentration of tolvaptan increased by

■ GRAPEFRUIT JUICE—avoid concomitant use

■ Lipid-regulating Drugs: separating administration from tolvaptan by 12 hours advised by manufacturer of

■ LOMITAPIDE

Topiramate

■ Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by

■ MAOIs and

■ TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by

■ SSRI S and

■ TRICYCLICS (convulsive threshold lowered)

■ Antidiabetics: topiramate possibly increases plasma concentration of

METFORMIN; topiramate possibly reduces plasma concentration of

■ PERAMAPLAF; plasma concentration of topiramate possibly reduced by

■ PHENOBARBITAL and PRIMIDONE; hyperammonaemia and CNS toxicity reported when topiramate given with

■ SODIUM VALPROATE and VALPROIC ACID

■ Antimalarials: anticonvulsant effect of antiepileptics antagonised by

■ MEfloQUINE
Topiramate (continued)

- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by **ANTIPSYCHOTICS** (convulsive threshold lowered)
- Diuretics: plasma concentration of topiramate possibly increased by **HYDROCHLOROTHIAZIDE**
- Lithium: topiramate possibly affects plasma concentration of **LITHIUM**
- Oestrogens: topiramate accelerates metabolism of **OESTROGENS** (reduced contraceptive effect with combined oral contraceptives, contraceptive patches, and vaginal rings—see Contraceptive Interactions in BNFC)
- Orlisstat: possible increased risk of convulsions when antiepileptics given with **ORLISSTAT**
- Probucol: topiramate accelerates metabolism of **PROBUCOL** (reduced contraceptive effect with combined oral contraceptives, probucol-only oral contraceptives, contraceptive patches, contraceptive patches, vaginal rings, eutongrel–releasing implant, and emergency hormonal contraception—see Contraceptive Interactions in BNFC)**

Terasmide see Diuretics

Toremifene

- Anti-oestrogens: toremifene possibly accelerates metabolism of **CARBAMAZEPINE** (reduced plasma concentration); metabolism of toremifene possibly accelerated by **FOSPHENOTIOIN** and **PHENYTOIN**; metabolism of toremifene accelerated by **PHENOBARBITAL** and **PRIMIDONE** (reduced plasma concentration)
- Cytotoxics: possible increased risk of ventricular arrhythmias when toremifene given with **VANDETANIB**—avoid concomitant use
- Diuretics: increased risk of hypercalcaemia when toremifene given with **THIAZIDES** and RELATED DIURETICS

Trabectedin

- Alcohol: manufacturer of trabectedin advises avoid concomitant use with **ALCOHOL**
- Antibacterials: plasma concentration of trabectedin reduced by **RIFAMPICIN**
- Antipsychotics: avoid concomitant use of cytoxotytics with **CLOZAPINE** (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when trabectedin given with live **VACCINES**—avoid concomitant use

Tramadol see Opioid Analgesics

Trandolapril see ACE Inhibitors

Tranylcypromine see MAOIs

Trastuzumab

- Antipsychotics: possible concomitant use of cytoxotytics with **CLOZAPINE** (increased risk of agranulocytosis)
- Cytotoxics: possible increased risk of cardiotoxicity when trastuzumab given with **DAUNORUBICIN**, **DOXORUBICIN**, **EPIRUBICIN** and **IDARUBICIN**—avoid concomitant use for up to 28 weeks after stopping trastuzumab
- Vaccines: risk of generalised infections when monoclonal antibodies given with live **VACCINES**—avoid concomitant use

Trazodone see Antidepressants, Tricyclic (related)

Tretinoin see Retinoids

Triamcinolone see Corticosteroids

Triamterene see Diuretics

Trientine

- Iron Salts: trientine reduces absorption of oral **IRON SALTS**
- Zinc: trientine reduces absorption of **ZINC**, also absorption of trientine reduced by zinc

Trifluoperazine see Antipsychotics

Trichexphenidyl see Antimuscarinics

Trimeprazin (continued)

- ACE Inhibitors: possible increased risk of hypercalcaemia when trimethoprim given with **ACE INHIBITORS**
- Angiotensin-II Receptor Antagonists: possible increased risk of hypercalcaemia when trimethoprim given with **ANGIOTENSIN-II RECEPTOR ANTAGONISTS**
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when trimethoprim (as co-trimoxazole) given with **AMIODARONE**—manufacturer of amiodarone advises avoid concomitant use of co-trimoxazole

Trimethoprim

- Antibacterials: plasma concentration of trimethoprim possibly reduced by **RIFAMPICIN**; plasma concentration of both drugs may increase when trimethoprim given with **DAPSONE**
- Anticoagulants: trimethoprim possibly enhances anticoagulant effect of **COUMARINS**
- Anti-diabetics: trimethoprim possibly enhances hypoglycaemic effect of **REPAGLINDINE**—manufacturer advises avoid concomitant use; trimethoprim rarely enhances the effects of **SULFONYLUREAS**
- Antiepileptics: trimethoprim increases plasma concentration of **PHENOBARBITAL** and **PHENYTOIN** (also increased antifolate effect)
- Antimalarials: increased antifolate effect when trimethoprim given with **PYRIMETHAMINE**
- Antibacterials: plasma concentration of trimethoprim possibly enhanced by **COUMARINS**
- Anti-monoclonal antibodies given with **LAMIVUDINE**—avoid concomitant use of high-dose co-trimoxazole
- Azathioprine: increased risk of haematological toxicity when trimethoprin (also with co-trimoxazole) given with **AZATHIOPRINE**
- Cardiac Glycosides: trimethoprim possibly increases plasma concentration of **DIGOXIN**
- Ciclosporin: increased risk of nephrotoxicity when trimethoprin given with **CICLORSPORIN**, also plasma concentration of ciclosporin reduced by **INTRAVENOUS** trimethoprin
- Cytotoxics: increased risk of haematological toxicity when trimethoprin (also with co-trimoxazole) given with **MERCaptopurine**; increased risk of severe bone marrow depression (fatalities reported) and other haematological toxicities when trimethoprin (also with co-trimoxazole) given with **METHOTREXATE**
- Diuretics: increased risk of hyperkalaemia when trimethoprin given with **EPLERENONE**; possible increased risk of hyperkalaemia when trimethoprin given with **SPIRONOLACTONE**
- Tacrolimus: possible increased risk of nephrotoxicity when trimethoprin given with **TACROLIMUS**
- Vaccines: antibacterials inactivate **ORAL TYPHOID VACCINE**—see under Typhoid Vaccine in BNFC

Trimipramine see Antidepressants, Tricyclic

Tripotassium Dicitratosbismuthate

- Antibacterials: tripotassium dicitratosbismuthate reduces absorption of **TETRACYCLINES**

Tropicamide see Antimuscarinics

Tropisum see Antimuscarinics

Typhoid Vaccine (oral) see Vaccines

Typhoid Vaccine (parenteral) see Vaccines

Ubidadecarenone

- Anti-oestrogens: ubidadecarenone may enhance or reduce anticoagulant effect of **WARFARIN**

Ulcere-healing Drugs see Histamine H2-antagonists, Proton Pump Inhibitors, Sucralfate, and Tripotassium Dicitratosbismuthate

Ulipristal

- Antibacterials: manufacturer of low-dose ulipristal advises avoid concomitant use with **CLARITHROMYCIN** and **TELITHROMYCIN**; plasma concentration of low-dose ulipristal increased by **ERYTHROMYCIN**—manufacturer of low-dose ulipristal advises avoid concomitant use; manufacturer of ulipristal advises avoid concomitant use with **RIFAMPICIN** (contraceptive effect of ulipristal possibly reduced)
- Anticoagulants: manufacturer of ulipristal advises give **DABIGATRAN** at least 1.5 hours before or after ulipristal
- Antidepressants: manufacturer of ulipristal advises avoid concomitant use with **ST JOHN’S WORT** (contraceptive effect of ulipristal possibly reduced)
- Antibacterials: manufacturer of ulipristal advises avoid concomitant use with **CARBAMAZEPINE**, **PHENOBARBITAL**, **PHENYTOIN** and **PRIMIDONE** (contraceptive effect of ulipristal possibly reduced)
- Antifungals: plasma concentration of low-dose ulipristal increased by **ITRACONAZOLE**—manufacturer of low-dose ulipristal advises avoid concomitant use; manufacturer of ulipristal advises avoid concomitant use with **ITRACONAZOLE**
Vaccines (continued)

- Interferons: avoidance of vaccines advised by manufacturer of INTERFERON GAMMA
- Leflunomide: risk of generalised infections when live vaccines given with LEFLUNOMIDE—anticoncomitant use
- Teflunomide: risk of generalised infections when live vaccines given with TEFUNOMIDE—avoid concomitant use
- Theophylline: influenza vaccine possibly increases plasma concentration of THEOPHYLLINE

Valaciclovir

- Aminophylline: valaciclovir possibly increases plasma concentration of AMINOGLYCNINE
- Clocospin: increased risk of nephrotoxicity when valaciclovir given with CLOCOSPIN
- Mycophenolate: plasma concentration of valaciclovir increased by MYCOPHENOLATE, also plasma concentration of inactive metabolite of mycophenolate increased
- Tacrolimus: possible increased risk of nephrotoxicity when valaciclovir given with TACROLIMUS
- Theophylline: valaciclovir possibly increases plasma concentration of THEOPHYLLINE

Valganciclovir

- Antibacterials: increased risk of convulsions when valganciclovir given with AMINOPTYLINE WITH CLASS C
- Aminophylline: influenza vaccine possibly increases plasma concentration of AMINOGLYCNINE
- INTERFERON GAMMA
- Teflunomide: risk of generalised infections when live vaccines given with TEFUNOMIDE—avoid concomitant use
- Theophylline: influenza vaccine possibly increases plasma concentration of THEOPHYLLINE

Valproic Acid

- Analgesics: effects of valproic acid enhanced by ASPIRIN
- Antidepressants: metabolism of valproic acid possibly inhibited by ERYTHROMYCIN (increased plasma concentration); avoidance of valproic acid advised by manufacturer of
- PIVMECILLINAM; plasma concentration of valproic acid reduced by CARBAPENEMS—avoid concomitant use
- Anticonvulsant effect of antiepileptics possibly increased by CARBAMAZEPINE and TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by SSRIS and TRICYCLICS (convulsive threshold lowered)
- Antiepileptics: plasma concentration of valproic acid reduced by CARBAMAZEPINE, also plasma concentration of active metabolite of carbamazepine increased; valproic acid possibly increases plasma concentration of RUFINAEMIDE (reduce dose of rufinamide); valproic acid sometimes reduces plasma concentration of an active metabolite of OXCARBAZEPINE; valproic acid increases plasma concentration of PHENOBARBITAL and PRIMIDONE (also plasma concentration of valproic acid reduced); valproic acid possibly increases plasma concentration of RUFINAEMIDE (reduce dose of rufinamide); hyperammonaemia and CNS toxicity reported when valproic acid given with TOPIRAMATE
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by MEPHOSIN
- Antipsychotics: convulsive threshold lowered; valproic acid possibly increases or decreases plasma concentration of CLOZAPINE; increased risk of side-effects including neutropenia when valproic acid given with OLanzapine
- Antinflamatory: valproic acid possibly increases plasma concentration of ZIDOVUDINE (increased risk of toxicity)
**Valproic Acid** (continued)  
- Anxiolytics and Hypnotics: plasma concentration of valproic acid possibly increased by CLOBAZAM; increased risk of side-effects when valproic acid given with CLONAZEPAM; valproic acid possibly increases plasma concentration of DIAZEPAM and LORAZEPAM
- Bupropion: valproic acid inhibits the metabolism of BUPROPION
- Cytotoxics: valproic acid increases plasma concentration of TEMOZOLOMIDE
- Guanfacine: plasma concentration of valproic acid increased by GUANFACINE
- Lipid-regulating Drugs: absorption of valproic acid possibly reduced by COLESTYRAMINE
- Netupitant: caution with valproic acid advised by manufacturer of NETUPITAN
- Oestrogens: plasma concentration of valproic acid possibly reduced by ETHINYLESTRADIOL
- Orlistat: possible increased risk of convulsions when antiepileptics given with ORLISTAT
- Sodium Benzoate: valproic acid possibly reduces effects of SODIUM BENZOATE
- Sodium Oxabate: valproic acid increases the plasma concentration of SODIUM OXABATE (see under Sodium Oxabate, in BNFC)
- Sodium Phenylbutyrate: valproic acid possibly reduces effects of SODIUM PHENYLButYRATE
- Ulcer-healing Drugs: metabolism of valproic acid inhibited by Cimetidine (increased plasma concentration)

**Valsartan** see Angiotensin-II Receptor Antagonists

**Vancomycin**  
- Anaesthetics, General: hypersensitivity-like reactions can occur when intravenous vancomycin given with GENERAL ANAESTHETICS
- Antibacterials: increased risk of nephrotoxicity and ototoxicity when vancomycin given with AMINOGLYCOSIDES, CAPREOMYCIN or COLISTIMETHATE SODIUM; increased risk of nephrotoxicity when vancomycin given with POLYMIXINS
- Antifungals: possible increased risk of nephrotoxicity when vancomycin given with AMPHOTERICIN
- Ciclosporin: increased risk of nephrotoxicity when vancomycin given with CICLOSPORIN
- Cytotoxics: increased risk of nephrotoxicity and possibly of ototoxicity when vancomycin given with CISPLATIN
- Diuretics: increased risk of toxicity when vancomycin given with LOOP DIURETICS
- Lipid-regulating Drugs: effects of oral vancomycin antagonised by COLESTYRAMINE
- Muscle Relaxants: vancomycin enhances effects of SUXAMETHONIUM
- Tacrolimus: possible increased risk of nephrotoxicity when vancomycin given with TACROLIMUS
- Vaccines: antibacterials inactivate ORAL TYPHOID VACCINE—see under Typhoid Vaccine in BNFC

**Vandetanib**  
- Analgesics: possible increased risk of ventricular arrhythmias when vandetanib given with METHADONE—avoid concomitant use
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when vandetanib given with AMIODARONE or DISOPYRAMIDE—avoid concomitant use
- Antibacterials: possible increased risk of ventricular arrhythmias when vandetanib given with parenteral ERYTHROMYCIN—avoid concomitant use; possible increased risk of ventricular arrhythmias when vandetanib given with MOXIFLOXACIN—avoid concomitant use; plasma concentration of vandetanib reduced by Rifampicin—manufacturer of vandetanib advises avoid concomitant use
- Antidepressants: manufacturer of vandetanib advises avoid concomitant use with ST JOHN'S WORT (plasma concentration of vandetanib possibly reduced)
- Antidiabetics: vandetanib possibly increases plasma concentration of METFORMIN (consider reducing dose of metformin)
- Antiepileptics: manufacturer of vandetanib advises avoid concomitant use with CARBAMAZEPINE, PHENOBARBITAL

**Vandetanib Antiepileptics (continued)**  
- Primidone (plasma concentration of vandetanib possibly reduced)
- Antidepressants: possible increased risk of ventricular arrhythmias when vandetanib given with ARTEMETHER with LUMEFANTRINE—avoid concomitant use
- Antihistamines: possible increased risk of respiratory depression when vandetanib given with DIPHENDROMER—avoid concomitant use
- Antipsychotics: possible increased risk of ventricular arrhythmias when vandetanib given with AMISULPRIDE, CHLORPROMAZINE, HALOPERIDOL, PIMZOIDE, SULPIRIDE or ZUCLOPENTHIXOL—avoid concomitant use; avoid concomitant use of cytoxotics with CLOZAPINE (increased risk of agranulocytosis)
- Beta-blockers: possible increased risk of ventricular arrhythmias when vandetanib given with SOTALOL—avoid concomitant use
- Cardiac Glycosides: vandetanib increases plasma concentration of DIGOXIN—possible increased risk of bradycardia
- Cytotoxics: possible increased risk of ventricular arrhythmias when vandetanib given with ARSENIC TRIOXIDE—avoid concomitant use
- Hormone Antagonists: possible increased risk of ventricular arrhythmias when vandetanib given with TOREMIFENE—avoid concomitant use
- SHT, Receptor Antagonists: increased risk of ventricular arrhythmias when vandetanib given with ONDANSETRON—avoid concomitant use
- Pentamide Isetionate: possible increased risk of ventricular arrhythmias when vandetanib given with PENTAMIDINE ISETIONATE—avoid concomitant use

**Vardenafil**  
- Alpha-blockers: enhanced hypotensive effect when vardenafil given with ALFA-BLOCKERS—when patient is stable on the alpha blocker initiate vardenafil at the lowest possible dose—separate doses by 6 hours (except with tamsulosin)
- Anti-arrhythmics: possible increased risk of ventricular arrhythmias when vardenafil given with ANTIPSYCHOTICS (risk of ventricular arrhythmias)
- Antibacterials: plasma concentration of vardenafil possibly increased by CLARITHROMYCIN (consider reducing initial dose of vardenafil); plasma concentration of vardenafil increased by ERYTHROMYCIN (reduce dose of vardenafil)
- Antifungals: plasma concentration of vardenafil increased by KETOCONAZOLE—avoid concomitant use; plasma concentration of vardenafil possibly increased by ITRACONAZOLE—avoid concomitant use
- Antivirals: plasma concentration of vardenafil possibly increased by FOSAMPRENIVIR; plasma concentration of vardenafil increased by INDINAVIR and RITONAVIR—avoid concomitant use; increased risk of ventricular arrhythmias when vardenafil given with SAQUINAVIR—avoid concomitant use; avoidance of vardenafil advised by manufacturer of TELAPREVI; caution with vardenafil advised by manufacturer of TIPRANAVIR
- Calcium-channel Blockers: enhanced hypotensive effect when vardenafil given with NIFEDIPINE
- Cobicistat: plasma concentration of vardenafil possibly increased by COBICISTAT—manufacturer of cobicistat advises reduce dose of vardenafil (consult cobicistat product literature)
- Dapoxetine: avoidance of vardenafil advised by manufacturer of DAPOXETINE
- Grapefruit Juice: plasma concentration of vardenafil possibly increased by GRAPEFRUIT JUICE—avoid concomitant use
- Nicorandil: possible increased hypotensive effect when vardenafil given with NICORANDIL—avoid concomitant use
- Nitrates: possible increased hypotensive effect when vardenafil given with NITRATES—avoid concomitant use
- Riociguat: possible enhanced hypotensive effect when vardenafil given with RIOCIGUAT—avoid concomitant use
**Vasodilator Antihypertensives**

- ACE Inhibitors: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ACE INHIBITORS
- Adrenergic Neurone Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ADRENERGIC NEURONE BLOCKERS
- Alcohol: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ALCOHOL
- Aldesleukin: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ALDESLEUKIN
- Alpha-blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ALPHA-BLOCKERS
- Anaesthetics, General: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with GENERAL ANAESTHETICS
- Analgesics: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by NSAIDS.
- Angiotensin-II Receptor Antagonists: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ANGIOTENSIN-II RECEPTOR ANTAGONISTS
- Antidepressants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with MAOIS;
  enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with TRICYCLIC-RELATED ANTIDEPRESSANTS
- Antipsychotics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with BETA-BLOCKERS
- Calcium-channel Blockers: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with DIURETICS
- Dopaminergics: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with MOXISYLYTE
- Moxonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with MOXISYLYTE
- Moxonidine: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with MOKONIDINE.
- Muscle Relaxants: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with BACLOHEN;
  enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with NICOANDIL.
- Nitrates: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with NITRATES
- Oestrogens: hypotensive effect of hydralazine, minoxidil and sodium nitroprusside antagonised by OESTROGENS
- Prostaglandins: enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with ALPROSTADIL
- Vasodilator Antihypertensives: enhanced hypotensive effect when hydralazine given with MINOXIDIL or SODIUM NITROPRUSSIDE;
  enhanced hypotensive effect when minoxidil given with SODIUM NITROPRUSSIDE

**Veceduronium** see Muscle Relaxants

**Vedolizumab**
- Antipsychotics: avoid concomitant use of cytoxotics with
- CLOzapine (increased risk of agranulocytosis)
- Vaccines: risk of generalised infections when monoclonal antibodies given with live vacCines—avoid concomitant use

**Venlafaxine**
- Antibacterials: manufacturer of vemurafenib advises avoid concomitant use with RifABUTIN and RifAMPICIN
- Anticoagulants: venlafaxin possibly enhances anticoagulant effect of WARFARIN
- Antidepressants: manufacturer of vemurafenib advises avoid concomitant use with ST JOHN’S WORT
- Antiepileptics: manufacturer of vemurafenib advises avoid concomitant use with CarbamAZPine, FosPHENyTOIN and PHTYTOIN.
- Antipsychotics: avoid concomitant use of cytoxotics with
- CLOzapine (increased risk of agranulocytosis)
- Cytoxotics: avoidance of vemurafenib advised by manufacturer of PipILUmAB.

**Venlafaxine enhanced hypotensive effect when hydralazine, minoxidil or sodium nitroprusside given with**

**A1**

**Interactions**

**Vasodilator Antihypertensives — Venlafaxine** 923

- Analgesics: increased risk of bleeding when venlafaxine given with NSAIDS or ASPIRIN; possible increased serotonergic effects when SSRI-related antidepressants given with FENTANYL; possible increased serotonergic effects when venlafaxine given with TRAMADOL.
- Anti-arrhythmics: manufacturer of venlafaxine advises avoid concomitant use with AMIODARONE (risk of ventricular arrhythmias).
- Antidepressants: manufacturer of venlafaxine advises avoid concomitant use with ERYTHROMYCIN and MOXIFLOXACIN (risk of ventricular arrhythmias).
- Antipsychotics: venlafaxine possibly enhances anticoagulant effect of WARFARIN; possible increased risk of bleeding when SSRI-related antidepressants given with DABIGATRAN.
- Antidepressants: possible increased serotonergic effects when venlafaxine given with ST JOHN’S WORT, DULOXETINE or MIRTAZAPINE; enhanced CNS effects and toxicity when venlafaxine given with MAOIs (venlafaxine should not be started until 2 weeks after stopping MAOIs, avoid MAOIs for 1 week after stopping venlafaxine); after stopping SSRI-related antidepressants do not start MOXIBEMIDE for at least 1 week; possible increased risk of convulsions when SSRI-related antidepressants given with VORTIOXETINE.
- Antimalarials: avoidance of antidepressants advised by manufacturer of ARTENIMOL WITH PIPERAQUINE.
- Antidepressants: possible increased serotonergic effects when venlafaxine given with ATOMOXETINE;
  increased risk of convulsions when antidepressants given with ATOMOXETINE.
- Beta-blockers: manufacturer of venlafaxine advises avoid concomitant use with SOTALOL (risk of ventricular arrhythmias).
- Dapoxetine: possible increased risk of serotonergic effects when venlafaxine given with DAPoxetine (manufacturer of dapoxetine advises venlafaxine should not be started until 1 week after stopping dapoxetine, avoid dapoxetine for 2 weeks after stopping venlafaxine).
- Dopaminergics: caution with venlafaxine advised by manufacturer of ENTACAPONE; increased risk of hypertension and CNS excitation when venlafaxine given with SELEGINLE (selegiline should not be started until 1 week after stopping venlafaxine, avoid venlafaxine for 2 weeks after stopping selegiline).
- SHI, receptor Agonists: possible increased serotonergic effects when venlafaxine given with SHI, AGONISTS.
- SH2, receptor Antagonists: possible increased serotonergic effects when SSRI-related antidepressants given with SHI, ANTAGONISTS.
- Lithium: possible increased serotonergic effects when venlafaxine given with LITHIUM.
Venlafaxine (continued)
- Methylthioninium: risk of CNS toxicity when SSR1-related antidepressants given with ● METHYLTHIONINIUM—avoid concomitant use (if avoidance not possible, use lowest possible dose of methylthioninium and observe patient for up to 4 hours after administration)

Verapamil see Calcium-channel Blockers

**Vigabatin**
- Antidepressants: anticonvulsant effect of antiepileptics possibly antagonised by MAOIs and ● TRICYCLIC-RELATED ANTIDEPRESSANTS (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ● SSRI and ● TRICYCLES (convulsive threshold lowered)
- Antiepileptics: vigabatin reduces plasma concentration of antiepileptics
- Antimalarials: anticonvulsant effect of antiepileptics antagonised by ● MELOQUINE
- Antipsychotics: anticonvulsant effect of antiepileptics antagonised by ● ANTIPSYCHOTICS (convulsive threshold lowered)
- Orlstat: possible increased risk of convulsions when antiepileptics given with ● ORLISTAT

**Vilanoterol** see Sympathomimetics, Beta₂

**Vildagliptin** see Antidiabetics

**Vinblastine**
- Aldesleukin: avoidance of vinblastine advised by manufacturer of ● ALDESLEUKIN
- Antibacterials: toxicity of vinblastine increased by ● ETHROMYCIN—avoid concomitant use; possible increased risk of ventricular arrhythmias when vinblastine given with ● DELAMANID
- Antifungals: possible increased risk of vinblastine toxicity when given with ● ITRACONAZOLE; metabolism of vinblastine possibly inhibited by ● POSaconazole (increased risk of neurotoxicity)
- Antimalarials: avoidance of vinblastine advised by manufacturer of ● ARTENIMOL WITH PIPERAQUINE
- Antipsychotics: avoid concomitant use of cytotoxics with ● CLOzapine (increased risk of agranulocytosis)
- Antivirals: plasma concentration of vinblastine possibly increased by ● RITONAVIR

**Vincristine**
- Antibacterials: possible increased risk of ventricular arrhythmias when vincristine given with ● DELAMANID
- Antifungals: increased risk of vincristine toxicity when given with ● ITRACONAZOLE; metabolism of vincristine possibly inhibited by ● POSaconazole (increased risk of neurotoxicity)
- Antimalarials: avoidance of vincristine advised by manufacturer of ● ARTENIMOL WITH PIPERAQUINE
- Antipsychotics: avoid concomitant use of cytotoxics with ● CLOzapine (increased risk of agranulocytosis)
- Calcium-channel Blockers: metabolism of vincristine possibly inhibited by ● NIFEdipine
- Cardiac Glycosides: vincristine possibly reduces absorption of DIGOXIN tablets
- Cytotoxics: increased risk of hepatotoxicity when vincristine given with ● DACTINOMYCIN

**Vindesine**
- Antibacterials: possible increased risk of ventricular arrhythmias when vindesine given with ● DELAMANID
- Antifungals: possible increased risk of vindesine toxicity when given with ● ITRACONAZOLE
- Antipsychotics: avoid concomitant use of cytotoxics with ● CLOzapine (increased risk of agranulocytosis)

**Vinflunine**
- Antibacterials: plasma concentration of vinflunine possibly reduced by ● RIFAMPICIN—manufacturer of vinflunine advises avoid concomitant use; increased risk of ventricular arrhythmias when vinflunine given with ● DELAMANID
- Antidepressants: plasma concentration of vinflunine possibly reduced by ● ST JOHN S W O R T —manufacturer of vinflunine advises avoid concomitant use
- Antiparasitics: plasma concentration of vinflunine increased by ● KETOCONAZOLE—manufacturer of vinflunine advises avoid concomitant use; possible increased risk of vinflunine toxicity when given with ● ITRACONAZOLE

**Vinorelbine**
- Antibacterials: possible increased risk of neutropenia when vinorelbine given with ● CLRITHROMYCIN; possible increased risk of ventricular arrhythmias when vinorelbine given with ● DELAMANID
- Antifungals: possible increased risk of vinorelbine toxicity when given with ● ITRACAzoLE
- Antimalarials: avoidance of vinorelbine advised by manufacturer of ● ARTENIMOL WITH PIPERAQUINE
- Antipsychotics: avoid concomitant use of cytotoxics with ● CLOzapine (increased risk of agranulocytosis)

**Vismodegib**
- Antibacterials: manufacturer of vismodegib advises avoid concomitant use with ● Rifampicin (plasma concentration of vismodegib possibly reduced)
- Antidepressants: manufacturer of vismodegib advises avoid concomitant use with ● ST JOHN S W O R T (plasma concentration of vismodegib possibly reduced)
- Antiepileptics: manufacturer of vismodegib advises avoid concomitant use with ● CARBAMAZEPINE, ● fosphenytin and ▶ PHENYTOIN (plasma concentration of vismodegib possibly reduced)
- Antipsychotics: avoid concomitant use of cytotoxics with ● CLOzapine (increased risk of agranulocytosis)

**Vitamin A** see Vitamins
**Vitamin D** see Vitamins
**Vitamin E** see Vitamins
**Vitamin K (Phytonemadione)** see Vitamins

**Vitamins**
- Antibacterials: absorption of vitamin A possibly reduced by ● NEOMYCIN
- Anticoagulants: vitamin E possibly enhances anticoagulant effect of ● COUMARINS; vitamin K antagonises anticoagulant effect of ● COUMARINS and ● PHENINDIONE
- Antiepileptics: alfalcaldicol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalciferol or vitamin D requirements possibly increased when given with ● CARBAMAZEPINE; alfalcaldicol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalciferol or vitamin D requirements possibly increased when given with ● FOSPHENYTOIN; alfalcaldicol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalciferol, or vitamin D requirements possibly increased when given with ● PHENOBARBITAL; alfalcaldicol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalciferol, or vitamin D requirements possibly increased when given with ● PRIMIDONE
- Antifungals: plasma concentration of paricalciferol possibly increased by ● KETOCONAZOLE; effects of alfalcaldicol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalciferol and vitamin D requirements possibly increased by ● MICONAZOLE
- Antivirals: increased risk of bleeding when high doses of vitamin E given with ● TIPRANAVIR
- Ciclosporin: vitamin E possibly affects plasma concentration of ● CICLOSPORIN
- Cytotoxics: effects of alfalcaldicol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalciferol and vitamin D requirements possibly reduced by ● DACTINOMYCIN; avoidance of vitamin E advised by manufacturer of ● IBRUTINIB
- Diuretics: increased risk of hypercalcaemia when alfalcaldicol, calcitriol, colecalciferol, dihydrotachysterol, ergocalciferol, paricalciferol or vitamin D given with ● THIAZIDES AND RELATED DIURETICS
### Vitamins – Zuclopenthixol

#### Interactions

- **Dopaminergics:** pyridoxine reduces effects of levodopa when given without dopa-decarboxylase inhibitor.
- **Lipid-regulating Drugs:** absorption of calcitriol possibly reduced by colesteryamine.
- **Retinoids:** risk of hypervitaminosis A when vitamin A given with retinoids—avoid concomitant use.
- **Selenium:** ascorbic acid possibly reduces absorption of selenium (give at least 1 hour apart).
- **Sevelamer:** absorption of calcitriol reduced by sevelamer (give at least 1 hour before or 3 hours after sevelamer).

#### Zidovudine

- **Antivirals:** profound myelosuppression when zidovudine given with ganciclovir or valganciclovir (if possible avoid concomitant administration, particularly during initial ganciclovir or valganciclovir therapy); increased risk of granulocytopenia when zidovudine given with nevirapine; increased risk of anaemia when zidovudine given with ribavirin—avoid concomitant use; zidovudine possibly inhibits effects of stavudine (manufacturers advise avoid concomitant use); plasma concentration of zidovudine reduced by tipranavir.
- **Atovaquone:** plasma concentration of zidovudine increased by atovaquone (increased risk of toxicity).
- **Netuptant:** caution with zidovudine advised by manufacturer of netuptant.
- **Orlistat:** absorption of zidovudine possibly reduced by orlistat.
- **Zinc:** absorption of zinc reduced by oral iron salts, also absorption of oral iron salts reduced by zinc.

#### Zoledronic Acid

See Bisphosphonates.

- **Zolmitriptan:** see 5-HT-receptor Agonists (under HT).

#### Zolpidem

See Anxiolytics and Hypnotics.

#### Zonisamide

- **Antidepressants:** anticonvulsant effect of antiepileptics possibly antagonised by maois and tricyclic-related antidepressants (convulsive threshold lowered); anticonvulsant effect of antiepileptics antagonised by ssris and tricyclics (convulsive threshold lowered).
- **Antiepileptics:** plasma concentration of zonisamide reduced by carbamazepine, fosphenytoin, phenobarbital, phenytoin and primidone.
- **Antimalarials:** anticonvulsant effect of antiepileptics antagonised by mefloquine.
- **Antipsychotics:** anticonvulsant effect of antiepileptics antagonised by antipsychotics (convulsive threshold lowered).
- **Diuretics:** manufacturer of zonisamide advises avoid concomitant use with carbonic anhydrase inhibitors in children.
- **Orlistat:** possible increased risk of convulsions when antiepileptics given with orlistat.

#### Zopiclone

See Anxiolytics and Hypnotics.

#### Zuclopenthixol

See Antipsychotics.

In certain conditions some foods (and toilet preparations) have characteristics of drugs and the Advisory Committee on Borderline Substances (ACBS) advises as to the circumstances in which such substances may be regarded as drugs. Prescriptions issued in accordance with the Committee’s advice and endorsed ‘ACBS’ will normally not be investigated.

Information

General Practitioners are reminded that the ACBS recommends products on the basis that they may be regarded as drugs for the management of specified conditions. Doctors should satisfy themselves that the products can safely be prescribed, that patients are adequately monitored and that, where necessary, expert hospital supervision is available.

Foods which may be prescribed on FP10, GP10 (Scotland), or WP10 (Wales)

All the food products listed in this appendix have ACBS approval. The clinical condition for which the product has been approved is included with each entry.

Note

Foods included in this appendix may contain cariogenic sugars and patients should be advised to take appropriate oral hygiene measures.

Enteral feeds and supplements

For most enteral feeds and nutritional supplements, the main source of carbohydrate is either maltodextrin or glucose syrup; other carbohydrate sources are listed in the relevant table, below. Feeds containing residual lactose (less than 1 g lactose/100 mL formula) are described as ‘clinically lactose-free’ or ‘lactose-free’ by some manufacturers. The presence of lactose (including residual lactose) in feeds is indicated in the relevant table, below. The primary sources of protein or amino acids are included with each product entry. The fat or oil content is derived from a variety of sources such as vegetables, soya bean, corn, Palm nuts, and seeds; where the fat content is derived from animal or fish sources, this information is included in the relevant table, below. The presence of medium chain triglycerides (MCT) is also noted where the quantity exceeds 30% of the fat content.

Enteral feeds and nutritional supplements can contain varying amounts of vitamins, minerals, and trace elements—the manufacturer’s product literature should be consulted for more detailed information. Feeds containing vitamin K may affect the INR in patients receiving warfarin; see Interactions: Appendix 1 (Vitamins).

The suitability of food products for patients requiring a vegan, kosher, halal, or other compliant diet should be confirmed with individual manufacturers.

Note

Foods containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be avoided in children unless recommended by an appropriate specialist or dietician.

Nutritional values

Nutritional values of products vary with flavour and pack size—consult product literature.

Standard ACBS indications: Disease-related malnutrition, intractable malabsorption, pre-operative preparation of malnourished patients, dysphagia, proven inflammatory bowel disease following total gastrectomy, short bowel syndrome, bowel fistula.

Paediatric ACBS indications: Disease-related malnutrition, intractable malabsorption, growth failure, pre-operative preparation of malnourished patients, dysphagia, short bowel syndrome, bowel fistula.

Other conditions for which ACBS products can be prescribed

This is a list of clinical conditions for which the ACBS has approved toilet preparations. For details of the preparations see Chapter 13.

Dermatitis, eczema and pruritis

Aveeno<sup>®</sup> Bath Oil; Aveeno<sup>®</sup> Cream; Aveeno<sup>®</sup> Lotion; E45<sup>®</sup> Emollient Bath Oil; E45<sup>®</sup> Emollient Wash Cream; E45<sup>®</sup> Lotion
Disfiguring skin lesions (birthmarks, mutilating lesions, scars, vitiligo)
Covermark® classic foundation and finishing powder; Dermablend® Ultra corrective foundation; Dermacolor® Camouflage cream and fixing powder; Keromask® masking cream and finishing powder; Veil® Cover cream and Finishing Powder. (Cleansing Creams, Cleansing Milks, and Cleansing Lotions are excluded).

Disinfectants (antiseptics)
May be prescribed on an FP10 only when ordered in such quantities and with such directions as are appropriate for the treatment of patients, but not for general hygienic purposes.

Dry mouth (xerostomia)
For patients suffering from dry mouth as a result of having (or having undergone) radiotherapy, or sicca syndrome.
AS Saliva Orthana®; Biotène Oralbalance®; BioXtra®; Glandosane®; Saliveze®

Photodermatoses (skin protection in)
Anthelios® XL SPF 50+ Melt-in cream; Sunsense® Ultra; Uvistat® Lipscreen SPF 50, Uvistat® Suncream SPF 30 and 50

Prices quoted in Appendix 2 are basic NHS net prices; for further information see Prices in BNFC.
## Table 1 Enteral feeds (non-disease specific)

Less than 5 g protein/100 mL

### Enteral feeds: 1 kcal/mL and less than 5 g protein/100 mL

Not suitable for use in child under 1 year unless otherwise stated; not recommended for child 1-6 years

### Additional Information

- **Soya Multi Fibre** (Nutricia Ltd) provides 3.9 g protein, 12.3 g carbohydrate, 4 g fat, and 1.5 g fibre.
- **Enteral feeds** vary in energy content, with some specifically formulated to reduce protein and carbohydrate content.
- **Amino acid formula** is indicated for specific medical conditions, especially in children.
- **Enteral feeds** are classified based on their energy and protein content per 100 mL.

---

**Note:** The descriptions and formulations provided are based on the information available on the image. Actual formulations and product specifications may vary. For detailed and accurate information, please refer to the product labels or contact the manufacturers directly.

Nutritional supplements for metabolic diseases

GA1 Anamix® Infant

» Nutritional supplement for the dietary management of proven glutaric aciduria (type 1) in children from birth to 3 years.

POWDER, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 15.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

Glutaric aciduria (type 1)

GA Gel®

» Nutritional supplement for dietary management of type 1 glutaric aciduria in children 6 months–10 years.

GEL, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 10 g, carbohydrate 10.5 g, fat trace, energy 539 kJ (81 kcal)/24 g, with vitamins, minerals, and trace elements.

GA gel oral powder 24g sachets (Vitafo International Ltd)
30 sachet (ACBS) - NHS indicative price = £212.44

XLYS, Low TRY, Maxamaid®

» Nutritional supplement for the dietary management of type 1 glutaric aciduria.
POWDER, protein equivalent (essential and non-essential amino acids except lysine, and low tryptophan) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1511 kJ (369 kcal)/100 g, with vitamins, minerals, and trace elements.

XLYS LOW TRY Maxamaid powder (Nutricia Ltd) 500 gram (ACBS) · NHS indicative price = £98.23

XLYS TRY Glutaridon®
- Nutritional supplement for the dietary management of type 1 glutaric aciduria in children and adults; requires additional source of vitamins, minerals, and trace elements. POWDER, protein equivalent (essential and non-essential amino acids except lysine and tryptophan) 79 g, carbohydrate 4 g, energy 1411 kJ (332 kcal)/100 g.

XLYS TRY Glutaridon powder (Nutricia Ltd) 500 gram (ACBS) · NHS indicative price = £186.08

Glycogen storage disease
Corn flour and corn starch
For glycogen storage disease
Glycosade®
- A nutritional supplement for use in the dietary management of glycogen storage disease and other metabolic conditions where a constant supply of glucose is essential. Not suitable for use in children under 2 years. POWDER, protein 200 mg, carbohydrate (maize starch) 47.6 g, fat 100 mg, fibre less than 600 mg, energy 803 kJ (192 kcal)/60 g.

Glycosade oral powder 60g sachets (Vitaflo International Ltd) 30 sachet (ACBS) · NHS indicative price = £11.65

Homocystinuria or hypermethioninaemia
HCU Anamix® Infant
- Nutritional supplement for the dietary management of proven vitamin B6 non-responsive homocystinuria or hypermethioninaemia in children from birth to 3 years. POWDER, protein equivalent (essential and non-essential amino acids except methionine) 15.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 5.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

HCU Anamix Infant powder (Nutricia Ltd) 400 gram (ACBS) · NHS indicative price = £38.91

HCU COOLER® 15
- A methionine-free protein substitute for use as a nutritional supplement in children over 3 years with homocystinuria. LIQUID, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 7 g, fat 500 mg, energy 595 kJ (92 kcal)/150 mL, with vitamins, minerals, and trace elements.

HCU orange cooler 15 liquid (Vitaflo International Ltd) 130 ml (ACBS) · NHS indicative price = £11.21

HCU Express® 15
- A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria. POWDER, protein (essential and non-essential amino acids except methionine) 15 g, carbohydrate 3.8 g, fat 30 mg, energy 315 kJ (75.5 kcal)/25 g with vitamins, minerals, and trace elements.

HCU express 15 oral powder 25g sachets (Vitaflo International Ltd) 30 sachet (ACBS) · NHS indicative price = £52.89

HCU Express® 20
- A methionine-free protein substitute for use as a nutritional supplement in children over 8 years with homocystinuria. POWDER, protein (essential and non-essential amino acids except methionine) 20 g, carbohydrate 4.7 g, fat 70 mg, energy 416 kJ (99 kcal)/34 g with vitamins, minerals, and trace elements.

HCU express 20 oral powder 34g sachets (Vitaflo International Ltd) 30 sachet (ACBS) · NHS indicative price = £42.61

HCU gel®
- A methionine-free protein substitute for use as a nutritional supplement for the dietary management of children 1–10 years with homocystinuria. POWDER, protein (essential and non-essential amino acids except methionine) 10 g, carbohydrate 10.3 g, fat 20 mg, energy 339 kJ (81 kcal)/24 g with vitamins, minerals, and trace elements.

HCU gel oral powder 24g sachets (Vitaflo International Ltd) 30 sachet (ACBS) · NHS indicative price = £212.58

HCU Lophlex® LQ 20
- Nutritional supplement for the dietary management of homocystinuria in children under 3 years. LIQUID, protein equivalent (essential and non-essential amino acids except methionine) 20 g, carbohydrate 8.8 g, fat 440 mg, energy 509 kJ (120 kcal)/125 mL, with vitamins, minerals, and trace elements.

HCU Lophlex LQ 20 liquid (Nutricia Ltd) 125 ml (ACBS) · NHS indicative price = £16.05

HCU LV®
- Nutritional supplement for the dietary management of hypermethioninaemia or vitamin B6 non-responsive homocystinuria in children over 8 years. POWDER, protein (essential and non-essential amino acids except methionine) 25 g, carbohydrate 4.5 g, fat 590 mg, energy 1386 kJ (326 kcal)/100 g.

HCU LV oral powder 27.8g sachets (Nutricia Ltd) tropical, unflavoured 30 sachet (ACBS) · NHS indicative price = £493.20

XMET Homidon®
- Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria in children and adults. POWDER, protein (essential and non-essential amino acids except methionine) 77 g, carbohydrate 4.5 g, fat nil, energy 1586 kJ (326 kcal)/100 g.

XMET Homidon powder (Nutricia Ltd) 500 gram (ACBS) · NHS indicative price = £186.08

XMET Maxamaid®
- Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria in children and adults. POWDER, protein (essential and non-essential amino acids except methionine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1511 kJ (390 kcal)/100 g, with vitamins, minerals, and trace elements. Maxamaid products are generally intended for use in children 1–8 years.

XMET Maxamaid powder (Nutricia Ltd) 500 gram (ACBS) · NHS indicative price = £98.23

XMET Maxamum®
- Nutritional supplement for the dietary management of hypermethioninaemia or homocystinuria. POWDER, protein equivalent (essential and non-essential amino acids except methionine) 39 g, carbohydrate 34 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements. Maxamum products are generally intended for use in children over 8 years.

XMET Maxamum powder (Nutricia Ltd) 500 gram (ACBS) · NHS indicative price = £157.46

Hyperlysinaemia
HYPER LYS Anamix® Infant
- Nutritional supplement for the dietary management of proven hyperlysinaemia in children from birth to 3 years. POWDER, protein equivalent (essential and non-essential amino acids except lysine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1913 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 5.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.
Nutritional supplements for metabolic diseases

**Nutritional supplement for the dietary management of hyperlysinaemia:**

**POWDER, protein equivalent (essential and non-essential amino acids except lysine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1511 kJ (369 kcal)/100 g with vitamins, minerals, and trace elements.**

**IVA Anamix Infant powder** (Nutricia Ltd) 400 gram (ACBS) • NHS indicative price = £38.91

Maxamaid products are generally intended for use in children 1–8 years.
Methylenalonic or propionic acidaemia

MMA/PA Anamix® Infant

- Nutritional supplement for the dietary management of proven methylenalonic acidemia or propionic acidemia in children from birth to 3 years.

POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 13.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.5 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

MMA PA Anamix Infant powder (Nutricia Ltd)

400 gram (ACBS) - NHS indicative price = £38.91

XMTVI Asadon®

- Nutritional supplement for the dietary management of methylenalonic acidemia or propionic acidemia in children and adults.

POWDER, protein equivalent (essential non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g.

XMTVI Asadon powder (Nutricia Ltd)

200 gram (ACBS) - NHS indicative price = £74.43

XMTVI Maxamaid®

- Nutritional supplement for the dietary management of methylenalonic acidemia or propionic acidemia.

POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements.

XMTVI Maxamaid powder (Nutricia Ltd)

500 gram (ACBS) - NHS indicative price = £98.23

XMTVI Maxamum®

- Nutritional supplement for the dietary management of methylenalonic acidemia or propionic acidemia.

POWDER, protein equivalent (essential and non-essential amino acids except methionine, threonine, and valine, and low isoleucine) 25 g, carbohydrate 51 g, fat less than 500 mg, energy 1311 kJ (309 kcal)/100 g, with vitamins, minerals, and trace elements.

XMTVI Maxamum powder (Nutricia Ltd)

500 gram (ACBS) - NHS indicative price = £157.46

Other inborn errors of metabolism

Cystine500®

- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.

POWDER, cystine 500 mg, carbohydrate 3.5 g, fat nil, energy 63 kJ (15 kcal)/4 g

DocOmega®

- Nutritional supplement for the dietary management of inborn errors of metabolism for adults and children from birth.

POWDER, protein (cows’ milk, soya) 100 mg, carbohydrate 3.2 g, fat 500 mg (of which docosahexaenoic acid 200 mg), fibre nil, energy 74 kJ (18 kcal)/4 g, with minerals

DocOmega oral powder 4g sachets (Vitaflor International Ltd)

30 sachet (ACBS) - NHS indicative price = £39.06

EAA® Supplement

- Nutritional supplement for the dietary management of disorders of protein metabolism including urea cycle disorders and disorders of amino acid metabolism in children from birth.

POWDER, protein equivalent (essential amino acids) 5 g, carbohydrate 4 g, fat nil, energy 151 kJ (36 kcal)/12.5 g, with vitamins, minerals, and trace elements.

EAA® Supplement oral powder 12.5g sachets (Vitaflor International Ltd)

50 sachet (ACBS) - NHS indicative price = £205.64

- Nutritional supplement for use in the dietary management of inborn errors of amino acid metabolism in adults and children from birth.

POWDER, isoleucine 50 mg, carbohydrate 3.8 g, fat nil, energy 65 kJ (15 kcal)/4 g

Isoleucine50 oral powder 4g sachets (Vitaflor International Ltd)

30 sachet (ACBS) - NHS indicative price = £53.97

KeyOmega®

- Nutritional supplement for the dietary management of inborn errors of metabolism.

POWDER, protein (cows’ milk, soya) 170 mg, carbohydrate 2.8 g, fat 800 mg (of which arachidonic acid 200 mg, docosahexaenoic acid 100 mg), energy 80 kJ (19 kcal)/4 g.

KeyOmega oral powder 4g sachets (Vitaflor International Ltd)

30 sachet (ACBS) - NHS indicative price = £59.94

Leucine100®

- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.

POWDER, leucine 100 mg, carbohydrate 3.7 g, fat nil, energy 63 kJ (15 kcal)/4 g

Leucine100 oral powder sachets (Vitaflor International Ltd)

30 sachet (ACBS) - NHS indicative price = £55.97

Low protein drink

- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children over 1 year.

POWDER, protein (cows’ milk) 4.5 g (phenylalanine 100 mg), carbohydrate 59.5 g, fat 29.9 g, fibre nil, energy 2194 kJ (528 kcal)/100 g, with vitamins, minerals, and trace elements. Contains lactose.

Milupa LP drink (Nutricia Ltd)

400 gram (ACBS) - NHS indicative price = £9.23

Phenylalanine50®

- Nutritional supplement for use in the dietary management of inborn errors of metabolism in adults and children from birth.

POWDER, phenylalanine 50 mg, carbohydrate 3.8 g, fat nil, energy 63 kJ (15 kcal)/4 g

Phenylalanine50 oral powder sachets (Vitaflor International Ltd)

30 sachet (ACBS) - NHS indicative price = £52.40

ProZero®

- A protein-free nutritional supplement for the dietary management of inborn errors of metabolism in children over 6 months and adults.

LIQUID, carbohydrate 8.1 g (of which sugars 5.5 g), fat 5.8 g, energy 278 kJ (66 kcal)/100 mL. Contains lactose.

ProZero liquid (Vitaflor International Ltd)

250 ml (ACBS) - NHS indicative price = £1.44 | 1000 ml (ACBS) - NHS indicative price = £5.75

Tyrosine100®

- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.

POWDER, tyrosine 1 g, carbohydrate 2.9 g, fat nil, energy 63 kJ (15 kcal)/4 g sachet.
Nutritional supplements for metabolic diseases

Tyrosine1000 oral powder 4g sachets (Vitaflo International Ltd)
30 sachet (ACBS) - NHS indicative price = £4.95

Valinex®
- Nutritional supplement for the dietary management of inborn errors of amino acid metabolism in adults and children from birth.
- POWDER, valine 50 mg, carbohydrate 3.8 g, fat nil, energy 65 kJ (15 kcal)/4 g

Valinex50 oral powder 4g sachets (Vitaflo International Ltd)
30 sachet (ACBS) - NHS indicative price = £53.97

Phenylketonuria

Add-Ins®
- Nutritional supplement for the dietary management of proven phenylketonuria in children over 4 years.
- POWDER, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate nil, fat 5.1 g, energy 559 kJ (86 kcal)/18.2 g sachet, with vitamins, minerals, and trace elements.

Add Ins oral powder 18.2g sachets (Nutricia Ltd)
60 sachet (ACBS) - NHS indicative price = £375.60

Easiphem®
- Nutritional supplement for the dietary management of proven phenylketonuria in children over 8 years.
- LIQUID, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 6.7 g, carbohydrate 5.1 g, fat 2 g, energy 275 kJ (65 kcal)/100 mL with vitamins, minerals, and trace elements.

Easiphem liquid (Nutricia Ltd)
250 ml (ACBS) - NHS indicative price = £9.65

L-Tyrosine

L-Tyrosine powder (Nutricia Ltd)
100 gram (ACBS) - NHS indicative price = £21.91

Lophlex

Lophlex powder 27.8g sachets (Nutricia Ltd)
500 gram (ACBS) - NHS indicative price = £128.24

Phlexy-Vits®
- For use as a vitamin and mineral component of restricted therapeutic diets in children under 11 years and adults with phenylketonuria and similar amino acid abnormalities.
- POWDER, vitamins, minerals, and trace elements.

Phlexy-Vits (Nutricia Ltd)
powder 210 gram (ACBS) - NHS indicative price = £71.40

PK Aid 4®
- Nutritional supplement for the dietary management of phenylketonuria in children and adults.
- POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 79 g, carbohydrate 4.5 g, fat nil, energy 1420 kJ (334 kcal)/100 g.

PK Aid 4 powder (Nutricia Ltd)
500 gram (ACBS) - NHS indicative price = £145.04

PKU Anamix® First Spoon

PKU Anamix First Spoon oral powder 12.5g sachets (Nutricia Ltd)
30 sachet (ACBS) - NHS indicative price = £91.80

PKU Anamix® Infant

PKU Anamix Infant powder 12.5g sachets (Nutricia Ltd)
30 sachet (ACBS) - NHS indicative price = £91.80

PKU Anamix Infant powder (Nutricia Ltd)
400 gram (ACBS) - NHS indicative price = £55.36

PKU Anamix® Junior

PKU Anamix Junior powder (Nutricia Ltd)
chocolate, neutral 87g gram (ACBS) - NHS indicative price = £125.90 | 1080 gram (ACBS) - NHS indicative price = £126.30

PKU Anamix® Junior LQ

PKU Anamix Junior LQ powder (Nutricia Ltd)
chocolate, neutral 87g gram (ACBS) - NHS indicative price = £125.90 | 1080 gram (ACBS) - NHS indicative price = £126.30

Phlexy-10 500mg capsules (Nutricia Ltd)
200 capsule (ACBS) - NHS indicative price = £42.80

Phlexy-Vits (Nutricia Ltd)
powder 210 gram (ACBS) - NHS indicative price = £71.40

Phlexy-Vits (Nutricia Ltd)
powder 250 gram (ACBS) - NHS indicative price = £117.00

Phlexy-Vits tablets 200 tablet (ACBS) - NHS indicative price = £71.40

Phlexy-Vits tablets 180 tablet (ACBS) - NHS indicative price = £81.00

Phlexy-10 tablets (Nutricia Ltd)
75 tablet (ACBS) - NHS indicative price = £27.00

Phlexy-10 tablets (Nutricia Ltd)
200 tablet (ACBS) - NHS indicative price = £54.00

Loprofin PKU drink mix, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 8.35 g, carbohydrate 8.8 g/20 g sachet.

Loprofin PKU drink mix, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 8.8 g/20 g sachet.

Loprofin PKU drink mix, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 12.5 g, carbohydrate 8.8 g/20 g sachet.

Loprofin PKU drink mix, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.8 g/20 g sachet.

Loprofin PKU drink mix, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 5 g, carbohydrate 8.8 g/20 g sachet.

Loprofin PKU drink mix, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 2.5 g, carbohydrate 8.8 g/20 g sachet.

Loprofin PKU drink mix, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 1 g, carbohydrate 8.8 g/20 g sachet.

Loprofin PKU drink mix, powder, protein equivalent (essential and non-essential amino acids except phenylalanine) 0.5 g, carbohydrate 8.8 g/20 g sachet.
Nutritional supplements for metabolic diseases

PKU coolero®
- Nutritional supplement for the dietary management of phenylketonuria in children over 3 years.
LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 5.1 g, energy 258 kJ (62 kcal)/87 mL pouch, with vitamins, minerals, and trace elements.

PKU (Vitaflo International Ltd)
- orange cooler 10 liquid, purple cooler 10 liquid, red cooler 10 liquid, white cooler 10 liquid 87 mL (ACBS) - NHS indicative price = £4.56

PKU coolers®
- Nutritional supplement for the dietary management of phenylketonuria in children over 3 years.
LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 7.8 g, energy 386 kJ (92 kcal)/150 mL pouch, with vitamins, minerals, and trace elements.

PKU (Vitaflo International Ltd)
- orange cooler 15 liquid, purple cooler 15 liquid, red cooler 15 liquid, white cooler 15 liquid 150 mL (ACBS) - NHS indicative price = £6.80

PKU cooler20®
- Nutritional supplement for the dietary management of phenylketonuria in children over 3 years.
LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 10.2 g, energy 517 kJ (124 kcal)/174 mL pouch, with vitamins, minerals, and trace elements.

PKU (Vitaflo International Ltd)
- orange cooler 20 liquid, purple cooler 20 liquid, red cooler 20 liquid, white cooler 20 liquid 174 mL (ACBS) - NHS indicative price = £9.12

PKU express15®
- Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 2.4 g, energy 295 kJ (70 kcal)/25 g, with vitamins, minerals, and trace elements.

PKU (Vitaflo International Ltd)
- orange cooler 15 liquid, purple cooler 15 liquid, red cooler 15 liquid, white cooler 15 liquid 130 mL (ACBS) - NHS indicative price = £10.33

PKU express 15 powder (Vitaflo International Ltd)
- lemon, orange, tropical, unflavoured 750 gram (ACBS) - NHS indicative price = £20.00

PKU express20®
- Nutritional supplement for the dietary management of phenylketonuria. Not recommended for children under 3 years.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 5.3 g, energy 389 kJ (93 kcal)/54 g, with vitamins, minerals, and trace elements.

PKU express 20 powder (Vitaflo International Ltd)
- lemon, orange, tropical, unflavoured 1020 gram (ACBS) - NHS indicative price = £258.39

PKU gel®
- For use as part of the low-protein dietary management of phenylketonuria in children 1–10 years
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 8.9 g, fat less than 100 mg, energy 318 kJ (76 kcal)/24 g, with vitamins, minerals, and trace elements.

PKU gel powder (Vitaflo International Ltd)
- orange, raspberry, unflavoured 720 gram (ACBS) - NHS indicative price = £138.56

PKU Lophlex® LQ 10
- Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women.
LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 4.4 g, fibre 250 mg, energy 245 kJ (58 kcal)/62.5 mL, with vitamins, minerals, and trace elements.

PKU Lophlex LQ 10 liquid juicy (Nutricia Ltd)
berries, orange 62.5 mL (ACBS) - NHS indicative price = £5.18

PKU Lophlex® LQ 20
- Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women.
LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 8.8 g, fibre 340 mg, energy 490 kJ (115 kcal)/125 mL, with vitamins, minerals, and trace elements.

PKU Lophlex LQ 20 liquid (Nutricia Ltd)
- berry, juicy berries, orange 125 mL (ACBS) - NHS indicative price = £10.33

PKU Lophlex® Sensation 20
- Nutritional supplement for the dietary management of phenylketonuria in children over 4 years and adults including pregnant women.
SEMI-SOLID, protein equivalent (containing essential and non-essential amino acids except phenylalanine) 20 g, carbohydrate 20.2 g, fibre 1 g, energy 706 kJ (166 kcal)/109 g, with vitamins, minerals, and trace elements.

PKU Lophlex Sensation 20 (Nutricia Ltd)
berries, orange 327 gram (ACBS) - NHS indicative price = £33.00

PKU squeeze®
- Nutritional supplement for the dietary management of phenylketonuria in children from birth to 3 years.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 10 g, carbohydrate 5.3 g, energy 389 kJ (93 kcal)/54 g, with vitamins, minerals, and trace elements.

PKU squeeze liquid (Vitaflo International Ltd)
- 2550 gram (ACBS) - NHS indicative price = £152.27

XP Maxamaid®
- Nutritional supplement for the dietary management of phenylketonuria in children from birth to 10 years.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 15 g, carbohydrate 2.4 g, energy 295 kJ (70 kcal)/25 g, with vitamins, minerals, and trace elements.

XP Maxamaid powder (Nutricia Ltd)
- orange, unflavoured 500 gram (ACBS) - NHS indicative price = £8.11

XP Maxamum®
- Nutritional supplement for the dietary management of phenylketonuria in children over 3 years and adults.
POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine) 59 g, carbohydrate 54 g, fat less than 500 mg, energy 1260 kJ (297 kcal)/100 g, with vitamins, minerals, and trace elements.

XP Maxamum oral powder 50g sachets (Nutricia Ltd)
- orange, unflavoured 50 sachet (ACBS) - NHS indicative price = £269.40

XP Maxamum powder (Nutricia Ltd)
- orange, unflavoured 500 gram (ACBS) - NHS indicative price = £89.88

Tyrosinaemia

Methionine-free TYR Anamix® Infant
- Nutritional supplement for the dietary management of proven tyrosinaemia type 1 in children from birth to 3 years.
POWDER, protein equivalent (essential and non-essential amino acids except methionine, phenylalanine, and tyrosine) 15.1 g, carbohydrate 49.5 g, fat 23 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

TYR Anamix Infant methionine free powder (Nutricia Ltd)
- 400 gram (ACBS) - NHS indicative price = £38.91
Nutritional supplements for metabolic diseases

TYR Anamix® Infant
- Nutritional supplement for the dietary management of proven tyrosinaemia where plasma-methionine concentrations are normal in children from birth to 3 years.
- POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 13.1 g, carbohydrate 49.5 g, fat 25 g, fibre 5.3 g, energy 1915 kJ (457 kcal)/100 g, with vitamins, minerals, and trace elements; standard dilution (15%) provides protein equivalent 2 g, carbohydrate 7.4 g, fat 3.5 g, fibre 800 mg, energy 287 kJ (69 kcal)/100 mL.

TYR Anamix® Junior
- Nutritional supplement for the dietary management of proven tyrosinaemia in children 1–10 years.
- POWDER, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 8.4 g, carbohydrate 11 g, fat 5.9 g, energy 475 kJ (113 kcal)/29 g sachet, with vitamins, minerals, and trace elements.

TYR Anamix Junior oral powder 20g sachets (Nutricia Ltd)
- 30 sachet (ACBS) - NHS indicative price = £206.40

TYR Anamix® Junior LQ
- Nutritional supplement for the dietary management of tyrosinaemia type I (when nitisinone (NTBC) is used, see ), type II, and type III, in children over 1 year.
- LIQUID, protein equivalent (essential and non-essential amino acids except phenylalanine and tyrosine) 10 g, carbohydrate 8.8 g, fat 4.8 g, fibre 310 mg, energy 500 kJ (119 kcal)/125 mL, with vitamins, minerals and trace elements.

TYR Anamix Junior LQ liquid (Nutricia Ltd)
- 125 mL (ACBS) - NHS indicative price = £9.02

TYR cooler® 15
- Nutritional supplement for the dietary management of tyrosinaemia in children over 5 years and adults.
- LIQUID, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 7 g, fat 500 mg, energy 1386 kJ (326 kcal)/100 g, with vitamins, minerals and trace elements.

TYR orange cooler 15 liquid (Vitaflo International Ltd)
- 150 mL (ACBS) - NHS indicative price = £11.21

TYR red cooler (Vitaflo International Ltd)
- 20 liquid 174 ml (ACBS) - NHS indicative price = £14.84
- 15 liquid 130 ml (ACBS) - NHS indicative price = £11.21
- 10 liquid 87 ml (ACBS) - NHS indicative price = £7.10

TYR expressSS®
- Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years and adults.
- POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 15 g, carbohydrate 5.4 g, fat less than 100 mg, energy 510 kJ (74 kcal)/25 g, with vitamins, minerals, and trace elements.

TYR express 15 oral powder 25g sachets (Vitaflo International Ltd)
- 30 sachet (ACBS) - NHS indicative price = £329.89

TYR expressSS®
- Nutritional supplement for the dietary management of tyrosinaemia in children over 8 years.
- POWDER, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 20 g, carbohydrate 4.7 g, fat less than 100 mg, energy 416 kJ (99 kcal)/54 g, with vitamins, minerals, and trace elements.

TYR express 20 oral powder 34g sachets (Vitaflo International Ltd)
- 30 sachet (ACBS) - NHS indicative price = £426.21

TYR Gel®
- Nutritional supplement for the dietary management of tyrosinaemia in children 1–10 years.
- GEL, protein equivalent (essential and non-essential amino acids except tyrosine and phenylalanine) 10 g, carbohydrate 10.3 g, fat less than 100 mg, energy 539 kJ (81 kcal)/24 g, with vitamins, minerals and trace elements.
Appendix 3

Cautionary and advisory labels for dispensed medicines

Guidance for cautionary and advisory labels

Medicinal forms within BNF publications include code numbers of the cautionary labels that pharmacists are recommended to add when dispensing. It is also expected that pharmacists will counsel patients and carers when necessary.

Counselling needs to be related to the age, experience, background, and understanding of the individual patient or carer. The pharmacist should ensure understanding of how to take or use the medicine and how to follow the correct dosage schedule. Any effects of the medicine on co-ordination, performance of skilled tasks (e.g. driving or work), any foods or medicines to be avoided, and what to do if a dose is missed should also be explained. Other matters, such as the possibility of staining of the clothes or skin, or discolouration of urine or stool by a medicine should also be mentioned.

For some medicines there is a special need for counselling, such as an unusual method or time of administration or a potential interaction with a common food or domestic remedy, and this should be mentioned where necessary.

Original packs

Most preparations are dispensed in unbroken original packs that include further advice for the patient in the form of patient information leaflets. The advice in patient information leaflets may be less appropriate when the medicine is for a child, particularly for unlicensed medicines or indications. Pharmacists should explain discrepancies to carers, if necessary. The patient information leaflet should only be withheld in exceptional circumstances because it contains other information that should be provided. Label 10 may be of value where appropriate. More general leaflets advising on the administration of preparations such as eye drops, eye ointments, inhalers, and suppositories are also available.

Scope of labels

In general no label recommendations have been made for injections on the assumption that they will be administered by a healthcare professional or a well-instructed patient. The labelling is not exhaustive and pharmacists are recommended to use their professional discretion in labelling new preparations and those for which no labels are shown.

Individual labelling advice is not given on the administration of the large variety of antacids. In the absence of instructions from the prescriber, and if on enquiry the patient has had no verbal instructions, the directions given under 'Dose' should be used on the label.

It is recognised that there may be occasions when pharmacists will use their knowledge and professional discretion and decide to omit one or more of the recommended labels for a particular patient. In this case counselling is of the utmost importance. There may also be an occasion when a prescriber does not wish additional cautionary labels to be used, in which case the prescription should be endorsed 'NCL' (no cautionary labels). The exact wording that is required instead should then be specified on the prescription.

Pharmacists label medicines with various wordings in addition to those directions specified on the prescription. Such labels include 'Shake the bottle', 'For external use only', and 'Store in a cool place', as well as 'Discard... days after opening' and 'Do not use after...', which apply particularly to antibiotic mixtures, diluted liquid and topical preparations, and to eye-drops. Although not listed in the BNF for Children these labels should continue to be used when appropriate; indeed, 'For external use only' is a legal requirement on external liquid preparations, while 'Keep out of the reach of children' is a legal requirement on all dispensed medicines. Care should be taken not to obscure other relevant information with adhesive labelling.

It is the usual practice for patients to take standard tablets with water or other liquids and for this reason no separate label has been recommended.

The label wordings recommended by the BNF for Children apply to medicines dispensed against a prescription. Children and carers should be aware that a dispensed medicine should never be taken by, or shared with, anyone other than for whom the prescriber intended it. Therefore, the BNF for Children does not include warnings against the use of a dispensed medicine by persons other than for whom it was specifically prescribed.

The label or labels for each preparation are recommended after careful consideration of the information available. However, it is recognised that in some cases this information may be either incomplete or open to a different interpretation. The BNF for Children will therefore be grateful to receive any constructive comments on the labelling suggested for any preparation.

Recommended label wordings

For BNF for Children 2011–2012, a revised set of cautionary and advisory labels were introduced. All of the existing labels were user-tested, and the revised wording selected reflects terminology that is better understood by patients.

Wordings which can be given as separate warnings are labels 1–19, 29–30, and 32. Wordings which can be incorporated in an appropriate position in the directions for dosage or administration are labels 21–28. A label has been omitted for number 20; labels 31 and 33 no longer apply to any medicines in the BNF for Children and have therefore been deleted.

If separate labels are used it is recommended that the wordings be used without modification. If changes are made to suit computer requirements, care should be taken to retain the sense of the original.

Welsh labels

Comprehensive Welsh translations are available for each cautionary and advisory label. These appear directly under the English label.

Labels

1 Warning: This medicine may make you sleepy

Rhybudd: Gall y feddyginiaeth hon eich gwneud yn gysglyd

To be used on preparations for children containing antihistamines, or other preparations given to children where the warnings of label 2 on driving or alcohol would not be appropriate.

2 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol

Peidiwch â gyrru, defnyddio offer llaw neu beiriannau os yw hyn yn digwydd.

To be used on preparations for adults that can cause drowsiness, thereby affecting coordination and the ability to drive and operate hazardous machinery; label 1 is more appropriate for children. It is an offence to drive while under the influence of drink or drugs.

Some of these preparations only cause drowsiness in the

Preparations, while ‘Keep out of the reach of children’ is a legal requirement on all dispensed medicines. Care should be taken not to obscure other relevant information with adhesive labelling.

It is the usual practice for patients to take standard tablets with water or other liquids and for this reason no separate label has been recommended.

The label wordings recommended by the BNF for Children apply to medicines dispensed against a prescription. Children and carers should be aware that a dispensed medicine should never be taken by, or shared with, anyone other than for whom the prescriber intended it. Therefore, the BNF for Children does not include warnings against the use of a dispensed medicine by persons other than for whom it was specifically prescribed.

The label or labels for each preparation are recommended after careful consideration of the information available. However, it is recognised that in some cases this information may be either incomplete or open to a different interpretation. The BNF for Children will therefore be grateful to receive any constructive comments on the labelling suggested for any preparation.

Recommended label wordings

For BNF for Children 2011–2012, a revised set of cautionary and advisory labels were introduced. All of the existing labels were user-tested, and the revised wording selected reflects terminology that is better understood by patients.

Wordings which can be given as separate warnings are labels 1–19, 29–30, and 32. Wordings which can be incorporated in an appropriate position in the directions for dosage or administration are labels 21–28. A label has been omitted for number 20; labels 31 and 33 no longer apply to any medicines in the BNF for Children and have therefore been deleted.

If separate labels are used it is recommended that the wordings be used without modification. If changes are made to suit computer requirements, care should be taken to retain the sense of the original.

Welsh labels

Comprehensive Welsh translations are available for each cautionary and advisory label. These appear directly under the English label.

Labels

1 Warning: This medicine may make you sleepy

Rhybudd: Gall y feddyginiaeth hon eich gwneud yn gysglyd

To be used on preparations for children containing antihistamines, or other preparations given to children where the warnings of label 2 on driving or alcohol would not be appropriate.

2 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol

Peidiwch â gyrru, defnyddio offer llaw neu beiriannau os yw hyn yn digwydd.

Peidiwch ag yfed alcohol

To be used on preparations for adults that can cause drowsiness, thereby affecting coordination and the ability to drive and operate hazardous machinery; label 1 is more appropriate for children. It is an offence to drive while under the influence of drink or drugs.

Some of these preparations only cause drowsiness in the
first few days of treatment and some only cause drowsiness in higher doses.

In such cases the patient should be told that the advice applies until the effects have worn off. However many of these preparations can produce a slowing of reaction time and a loss of mental concentration that can have the same effects as drowsiness.

Avoidance of alcoholic drink is recommended because the effects of CNS depressants are enhanced by alcohol. Strict prohibition however could lead to some patients not taking the medicine. Pharmacists should therefore explain the risk and encourage compliance, particularly in patients who may think they already tolerate the effects of alcohol (see also label 3). Queries from patients with epilepsy regarding fitness to drive should be referred back to the patient’s doctor.

Side-effects unrelated to drowsiness that may affect a patient’s ability to drive or operate machinery safely include blurred vision, dizziness, or nausea. In general, no label has been decided to cover these cases, but the patient should be suitably counselled.

3 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines
Rhybudd: Galt y feddyginiaeth hon eich gwneud yn gysglyd. Parhewch i defnyddio gwely haul bai naefod yr wy hyn yn digwydd
To be used on preparations containing monoamine-oxidase inhibitors; the warning to avoid alcohol and decaholised (low alcohol) drink is covered by the patient information leaflet. Also to be used as for label 2 but where alcohol is not an issue.

4 Warning: Do not drink alcohol
Rhybudd: Peidiwch ag yfed alcohol
To be used on preparations where a reaction such as flushing may occur if alcohol is taken (e.g. metronidazole). Alcohol may also enhance the hypoglycaemia produced by some oral antidiabetic drugs but routine application of a warning label is not considered necessary.

Patients should be advised not to drink alcohol for as long as they are receiving/using a course of medication, and in some cases for a period of time after the course is finished.

5 Do not take indigestion remedies 2 hours before or after you take this medicine
Peidiwch â chymryd meddyginiaethau camdreulial neu feddyginiaeth sy’n cynnwys haearn neu sinc, 2 awr cyn neu ar ôl y feddyginiaeth hon
To be used on label 25 on preparations coated to resist gastric acid (e.g. enteric-coated tablets). This is to avoid the possibility of premature dissolution of the coating in the presence of an alkaline pH.

Label 5 also applies to drugs such as gabapentin where the absorption is significantly affected by antacids. Pharmacists will be aware (from a knowledge of physiology) that the usual time during which indigestion remedies should be avoided is at least 2 hours before and after the majority of medicines have been taken; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

6 Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
Peidiwch â chymryd meddyginiaethau camdreulial neu feddyginiaeth sy’n cynnwys haearn neu sinc, 2 awr cyn neu ar ôl y feddyginiaeth hon
To be used on preparations containing oxfloxacin and some other quinolones, doxycycline, tetracycline, minocycline, and penicillamine. These drugs chelate calcium, iron, and zinc and are less well absorbed when taken with calcium-containing antacids or preparations containing iron or zinc. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

7 Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
Peidiwch â chymryd laeth, meddyginiaethau camdreulial, neu feddyginiaeth sy’n cynnwys haearn neu sinc, 2 awr cyn neu ar ôl y feddyginiaeth hon
To be used on preparations containing ciprofloxacin, norfloxacin, or tetracyclines that chelate calcium, iron, magnesium, and zinc, and are thus less available for absorption. Pharmacists will be aware (from a knowledge of physiology) that these incompatible preparations should be taken at least 2 hours apart for the majority of medicines; when a manufacturer advises a different time period, this can be followed, and should be explained to the patient.

8 Warning: Do not stop taking this medicine unless your doctor tells you to stop
Rhybudd: Peidiwch â stopio cymryd y feddyginiaeth hon, oni bai fod eich meddyg yn dweud wrthych am stopio
To be used on preparations that contain a drug which is required to be taken over long periods without the patient necessarily perceiving any benefit (e.g. antituberculous drugs).

Also to be used on preparations that contain a drug whose withdrawal is likely to be a particular hazard (e.g. clonidine for hypertension). Label 10 (see below) is more appropriate for corticosteroids.

9 Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop
Gadewch â gymryd y feddyginiaeth nes y bydd eich meddyg sy’n cadw drwy un diwrnod byth wedi’i orffen, oni bai eich bod yn cael cyngor i stopio
To be used on preparations where a course of treatment should be completed to reduce the incidence of relapse or failure of treatment.

The preparations are antimicrobial drugs given by mouth. Very occasionally, some may have severe side-effects (e.g. diarrhoea in patients receiving clindamycin) and in such cases the patient may need to be advised of reasons for stopping treatment quickly and returning to the doctor.

10 Warning: Read the additional information given with this medicine
Rhybudd: Darllenwch y wybodaeth ychwanegol y gafer oedd y feddyginiaeth hon
To be used particularly on preparations containing anticoagulants, lithium, and oral corticosteroids. The appropriate treatment card should be given to the patient and any necessary explanations given.

This label may also be used on other preparations to remind the patient of the instructions that have been given.

11 Protect your skin from sunlight— even on a bright but cloudy day. Do not use sunbeds
Dioglechw iech ei rhon rhag golau’r haul, hyd y bydd eich oed ar ddiwrnod braf ond cymylagon. Peidiwch â defnyddio gwyli haul
To be used on preparations that may cause phototoxic or photoallergic reactions if the patient is exposed to ultraviolet radiation. Many drugs other than those listed in Appendix 3 (e.g. phenothiazines and sulfonamides) may, on rare occasions, cause reactions in susceptible patients. Exposure to high intensity ultraviolet radiation from sunray lamps and sunbeds is particularly likely to cause reactions.

12 Do not take anything containing aspirin while taking this medicine
Peidiwch â chymryd unrhywd WRH beth sy’n cynnwys aspirin y gyda’r feddyginiaeth hon
To be used on preparations that may cause phototoxic or photoallergic reactions if the patient is exposed to ultraviolet radiation. Many drugs other than those listed in Appendix 3 (e.g. phenothiazines and sulfonamides) may, on rare occasions, cause reactions in susceptible patients. Exposure to high intensity ultraviolet radiation from sunray lamps and sunbeds is particularly likely to cause reactions.

13 Dissolve or mix with water before taking
Gadewch i doddi mewn dŵr cyn ei gymryd
To be used on preparations that are intended to be dissolved in water (e.g. soluble tablets) or mixed with water (e.g. powders,
granules) before use. In a few cases other liquids such as fruit juice or milk may be used.

14 This medicine may colour your urine. This is harmless. Gall y feddyginaeth hon liwio eich dŵr. Nid yw hyn yn arwydd o ddwr
To be used on preparations that may cause the patient’s urine to turn an unusual colour. These include triamterene (blue under some lights), levodopa (dark reddish), and rifampicin (red).

15 Caution: flammable. Keep your body away from fire or flames after you have put on the medicine
Rhybudd: Fflamadwy. Ar ôl rhoi'r feddyginaeth ymlaen, cadwch yr oll o dan neu ffînamau
To be used on preparations containing sufficient flammable solvent to render them flammable if exposed to a naked flame.

16 Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening
Rhowch y dabled i dodi dan eich tafod - peidiwch â bywch gyda neu ar ôl bwyd
Cymerwch y feddyginiaeth hon liwio eich dŵr. Mae hyn yn golygu awr cyn, neu 2 awr ar ôl bwyd
To be used on preparations that should be sucked or chewed. The pharmacist should use discretion as to which of these words is appropriate.

22 Take 30 to 60 minutes before food
Cymerych 30 i 60 munud cyn bwyd
To be used on some preparations whose absorption is thereby improved.
Most oral antibacterials require label 23 instead (see below).

23 Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
Cymerwch y feddyginaeth hon ar stumog wag. Mae hyn yn golygu awr cyn, neu 2 awr ar ôl bwyd
To be used on oral antibacterials whose absorption may be reduced by the presence of food and acid in the stomach.

24 Suck or chew this medicine
Bydd angen cnoi neu sugno'r feddyginaeth hon
To be used on preparations that should be sucked or chewed.

25 Swallow this medicine whole. Do not chew or crush
Llynwch yn gyfan. Peidiwch â chnoi neu falu fân
To be used on preparations that are enteric-coated or designed for modified-release.
Also to be used on preparations that taste very unpleasant or may damage the mouth if not swallowed whole.
Patients should be advised (where relevant) that some modified-release preparations can be broken in half, but that the halved tablet should still be swallowed whole, and not chewed or crushed.

26 Dissolve this medicine under your tongue
Gadewch i'r feddyginiaeth hon doddi o dan y tafod
To be used on preparations designed for sublingual use.
Patients should be advised to hold under the tongue and avoid swallowing until dissolved. The buccal mucosa between the gum and cheek is occasionally specified by the prescriber.

27 Take with a full glass of water
Cymerwch gyda llond gywdr o ddŵr
To be used on preparations that should be well diluted (e.g. chloral hydrate), where a high fluid intake is required (e.g. sulfonamides), or where water is required to aid the action (e.g. methylcellulose). The patient should be advised that 'a full glass' means at least 150 mL. In most cases fruit juice, tea, or coffee may be used.

28 Spread thinly on the affected skin only
Taelwch yn denau ar y croen sydd wedi'i effeithio yn unig
To be used on external preparations that should be applied sparingly (e.g. corticosteroids, dithranol).

29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
Peidiwch â chymryd mwy nag 2 ar unrhyw un adeg. Peidiwch â chymryd mwy nag 8 mewn 24 awr
To be used on containers of dispensed solid dose preparations containing paracetamol for adults when the instruction on the label indicates that the dose can be taken on an 'as required' basis. The dose form should be specified, e.g. tablets or capsules.
This label has been introduced because of the serious consequences of overdosage with paracetamol.

30 Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well
Yn cynnwys paracetamol. Peidiwch â chymryd unrhyw beth arall sy'n cynnwys paracetamol tra'n cymryd y feddyginaeth hon. Siaradwch gyda'r meddyg ar unwaith os ydych yn cymryd gormod, hyd yn oed os ydych yn teimlo'n iawn
To be used on all containers of dispensed preparations containing paracetamol.

32 Contains aspirin. Do not take anything else containing aspirin while taking this medicine
Yn cynnwys aspirin. Peidiwch â chymryd unrhyw beth arall sy'n cynnwys aspirin tra'n cymryd y feddyginaeth hon
To be used on all containers of dispensed preparations containing aspirin when the name on the label does not include the word 'aspirin'.
Dental Practitioners’ Formulary

List of Dental Preparations
The following list has been approved by the appropriate Secretaries of State, and the preparations therein may be prescribed by dental practitioners on form FP10D (GP14 in Scotland, WP10D in Wales). Licensed sugar-free versions, where available, are preferred. Licensed alcohol-free mouthwashes, where available, are preferred.

Aciclovir Cream, BP
Aciclovir Oral Suspension, BP, 200 mg/5 mL
Aciclovir Tablets, BP, 200 mg
Aciclovir Tablets, BP, 800 mg
Amoxicillin Capsules, BP
Amoxicillin Oral Powder, DPF
Amoxicillin Oral Suspension, BP
Artificial Saliva Gel, DPF
Artificial Saliva Oral Spray, DPF
Artificial Saliva Pastilles, DPF
Artificial Saliva Protective Spray, DPF
Artificial Saliva Substitutes as listed below (to be prescribed only for indications approved by ACBS (patients suffering from dry mouth as a result of having or, having undergone, radiotherapy or sicca syndrome):

BioXtra® Gel Mouthspray
BioXtra® Moisturising Gel
Glandosane®
Solweze®
Artificial Saliva Substitute Spray, DPF
Aspirin Tablets, Dispersible, BP
Azithromycin Capsules, 250 mg, DPF
Azithromycin Oral Suspension, 200 mg/5 mL, DPF
Azithromycin Tablets, 250 mg, DPF
Azithromycin Tablets, 500 mg, DPF
Beclometasone Pressurised Inhalation, BP, 50 micrograms/metered inhalation, CFC-free, as: Clenil Modulite®
Benzydamine Mouthwash, BP 0.15%
Benzydamine Oromucosal Spray, BP 0.15%
Betamethasone Soluble Tablets, 500 micrograms, DPF
Carbamazepine Tablets, BP
Cefalexin Capsules, BP
Cefalexin Oral Suspension, BP
Cefalexin Tablets, BP
Cefradine Capsules, BP
Cetirizine Oral Solution, BP, 5 mg/5 mL
Cetirizine Tablets, BP, 10 mg
Chlorhexidine Gluconate Gel, BP
Chlorhexidine Mouthwash, BP
Chlorhexidine Oral Spray, DPF
Chlorphenamine Oral Solution, BP
Chlorphenamine Tablets, BP
Choline Salicylate Dental Gel, BP
Clarithromycin Oral Suspension, 125 mg/5 mL, DPF
Clarithromycin Oral Suspension, 250 mg/5 mL, DPF
Clarithromycin Tablets, BP
Clindamycin Capsules, BP
Co-amoxiclav Tablets, BP, 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt)
Co-amoxiclav Oral Suspension, BP, 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL
Co-amoxiclav Oral Suspension, BP, 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL
Diazepam Oral Solution, BP, 2 mg/5 mL
Diclofenac Sodium Tablets, Gastro-resistant, BP
Dihydrocodeine Tablets, BP, 30 mg
Doxycycline Tablets, Dispersible, BP
Doxycycline Capsules, BP, 100 mg
Doxycycline Tablets, 20 mg, DPF
Ephedrine Nasal Drops, BP
Erythromycin Ethyl Succinate Oral Suspension, BP
Erythromycin Ethyl Succinate Tablets, BP
Erythromycin Stearate Tablets, BP
Erythromycin Tablets, Gastro-resistant, BP
Fluconazole Capsules, 50 mg, DPF
Fluconazole Oral Suspension, 50 mg/5 mL, DPF
Hydrocortisone Cream, BP, 1%
Hydrocortisone Oromucosal Tablets, BP
Hydrogen Peroxide Mouthwash, BP, 6%
Ibuprofen Oral Suspension, BP, sugar-free
Ibuprofen Tablets, BP
Lansoprazole Capsules, Gastro-resistant, BP
Lidocaine Ointment, BP, 5%
Lidocaine Spray 10%, DPF
Loratadine Syrup, 5 mg/5 mL, DPF
Loratadine Tablets, BP, 10 mg
Menthol and Eucalyptus Inhalation, BP 1980
Metronidazole Oral Suspension, BP
Metronidazole Tablets, BP
Miconazole Cream, BP
Miconazole Oromucosal Gel, BP
Miconazole and Hydrocortisone Cream, BP
Miconazole and Hydrocortisone Ointment, BP
Nystatin Oral Suspension, BP
Omeprazole Capsules, Gastro-resistant, BP
Oxycetaclycine Tablets, BP
Paracetamol Oral Suspension, BP
Paracetamol Tablets, BP
Paracetamol Tablets, Soluble, BP
Phenoxybenzylpenicillin Oral Solution, BP
Phenoxybenzylpenicillin Tablets, BP
Promethazine Hydrochloride Tablets, BP
Promethazine Oral Solution, BP
Saliva Stimulating Tablets, DPF
Sodium Chloride Mouthwash, Compound, BP
Sodium Fluoride Mouthwash, BP
Sodium Fluoride Oral Drops, BP
Sodium Fluoride Tablets, BP
Sodium Fluoride Toothpaste 0.619%, DPF
Sodium Fluoride Toothpaste 1.1%, DPF
Sodium Fusidate Ointment, BP
Temazepam Oral Solution, BP
Temazepam Tablets, BP
Tetracycline Tablets, BP
Nurse Prescribers’ Formulary

Nurse Prescribers’ Formulary for Community Practitioners

List of preparations approved by the Secretary of State which may be prescribed on form FP10P (form HS21(N) in Northern Ireland, form GP10(N) in Scotland, forms WP1OCN and WP1OPN in Wales) by Nurses for National Health Service patients.

Community practitioners who have completed the necessary training may only prescribe items appearing in the nurse prescribers’ list set out below. Community Practitioner Nurse Prescribers are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved generic name.

Medicinal Preparations

Preparations on this list which are not included in the BP or BPC are described under Details of NPF preparations (p. 971). Almond Oil Ear Drops, BP Arachis Oil Enema, NPF Aspirin Tablets, Dispersible, 300 mg, BP (max. 96 tablets; max. pack size 32 tablets) Bisacodyl Suppositories, BP (includes 5-mg and 10-mg strengths) Bisacodyl Tablets, BP Catheter Maintenance Solution, Sodium Chloride, NPF Catheter Maintenance Solution, ‘Solution G’, NPF Catheter Maintenance Solution, ‘Solution R’, NPF Chlorhexidine Gluconate Alcoholic Solutions containing at least 0.05% Chlorhexidine Gluconate Aqueous Solutions containing at least 0.05% Choline Salicylate Dental Gel, BP Clotrimazole Cream 1%, BP Co-danthramer Capsules, NPF Co-danthramer Capsules, Strong, NPF Co-danthramer Oral Suspension, NPF Co-danthramer Oral Suspension, Strong, NPF Co-danthramer Tablets, BP Co-danthramer Tablets, NPF Co-danthramer Wash Gel Crotamiton Cream, BP Crotamiton Lotion, BP Dimethicone barrier creams containing at least 10% Dimethicone Lotion, NPF Docusate Capsules, BP Docusate Enema, NPF Docusate Oral Solution, BP Docusate Oral Solution, Paediatric, BP Econazole Cream 1%, BP Emollients as listed below: Aquadrate® 10% w/w Cream Arachis Oil, BP Balneum® Plus Cream Cetraben® Emollient Cream Dermamist® Diprobase® Cream Diprobase® Ointment Doublebase® Doublebase® Dayleve Gel E45® Cream E45® Itch Relief Cream Emulsifying Ointment, BP Eucerin® Intensive 10% w/w Urea Treatment Cream Eucerin® Intensive 10% w/w Urea Treatment Lotion Hydromol® Cream Hydromol® Intensive Hydrox Cream, BP Liquid and White Soft Paraffin Ointment, NPF Neutrogena® Norwegian Formula Dermatological Cream Nutraplus® Cream Oilatum® Cream Oilatum® Junior Cream Paraffin, White Soft, BP Paraffin, Yellow Soft, BP Ultrabase® Unguentum M® Emollient Bath and Shower Preparations as listed below: Aqueous Cream, BP Balneum® (except pack sizes that are not to be prescribed under the NHS (see Part XVIIIA of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff)) Balneum Plus® Bath Oil (except pack sizes that are not to be prescribed under the NHS (see Part XVIIIA of the Drug Tariff, Part XI of the Northern Ireland Drug Tariff)) CETRAB® Bath Emollient Bath Additive Dermalo® Bath Emollient Doublebase® Bath Emollient Additive Doublebase® Emollient Shower Gel Doublebase® Emollient Wash Gel Hydromol® Bath and Shower Emollient Oilatum® Emollient Oilatum® Gel Oilatum® Junior Bath Additive Zerolatum® Emollient Medicinal Bath Oil Folic Acid Tablets 400 micrograms, BP Glycerol Suppositories, BP Ibuprofen Oral Suspension, BP (except for indications and doses that are prescription-only) Ibuprofen Tablets, BP (except for indications and doses that are prescription-only) Ispaghula Husk Granules, BP Ispaghula Husk Granules, Effervescent, BP Ispaghula Husk Oral Powder, BP Lactulose Solution, BP Lidocaine Ointment, BP Lidocaine and Chlorhexidine Gel, BP Macroglol Oral Liquid, Compound, NPF Macroglol Oral Powder, Compound, NPF Macroglol Oral Powder, Compound, Half-strength, NPF Magnesium Hydroxide Mixture, BP Magnesium Sulfate Paste, BP Maltahoe aqueous lotions containing at least 0.5% Mebendazole Oral Suspension, NPF Mebendazole Tablets, NPF Methylcellulose Tablets, BP Miconazole Cream 2%, BP Miconazole Oromucosal Gel, BP Mouthwash Solution-tablets, NPF Nicotine Inhalation Cartridge for Oromucosal Use, NPF Nicotine Lozenge, NPF Nicotine Medicated Chewing Gum, NPF Nicotine Nasal Spray, NPF Nicotine Oral Spray, NPF Nicotine Sublingual Tablets, NPF Nicotine Transdermal Patches, NPF Nystatin Oral Suspension, BP Olive Oil Ear Drops, BP Paracetamol Oral Suspension, BP (includes 120 mg/5 mL and 250 mg/5 mL strengths—both of which are available as sugar-free formulations)
Paracetamol Tablets, BP (max. 96 tablets; max. pack size 32 tablets)
Paracetamol Tablets, Soluble, BP (includes 120-mg and 500-mg tablets; max. 96 tablets; max. pack size 32 tablets)
Permethrin Cream, NPF
Phosphates Enema, BP
Povidone–Iodine Solution, BP
Senna Oral Solution, NPF
Senna Tablets, BP
Senna and Ispaghula Granules, NPF
Sodium Chloride Solution, Sterile, BP
Sodium Citrate Compound Enema, NPF
Sodium Picosulfate Capsules, NPF
Sodium Picosulfate Elixir, NPF
Spermicidal contraceptives as listed below:
  - Gygel® Contraceptive Jelly
Sterculia Granules, NPF
Sterculia and Frangula Granules, NPF
Titanium Ointment, BP
Water for Injections, BP
Zinc and Castor Oil Ointment, BP
Zinc Oxide and Dimeticone Spray, NPF
Zinc Oxide Impregnated Medicated Bandage, NPF
Zinc Oxide Impregnated Medicated Stocking, NPF
Zinc Paste Bandage, BP 1993
Zinc Paste and Ichtammol Bandage, BP 1993

**Appliances and Reagents (including Wound Management Products)**

Community Practitioner Nurse Prescribers in England, Wales and Northern Ireland can prescribe any appliance or reagent in the relevant Drug Tariff. In the Scottish Drug Tariff, Appliances and Reagents which may not be prescribed by Nurses are annotated Ns.

**Appliances** (including Contraceptive Devices) as listed in Part IXC of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 5 of the Scottish Drug Tariff).

**Incontinence Appliances** as listed in Part IXB of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 5 of the Scottish Drug Tariff).

**Stoma Appliances and Associated Products** as listed in Part IXC of the Drug Tariff (Part III of the Northern Ireland Drug Tariff, Part 6 of the Scottish Drug Tariff).

**Chemical Reagents** as listed in Part IXC of the Drug Tariff (Part II of the Northern Ireland Drug Tariff, Part 9 of the Scottish Drug Tariff).

The Drug Tariffs can be accessed online at:
- National Health Service Drug Tariff for England and Wales: [www.ppa.org.uk/ppa/edt_intro.htm](http://www.ppa.org.uk/ppa/edt_intro.htm)
- Health and Social Care, Business Services Organisation, Northern Ireland Drug Tariff: [http://www.hscbusiness.hscni.net/services/2034.htm](http://www.hscbusiness.hscni.net/services/2034.htm)

**Details of NPF preparations**

Preparations on the Nurse Prescribers’ Formulary which are not included in the BP or BPC are described as follows in the Nurse Prescribers’ Formulary. Although brand names have sometimes been included for identification purposes, it is recommended that non–proprietary names should be used for prescribing medicinal preparations in the NPF except where a non–proprietary name is not available.

**Arachis Oil Enema**
- arachis oil 100%

**Catheter Maintenance Solution, Sodium Chloride**
- proprietary products: OptiFlo S; Uro-Tainer Sodium Chloride; Uriflex-S), sodium chloride 0.9%

**Catheter Maintenance Solution, ‘Solution G’**
- proprietary products: OptiFlo G; Uro-Tainer Subly G; Uriflex G), citric acid 3.23%, magnesium oxide 0.38%, sodium bicarbonate 0.7%, disodium edetate 0.01%

**Catheter Maintenance Solution, ‘Solution R’**
- proprietary products: OptiFlo R; Uro-Tainer Solution R; Uriflex R), citric acid 6%, glycolactone 0.6%, magnesium carbonate 2.8%, disodium edetate 0.01%

**Chlorhexidine gluconate alcoholic solutions**
- proprietary products: ChloraPrep; Hydroxyl; Hydrox spray), chlorhexidine gluconate in alcoholic solution

**Chlorhexidine gluconate aqueous solutions**
- proprietary product: Unisept), chlorhexidine gluconate in aqueous solution

**Co-danthramer Capsules**
- co-danthramer 25/200 (dantron 25 mg, poloxamer 188 200 mg)

**Co-danthramer Capsules, Strong**
- co-danthramer 37.5/500 (dantron 37.5 mg, poloxamer 188 500 mg)

**Co-danthramer Oral Suspension**
- proprietary product: Codalax), co-danthramer 75/1000 in 5 mL (dantron 75 mg, poloxamer 188 1 g/5 mL)

**Co-danthrusate Oral Suspension**
- proprietary product: Normax), co-danthrusate 50/60 (dantron 50 mg, docucate sodium 60 mg/5 mL)

**Dimeticone barrier creams**
- proprietary products Conotrane Cream, dimeticone ‘350’ 22%; Stopel Barrier Cream, dimeticone ‘1000’ 10%, dimeticone 10–22%

**Dimeticone Lotion**
- proprietary product: Hedrin), dimeticone 4%

**Docusate Enema**
- proprietary product: Norgalax Micro-enema), docusate sodium 120 mg in 10 g

**Liquid and White Soft Paraffin Ointment**
- liquid paraffin 50%, white soft paraffin 50%

**Macrogol Oral Liquid, Compound**
- proprietary products: Movicol Liquid), macrogol ‘3350’ (polyethylene glycol ‘3350’) 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/25 mL

**Macrogol Oral Powder, Compound**
- proprietary products: Laxido Orange, Molaxole, Movicol), macrogol ‘3350’ (polyethylene glycol ‘3350’) 13.125 g, sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 46.6 mg/sachet; (amount of potassium chloride varies according to flavour of Movicol® as follows: plain–flavour (sugar–free) = 50.2 mg/sachet; lime and lemon flavour = 46.6 mg/sachet; chocolate flavour = 31.7 mg/sachet. 1 sachet when reconstituted with 125 mL water provides K+ 5.4 mmol/litre)

**Macrogol Oral Powder, Compound, Half–strength**
- proprietary product: Movicol-Hal), macrogol ‘3350’ (polyethylene glycol ‘3350’) 6.563 g, sodium bicarbonate 89.3 g, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet

**Malathion aqueous lotions**
- proprietary products: Derbac-M Liquid), malathion 0.5% in an aqueous basis

**Mebendazole Oral Suspension**
- proprietary product: Vermox), mebendazole 100 mg/5 mL
Mebendazole Tablets (proprietary products: Ovex, Vermox), mebendazole 100 mg (can be supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg)

Mouthwash Solution-tablets consist of tablets which may contain antimicrobial, colouring and flavouring agents in a suitable soluble effervescent basis to make a mouthwash

Nicotine Inhalation Cartridge for Oromucosal Use (proprietary products: NicAssist Inhalator, Nicorette Inhalator), nicotine 15 mg (for use with inhalation mouthpiece; to be prescribed as either a starter pack (6 cartridges with inhalator device and holder) or refill pack (42 cartridges with inhalator device)

Nicotine Lozenge nicotine (as bitartrate) 1 mg or 2 mg (proprietary product: Nicorette Mint Lozenge, Nicotinell Mint Lozenge), nicotine (as resinate) 1.5 mg, 2 mg, or 4 mg (proprietary product: NiQuitin Lozenges, NiQuitin Minis, NiQuitin Pre-quit)

Nicotine Medicated Chewing Gum (proprietary products: NicAssist Gum, Nicorette Gum, Nicotinell Gum, NiQuitin Gum), nicotine 2 mg or 4 mg

Nicotine Nasal Spray (proprietary product: NicAssist Nasal Spray, Nicorette Nasal Spray), nicotine 500 micrograms/metered spray

Nicotine Oral Spray (proprietary product: Nicorette Quickmist), nicotine 1 mg/metered spray

Nicotine Sublingual Tablets (proprietary product: NicAssist Microtab, Nicorette Microtab), nicotine (as a cyclodextrin complex) 2 mg (to be prescribed as either a starter pack (2 × 15-tablet discs with dispenser) or refill pack (7 × 15-tablet discs))

Nicotine Transdermal Patches releasing in each 16 hours, nicotine approx. 5 mg, 10 mg, or 15 mg (proprietary products: Boots NicAssist Patch, Nicorette Patch), or releasing in each 16 hours approx. 10 mg, 15 mg, or 25 mg (proprietary products: NicAssist Translucent Patch, Nicorette Invisi Patch), or releasing in each 24 hours nicotine approx. 7 mg, 14 mg, or 21 mg (proprietary products: Nicopatch, Nicotinell TTS, NiQuitin, NiQuitin Clear) (prescriber should specify the brand to be dispensed)

Permethrin Cream (proprietary product: Lyclear Dermal Cream), permethrin 5%

Senna Oral Solution (proprietary product: Senokot Syrup), sennosides 7.5 mg/5 mL

Senna and Ispaghula Granules (proprietary product: Manevac Granules), senna fruit 12.4%, ispaghula 54.2%

Sodium Citrate Compound Enema (proprietary products: Micolette Micro-enema; Micralax Micro-enema; Relaxit Micro-enema), sodium citrate 450 mg with glycerol, sorbitol and an anionic surfactant

Sodium Picosulfate Capsules (proprietary products: Dulcolax Perles), sodium picosulfate 2.5 mg

Sodium Picosulfate Elixir (proprietary product: Dulcolax Liquid), sodium picosulfate 5 mg/5 mL

Sterculia Granules (proprietary product: Normacol Granules), sterculia 62%

Sterculia and Frangula Granules (proprietary product: Normacol Plus Granules), sterculia 62%, frangula (standardised) 8%

Zinc Oxide Impregnated Medicated Bandage (proprietary product: Steripaste), sterile cotton bandage impregnated with paste containing zinc oxide 15%

Zinc Oxide Impregnated Medicated Stocking (proprietary product: Zipzoc), sterile rayon stocking impregnated with ointment containing zinc oxide 20%
Non-medical prescribing

Overview
A range of non-medical healthcare professionals can prescribe medicines for patients as either Independent or Supplementary Prescribers.

Independent prescribers are practitioners responsible and accountable for the assessment of patients with previously undiagnosed or diagnosed conditions and for decisions about the clinical management required, including prescribing. They are recommended to prescribe generically, except where this would not be clinically appropriate or where there is no approved non-proprietary name.

Supplementary prescribing is a partnership between an independent prescriber (a doctor or a dentist) and a supplementary prescriber to implement an agreed Clinical Management Plan for an individual patient with that patient’s agreement.

Independent and Supplementary Prescribers are identified by an annotation next to their name in the relevant professional register.

Information and guidance on non-medical prescribing is available on the Department of Health website at www.dh.gov.uk/health/2012/04/prescribing-change.

For information on the mixing of medicines by Independent and Supplementary Prescribers, see Mixing of medicines prior to administration in clinical practice—responding to legislative changes, National Prescribing Centre, May 2010 (available at www.npc.nhs.uk/improving_safety/mixing_meds/resources/mixing_of_medicines.pdf).

For information on the supply and administration of medicines to groups of patients using Patient Group Directions see Guidance on prescribing p. 1.

Nurses
Nurse Independent Prescribers (formerly known as Extended Formulary Nurse Prescribers) are able to prescribe any medicine for any medical condition.

Nurse Independent Prescribers are able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Nurse Independent Prescribers must work within their own level of professional competence and expertise.

The Nurse Prescribers’ Formulary for Community Practitioners p. 970 provides information on prescribing.

Pharmacists
Pharmacist Independent Prescribers can prescribe any medicine for any medical condition.

They are also able to prescribe, administer, and give directions for the administration of Schedule 2, 3, 4, and 5 Controlled Drugs. This extends to diamorphine, dipipanone, or cocaine for treating organic disease or injury, but not for treating addiction.

Pharmacist Independent Prescribers must work within their own level of professional competence and expertise.

Optometrists
Optometrist Independent Prescribers can prescribe any licensed medicine for ocular conditions affecting the eye and the tissues surrounding the eye, except Controlled Drugs or medicines for parenteral administration. Optometrist Independent Prescribers must work within their own level of professional competence and expertise.
Index of proprietary manufacturers

Alphabetical list of manufacturers and other companies

The following is an alphabetical list of manufacturers and other companies referenced in the BNF, with their medicines information or general contact details. For information on 'special-order' manufacturers and specialist importing companies see 'Special-order manufacturers'.

Unlicensed medicines are available from ‘special-order’ manufacturers and specialist-importing companies; the MHRA maintains a register of these companies at tinyurl.com/cdskj.

Licensed hospital manufacturing units also manufacture ‘special-order’ products as unlicensed medicines, the principal NHS units are listed below. A database (Pro-File; www.pro-file.nhs.uk) provides information on medicines manufactured in the NHS; access is restricted to NHS pharmacy staff.

The Association of Pharmaceutical Specials Manufacturers may also be able to provide further information about commercial companies (www.apsm-uk.com).

The MHRA recommends that an unlicensed medicine should only be used when a patient has special requirements that cannot be met by use of a licensed medicine.

As well as being available direct from the hospital manufacturer(s) concerned, many NHS-manufactured Specials may be bought from the Oxbridge Pharmacy Store, owned and operated by Oxford Health NHS Foundation Trust.

## Yellow Card

**COMMISSION ON HUMAN MEDICINES (CHM)**

**REPORT OF SUSPECTED ADVERSE DRUG REACTIONS**

If you suspect an adverse reaction may be related to one or more drugs/vaccines/complementary remedies, please complete this Yellow Card. See 'Adverse reactions to drugs' section in BNFC or [www.mhra.gov.uk/yellowcard](http://www.mhra.gov.uk/yellowcard) for guidance. Do not be put off reporting because some details are not known.

### PATIENT DETAILS
- **Patient initials:**
- **Sex:** M / F
- **Is the patient pregnant?** Y / N
- **Ethnicity:**
- **Age (at time of reaction):**
- **Weight (kg):**
- **Identification number (e.g. Practice or Hospital Ref):**

### SUSPECTED DRUG(S)/VACCINE(S)
- **Drug/Vaccine (Brand if known):**
- **Batch:**
- **Route:**
- **Dosage:**
- **Date started:**
- **Date stopped:**
- **Prescribed for:**

### SUSPECTED REACTION(S)
Please describe the reaction(s) and any treatment given. (Please attach additional pages if necessary):

**Outcome**
- Recovered
- Recovering
- Continuing
- Other

**Date reaction(s) started:**
**Date reaction(s) stopped:**

Do you consider the reactions to be serious? **Yes / No**

If yes, please indicate why the reactions is considered to be serious (please tick all that apply):
- [ ] Patient died due to reaction
- [ ] Life threatening
- [ ] Congenital abnormality
- [ ] Involved or prolonged inpatient hospitalisation
- [ ] Involved persistent or significant disability or incapacity
- [ ] Medically significant; please give details: ____________________________

If the reactions were not serious according to the categories above, how bad was the suspected reaction?
- [ ] Mild
- [ ] Unpleasant, but did not affect everyday activities
- [ ] Bad enough to affect everyday activities
It's easy to report online: www.mhra.gov.uk/yellowcard

OTHER DRUG(S) (including self-medication and complementary remedies)
Did the patient take any other medicines/vaccines/complementary remedies in the last 3 months prior to the reaction? Yes / No
If yes, please give the following information if known:

<table>
<thead>
<tr>
<th>Drug/Vaccine (Brand if known)</th>
<th>Batch</th>
<th>Route</th>
<th>Dosage</th>
<th>Date started</th>
<th>Date stopped</th>
<th>Prescribed for</th>
</tr>
</thead>
<tbody>
<tr>

# REPORT OF SUSPECTED ADVERSE DRUG REACTIONS

If you suspect an adverse reaction may be related to one or more drugs/vaccines/complementary remedies, please complete this Yellow Card. See 'Adverse reactions to drugs' section in BNFC or [www.mhra.gov.uk/yellowcard](http://www.mhra.gov.uk/yellowcard) for guidance. Do not be put off reporting because some details are not known.

## PATIENT DETAILS
- Patient initials: __________
- Sex: M / F
- Is the patient pregnant? Y / N
- Ethnicity: __________
- Age (at time of reaction): __________
- Weight (kg): __________
- Identification number (e.g. Practice or Hospital Ref): __________

## SUSPECTED DRUG(S)/VACCINE(S)
- Drug/Vaccine (Brand if known): __________
- Batch: __________
- Route: __________
- Dosage: __________
- Date started: __________
- Date stopped: __________
- Prescribed for: __________

## SUSPECTED REACTION(S)
Please describe the reaction(s) and any treatment given. (Please attach additional pages if necessary):

### Outcome
- Recovered
- Recovering
- Continuing
- Other

- Date reaction(s) started: __________
- Date reaction(s) stopped: __________

Do you consider the reactions to be serious? Yes / No

If yes, please indicate why the reaction is considered to be serious (please tick all that apply):
- Patient died due to reaction
- Life threatening
- Congenital abnormality
- Involved or prolonged inpatient hospitalisation
- Involved persistent or significant disability or incapacity
- Medically significant; please give details: ______________________________________

If the reactions were not serious according to the categories above, how bad was the suspected reaction?
- Mild
- Unpleasant, but did not affect everyday activities
- Bad enough to affect everyday activities
OTHER DRUG(S) (including self-medication and complementary remedies)

Did the patient take any other medicines/vaccines/complementary remedies in the last 3 months prior to the reaction? Yes / No
If yes, please give the following information if known:

<table>
<thead>
<tr>
<th>Drug/Vaccine (Brand if known)</th>
<th>Batch</th>
<th>Route</th>
<th>Dosage</th>
<th>Date started</th>
<th>Date stopped</th>
<th>Prescribed for</th>
</tr>

Medical emergencies in the community

Overview
Drug treatment outlined below is intended for use by appropriately qualified healthcare professionals. Only drugs that are used for immediate relief are shown; advice on supporting care is not given. Where the child’s condition requires investigation and further treatment, the child should be transferred to hospital promptly.

Asthma: Acute
Regard each emergency consultation as being for severe acute asthma until shown otherwise; failure to respond adequately at any time requires immediate transfer to hospital.

Either Salbutamol aerosol inhaler p. 146
(100 micrograms/metered inhalation)
By aerosol inhalation via large-volume spacer (and a close-fitting face mask if child under 3 years)
- Child: 2–10 puffs each inhaled separately, repeated every 10–20 minutes or as necessary

Or Salbutamol nebuliser solution p. 148
(2.5 mg/mL)
By nebulisation for childhood asthma
- Child 4 years and below: 5 mg every 20–30 minutes or as necessary
- Child 5–11 years: 5–10 mg every 20–30 minutes or as necessary
- Child 12–17 years: 10 mg every 20–30 minutes or as necessary

Or Terbutaline sulfate nebuliser solution p. 148
(2.5 mg/mL)
By nebulisation for childhood asthma
- Child 4 years and below: 5 mg every 20–30 minutes or as necessary
- Child 5–11 years: 5–10 mg every 20–30 minutes or as necessary
- Child 12–17 years: 10 mg every 20–30 minutes or as necessary

PLUS (in all cases)

Either Prednisolone tablets p. 413 (or prednisolone soluble tablets) (5 mg)
By mouth
- Child 11 years and below: 1–2 mg/kg (max. 40 mg) once daily for up to 3 days or longer if necessary; if child has been taking an oral corticosteroid for more than a few days, give prednisolone 2 mg/kg (max. 60 mg) once daily
- Child 12–17 years: 40–50 mg once daily for at least 5 days

Or Dexamethasone oral solution p. 410
(2 mg/5 mL)
By mouth
- Child 1-month to 2 years: 150 micrograms/kg as a single dose

While awaiting ambulance, repeat nebulised beta₂ agonist (as above) and give with:
Isotropium bromide nebuliser solution p. 143
(250 micrograms/mL)
By inhalation of nebulised solution (via oxygen-driven nebuliser if available)
- Child 11 years and below: 250 micrograms, repeated every 20–30 minutes for the first 2 hours, then every 4–6 hours as necessary
- Child 12–17 years: 500 micrograms every 4–6 hours as necessary

Croup
Dexamethasone oral solution p. 410
(2 mg/5 mL)
By mouth
- Child 1 month–2 years: 150 micrograms/kg as a single dose

Anaphylaxis

Anaphylaxis
Adrenaline/epinephrine injection p. 128
(1 mg/mL (1 in 1000))
By intramuscular injection
- Child 5 years and below: 150 micrograms (0.15 mL), repeated every 5 minutes if necessary
- Child 6–11 years: 300 micrograms (0.3 mL), repeated every 5 minutes if necessary
- Child 12–17 years: 500 micrograms (0.5 mL), repeated every 5 minutes if necessary; 300 micrograms (0.3 mL) should be given if child is small or prepubertal

High-flow oxygen and intravenous fluids should be given as soon as available.

Chlorphenamine maleate injection p. 168
By intramuscular or intravenous injection
May help counter histamine-mediated vasodilation and bronchoconstriction.

Hydrocortisone (preferably as sodium succinate)
By intravenous injection
Has delayed action but should be given to severely affected patients to prevent further deterioration.

Bacterial disease

Meningococcal Disease
Benzylenicillin sodium injection p. 318
(600 mg, 1.2 g)
By intravenous injection (or by intramuscular injection if venous access not available)
- Neonate: 300 mg
- Child 1-month–11 months: 300 mg
- Child 1–9 years: 600 mg
- Child 10–17 years: 1.2 g
Note: A single dose should be given before urgent transfer to hospital, so long as this does not delay the transfer.

Or if history of allergy to penicillin
Cefotaxime injection p. 301
(1 g)
By intravenous injection (or by intramuscular injection if venous access not available)
- Neonate: 50 mg/kg
- Child 1-month–11 months: 50 mg/kg (max. 1 g)
- Child 12–17 years: 1 g
Note: A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer.
OR if history of immediate hypersensitivity reaction (including anaphylaxis, angioedema, urticaria, or rash immediately after administration) to penicillin or to cephalosporins

Chloramphenicol injection p. 334 (1 g)
BY INTRAVENOUS INJECTION
- Child: 12.5–25 mg/kg

NOTE A single dose can be given before urgent transfer to hospital, so long as this does not delay the transfer.
See also Central nervous system infections, bacterial p. 286.

Hypoglycaemia

DIABETIC HYPOGLYCAEMIA
Glucose or sucrose
BY MOUTH
- Child over 2 years: approx. 10–20 g
  (55–110 mL Lucozade® Energy Original or 100–200 mL Coca-Cola®—both non-diet versions or 2–4 teaspoonsfuls of sugar or 3–6 sugar lumps) repeated after 10–15 minutes if necessary

OR if hypoglycaemia unresponsive or if oral route cannot be used
Glucagon injection p. 433 (1 mg/mL)
BY SUBCUTANEOUS OR INTRAMUSCULAR INJECTION
- Child body-weight up to 25 kg: 500 micrograms (0.5 mL)
- Child body-weight 25 kg and above: 1 mg (1 mL)

OR if hypoglycaemia prolonged or unresponsive to glucagon after 10 minutes
Glucose intravenous infusion p. 549 (10%)
BY INTRAVENOUS INJECTION INTO LARGE VEIN
- Child: 5 mL/kg (glucose 500 mg/kg)

Seizures

CONVULSIVE (INCLUDING FEBRILE) SEIZURES LASTING LONGER THAN 5 MINUTES

EITHER Diazepam rectal solution p. 207 (2 mg/mL, 4 mg/mL)
BY RECTUM
- Neonate: 1.25–2.5 mg, repeated once after 10–15 minutes if necessary
- Child 1 month-1 year: 5 mg, repeated once after 10–15 minutes if necessary
- Child 2-11 years: 5–10 mg, repeated once after 10–15 minutes if necessary
- Child 12-17 years: 10–20 mg, repeated once after 10–15 minutes if necessary

OR Midazolam oromucosal solution p. 210
BY BUCCAL ADMINISTRATION, REPEATED ONCE AFTER 10 MINUTES IF NECESSARY
- Neonate: 300 micrograms/kg [unlicensed]
- Child 1-2 months: 300 micrograms/kg (max. 2.5 mg) [unlicensed]
- Child 3 months-11 months: 2.5 mg
- Child 1-4 years: 5 mg
- Child 5-9 years: 7.5 mg
- Child 10-17 years: 10 mg

</tbody>
</table>

### Mass

- 1 kilogram (kg) = 1000 grams (g)
- 1 gram (g) = 1000 milligrams (mg)
- 1 milligram (mg) = 1000 micrograms
- 1 microgram = 1000 nanograms
- 1 nanogram = 1000 picograms

### Volume

- 1 litre = 1000 millilitres (mL)
- 1 millilitre (1 mL) = 1000 microlitres
- 1 pint ≈ 568 mL

### Other units

- 1 kilocalorie (kcal) = 4186.8 joules (J)
- 1000 kilocalories (kcal) = 4.1868 megajoules (MJ)
- 1 megajoule (MJ) = 238.8 kilocalories (kcal)
- 1 millimetre of mercury (mmHg) = 133.3 pascals (Pa)
- 1 kilopascal (kPa) = 7.5 mmHg (pressure)

### Plasma-drug concentrations

Plasma-drug concentrations in BNF publications are expressed in mass units per litre (e.g. mg/litre). The approximate equivalent in terms of amount of substance units (e.g. micromol/litre) is given in brackets.

### Prescribing for children: weight, height, and gender

The table below shows the **mean values** for weight, height and gender by age; these values have been derived from the UK-WHO growth charts 2009 and UK1990 standard centile charts, by extrapolating the 50th centile, and may be used to calculate doses in the absence of actual measurements. However, the child’s actual weight and height might vary considerably from the values in the table and it is important to see the child to ensure that the value chosen is appropriate. In most cases the child’s actual measurement should be obtained as soon as possible and the dose recalculated.

</tr>
</tbody>
</table>

### Length

- 1 metre (m) = 1000 millimetres (mm)
- 1 centimetre (cm) = 10 mm
- 1 inch (in) = 25.4 mm
- 1 foot (ft) = 12 inches
- 12 inches = 304.8 mm
Recommended wording of cautionary and advisory labels

For details including Welsh language translation, please see Appendix 3

1 Warning: This medicine may make you sleepy
2 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines. Do not drink alcohol
3 Warning: This medicine may make you sleepy. If this happens, do not drive or use tools or machines
4 Warning: Do not drink alcohol
5 Do not take indigestion remedies 2 hours before or after you take this medicine
6 Do not take indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
7 Do not take milk, indigestion remedies, or medicines containing iron or zinc, 2 hours before or after you take this medicine
8 Warning: Do not stop taking this medicine unless your doctor tells you to stop
9 Space the doses evenly throughout the day. Keep taking this medicine until the course is finished, unless you are told to stop
10 Warning: Read the additional information given with this medicine
11 Protect your skin from sunlight—even on a bright but cloudy day. Do not use sunbeds
12 Do not take anything containing aspirin while taking this medicine
13 Dissolve or mix with water before taking
14 This medicine may colour your urine. This is harmless
15 Caution: flammable. Keep your body away from fire or flames after you have put on the medicine
16 Dissolve the tablet under your tongue—do not swallow. Store the tablets in this bottle with the cap tightly closed. Get a new supply 8 weeks after opening
17 Do not take more than... in 24 hours
18 Do not take more than... in 24 hours. Also, do not take more than... in any one week
19 Warning: This medicine makes you sleepy. If you still feel sleepy the next day, do not drive or use tools or machines. Do not drink alcohol
21 Take with or just after food, or a meal
22 Take 30 to 60 minutes before food
23 Take this medicine when your stomach is empty. This means an hour before food or 2 hours after food
24 Suck or chew this medicine
25 Swallow this medicine whole. Do not chew or crush
26 Dissolve this medicine under your tongue
27 Take with a full glass of water
28 Spread thinly on the affected skin only
29 Do not take more than 2 at any one time. Do not take more than 8 in 24 hours
30 Contains paracetamol. Do not take anything else containing paracetamol while taking this medicine. Talk to a doctor at once if you take too much of this medicine, even if you feel well
32 Contains aspirin. Do not take anything else containing aspirin while taking this medicine
Abbreviations and Symbols

Internationally recognised units and symbols are used in the BNF publications where possible.

ACBS  Advisory Committee on Borderline Substances, see Borderline Substances
ACE  Angiotensin-converting enzyme
ADHD  Attention deficit hyperactivity disorder
AIDS  Acquired immunodeficiency syndrome
approx.  approximately
AV  atroventricular
BAN  British Approved Name
BMI  body mass index
BP  British Pharmacopoeia 2013, unless otherwise stated
BPC  British Pharmaceutical Codex 1973 and Supplement 1976, unless otherwise stated
BRCA  breast cancer gene
CAPD  Continuous ambulatory peritoneal dialysis
CDM  Committee on Safety of Medicines (now subsumed under CSM)
CHM  Committee on Human Medicines
CHMP  Committee for Medicinal Products for Human Use
CNS  central nervous system
CSM  Committee on Safety of Medicines (now subsumed under Commission on Human Medicines)
d. c.  direct current
DMARD  Disease-modifying antirheumatic drug
diphenhydramine tartrate
DPP  Dental Practitioners’ Formulary
e/c  enteric-coated (term gastro-resistant in BP)
ECG  electrocardiogram
EEG  electro-encephalogram
eGFR  estimated glomerular filtration rate, see Prescribing in renal impairment p. 15
E200 Sorbic Acid
E172 Iron oxides, iron hydroxides
E171 Titanium Dioxide
E422 Glycerol
E420 Sorbitol
E322 Lecithins
E127 Erythrosine BS
E421 Mannitol
E124 Ponceau 4R
E123 Amaranth
E110 Sunset Yellow FCF
E232 Butylated Hydroxyanisole
E231 Butylated Hydroxytoluene
E120 Propylene Glycol
E020 Sorbic Acid
E012 Tartrazine

Latin abbreviations

Directions should be in English without abbreviation. However, Latin abbreviations have been used when prescribing.

The following is a list of appropriate abbreviations. It should be noted that the English version is not always an exact translation.

a. c.  = ante cibum (before food)
b. d.  = bis die (twice daily)
o. d.  = omni die (every day)
o. m.  = omni mane (every morning)
o. n.  = omni nocte (every night)
p. c.  = post cibum (after food)
p. r. n. = pro re nata (when required)
qu. d. s. = quater die sumendum (to be taken four times daily)
q. q. h. = quarta quoque hora (every four hours)
st. = stat  immediately
t. d. s. = ter die sumendus (to be taken three times daily)
t. i. d. = ter in die (three times daily)

E numbers

The following is a list of common E numbers and the inactive ingredients to which they correspond.

E102  Tartrazine
E211  Sodium Benzoate
E104  Quinoline Yellow
E223  Sodium Metabisulfite
E110  Sunset Yellow FCF
E320  Butylated Hydroxyanisole
E123  Amaranth
E321  Butylated Hydroxytoluene
E124  Ponceau 4R
E322  Lecithins
E127  Erythrosine BS
E420  Sorbitol
E132  Indigo Carmine
E421  Mannitol
E142  Green S
E422  Glycerol
E171  Titanium Dioxide
E901  Beeswax (white and yellow)
E172  Iron oxides, iron hydroxides
E1520  Propylene Glycol
E200  Sorbic Acid
